The water is in good order for all-round fishing. J. Stroud, three days; best day with Mr. Littlewood and friend, four dozen roach and four chub. A. Stroud, five days; best day with Mr. Walter Howard, of Moore and Burgess Minstrels, and his friend, Mr. Will Arther, eight dozen roach and thirteen bream.—ALFRED STROUD.

Thames (Twickenham).

A little rise in the water. Moderate wind, S.W., but nothing to cause alarm, as the water is now falling fast, and anglers may expect a good time of it next week, as tide will suit for whole day's fishing. I have still been fully employed. We have had some very large takes during the past week. Spiers, one day with Mr. Fitcher, Newgate Street, 31 lb., including 12 very fine roach and 1 barbel; Mr. Grimes, 12 dozen roach and dace; Pert Hammerton, Capt. Smith, 13 dozen one day; Mr. Orde, 8 dozen in five days; Jem. Hammerton, with Dr. Calender, 10 lb. one day; ditto, one day 15 lb., and one barbel scaling 7 lb.; Dick Moffat, with Mr. Cobett, 16 lb. in five hours; Mr. Holmes, one day, 10 dozen, 1 large eel; Joe Dobbin, 1 dozen, with Dr. Clark,

26 lb., 2 barbel; one day with Mr. Walker, 36 lb., and 1 fine barbel 5 lb.; one day with Mr. Cook, of the Star and Garter, St. Anne's Hill, Wandsworth, 18½ lb. of fine fish. N.B.—In reference to the report which appeared in the *Referee* of August 7, I must entirely repudiate the whole of the same with reference to our takes, the reporter not having any authority to make such idiotic statements. The fact of an 8½ lb. perch speaks for itself with common-sense persons.—ALFRED PERRIN.

Thames (Windsor).

One hundred and forty-two more trout, making a total of 272 turned in within the last three weeks by the Windsor and Eton Angling Society, is the best news I have this week, though, from what I saw of the size, with the exception of one-and-half dozen, they were much too small to put in this water, the average being about five inches, just a nice size for jack bait. As they have not been used to being preyed upon in their native stream, doubtless the only place benefited by this increase will be "John's larder." When turned in they do not swim off as other fish would, but lie on the bottom, and refuse to move even when touched, looking much as if resigned to their fate. I did not see the lot turned in about. Sport in the neighbourhood has been pretty fair. We could do with a lot more rain, as the water is still very low, though a better temperature. Had we not had the late rain I am afraid there would not have been a fin to record. On the 7th inst. Dick Gray, with a patron, had a very handsome trout, between four or five pound, eight chub, one perch, one dace, all taken ledgering with worm. On the 5th inst. he had, fishing with Mr. Hockey, of 84, Old Kent Road, London, one bream, three-and-half pounds (a curiosity in the upper waters), two barbel, five perch, one dozen dace and three chub. In the Windsor Weir stream two good jack were had on the 7th inst. by Mr. Marsh, going eight pound and five pound. On the 6th inst., at the same place, Mr. Libert, who is staying at Park Street, Windsor, caught a jack six-and-half pound, and a few days before took an eel, whilst spinning a gudgeon, weighing one-and-half pounds. On the 7th inst. James Gray, with a patron, had nine barbel, largest four pound. At Datchet, on the 7th inst., James Hoare, with a patron, had nine barbel, and on the 8th inst., with a patron, eight barbel. Owing to the late rain bank angling has greatly improved, and some good roach are being had by good fishermen and fishing fine. A friend of mine from the Bank took between 6.30 p.m. and dusk, from the Brocas, Eton, 46 good roach. A brace of chub, going six pound, were had from the Windsor Weir, where many more are waiting for a judiciously cast-fly in the shape of a good palmer or red and black-bodied bee. Gudgeon are coming well to the rake, and some good sport is now being had, the fish being of good size. One punt in a few hours had just on fourteen dozen. Barbel are being baited, and should we get a discoloured water, caused by a good fall of rain, expect some capital sport would be had. As it is, fishing, even after the late rain, must be "fine and far off."—B. R. BAMBRIDGE.

Ancholme.

The sport on this river continues to be very good. Large baskets of coarse fish are made by juveniles, and some very large bream continue to be taken by both local anglers and visitors—we get a good contingent of the latter from Sheffield from time to time. Almost all kinds of bait are now taken. I have found new brown bread to be a most killing bait for roach, the particles of bran attract the funny tribe. As I have said on former occasions, I should like to see this stream well stocked with tench and carp, and a few barbel and black bass would also be acceptable. The introduction of fresh varieties would in time immensely help the sale of tickets, and prove a source of profit to the Commissioners. The terms for tickets are very reasonable: 6d. per day, or 5s. the season for non-residents.—THOMAS FORD.

Avon (Stratford-on-Avon.)

The water here is in very fair condition, if anything, a little too fine, but with another day's steady rain, like the present one, I think we may expect to hear of some good being done. At present there has not been much done, excepting dapping for chub with the natural blue bottle, a friend of mine taking in this way eighteen pounds, largest fish being two pounds. My brother (Mr. G. E. Warner, with two friends, have had exceptionally good sport among the roach considering the state of the water, taking altogether about fifty pounds; Mr. Warner, thirty-five pounds, largest fish, one pound eight ounces, in all, seventy fish; friends, fifteen pound, all taken with stewed malt. The bream are not properly on the feed, as only an occasional odd one has been caught. What I think is wanting, is a good fresh for bottom fishing, and until then there will be very little done.—ARTHUR W. WARNER.

Barle and Exe (Dulverton).

These rivers are now in very good order for angling either with fly or minnow, and some very fair baskets have been taken during the last week. It has been raining the last two days, but not heavy enough to bring down a flood. The glass is, however, now rising, and there is every prospect of good fishing during the next few days. A friend of mine killed on Monday 30 nice trout with the blue upright, cowdung and red spinner, and on Tuesday 28, with the minnow. In my report for last week, I see an error in printing, as the word "roach" was inserted for "trout," and, as the former fish do not frequent these rivers, I mention it, as some ardent roach anglers might be led astray. No salmon have as yet been caught.—W.

Dove (Derbyshire).

We have had copious rains this week, which have brought an immense quantity of water into the river and raised its height considerably. Round Ham, Hartington, Ashbourne and Uttoxeter heavy floods have been threatened, but at the time of writing (Thursday night) the water seems to be slightly receding. I think the fresh will greatly improve the condition of the river, as it will remove the accumulations of the last three months, and stir the fish up into good biting humour. With the exception of Monday last, I cannot hear of a great deal being done, the reason being the swollen state of the river. However, the bottom fishers have succeeded fairly well in the still places amongst chub, dace, roach and perch. One wasp-grub has proved the best bait on the bottom, but this lure is hard to obtain about here, in consequence of the scarcity of wasps' nests this season. The rodster got 10 lb. of chub and bream near Rochester, on Wednesday, and others have done pretty well at the junction of the Dove and Trent. Just before the floods set in, excellent baskets of trout were secured near Mayfield, the average numbering quite 8 brace per-rod. The members of the Norbury Club have been enjoying splendid sport, one of them getting nine brace last Saturday evening. The improved Devon has been working great execution amongst the large trout. This bait is double the weight of the ordinary Devon and has bigger hooks. In Bentley tributary, on Monday, five brace were taken with it, one fish scaling nearly 2 lb. Though the river is receding, yet more rain threatens as I write.—THE SPODGER.

Exe (Exeter).

The weather has been rather unsettled for good fishing during the past few days, but should the wind change more to the southward after the heavy down-pour of yesterday (Monday) and during the night, we may expect some pretty fair sport. Several parties were out and got thoroughly drenched, but were pretty successful with the perch, roach and eels. It appears that the report of salmon having been poisoned or otherwise destroyed by dynamite in and about Salmon Pool is correct enough after all enquiries made, as a reward of £10 is offered for the apprehension of the offender or offenders, whom I sincerely hope will be brought to justice. The bill states that salmon have been taken from the Exe by this scandalous means; if they only took one third of what have been seen floating in the stream since they must have had a good haul. On Sunday week a friend of mine who owns some first-rate diving dogs (Irish retrievers) whilst going through their usual morning's swimming bout, brought to the surface two fish which would have weighed 16 or 18 lb. each. The net fishermen in the tidal waters are doing well, and it is to be hoped the freshest now coming down will hasten the pollution onwards, and allow the fish to make for the upper waters, so as to enable the rod fishermen to bag a few during the time left at their disposal. Fish of all kinds plentiful in estuary. Mackerell numerous, but very small (jossies), although Mr. Satchell, fish-monger, of Martin's Lane, had a few rather fine ones from Torbay, which turned the scale at 2 lb. and over.

FRANK GOSDEN.

Hickling.

Messrs. Henry Bly and Adamson caught on Hickling waters on Monday last the following, viz., 15 roach weighing 12½ lb., 44 rudd, 42 lb. 7 oz.; 35 perch and bream, 29 lb., making the total 94 fish, and the weight 6 stone. The above being nearly all taken with red paste on single gut lines. It is advisable to drop a line to Mr. Samuel White, Pleasure Boat Inn, Hickling, to provide boats and accommodation, and put anglers on grounds where good catches may be taken.

—J. W. ADAMSON.

Lea (Cook's Ferry).

Since the opening of the season for jack-fishing the takes have been good, and some fine fish has been taken, scaling from 3 to 7 lb. The late rain has greatly improved the waters, and a great number of anglers have paid a visit to the old spot where both old and new friends are both welcome. By the end of this week we can look forward for good sport.—S. SEWELL.

Medway (Tonbridge).

We have had fine sport this week; water in splendid condition, and weather everything that can be desired. On Friday Mr. Carr, of Tunbridge Wells, got 30 lb. of bream and roach; on Saturday Messrs. J. Le Fleming, E. Greenwood and R. Mortimore got 15 lb. of oream and roach; on Monday, Mr. Buley killed six pike and Mr. Swinnard three; on the same day Mr. J. Purday, of London, grassed 5 bream averaging 3 lb. each, besides several good roach; and on Wednesday he killed over 41 lb. of bream and roach, one of the former going over 4 lb. The secretary on Tuesday got 14 lb. of bream, roach and perch. On Wednesday Mr. G. Payner and B. St. John Waghorne grassed a good basket of dace below the town. Prospects of sport good.—YE MEDWAY WATER-RAT.

Norfolk Broads.

One of the members of the Royal Beehive Angling Club, Norwich, accompanied by a friend on Friday last, caught 72 lb. of roach, and another member with a friend 174 fine roach. There are a large number of Thames anglers now gone to the Broads, and Mr. Alfred Nuthall of Kingston, and Mr. C. P. Wheatstone, the presidents of the Stanley Anglers, are going there in a few days. The Great Eastern Railway has just put on another daily express train at two o'clock, completing the journey in exactly three hours to Yarmouth. Until this year the trains used to occupy three hours and forty minutes, and the reduction of forty minutes is a grand improvement, and a great temptation for holiday takers and anglers.

Ormesby Broad.

The weather being fine for the last few days there have been several fishermen out, being well satisfied with the sport. Among the most successful were Mr. Bullimore and Mr. George, of Great Yarmouth, who in one day caught, with two rods, 60 lb. of fine bream and roach; and on Monday last, Mr. H. Brookwell, of London, belonging to Good Intent Angling Society, caught, with one rod, 50 lb. of fish, mostly bream, some of them weighing 3½ lb. each; and Mr. Weatherhead, of Isis Tavern, Ilfley, now at Ormesby, is getting very good sport. Most of the fish are being taken with brandling and lob worm. Any gentleman wishing for good fresh water fishing had better come to Ormesby Broad, seven miles distant from Yarmouth, five miles by North Norfolk Railway, fare, 5d.; and waggonettes leaving Ormesby station to the Broad, fare, 6d. each way.—T. RICHMOND.

Ouse (Bedford.)

Owing to the heavy rains of Sunday the river Ouse was very thick and muddy on Bank Holiday, and the fish did not feed at all well. The catches were very scanty, but on the following day the water settled down, and the fish bit well. I succeeded in hooking 35 roach and four bream, and the parties fishing both on the right and left of me had some fine catches of bream, many of them scaling four or five lbs. On Thursday I fished at Great Barford in a splendid reach of water, but the day was intensely hot, and the roach did not bite well until the cool of the evening, when I got 21. I fished on the north side of Bedford on Friday, and hooked 44 roach, weighing six-and-a-half lb. The water in this neighbourhood is very good and full of fish. A good stretch of it is in the hands of an Angling Club who employ keepers, and the waters are well looked after. It is easy of access from London, and day tickets are only 1s. 6d. each for bottom fishing. Perch and jack abound in the club waters, and I noticed that one place, called "The New Cut," seemed literally alive with fish.—ROVER.

Severn (Kidderminster).

The Severn is still as low as it has been for three or four weeks, and very fine. The fish are feeding upon the various animalculæ which abound upon the weeds and roots of the trees growing on the river banks, so will not be enticed by other baits. So long as the dry weather lasts the prospects for anglers are poor. Should a fresh water come on I have no doubt but what plenty of fish will be taken, as the roach are beginning to take the paste, but great caution has to be taken to capture them. A few good takes have been taken. Mr. William Mound has been fortunate in taking, with the black palmer and cock-y-bonduhu, in the canal at Fearnal Heath, sixty chub, weighing about 20 lb. The river

Stour, I am sorry to say, is poached and unfairly fished almost nightly, and yet the club members who have the right of this good river do not interfere to stop it.—AN ANGLER.

Suir and its Tributaries. Clonmel (Ireland).

We can see more weeds and stones in the river now than fish, it is so very low, so we have only to tell of a few peal being killed with rod and line, even the cots are getting very few this week; their season ends on Monday next, but the rod fishing will remain open for a month longer. Trout fishing has been very bad these few days. There is a good rise in the evening, but they won't look at any thing. At Golden, there were three men successfully convicted for poaching with a net for salmon, one man was fined £8 and the other two £10 and costs, and the net forfeited. The bailiff who prosecuted them has since been assaulted, and lies in a precarious state in the county infirmary.—DORA.

Swale.

Owing to the continuance of a lower temperature, many of the Midsummer flies are falling off, and the second hatchings of the spring varieties begin to appear. Some of the best flies upon the water just now are the checkwing, sanded dun, freckled dun, grey goose dun, blue spinner and red dun. Some good dishes have recently been obtained by visitors at Evinton Lodge in that part of the river preserved by Major Charlesworth.—THOMAS FORD.

Trent (Alrewas).

We have had all kinds of weather in this locality the past week—good, indifferent, and bad, the latter predominating from an angler's point of view. The latter end of last week some excellent baskets of fish were reported from Alrewas. Mr. Thornton had 15 lb. of good roach and perch, and Mr. W. Reynolds a 17½ lb. basket of fish, amongst them a barbel 3½ lb., which was landed on one of S. Allcock's Redditch No. 12 fine wire roach hooks—the very best roach hook I have tried in my experience as an angler, and which I strongly recommend to the notice of my angling brethren. Messrs. Adams, Parker, and Edwin Hooper have been having some excellent sport, beginning with worms, among a goodly lot of roach, perch, and eels, they captured a fine brace of chub. Mr. Parker's fish weighed 4 lb. and Mr. Hooper's close on 5 lb. It has been arranged that they be both set up in one case to adorn the room of the Birmingham and Midland Association with another who fell a victim under the following peculiar circumstances:—Our river keeper, taking a stroll on the banks of the river Tame, found a fish struggling in the water, and nearly dead. On taking it out he found it had partially gorged a rat, and was nearly choked. only the hind feet and tail of the rat visible. The chub was nearly 4 lb. and the rat half a pound. I have read of chub taking almost everything, but I think this is a rarity. The fish was sent to me with the rat in his gullet, so I can ratify the story. Pardon the joke, Mr. Editor, should it not be entertained by your readers? The weather has been miserably wet to-day, and very few anglers are out. Latest advices from the river state that the water is still discoloured from recent storms, and not in proper condition for fishing with worms, which will, I have no doubt, prove the best bait for the present. Anyhow, the largest fish will be taken with them, if not the largest quantity. When the water clears some good roach should be taken with stewed wheat. Great care, however, should be taken not to throw too much in while ground baiting; a few grains at a time is quite sufficient.—JAMES GREGORY.

Trent (Newark).

The water is still very low and bright, but is in capital condition for general angling. We have had some very heavy rains lately, but it has not yet made any difference to the water. All kinds of fish are biting very nicely. Some good barbel, bream, roach and dace have been killed in various localities on the Trent. A friend of mine and a friend took the other day seventeen fine chub, with wasp grub, the biggest going 5½ lb. (a grand fish). Worms are still the best baits for barbel and bream; wasp grubs for chub and gentles for roach and dace, with the addition of plain bread paste, and creed wheat and malt for the former fish, roach; fine tackle, patience, and a judicious application of ground bait, with a proper selection of swims; and then, I think, a few fish will reward the angler.—THE TRENT OTTER.

Trent (Nottingham.)

Although the weather has been very boisterous and stormy the anglers have got on quite as well as could be expected under the circumstances, the barbel fishers in particular have been doing some capital work, two rodsters up the river captured twenty barbel, the smallest weighing 4½ lb., and the largest 6 lb., they used worms for bait, and a better sample has not been seen in Nottingham this season. One of the gentlemen observed this is the result of being at a little trouble to find a new spot, it will always pay the angler in the long run, and I have always been of that opinion myself, and I think all professional fishermen ought, while their customers are away, to be at some little trouble to find them a fresh place where the fish have not been disturbed, instead of taking them to one old fished-out spot time after time. The barbel fishers at Shardlow have also brought down some good baskets, W. Bailey junr. took nine nice fish besides several chub without baiting. At Collingham the bream have been well on the feed, two rods taking 60 lb. in a few hours, I of course, need hardly say worms were the bait employed. Two other piscators took 15 lb. of eels and flanders, on the same day Monday, some capital roach with both maggots and wheat, several of the fish going over a pound each; and the gentlemen said had the weather been so unfavourable, twice the number of fish must have been landed, a few inches of rise in the water set the eels running, one rodster took ten in about an hour, the largest 1½ lb., the river to-day is again down to low water mark and the water is in capital condition for fishing with any of the baits employed at this season—worms for preference.—E. BAILEY.

Waveney (Beccles).

Water still in first-class condition and weather delightful, some nice showers having fallen during the week, thus keeping the waters slightly dulled. A rather singular capture was made here this week. Mr. G. Judge, whilst fishing for roach, with paste for bait, hooked and landed, much to his surprise, a nice eel, which weighed 13 oz. Large quantities of roach are being taken almost every day. The Caxton Angling Club will hold the third of their prize competitions for this season on Saturday next.

P.S.—Please rectify a mistake made last week, and make the weight of the tench caught by Mr. Block 2 lb. 8½ oz. instead of 26 lb. 8½ oz.—C.B.

Wye and Derwent (Derbyshire).

We had a very heavy thunderstorm here last Monday afternoon, which caused a nice little flush to come down the Derwent, which has made it a first-class time for the bottom fishers, and some fine catches of both trout and eels, and a great number of coarse fish, have been killed off of various parts of the Derwent

with worms and wasp grubs, both baits being well taken. This rain has not disturbed either the rivers Wye or Lathkill, as they are quite low, and as clear as gin. The fly-fishers have killed some small baskets with the artificial fly during the past week on the Wye, but wind has been so very rough and boisterous that it has been all against fly-fishing. Sport with the artificial fly the latter end of last week was first-class all over Derbyshire, and some very heavy baskets of fish were killed, one gentleman, a native, taking eleven brace of fish (grayling) that weighed 15 lb. This was done in F. C. Arkwright's presence in the water below Cromford Bridge in the Derwent, and several others have killed large baskets round and about Whatstandwell. The best feeding times are early in the morning and the last thing at night. The small honey dun bumbles, reds, sandflies and duns have been the best flies that can be used. Sport, both both on the brooks and ponds, has been good during the week, and some nice baskets of trout have been killed with both bottom and fly fishing. The trollers have done fairly on the Derwent both with the natural minnow and the small Derby trout killer, one gentleman killing six and a half brace of very fine trout with the latter artificial the latter end of last week, close to Matlock Bridge. Fishing prospects are looking A1 for next week.—GEORGE JAMES EATON, Starkholms, Matlock Bath.

Yore (Yorkshire).

(Arrived too late for last week.)

It rarely happens at this time of the year that anglers are favoured to the extent that they have been during the past fortnight. Heavy rain on Sunday last once more flooded the Yore and its tributaries, so that, excepting Monday, there has been good sport all this week. I have had three good days myself, Wednesday being the best, when I killed a grand dish of trout with the natural minnow. I had not a small fish amongst the lot, and they were in the pink of condition. The fish have not, however, taken fly well, but some heavy baskets of roach, dace and chub have been taken with maggots and wasp grub. There is a nice fly water in the Yore to-day (Thursday), and no doubt before long I shall have some good sport to record against the grayling fishermen, as these handsome fish are now getting into good order once more. Ripon races have been on this week, so that not so many anglers have been astir as usual.—FRANCIS M. WALBRAN.

There has been a lot more rain since my last week's report, consequently the Yore has again been in flood; the fish are getting glutted with bottom food, so that a little fly fishing would be a welcome change.—F. M. W.

AN AMAZING FISH STORY.

(Translation from the French in the San Francisco Chronicle.)

A rich proprietor at the interior had made to establish a pond artificial, where found themselves agglomerated 3000 trout.

The proprietor is the father of a girling of from five to six.

She had taken the habitude to go each morning to give to eat to the trouts, at the aid of crumbs of bread.

These fishes had become so entamed that they skipped out of the water for to atrap the crumbs which the infant held in the crevice of her hand.

It arrived one day that she lost the equilibrium and she fell, the head first, in the pond, of which the water was enough profound.

At the cries emitted by the girling the father was run himself.

But what horror!

He saw his infant extended without movement at the surface, where she floated as a cork.

What was not the surprise of the father in seeing that she had been supported by a mass compact of trouts?

The fishes had arranged themselves under her body as to sustain and prevent her from to drown.

If this history is truthful, the fishes are not so much deprived of the intelligence as one pleased himself to believe.

SANITARY OVERSIGHT OF THE PORT OF LONDON.—The attention of the Fishmongers' Company has been directed to the nuisance caused by the accumulation of decomposed fish in a floating dummy, and since then condemned fish has been thrown down in heaps in the market, and came under the jurisdiction of other authorities. Special attention has been paid to the drinking water on board vessels, and on the smaller ones, especially barges, there was great room for improvement. Vigilant oversight was devoted to vessels from Antwerp, as one case of small-pox had been discovered on board of one such vessel, and many cases occurred at that port. The closets at the various docks were strictly supervised, and the authorities were prompt in acting on suggestions. The earth system was in use.

A FISH CHOKED BY A RAT.—Mr. James Gregory, of Vyse Street, Birmingham, honorary secretary to the Birmingham and Midland Piscatorial Association, received on Wednesday afternoon by rail from the society's river keeper at Alrewas (Charles Draper), a splendid chub, which had unwittingly proved its own captor, having been choked by a rat. Draper found the fish that morning floundering in the river Tame, close to the bank, evidently in a distressed condition. He got it out, and then found that it had gorged a rat, which had stuck in its gullet and choked it. Only the hind feet of the rat were visible, protruding from the mouth of the fish. The chub scaled 3 lb. 10 oz., and the rat would weigh half a pound.

SALMON FISHING IN NEW BRUNSWICK.—The salmon fishing upon the Cascapedia and Restigouche Rivers has been a good deal better this year than last, and already some very large takes of fish have been had. Sir John McNeil, who has been fishing in the Grand Cascapedia, reports an unusual catch of salmon even for that most remarkable of salmon rivers. Sir John is reported to have taken with his own rod nine fish in one day, the largest weighing 46 lb., the next largest 42 lb., and the smallest 29 lb. On Mr. Stevens' fishery, on the Metapedia, sixteen fish were taken recently in one day, averaging over 27 lb., the successful fishermen being Mr. Stevens, Lord Elphinstone, Mr. John S. Kennedy, the well known New York banker, and Mr. Thorne. At the Rectigouche Salmon Club, where last year no fish were taken until after June 22, forty fish have been taken, averaging 27½ lb., the largest catches having been made by Mr. Locke W. Winchester and Mr. Julian Catlin, jun. The prospects are that the salmon season just about beginning will be one of the best for taking large fish in the memory of any of the old fishermen who have been accustomed to visit Northern New Brunswick.

GRAND INTERNATIONAL FISHERIES EXHIBITION, 1883.

A PUBLIC meeting was held on the 5th inst., at the Fishmongers' Hall, London Bridge, to support the suggestions made at a preliminary meeting of noblemen and gentlemen to hold an international fisheries exhibition during the year 1883, with the object of improving the fisheries of the United Kingdom. The Marquis of Exeter presided, and amongst others present were Lord Abinger, Sir J. Macdonald (Premier of Canada), Sir Andrew Lusk, M.P., Mr. E. Clarke, M.P., Mr. Edmund Birkbeck, M.P., Alderman W. Lawrence, M.P., Alderman Sir Thomas Dakin, Sir Henry Peek, Sir William Whiteway, Alderman Hanson, Admiral Ward (from the National Lifeboat Association), Dr. Hood, Mr. S. Shoobridge (Prime Warden of the Fishmongers' Company), Mr. Walpole, Mr. Lewis Buxton, Major Flood Page, W. Oldham Chambers, W. H. Brougham, J. Spreckley, A. Jardine, G. Fennel, R. B. Marston, J. P. Wheeldon, Capt. Alfred, &c.

The Chairman, in opening the proceedings, said the subject they were called together to discuss was one of the greatest importance to the country, and was at the present time engaging earnest public attention. The fish supply was totally inadequate to the demand, but he had no doubt the fisheries could be so improved as to meet the national requirements, and he held it to be their duty to do everything in their power to bring about such a desirable result. He could say with authority that the exhibition recently held in Norfolk had already brought about some very important improvements, and he ventured to assert that a similar exhibition in London would do ten times the amount of good.

The Prime Warden then moved the first resolution, in the following words:—"That in the opinion of this meeting it is desirable to hold a Grand International Fisheries Exhibition in London in the year 1883." He stated that the Fishmongers' Company took great interest in the project, and they would do what they could to carry it out with success. They proposed giving £500 towards the preliminary expenses, and to join in the guarantee fund to the extent of £2000. It was clear something out to be done to increase the supply of fish, and he believed a movement of this kind, properly carried out, would have the desired effect.

Mr. Birkbeck, M.P., seconded the motion, and said he was confident an exhibition of this kind would do a vast amount of good.

Lord Abinger, speaking in support of the proposition, said he hoped they would then take into consideration the best methods that should be adopted for the preservation of fish as well as their destruction.

Sir G. Macdonald remarked that the news of such an exhibition would be heartily welcomed in Canada, and he was sure the promoters would receive the support of the Canadian Government.

The motion was then put, and unanimously carried, and after some further discussion,

Sir A. Lusk moved a resolution, to the effect that her Majesty's Government be communicated with, informing them of the proposal to hold a Fisheries Exhibition, and asking for their co-operation and assistance, and that similar letters be addressed to the representatives of all the foreign Courts.

Mr. E. Clarke, M.P., in seconding the resolution, said he considered it was the duty of the Government to assist an undertaking of this kind, and he believed they would willingly do so.

The motion was agreed to, and Lord Abinger moved "That at the determination of the exhibition the committee be requested to draw up a general report on the subject of the fisheries in the United Kingdom and the best method of improving them."

Mr. Birkbeck, M.P., had much pleasure in seconding this proposition, which was also agreed to.

The following gentlemen were elected as vice-presidents:—The Duke of Sutherland, the Duke of St. Albans, Earl Percy, the Duke of Northumberland, Marquis of Exeter, the Duke of Manchester, Marquis of Hamilton, the Duke of Abercorn, Sir Thomas Brassey, M.P., the Duke of Athole, Lord Culville of Culross, Lord Lovat, Lord Henry Scott, Lord Walsingham, Sir John St. Aubyn, Bart, M.P., Mr. Mundella, M.P., and Mr. W. H. Smith, M.P.

A committee and sub-committee were next appointed, and votes of thanks having been accorded to the chairman and the Fishmongers' Company, the proceedings terminated.

FISHERY CONVICTION.—George Rule was convicted by the Kingston Bench on Thursday last of snatching fish at Surbiton, the charge being proved by Henry Walters of the T.A.P.S., he was fined 16s. including costs.

GREEN PEA TRAFFIC.—As the green pea season is now considered over, the following has been the amount of traffic on the Great Eastern Railway alone, between the 14th of June and 6th of August, 3407 tons. It has not been so good by 2480 tons as the same period last year. The heaviest weight this year on any one morning was Saturday the 9th of July, when, under the arrangements of Mr. W. Gardner, the goods manager, nearly 450 tons were delivered before 8:30 a.m.

Two eminent Baptist clergymen were spending a short time on the island of Sardinia. One of these gentlemen writes of an unusual experience he had in connection with a fish dinner. This repast is alluded to as "a lenten dinner," just the meal which Jesus gave to Peter and the rest after his resurrection—bread and fish only. Immediately after partaking of this apparently harmless diet both of the clergymen began to feel uncomfortable. For three days they thought they were poisoned. It turned out that the fishermen in the neighbourhood have a fashion of catching fish by putting into the water a drug which stupefies the poor creatures, so as to make their capture more easy. Sometimes a fish gets too much of the drug, and dies like a man with an overdose of quack medicine. This was what was the matter with the fish the clergymen had eaten. The letter says: "I had gotten hold of one of these, or, rather, he had gotten hold of me." This unwholesome little fish came very near taking these two eloquent clergymen out of the world. The symptoms of poisoning abated, leaving them in an enfeebled state for a week or two.

CLUB AND OTHER JOTTINGS.

By L. B.

I CANNOT begin my notes this week more auspiciously than by recording the fact that angling prospects are almost everywhere looking brighter. From the Thames dace-fishing continues all that can be desired. Gudgeon are on the move, and the capture of so many dozens are duly reported from many stations. Judicious baiting has in many cases resulted in some red-letter days among the barbel. Among the takes that have come to my knowledge are one by Mr. P. Geen of 33 barbel, together with a few roach, perch, and bream (total weight 74 lb.), from the neighbourhood of Shepperton; Mr. T. Hoole, 16 lb.; Messrs. Holden and Penney a good take from Thames, above Oxford, the former gentleman having one fish over 8 lb. It is still a bit early for roach, but some good takes have here and there been had by those who use fine tackle.

From the Welsh Harp the sport has varied with the weather, one chilly night in these still waters, often knocking the fish off the feed for two or three days. Among some of the best takes from here Mr. Robert Marshall, chairman of the North-Western, succeeded on Thursday last in capturing 46 lb. 4½ oz. of handsome bream; Mr. Smart nearly 30 lb. of bream and a jack 5 lb. 12 oz.; Mr. Roxbee 22 lb. of bream. On Sunday afternoon I took a walk round the greater part of the Welsh Harp Reservoir. The sport, with one or two exceptions, had been very indifferent. The water is getting very low. I saw a few dead fish, but much less than I expected, seeing the tropical weather we have been having. The jack do not seem to be feeding at all, but the few that have been taken were in excellent condition.

How the fish have been feeding at Elstree may be gathered from the following, selected from a number of good takes:—Messrs. Blackmore, Manly, and Bollington, 70 lb. of tench, heaviest 4½ lb.; on the 7th Mr. Bendall a take estimated at over 30 lb.; Mr. Harry Underwood on the same day having also a nice take of tench and perch. A brace of the former, which I saw, weighed close upon 6 lb. From the Ouse Mr. J. Welsh, of Cambridge, has been having some good sport, as is amply proved by 84 lb. of heavy bream falling to his rod before three o'clock in the afternoon; while from another portion of the same river (Sharnbrook) I hear of some heavy takes of fish, mostly bream.

A contemporary gravely informs its readers, anent a certain take of fish that "there was a perch amongst the bag weighing 8½ lb., barring that they were nothing more or less than a clean sample." Would a single hair line hold him, Mr. Editor? Mr. Murphy has been among the trout again, and has succeeded in capturing one weighing 2 lb. on a tight hair line, and he says he shall never forget what a fight it made. That's nothing, Mr. M.; suppose you should hook the above-mentioned stripey one's big brother.

The West Central Association's return visit to the Bostonian Angling Society which took place on Monday last, was perfectly successful; there were a great many anglers present, and some capital songs were sung. The same may be said of the East Central visit to the Great Northern Brothers on Tuesday.

I regret to hear that the water at Blunham (4 miles), known as Elliott's, from which—particularly from the river Ivel—such capital takes of large roach are to be had, has been rented by a London angling society. Were not two friends of mine, who went down on Monday week, intending to fish it, just a bit sorry to hear it? I am sorry too, as it always seems a pity to see a public water (or, at least practically so) closed against us though, of course, it cannot be helped. I should mention that as my friends had come so far, not knowing of the new state of things, a point was stretched in their favour, and they were told they might fish at the back of the house—a permission they did not, however, avail themselves of.

The United London Anglers' Central Committee met on Monday evening last at the Bald-Faced Stag, Worship Square, Finsbury, Mr. S. Morgan presiding. A long report was given by Mr. Secretary Ghurney of the recent fishery case at Waltham, of which a full report appeared in a recent number of the FISHING GAZETTE. The case of the prosecution of the person secured, out of a number who assaulted and nearly drowned Mr. G. Oram, a Lea bailiff, and his companion, while in the execution of their duty, was also gone into at length. A vote being passed sanctioning all expenses incurred in both cases, and another vote authorising the secretary to write to the Lea Conservancy on behalf of the London Anglers thanking them most heartily for their prompt and successful vindication of public right in the Waltham affair.

It was also decided that the delegates' dinner should take place at the Rye House on the first Sunday in September, price of tickets, 3s. Some valuable prizes being presented for competition on that day. This date was, however, fixed without consulting the almanac, and in the belief that the dates were such that another delegates' monthly meeting would intervene. Such, however, is not the case, and Mr. Ghurney now informs me that as the monthly meeting will not be till Monday, September 5, it will be necessary to postpone the dinner until the second Sunday, viz., September 11.

As I am about to despatch these notes, the following interesting particulars come to hand from Mr. P. Geen, concerning the take of barbel mentioned above. 74 lb. nett being their weight after their journey to Portsmouth:—Last Wednesday my son and I had a remarkable take of barbel. During the day I had driven my wife to Reading and back, 43 miles, and I did not reach the swim (which I had previously well baited), until 7 p.m. with the intention of taking some of the eels which I expected were busy with my worms. By ten—just three hours—our well was completely full. I packed a hamper which weighed at the station 96 lb., a few I gave away, and a number I returned to the water. The gross take must have been between

120 and 140 lb. The hamper was sent to the Portsmouth Waltonian Society, of which I have the honour to be a life member. Mr. Tranter, the secretary, informs me that the society have sent to London a brace of the best fish to be preserved."

NOTES FROM SHEFFIELD.

ON Monday last there was again a strong muster of angling clubs going away to fish their matches; between three and four hundred going to fish the Keadby canal, at Thorne Crowle, and Keadby, while over four hundred went to Brigg, to fish the Ancholme, but the greater portion of anglers journeying as far as Boston and the intermediate stations, over 1,200 going by the excursion promoted by the Sheffield Angling Association, and there is no doubt that there were as many going by the excursions of the Manchester, Sheffield and Lincolnshire Railway Company.

The members of the Suffolk Angling Club, Mr. Leonard's, Bridge Inn, had a very good show of fish on Sunday night, Mr. Geo. Buxton showing in 39 lb. of bream and roach, the bream weighing from 1 lb. to 4 lb.; Mr. George Harrop had also a nice dish of roach, all good ones, weighing 13 lb., taken with creed wheat; Mr. A. Crofts had 15 lb. of roach, taken with the same bait. At the Brave Old Oak, Mr. Westnadge's, there was a fair show of fish, amongst them a splendid pair of tench.

The Eccleshall Club, held at Mrs. Ormrod's, Broomhall Street, fished their match at Boston on Monday last, in rainy weather, and, consequently, the takes were small, Mr. W. Owen winning the first prize with 3 lb. 14 oz.; second, F. Baker, 13 oz. The club held at Mrs. Hirst's, Belle Vue Hotel, Walkley, fished their annual match at Sandiacre on Monday last, the hostess giving some very valuable prizes. Forty-one members competed, and all succeeded in taking fish, but all the fish taken were very small; Mr. Brown caught 48 fish, which only weighed 14½ oz.; H. Spillings taking first prize with 2 lb.; Mr. Revill second, 1 lb. 4½ oz.

The members of the Druids' Amateur Society Club, which is held at Mr. Blenkiron's, White Hart, fished their annual contest at Brigg; 52 members competed, and 39 of them succeeded in taking fish; first, Mr. Gill, 1 lb. 1½ oz.; Mr. Joseph Wainwright, second, with 13½ oz.—RED SPINNER.

CLUB REPORTS.

AMICABLE BROTHERS ANGLING SOCIETY.

The members will fish in a pegged-down match for thirteen prizes, at the Dagenham Lake Fishery, on Sunday next. The conveyances will leave at six o'clock, opposite the Bishopsgate Station, Great Eastern Railway. Time for fishing, ten o'clock till five. Mr. C. A. Medcalf weighed-in the first jack this season, 3 lb. 10 oz.; Mr. Moir, 7 lb. bream and a few roach, from Dagenham; Mr. Patrick, 3 lb., from the same water; Mr. Arnold and Mr. Howlett, roach, from the Thames; Mr. Wood, roach; Mr. Harding, 5 lb. dace, a few roach and gudgeon; Mr. Carrington, one perch, 1 lb. 2½ oz.—T. WORLEDGE.

Aug. 7.

ANGLERS' PRIDE ANGLING SOCIETY.

The members of the above society met at St. Margarets on Sunday last, and competed for three prizes, and the following was the result:—Mr. York very kindly gave a timepiece, which was won by Mr. Dodson, with perch; Mr. Jones gave a pair of vases, which were won by Mr. Dawe; and Mr. D. Mallett gave a tea service, which was won by Mr. Wall; also the following members competed:—Messrs. Mallett, Fiddes, Jones, Deeley, Soar, Hayes, Hines, Scult, &c.—D. MALLETT, sec.

August 9.

BIRMINGHAM AND MIDLAND PISCATORIAL SOCIETY.

The annual dinner of the members and friends of this society was held at the Grand Hotel, Colmore Row, Birmingham, on Tuesday evening. The chair was occupied by Mr. Oliver Pemberton, the president of the association, and amongst the gentlemen present were Mr. Adams Parker (vice president), Messrs. J. Allday, Antrobus, S. Mee, Burt, Cope, J. Botteley, S. Bassett, F. Houghton, Josebury, W. Bennett, Smith, E. Day, Ricket, W. Reynolds, J. Gregory, &c. The date was well chosen, it being the anniversary of the birth of Isaak Walton. The room, too, was appropriately embellished with some magnificent cases of pike, barbel, perch, &c., many of them successful trophies of the rods of members of the club. There was much genial chat about angling during the progress of dinner, anglers fighting doughty battles o'er again, and showing how gallant fish had been won. In giving the toast of "The Queen and the Royal Family," the President made graceful reference to the interest which the Prince of Wales had shown in matters pertaining to fishing by his presence at the opening of the Fisheries Exhibition at Norwich.—The toast of "The President" was proposed by Mr. Antrobus, and was received with much cordiality.—Mr. Josebury gave "The Association and the Memory of Isaak Walton."—The President in a few well chosen remarks, spoke of the pursuit of angling as a recreation which commended itself to everyone as a healthy enjoyment. He was happy to tell those who did not know him thoroughly that he had another self, as it were, and that he could now and then turn from the arduous duties of his profession, and find relief in the pursuit of that peaceful art which Isaak Walton had by his writings immortalised. He expressed a hope that when at last the great angler of all should make his final cast, none of those whom he saw around that festive board might be rejected as having spent worthless lives.—Mr. Allday proposed, "The Vice-president;" and Mr. Adams Parker responded. Mr. Parker proposed, "The Visitors;" which was replied to by Mr. W. Bennett. Mr. S. Mee proposed, "The Treasurer;" and Mr. John Allday, in responding, congratulated the society on its prosperous financial condition.—Other toasts followed, interspersed by occasional songs.

BOSTONIAN ANGLING SOCIETY.

The return visit to the above society took place on Monday last, our Mr. Jennings in the chair, Mr. Pipe, of the Little Independent Angling Society, in the vice-chair. During the evening we had some capital songs from our own and members of other societies that were present. Mr. Jennings made a short speech, thanking the Little Independent Angling Society for a handsome vase of wax fruit which they have presented to our society to be fished for. On Mr. Osman calling the roll the following clubs were found to be represented:—Cambridge, Friendly, Duke of Cornwall, Golden Barbel, North-Western, Phoenix, Westbourne Park, Great Northern, Little Independent, and Odds and Evens.—H. TAYLOR, hon. sec.

Aug. 10.

BRIGHTON ANGLERS' ASSOCIATION.

This association has been well represented this week by the members. Messrs. Tree, Anscombe, Collins, Ash, Cooper, Smith, Spink, Cardy and Son, all of whom had a respectable show of roach from the river Ouse. The weather during the week has been very unsettled, there was little chance of sitting long at swims, without a shower. Mr. Park tried Chichester Canal, and took a fair sample of roach and bream, which show the water to be getting better. At the meeting at headquarters last Monday, nine gentlemen give prizes to be competed for, which will be duly announced.—GROUND BAIT.

August 9, 1881.

CITY OF LONDON ANGLING SOCIETY.

We had a poor show of fish on the 7th. Mr. Castill, 2 lb. 7½ oz., roach and perch, from the Mole; Mr. Mortimer, 1 lb. 7½ oz., roach and bream, from Pulborough; Mr. J. Chambers, 1 lb. ½ oz., from the Roding; and Mr. Pratt, a few roach, from Amberley.—CAS.

THE EXCELSIOR ANGLING SOCIETY.

Several members of the above were out on Sunday, Mr. Tudenham being the first to arrive with a handsome tray of roach, perch and tench, a brace of the latter scaling about 4½ lb. Mr. Smith, with a nice show of roach, dace and barbel of about 14 lb. Messrs. Paine and Snow, roach and barbel.—A. THOMAS.

EXETER ANGLING CLUB.

The members have not turned up so well as they should do, the last meeting or two, but Bank Holiday, and the fine weather no doubt has much to do with it. Among the few who have reported, are Mr. T. A. Kelly, some very fine roach, over 1 lb. each; Mr. G. Lee, some splendid eels; Mr. F. Gosden, jun., in two afternoon's fishing in the canal, five dozen perch, several ½ lb. each; F. Gosden, sen., 4 lb. weight of mixed fish from river and canal. On Tuesday, the 9th, we have had some very heavy rain; and, if the weather holds up, no doubt there will be some good sport to report in my next. I hear of several members going out to-day, and lob worms are at a premium. I managed to get a fine stock last night from ground we have been turning over and over for weeks past for them without success. Digging several feet down would not find them, yet last evening they were to be had by hundreds.—FRANK GOSDEN, hon. sec., *pro tem.*

August 9, 1881.

GLOBE ANGLING SOCIETY.

The trays were well filled on August 7th. Mr. C. Russell winning a valuable prize, with some excellent roach, bream and dace from Amberley; Mr. C. Franklin, chub and dace; and Mr. J. Holmes, bream; several others contributing, made a very satisfactory show.—J. CHURCHMAN.

August 8, 1881.

GOLDEN BARBEL.

On the 7th the following had fish:—Messrs. Wittridge, perch and chub; Green, dace and bream; Hornfeck, chub and roach; J. Jones, bream, roach and perch; T. Lee, roach and dace; C. Chapman, bream; C. Whitehead, bream and dace; E. Henrie, roach, dace and bream; Lawford, roach, dace and chub; J. Roach, bream, roach and dace; Duck, roach ("he ought to catch 'em"); J. Randall, roach; T. Adams, bream; G. Entwistle, tench; J. Entwistle, tench, roach and perch; J. Gaugh, roach chub and dace; E. Harrison, dace chub, bream and perch; H. Harrison, bream and roach. Gross weight over 60 lb. Another addition has been made to the trophies that decorate the walls of the clubroom, in the shape of a carp taken by Mr. T. Bigsby, on the 21st July, 1881. It has been preserved by Mr. J. Lancaster.—PIXIE.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

On Wednesday, Aug. 3, Mr. Theobald showed a fine sample of roach from the Mole, over 7 lb., two fish weighing respectively 1 lb. 12 oz., and 1 lb. 4 oz. The heaviest fish will be preserved. Sunday, Aug. 7, Mr. Fitch had a nice show of roach and bream from Amberley, weighing 10 lb. 14 oz., one bream 3 lb.; J. Watling, 3 lb.; Jennings, 1 lb. 13 oz.; Messrs. Butler, Armstrong, Hutchings, and C. Warren also weighed fish from Amberley. From the Wey J. Theobald, 4 lb. 7 oz. bream; J. K. Fitch and Parkin bream from same place; Messrs. Phillips and J. Smith roach. The Eastern District visit was paid to this society on Wednesday last. Chairman, W. Phillips; Vice, C. Watling, jun. Some excellent harmony was contributed by Messrs. Phillips, C. Watling, jun., A. and E. Barr, Vanhegan, Letch, J. Smith, Jennings, Humphrey, Benning, Morley, and H. Horton. The visit was well attended, and a most enjoyable evening was spent. The next visit will be paid to the Odds and Evens Angling Society.—J. A. FITCH, jun. sec.

Aug. 10.

HAMMERSMITH UNITED.

The captures have been few and small this week, indeed, hardly worth recording; the principal successful anglers being Messrs. Hoole, Penney, Walters and Aldridge. I beg to remind the members that the 14th is the last day for receiving names and subscriptions for the excursion to Weybridge on the 21st.—VORTEX.

Aug. 8.

HULL PISCATORIAL SOCIETY.

An open benefit competition and excursion, in aid of the funds of the hospital for poor sick children, Story Street, Hull, under the distinguished patronage of the Right Worshipful the Mayor, Alderman Leak; C. Sykes, Esq., M.P.; C. H. Wilson, Esq., M.P.; W. H. H. Broadley, Esq., M.P.; Colonel Gerard Smith, J.P.; Alderman Summers; Councillor Wilkinson; Councillor Greasley; Thomas Stratton, Esq.; and other gentlemen, will take place on

Monday, August 15, 1881, in the River Ancholme, at Ferriby Sluice, when a number of valuable prizes will be competed for. The fine passenger steamer "Lady Elizabeth," will leave the Victoria Pier at 8 a.m., returning to Hull at 7 p.m. Athletic sports, cricket, dancing, and other amusements will be provided for the visitors. The fine band of the Second East Yorkshire Artillery Volunteers, having also been engaged, will contribute greatly to the enjoyment. Fishing to commence at 10 a.m., and sports at 2 p.m. Cricket and dancing during the day. Excursion tickets, 1s. each. Children half-price. Fishing tickets (including permission) 1s. 6d. each. Refreshments will be provided on board and on the field. Tickets may be obtained from the following gentlemen, viz.:—Mr. W. A. Bennett, Porter Street; Mr. W. Crossland, Blacksmiths' Arms, Naylor's Row; Mr. H. Vinson, Goodwin Street; Mr. H. Booth, fishing tackle maker, Prospect Street; Mr. C. Haldenby, Buckingham Street; Mr. William Brown, Garbutt Street; Mr. J. Cheeseman, 11, Bowlalley Lane; Mr. F. J. Hamlyn, Engine Street; Mr. R. Jackson, 2, Salt-house Lane; Captain Holbrook, Crown Hotel, Bridge Street; Mr. R. Durden, The Regent, Carr Lane; Mr. J. T. Noble, Red Lion, Whitefriargate; Mr. J. Wardrobe, Spring Street; Mr. H. J. Willett, Seven Stars, Fish Street; Mr. J. Jagger, Anlaby Road, &c. Particulars as to the sports, and any other information may be obtained by applying at the Club-room, Seven Stars, Fish Street. All friends desirous of assisting towards the success of this object, must apply for tickets early, as the supply is limited. Mr. W. A. Bennett, chairman; Mr. H. J. Willett, treasurer; Mr. W. Hague, hon. sec.

THE LITTLE INDEPENDENT ANGLING SOCIETY.

On Sunday last our takes were not very grand; they were as under:—Mr. H. Moore, bream, 9 lb. 8 oz.; Mr. Heelas, chub and bream, 9 lb. 8 oz.; Mr. Watts, roach; Mr. Mead, roach; Mr. Kelley, gudgeon.—W. BROWN, hon. sec.

London, August 10, 1881.

LIVERPOOL ANGLING ASSOCIATION.

A competition was brought off on Monday, August 1, in Marbury Mere, Northwich, Cheshire. There was not a very strong muster of members. Bank Holiday excursions taking many elsewhere, but most of them were veteran bait fishers, and a keen contest was anticipated. The day was very bright and hot, which was dead against the anglers—fish, as a rule, not feeding freely in this sort of weather—and, consequently, smallish takes were the rule. On weighing-in at 4 p.m., it was found the winners were Messrs. Evans, Woolfall and Higson, in the order named. The Mere is well stocked with good fish, and it was a great disappointment to have such middling takes. However, better luck next time, and better weather too. At the usual weekly meeting on Thursday evening, the 4th instant, another fishing excursion was fixed to take place in the Vyrnwy, at Llanymynech, on Tuesday, the 6th of September. The following are the prizes:—By Mr. W. Jones, aquarium, and Mr. Chandler, fern case fitted, for heaviest and second heaviest creel of fish; by Mr. Hugh, one guinea, for best take of trout and grayling; by the association, half guinea, for next best ditto; by the association, one guinea, for best take of chub, perch, roach, &c.; by the association, half guinea, for next best chub, perch, roach, &c. Club standard as to weight will be strictly adhered to. Competitors to use either fly or bait, but no salmon or pike to weigh. The graining mentioned in a paragraph in your last week's edition, is found in the River Alt, near here. I have taken them up to ¾ lb. out of it, which is a very good size for this fish, as the general average is from 5 oz. to 7 oz. I consider them the handsomest fish that swims being of the most beautiful silvery hue, delicate in appearance and symmetrical in shape; they fight when hooked, almost as fiercely as a trout, rushing from side to side, leaping out of the water and dashing about in the most determined manner, trying to the utmost your tackle and your skill.—R. WOOLFALL, hon. sec.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

Several members belonging to the above society had a variety of fish again last Sunday. Mr. Obbard, dace from the Lea; Mr. Neagus, roach and perch from the Stort; Messrs. G. Drew and Gorsuch, roach from the Thames; Mr. F. Long, with a splendid show of perch from the same river; Mr. J. Drew had bream from the Welsh Harp, one scaling 2 lb. 11½ oz.; Mr. Lucy, bream from Pulborough; Mr. T. Longman weighed-in roach, perch and dace.—THOS. WM. LUCY, sec.

August 10.

PECKHAM BROTHERS ANGLING SOCIETY.

The members of this club have had fair takes of fish this last fortnight. Mr. Minard's prize was won by Mr. Gendle. Mr. Garrad had a good tray of roach and bream from the river Wey. There was also a nice trout weighing over a pound taken in the river Ravensbourn, by Mr. Stidolph. Three jack have been taken by Mr. Matthew's from the river Lea, but they run rather small, also fair takes by Mr. Page and other members. Mr. Gendle's prize will be fished for on August 14.

PRINCESS OF WALES ANGLING SOCIETY.

During the past four or five weeks, there has been a desperate struggle for supremacy in gross weight between several of our members. Mr. H. Robson has contributed some heavy takes of bream; Mr. Percy, some fine large pike and bream; Mr. C. Aston, some capital takes of barbel; Mr. H. Aston, some exceedingly fine shows of barbel; Mr. Glaister, some very good shows of perch and roach; and Mr. Porter, some well-earned takes of roach; but an end was put to the struggle on the 7th instant, when Mr. H. Aston had five barbel, weighing 16 lb. 1 oz., the largest scaling 6 lb. 8½ oz.; this brings Mr. Aston's gross weight of barbel alone, for three shows only, to 38 lb. 1 oz. Mr. C. Aston was not far behind his son; for, although the young one beat his dad in gross weight, he was done for the specimen, his dad having two barbel, weighing 9 lb. 13 oz.; the largest, a handsome fellow, weighing 7 lb. 7½ oz., which was conveyed to Mr. C. Short, for preservation. Mr. Porter had the best show of roach. Gentleman desirous of joining can do so by attending at the Club-house any Thursday evening between nine and eleven o'clock, at the Prince of Wales, Great Barlow Street, Marylebone, W.—F. ROBSON.

SOUTH LONDON ANGLING SOCIETY.

On Bank Holiday and yesterday Mr. Mitchell visited Dorking, and caught 49 lb. bream, 3 lb. roach; Mr. Gening, the same place, 15 lb. bream, 17 roach; Mr. Head, same place, 20 lb. bream, 4 lb. roach, 4 lb. perch. He won a 10s. 6d. prize for heaviest weight. Yesterday Mr. Sargent went to Datchett, and took 7 lb. roach, 4 lb. eels; and Mr. Boorman, from the Colne 7 lb. roach. Mr. Morris and Mr. Godey went to the New River Reservoir but the fish only showed them their tails, no biting. Self was down at the

Ouse, but only took nearly 9 lb. roach and bream. The members fish for a series of prizes, such as pair ducks, leg of mutton, 1 lb. tobacco, new hat, sundry bottles of spirits, and on Thursday next at Sawbridgeworth. They will be glad to see friends there.

Monday, August 8, 1881.

THE STOKES NEWINGTON ANGLING SOCIETY.

The club-room of the above was well attended on the 7th instant, by the friends of the members, several of whom resumed hostilities, after their holidays, with renewed vigour and with great expectations. The trays were fairly adorned by the following gentlemen:—Mr. T. Gretton, contributing 5 lb. 13½ oz. roach and bream; Mr. A. Parrott, 3 lb. 2 oz. roach and bream; Mr. W. Webb, a small jack, about 2 lb., the first weighed in the club this season, and 1 lb. 2½ oz. roach; Mr. E. Morrow, a nice roach, weighing 17 oz., and Mr. E. North, dace. The fish are rapidly improving in condition, and look very hand-some, when exhibited.—THOMAS GRETTON, secretary.

August 9, 1881.

SURREY PISCATORIALS.

On the 30th, Mr. Pugh succeeded in getting at Henley, a very nice trout, weighing over 3 lb. 4 oz. On Bank Holiday, he was out with Hoblyn, of Henley, and succeeded in getting 50 lb. of barbel, the largest of which turned the scale at 8 lb. 6½ oz. They were photographed all together by Messrs. Marsh Brothers, who arranged them in such a manner that they formed a very pretty picture. This is an idea to which I think worth while calling the attention of those gentlemen who are in the habit of going away for several days, and getting large takes of fish, and not wishing to send them to town, especially during the hot weather, and it would also afford a memento of the ups and downs that occurred. On the occasion, Mr. Boalch, on the 1st, was out with C. Brown, at Richmond. He managed to get nearly 17 lb. of roach, dace and barbel. Mr. Beckett, visited the neighbourhood of The Royal Castle, and brought away with him some roach and dace. The prizes offered for honorary members were not taken on the occasion; they were, therefore, open for competition on the 10th, of which the following is the result:—Mr. Beckett, first, with 14 lb. 10½ oz. of roach and dace; Mr. Boalch, second, with 11 lb. 9½ oz. roach and dace; Mr. Duck, third, with 9 lb. 8 oz. roach and dace, all from Richmond; Mr. Pugh came fourth, with 9 lb. 5½ oz. of barbel, roach and dace from Shiplake. The convivial proprietor of the society's headquarters came next with 6 lb. 11½ oz. of barbel, dace and roach, from Richmond, followed close by Mr. Murray, with 5 lb. of bream, from Huntingdon; Messrs. Hayward, Linstead and Langlois also had about 8 lb. of roach and dace from Richmond. The total weight of fish exhibited being 63 lb. 4 oz. On the same evening, Mr. Pugh presented to the society two photographs taken by Marsh Brothers; the subjects being, one, the mill at Shiplake and Mr. Pugh in the act of striking a fish; the other thirteen barbel taken by him on the 1st of August, 1881. Members are particularly requested to attend on the 31st of August, 1881, for important business.—PIXIE, London.

August 11, 1881.

UNITED BROTHERS ANGLING SOCIETY.

The members of the above met at the club house on Saturday, August 6, to complete the necessary arrangements to carry out their annual excursion and to contest for prizes. The place selected was Hamstall, on the river Severn, where, after a beautiful and pleasant drive in the waggonette and refreshing the inner man, the ground was measured out, it being a pegged-down match. Time being called, each set to work in earnest to try to gain the first prize. After three hours time was again called, and each man hastened to the hotel to weigh. The first prize fell to Joseph Brooks, second, Richard Yarsley; third, John Good; fourth, Ambrose Foster; fifth, Isaac Hughes; sixth, Edwin Lawrence; and seventh, John Evans. The prizes were distributed on Tuesday evening, when a comfortable and pleasant evening was spent. The members desire to thank the donors of the prizes for their kindness in supporting them and genuine angling. Good accommodation for anglers can be had at the Hamstall Hotel, on the banks of the Severn, about two miles below Stourport, and good angling for all sorts of fish.—EDWIN LAWRENCE.

WALTONIANS.

The return visit to this society was paid on July 27, when a most enjoyable evening was passed. The following clubs were represented:—Bostonian, Golden Barbel, King's Cross United, North-Western, Phoenix, Prince of Wales, United Marlborough Brothers, Westbourne Park and City of London. We have had very fair shows of fish lately, those favouring Pulborough and Amberley being among the most successful. On the Bank Holiday two prizes were to be fished for, but for one offered for Offord and Huntingdon no one went out. The Society prize of a guinea was taken by Mr. Morris, with 8 lb. 5½ oz. Thirteen other gentlemen weighed-in, and the running for the prize was a close one. On Sunday last, Messrs. Malcolm and Roland had roach and bream from Pulborough, the former 8 lb. 14½ oz., the latter 5 lb. 11½ oz.—A. J. MARRIOTT.

Aug. 8.

WALWORTH WALTONIANS.

The results of the competition on the 31st July and August 1st were:—Mr. Bayley, roach and dace, also one eel turning the scale at 2½ lb.; Mr. Brown, roach and dace; Mr. Delehaye, chub, roach and bream; Messrs. Fox and Grigg also had fish. Mr. Bayley was the winner of Mr. Fox's writing-desk, and Messrs. Brown and Delehaye of Messrs. Harris and Norris's leg of mutton and trimmings. "M. le Pere" is at the head of the poll at present for the side of bacon given for competition during August.—PIXIE.

August 10.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-booms, Landing Nets, Gaits, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

FENCE MONTHS.

SIR,—My autumn arrangements are made, or I would cheerfully accept Mr. Balderston's kind and courteous invitation to go with him and look up those becks in Westmoreland and Cumberland to which I refer as being once declared as "fished out" by rod and line.

I am sorry to read the reasons he now assigns for the present depletion of these waters, which, if attributable only to rod-fishing, might have recovered; but so long a list as he gives of injurious agencies, constantly or periodically at work, is more than any preserves can possess the chance of fairly contending against.

If Mr. Balderston will let our trip stand over until next spring, I could, with due notice, give him the whole of April and May, the greater part of which it would occupy.

Of course, I conclude Mr. Balderston will pay all expenses.—I am, &c.,
C. KEL.

A SPLENDID TROUT CAUGHT WITH A TIGHT LINE.

SIR,—I was at the broad water, St. Margaret's, on Sunday last along with my friend Flimby Da Costa bottom fishing. Flimby with running tackle, myself with a tight line on one of Mr. Alfred Price's light cane rock rods, and while anxiously waiting for the perch to feed, I got a very light knock striking gently with my light tackle, I found I had caught a tartar, which turned out to be no other personage than the big trout, when, thanks to Mr. Price's sound tackle and the skilful handling of the landing net by Mr. Da Costa, we succeeded in grassing the beauty, which scaled six lb. twelve oz., which I shall preserve, and add to my already numerous collection.—I am, &c.,

T. S. WEBB, sec., Golden Tench Angling Club.

[To kill a nearly 7 lb. trout on a tight line is something to be proud of, and Mr. Webb must have used some skill as well as his friend who landed the fish.—ED.]

TROUT SPAWNING.

SIR,—Is it not very early for trout to be in spawn? I killed one on the 2nd and two on the 8th, quite heavy.

This has not been a good fishing season in this locality, as, owing to the very dry summer the rivers are very low and bright, and trout require a deal of catching. Since the heavy rain on Monday it has been rather better and I find the best fly that takes now is my old favourite the "red palmer."

I think, next to it, for general purposes, is "Wickham's Fancy," a fly designed by John Hammond, of Winchester, and named after a celebrated local physician and fly-fisher, the late Dr. Wickham.—I am, &c., RED PALMER.
Fareham, 11th August, 1881.

TAKING OF EELS.

SIR,—Your esteemed correspondent, Mr. J. Harrington Keene, wishes to hear from Sheffield, on the subject of eels. I beg to inform him that I am of the same opinion as himself regarding the destroying of eels. Taking all the enemies and the mishaps that fish spawn is liable to, there is nothing so destructive as the eel; that is the reason I advocated the taking of them all the year round. And there are many anglers who would sooner have a good dish of eels than any other fish.

The question of how they propagate, is a difficult one, I admit. As "J. H. K." states they are known to breed in ponds and other places where there is no outlet to the sea, but in the Trent every autumn they are observed going down the river towards the Humber, when great quantities of them are taken, especially about Newark. In the spring, about the middle of April, if the weather is open, they can also be seen on their return journey, arriving at home again in time for the spawning of other fish.

Now, if eels do not spawn in brackish waters, how are we to account for the multitude of small eels seen ascending the rivers during June and July. This is a question which will cause some one wiser than myself to cudgel his brains.

In the Lincoln and Boston waters, the taking of eels is let to different parties who lay baskets for them—or, as they are called about here, leaps or hives—by which means no other kind of fish is taken, and which privilege they pay for. Could not the waters near London be treated in the same manner?

I advocated the resolution of taking eels and flounders with rod and line during close time, for the sake of those who would wish to take them, and it should suit those who wish to destroy them; but in whatever form it may be introduced in any amended Act, we shall have to trust to the honour of the angler, not to take any other fish.—I am, &c., THOMAS W. GUEST.

[Why should you not trust to the honour of anglers? Why should all anglers be debarred from fishing because there may be some black sheep amongst them.—ED.]

FISHING IN HEREFORDSHIRE.

SIR,—If you can find room for this in the FISHING GAZETTE, it may be interesting to my fellow readers of your admirable paper and to anglers generally, as showing that the season is not as black as it is painted, and also that fish are to be taken elsewhere than in the neighbourhood of London.

I had an opportunity afforded me yesterday of a day's roaching in a large pool, with a stream through it, situated in a gentleman's private grounds, in the picturesque county of Herefordshire. I journeyed down on the Monday evening, and selecting a swim carefully ground baited with gentles; and when you have plenty, this is perhaps the best ground bait you can use, at least my experience says so.

I was on the spot at 7 a.m. the following morning, and, carefully anchoring the punt threw in a few additional handfuls of gentles as a preliminary intimation to the fish that I was there, and having put rod and line together, baited with a large yellow wasp grub, and threw in. In about a couple of minutes my float, as Mr. Francis has it, began to make tracks for the middle of the pond, when a turn of the wrist put matters on a different footing, and shortly afterwards a roach of three-quarters of a pound came to hand. Not a bad beginning.

Re-baiting, I got a couple of small perch, which were duly returned, and then a fair roach or two, and then a good one, and then another, and the fun became

fast and furious, big thumping roach being the order of the day. About 8.30 a.m. I stuck into something heavier and by the way the fish played I thought I should have a job for the preserver, although I feared greatly that my fine tackle would not succeed in killing him. After about seven minutes' play, however, he was got into the net, and turned out to be a tench of 1 lb. 9 oz., and a rare fight he gave, as these fish are very powerful, and fight to the last.

Resuming, I brought a few more back—or, to punt, I should say—when I found that they had become rather shy, so I bethought me of changing the bait. Directly I offered them four gentles with a chrysalis on the point—and I consider the chrysalis the most important point of gentle fishing—down went the float, and again the fun was resumed, until my arm grew tired of wielding the rod. Still, a desire to make a big bag prevailed, and I kept at it until 3 p.m., when nature would have her way, and I thankfully drew up my punt poles and made for the bank.

On scaling I counted six dozen and four roach, and one tench, the lot bumping the scale at 30 lb.; as I thought, in the present state of the water, a big day for one rod. In addition, I had returned to the water about 30 small perch, so that my total bag must have been about 35 lb., and I think if I had many more such days the pool would look smaller.

During the whole of the day I only changed my hook once, and all these fish were caught with the crystal roach hook, made by Messrs. Williams and Co., and this is probably the best hook.

I left off when the fish were biting freely, but "enough is as good as a feast," and I thought it wise to return early and spend a comfortable evening in smoking the pipe of contentment and peace.—I am, &c., W. S. P.

FISHING IN DERBYSHIRE.

SIR,—A correspondent asks in FISHING GAZETTE, for information about Derbyshire rivers, for fly. The Izaak Walton gives permission (I believe, gratis, but am not certain, for about three miles of water on the Dove), almost useless for sport at this time of year, as not only is the water as clear as glass, but the British tourist, who swarms in Dovedale, heaves a stone, by way of fun, at every fish he sees rise.

About seven miles of the Derwent can be fished at 2s. 6d. a day, by tickets, obtainable at the Peacock, Rowsley, or the Chatsworth Hotel, Edensor. The river is very difficult to fish (unless you wade), and just now is not only very low, but a huge dam is being repaired at New Bridge, above Calne, and another in Chatsworth Park, which makes what little water there is, all of a milky colour. The river is also overgrown in most places on both sides with alders, &c., and lose your flies, perpetually. Three-quarters of the river is as smooth as a mirror. There are a few good spots in the seven miles.

Of the Wye, there is about seven miles of water, from Bakewell Bridge to Filliford Bridge, which can be fished for 2s. 6d. per diem. This is beautiful water, no wading required (or allowed), banks clear, stream winding, fairly rapid and full of eddies. If there were not so many anglers upon it, it would be perfection. As it is, your basket should even now average the cost of your ticket, reckoning trout and grayling at 6d. a lb. The Peacock (Rowsley) issues tickets for this, as does the Rutland Arms, Bakewell. You can get a ticket for a week for 10s. for the Wye, which you cannot do here for the Derwent. I prefer to spend my 2s. 6d. on the Wye, though it involves five miles of walking to and fro from my lodgings, to throwing it into the Derwent, which is only five minutes distant from me.

There is also some open (i.e., ticket) water about Matlock, but I know nothing about it. I have said nothing about private waters; which are, of course, far superior.—I am, &c., C. C.

Edensor, Bakewell, August 8, 1881.

[6d. a lb. is a very low figure; 1s. 6d. and 2s. a lb. would be nearer the mark for trout and grayling, especially in the neighbourhood of Buxton and Matlock.—Ed.]

DAGENHAM LAKE FISHERY.

SIR,—Having read Mr. Fitch's admirable description of the lake, I hope I shall not be thought out of place in making a few remarks which may be useful to those who intend fishing this prolific water for the first time. Mrs. Bull's is the nearest house to the water, from the direction of Rainham; there is a lane a short distance from the house which leads direct to the lake opposite the ferry. Harry, the boatman, who is a civil and obliging fellow, will row you over. He will also supply you with breakfast or dinner at a very moderate charge. Light fishing is the only way of getting a good take of fish. The top of your float must be nearly level with the water, and strike at the least movement of the float; the bait paste or gentles—paste for choice. Do not use worms, for the bream will not take them.

An angler who can fish Dagenham Lake can fish any water. It is the best school for the young angler near London. Many an old angler fishing the lake

for the first time, finds he has still much to learn. From the direction of Barking, the nearest house is the Chequers, at the corner of Mud Lane. You cannot mistake it, for the Chequers are all over the outside of the house. Lodging can be had at either house. Brocket runs his van for 2s. 3d., including fishing.—I am, &c., CAS.

City of London A.S.

COOK'S FERRY FISHERY.

SIR,—Is it a fact that Cook's Ferry fishery on the Lea is now held by a club of twenty gentlemen exclusively, and is not a subscription water annually or daily?—I am, &c., AUGUST DUN.

FISHING COTTAGE WANTED.

SIR,—Will any brother piscator inform me of an unfurnished cottage with a small garden, on the banks of a fishable river, within twenty-five miles or so of London, where a boat could be used. Easy access to rail as well as river is a necessity. Such information would be esteemed a great favour.—I am, &c., 14, Henrietta Street, Cavendish Square. PISCATOR.

FISHING IN SPAIN.

SIR,—Perhaps some of your readers can inform me whether there is any rod fishing in salt or fresh water to be had during autumn in the districts of Spain, between Santander and the French frontier. As it is a mining country, most of the rivers are, I presume, quite spoiled for angling; but, if I remember, Major Campion speaks of good fishing in the estuaries. M. S.

London, August 9, 1881.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Alcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by him to be the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

MRS. F. Y. BROCKAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

VOLUMES OF THE FISHING GAZETTE FOR 1878, 1879, AND 1880.

On receipt of P.O.O. for Twelve Shillings, we will send any of the above in handsome cloth cover.

N.B.—ONLY A FEW REMAIN UNSOLD.

Orders to be sent and to be made payable to R. B. MARSTON (at the Fleet Street P.O.),

FISHING GAZETTE OFFICE,
12, FETTER LANE, LONDON.

WANTED.

ROWING PUNT
(SECOND-HAND), in good repair.

Written particulars, including lowest Cash Price, and where can be seen, to

"L. B.,"

"FISHING GAZETTE" OFFICE,
14, FETTER LANE, E.C.

TROUT FISHING AND SHOOTING.

FISHING in Lakes, River and Sea, good bathing, boats. Flapper shooting from Aug. 1 on three lakes, 2500 acres of preserved shooting, with partridge and snipe in season. Free to visitors. MAELOG HOTEL, TY-BIOES, ANGLESEA, "PROPRIETOR."

TO FISHING AND BOATING MEN, HOTEL KEEPERS AND OTHERS.

HIGH-CLASS RIVERSIDE HOTEL in Berks, standing in pretty Grounds sloping to the Thames; about a mile and a half from an important railway station (G.W.R.); contains 11 bedrooms, drawing, private, sitting, and coffee rooms, bar, and all business and domestic accommodation; boat houses, stabling, coach houses, and other buildings. Price, including Furniture, Pony, 4 Traps, and Boats, £850, all at.—Apply to Long and Newson, Hotel Valuers and Auctioneers, Town Hall, Hounslow.

LONDON and COUNTY ADVANCE and DISCOUNT COMPANY (Limited). Cash advances from £10 to £500, without preliminary fees or deduction for interest, for short or long periods, repayable by easy instalments, at moderate rates, upon personal security, life policies, furniture without removal, deeds, shares, bonds, &c. Bills discounted. Forms gratis. Offices, 35, Farringdon-street, E.C. JOHN STONE, Secretary.

(THE DEVONSHIRE RIVERS.)

FISHING TACKLE. &c.

DEVONSHIRE FLIES (GOOD in ANY STREAM), 1s. 6d. per dozen. Flies made to pattern. A large stock of Rods and Tackle of all kinds. Some choice SPLIT CANE RODS by "Copham," bargains. The Devon and other artificial Baits, Reels, Lines, Gut Casting Lines, Fly Books, Wading Stockings and Trousers, Baskets, and every other requisite. Address, WILLIAM MUDFORD, Fore Street, Tiverton, Devonshire. Ticket dépôt for the Tiverton Fishing Association.

ANGLING.

Now ready, third Edition.

THE ANGLER'S INSTRUCTOR,

By WM. BAILEY.

A book on the best modes of Angling in English Rivers, Lakes and Ponds, and on the habits of the fish, besides all the latest practical hints on many things that have not up to now been made public, to be had of W. Bailey, 170, Kirke White Street, Nottingham. By post, 2s. 9d.

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, *Fetter Lane, London, E.C.* and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.

The Fishing Gazette.

SATURDAY, AUGUST 20, 1881

BARBEL FISHING:

PERHAPS the remarks I am about to make will not meet the views of some Thames anglers; but they must understand that I have successfully fished for barbel in both Thames and Trent, and my only motive for writing these letters is not to dictate, but to show the anglers on both rivers what, from my experience, they ought to observe. There have been so many mistakes

lately made on the Trent, that I cannot allow the time to pass without a few observations, and perhaps Trent fishermen will find it rather warm. I must once more repeat what I have to say, "do it gently," for I have no desire to offend. In the first place, some of our anglers for barbel, after the rodsters have seen the different remarks made in the papers, and also in already published books on the subject, it is surprising that they should make such terrible blunders. Some of the piscators who visit the different parts of the Trent have frequently succeeded in capturing barbel, and in catching good baskets, especially towards the end of August and the beginning of September, when it ought to be well known that the fish retire into deep swims. This class of anglers appear to forget that barbel in July do not go into deep water, but frequent the shallow and rapid streams; but, as I have often said, if you do not know where the fish are likely to be found at certain times of the season, how is it possible to catch them? Some of our rodsters know all about this sort of thing, and you never find them trying deep water in the early part of the season. Now comes the question as regards baiting places for barbel, and the proper treatment to give them and the night time to do it; this, I feel satisfied, is a very important point, and no doubt the cause of many failures. I shall touch once more on the doings of the Thames anglers, and then come back to the Trent barbel fishers. On the former river, I believe baiting a place three nights in succession is frequently practised, and some of the most practical men, as well as several writers on the subject, recommend the same thing. Now, it matters not what sort of stuff is used, whether it be worms, cheese, or scratchings; how would a man fancy to be compelled to feed on bread and cheese several times in succession? Would it not be right to think he would like a change, and, if it was offered him three or four times, he would doubtless say: "I am sick of that stuff; give me something that I can fancy, then probably I shall eat it." Perhaps the reader will understand this, if not I will try to show him by relating one or two instances that have occurred only lately. I do not mean this season, but about three or four years ago. I was fishing on the Thames with a gentleman, and he made a catch of 220 lb. in two short days. While the barbel were biting nearly every swim, one of the local fishermen came up and said: "Mr. B., I want to have a few words with you;" he said: "Your friend is hooking the barbel in good style out of a place we never thought of fishing; I baited a noted spot of mine last week, and gave the fish plenty of stuff on three different nights, and on the following day could not get a bite. What have you done to the place you are now fishing; if it is a fair question, I should much like to know?" "Well," I said, "in the first place, you did wrong in baiting your place on three different occasions, the fish became so surfeited by being continually bored and presented with the same sort of stuff that they refused to take the bait you offered them, which was sure to be the case. What I have done at this spot was to throw in a thousand worms just after breakfast yesterday morning, and after the right depth of the swim had been got at once returned to Reading. Now you see the result. If you had baited your noted spot only once you would, no doubt, have brought off a good catch, and if you do it again, the chances are, you will get disappointed a second time. In my next letter on this subject, I intend to give our Trent fishermen a few rubs on their doings, and shall expect some sharp replies; however, I will not stop for that.—W. BAILEY.

THE NATURALIST IN VANCOUVER ISLAND AND BRITISH COLUMBIA.

IN a most charming book under the above title, published by Messrs R. Bentley and Son, Mr. John Keast Lord relates his experiences gained as naturalist to the British North American Boundary Commission. The work which is in two volumes, contains some good illustrations, of which, through the courtesy of the publishers, we are able to give our readers a most interesting specimen.

We cannot but think that the title of this work might with advantage have been the Naturalist and Sportsman, &c. A sportsman on seeing the title in a catalogue might pass the book as a scientific work not likely to afford him much interest of a fishing or shooting nature; but the work has not a dull page in it, and fishing and hunting adventures, stories of the Indians, and droll anecdotes of camp life, abound. The quantities of salmon which ascend the rivers of British Columbia are simply enormous. Mr. Lord states in one place "about a mile from my camp was a large patch of pebbly ground, dry even at the highest floods, through which a shallow stream found its way into the larger river, though barely of sufficient depth to cover an ordinary sized salmon, yet I have seen that stream so filled, that fish pushed one another out of the water high and dry upon the pebbles. Each, with its head up stream, struggled, fought, and

scuffled for precedence. With one's hands only, or, more easily, by employing a gaff or a crook-stick, tons of salmon could have been procured by the simple process of hooking them out." And this is only a sample of what takes place in nearly all the small streams into which the salmon crowd to spawn; thousands of them never can spawn, from sheer want of room. After spawning these fish die in the rivers. They never appear to attempt to return to the sea, and they die simply from starvation, as they eat absolutely nothing after leaving the estuaries. Our author says:—"The Indians all say that these salmon never eat when in the rivers; and I could never discover that they had any recorded instance, or even tradition, of a salmon being taken with bait. I tried every lure I could think of to tempt these lordly fish. The most killing salmon flies of Scotch, Irish, and English ties, thrown in the most approved fashion, were trailed close to their noses; such flies as would have coaxed any old experienced salmon in the civilised world of waters to forget his caution. Hooks cunningly baited with live fish, aquatic larvæ, and winged insects were scorned, and not even honoured with a sniff. Others of the commission also tried their powers of fascination, but with equally unsuccessful results." The salmon Mr. Lord refers to in the above is the *salmo quinnat* which, unlike the salmon of our own streams, spawns in midsummer, when the water is at its lowest temperature and greatest flood height, from the melting snow. In August the Chilukweyuk river, a tributary of the Fraser, became perfectly unendurable from the quantities of dead fish floating down, and Mr. Lord relates an amusing story about these fish,

A DOGMATIC DOG-ANGLER.

"I had with me a splendid retriever, that, to my disgust and annoyance, used to amuse himself during my absence from the tent, by swimming in after the dead floating salmon, bringing them ashore, and safely storing them in my canvas dwelling; and on my return I used to discover a heap of fish, the stench from which was beyond human endurance. If fastened out from the tent, he piled them up at the door: all the lessons bestowed on him failed to convince him of his folly; he stuck to his disagreeable habit with a perseverance worthy of a better cause."

In one place the salmon at a ford were ascending in such quantities that Mr. Lord had great trouble in riding his horse through them; the fish were in such numbers about his legs as to impede his progress, and frightened him so that he plunged viciously and very nearly threw his rider off.

CURIOUS INDIAN SPINNING BAIT FOR SALMON.

In salt water these salmon readily take a bait. "The Indians when fishing use two spears, one about 30 feet in length; the other shorter, having a barbed end, is about 20 feet long. In a canoe thus equipped, favourable fishing grounds are sought, the Indian having the long spear, being also provided with a small hollow cone of wood, trimmed round its greater circumference with small feathers, much like a shuttlecock; this he places on the end of the longer spear, and presses it under water, until down the full length of the handle; a skilful jerk detaches this cone-like affair from the spear-haft, when it wriggles up through the water like a struggling fish. The savage with the short spear intently watches this deceiver; a salmon runs at it, and is speared like magic."

WONDERFUL TROUT FISHING.

Trout are found in great abundance in all the north-western streams, run in weight up to three pounds, and are delicious eating. How easily they may be captured, may be inferred from the fact that Mr. Lord's first experience of fishing for them was as follows. He was sitting on the bank of a stream admiring the beauties of nature when

"My reverie was broken by a sudden splash; a speckled tyrant, lurking under the bank on which I sat, had pounced upon a large grey fly, that, unconscious of danger, had touched the water with its gauzy wings. Very well Master Trout, you may perhaps be as easily duped as your more cautious *confrères*; so, setting to work, I overhauled my 'possible sack,' found a few coarse hooks, a bit of gut, and some thread.

"Among other materials wherewith to make a fly, feathers were indispensable. Shouldering my gun, I strode off to look for a 'white fleshier,' alias ruffed grouse; soon stirred one up, bagged him, hauled out his glossy bottle-green frill; selected some feathers which I thought would turn a decent hackle, picked out a couple of brighter ones for wings, some red wool from my blanket for dubbing, and with these materials I tried a fly. Not the slightest resemblance, fancied or real, did it bear to anything ever created, but still it was a fly, and, as I flattered myself, a great achievement. A line was made from ends of cord; then cutting a young larch, I made my tackle fast to the end, and thus equipped sailed up the stream."

With this primitive tackle our author caught as many fine trout as he cared to carry to camp, and he got them by simply flopping his fly on to the still pools, and out of the same pool he could take trout after trout as fast as he could do it. But our quotations are getting too long—the fact is the book is so full of interest it is a difficult matter to leave off quoting.

THE CANDLE FISH.

Salmo (mallotus) pacificus, or the candle fish. "I have never seen any fish half as fat and as good for arctic winter food as these little candle fish. It is next to impossible to broil or fry them, for they melt completely into oil. Some idea of their marvellous fatness may be gleaned from the fact that the natives use them as lamps for lighting their lodges. The fish, when dried, has a piece of rush pith, or a strip from the inner bark of the cypress tree, drawn through it, a long round needle made of hard wood being used for the purpose; it is then lighted, and burns steadily until consumed. I have read comfortably by its light; the candlestick—literally a stick for the candle—consists of a bit of wood split at one end, with the fish inserted in the cleft."

(To be continued.)

MORTALITY AMONGST THAMES TROUT—FLY-FISHING FOR, AND WEIGHTS OF, SAME—CHARACTERISTICS OF TRUE ANGLER—MR. BALDERSTON, v. CREEL—AND FISH-PROTECTION.

THE mortality amongst Thames trout reported in the last issue by "B." is truly deplorable, and it is very hard to assign a cause, unless a post mortem examination be made as soon as possible after the discovery of the fish. This, I think, is eminently desirable should other cases come within "B's." cognizance. I have been very interested in all piscine diseases for many years, and have found several instances of the ordinary *salmo fario* dying in palpable consequence of the contamination of decaying vegetation, and its direct nourishment of parasitic growth's, both internal and external. I have taken as many as 22 feet of tapeworms (*ligula digramma* of Creplin), from the pylorus of a pound trout. If "B." could make some arrangement to send a trout to the office of the GAZETTE, with our respected editor's permission, and let me know, I should be pleased to examine it. I think our journal should certainly have a sort of veterinary department.

* * * * *

Fly-fishing for Thames trout, though, as I am aware, pursued by Mr. Lukyn with success, is, nevertheless, very exhausting work for the ordinary angler. I grant the salutary nature of this gentleman's example, but can fly-fishing, I ask with all respect, compare as to results with spinning, or the Nottingham live-baiting method? Now, when it is a certain fact that every trout of Thames taken by the average gentleman amateur angler costs him at least half-a-guinea per pound of its weight, is it fair to advise him to increase this expense by the use of a style of fishing producing fish much more sparsely?

* * * * *

But, friend "B.," for goodness sake don't suppose I am carp- ing at your information and advice: friendly friction hurts no one. Is it a fact, however, that in a fortnight Mr. Littlewood's trout have grown to double size? And again—though I am quite as earnest as yourself in acknowledging the gift of this gentleman, whose piscicultural skill I consider of the highest—are we doing right in turning into the Thames trout of an inferior breed to that of our native strain? I opine not.

* * * * *

On glancing through an old volume of the *Quarterly Review*, I find an estimate of the number of Thames trout taken during the week ending August 30, 1873. There were but three, one of 4½ lb., one 2 lb. 10 oz., and one 6 lb. 10 oz. throughout the entire length of the Thames. The largest during that year was 14 lb. 5 oz. In May, 1872, a brace of beauties were taken by one gentleman at Kingston with the bleak; one 11 lb. 8 oz., and the other 11 lb. 3 oz. It is said that in 1874, thirty fish only were taken in all, whose weight amounted to 188 lb. An average of over 6 lb.

* * * * *

The characteristics of the true angler, to whom the old adage *poeta nascitur non fit*, is said to apply, with slight adaptation, have been enumerated by more than one writer, and it may be pleasing to recall one or two passages from the lawgivers of the art, that the ideal may not be forgotten. J. D., Esq., the laureate of angling, enumerates the attributes of a true brother of the craft thus: faith, hope, love, patience, humility, strength, courage,

knowledge, placability of mind (*i.e.*, contentment) and memory. Says Oppian, also:

"First be the fisher's limbs compact and sound,
With solid flesh and well-braced sinews bound.

* * * * *
Let resolution all his passions sway,
Nor pleasure charm his mind nor fears dismay."

The above references to the proper attributes of the angler flitted across my memory on reading the letter of Mr. R. Balderston (lecturer in the Natural Sciences, late Professor and Scholar in Science, &c.), in which he strongly, or rather with an assumption of strength, replies to "Creel" in your issue of July 30.

* * * * *

"Creel" in the communication referred to, very temperately and good-naturedly upholds the position first upheld by me, and afterwards assented to by Mr. Leo Bonvoisin, than whom there is no one better able to form a more correct opinion on the subject in hand. This position, broadly stated, amounts to the assertion that a river or stream can be "fished out." "Creel" has been certified by our editor, in a recent number, to be a gentleman, and therefore his statement that he could name "numerous instances" of fished-out waters, where the proprietors have closed the waters, and artificially propagated the fish for their recuperation, must be taken as an absolute fact. "Creel" is, moreover, a practical angler—judging from his writings, for I do not know him personally—and his opinion is also that of a large number of anglers, who have studied the actual facts, not theories of the case. I also could name instances of private waters where rod-fishing (and other minor causes, of course), have depleted them to such an extent as to render the sport comparatively *nil*. I therefore again reiterate my conviction that, combined with the exigencies of floods, navigation, &c., the metropolitan rivers—which were those originally under consideration—may be depleted indefinitely by fair, though crowded and indiscriminate, rod-fishing.

* * * * *

So much for "Creel" and our argument. Now for Mr. Balderston (L. N. S. L. P. and S., &c.) and his rhetorical reply. Having discovered the sublimity of the ignorance under which the so-called anglers labour, he very inconsistently puts an algebraical problem to "L. B.," which has no relation to the subject in hand at all. "L. B." does not trouble himself with the unknown quantities of any river, he is not such a jack—I mean "scholar of science;" but he has very usefully arrived at an approximate estimation of what may be taken from the rivers within a certain area, in a season. His statement exhibits no ignorance, but to the frequenters of the London waters is an item of great interest. It is to be hoped that by extracts from the weighing-in books of societies some idea of the recorded weight of fishes may be ascertained, if only for the benefit of the statistician.

* * * * *

"The Raven,"—I beg pardon—Mr. Balderston, in the next paragraph far surpasses "L. B." in vagueness—assuming, for an instant, that "L. B." was vague. Mr. B. says: "Furthermore, I know, from true data, that the number of fish in rivers and ponds is far greater than most anglers believe." Now, I ask, who doubts this? He has further seen places where "capital sport could be had through a prolonged period without a sensible deterioration." Who said he hadn't, and what has the statement to do with the subject in hand? The Thames has furnished good sport for a very long time, but that doesn't argue that it will always stand the strain of the last few years, which increases with a rapidity truly wonderful. Then as to the pleonastic nonsense which follows about "the protest of the sapient, the protectionists, being but a vapouring from brains of heated liquidity, notable for the absence of the solid," it needs but a pin-prick to dissipate the wind-bags of such bombast. Proof! proof! we cry—and here it is, in the next sentence, "when I see the fish swarming before my eyes . . . mass of ripples . . . countless dace and bleak . . . aerial evolutions . . . schools of thousands of fish side by side . . . simply myriads"—yes! when you do this, Mr. B., in one out of ten of the streams of England, you can prove you are right as to the stupidity of our complaint anent over-fishing.

* * * * *

But it is really occupying space wastefully to disrobe the grandiloquent prose of Mr. B. of its extra garments so as to reveal its true meaning. If an ideal river or lake existed, wherein no pollution, no floods played the deuce, no poachers dealt midnight destruction, and a plenty of food reigned, then it is possibly doubtful if anglers could outfish the stream. But in these sublunary streams, such a climax is possible, and every watchful man can see it going on in the Thames and Lea. Nobody doubts the fecundity of the fish, but I, for one, greatly dispute the inordinate results in ordinary waters arising from such fecundity, which are insisted on by the "Raven."

J. HARRINGTON KEENE.

MORE PRIZES FOR OUR FLY AND BAIT CASTING TOURNAMENT.

IT is with much pleasure we announce that, in addition to the prizes promised by Messrs. S. Allcock and Co., of Redditch, the Manchester Spinning Company, of 51, Corporation Street, Manchester, have very kindly promised the following:—

1. A superior hard cable waterproof trout landing net. Value 6s.
2. An enamel cable taper salmon line. Value 16s.
3. An enamel taper trout line. Value 6s.
4. A sixteen-plait enamel waterproof, pure china-silk trout line. Value 6s.
5. A superior treble cable enamel "Zephyr" waterproof trout line. Value 4s.
6. A treble cable waterproof cod line. Value 3s.
7. An enamel wire-spring enamel waterproof salmon casting line. Value 6s.

And, further, they say they "will perhaps add to this list."

We ought to mention that the company get so many applications for expensive samples that they are obliged to ask that 2d. be sent to defray cost of same.

The "Tournament" promises to be a success, and we sincerely trust it may bring in a substantial amount for the funds of the Anglers' Benevolent Society.

A DAY AT STAMFORD, ON THE TEME, WORCESTERSHIRE.

AFTER a drive of fourteen miles through some of the most charming country in the Midlands, here and there the corn cut, and standing in the sheaf; then the hop yards with their vines streaming in the breeze; the forest of oaks at the foot of the hill—is a treat not to be forgotten, though the mind is bent upon angling. But we are soon once more upon the ford, rod in hand, fishing stockings on, and a most beautiful morning, the 6th of August was to tempt the grayling. My two friends go one to the tail of the ford, the other a little further down stream to a favourite perch swim; he lands two fine fellows in a short time, a few good dace also give their last kick in their natural element, and together with chub make up a good take. Friend No. 2 gets a bad start, but finally lands in all about 4½ lb. chub, dace, and roach. Myself, with the sky-blue for a leader, the red-ant as No. 1 dropper, and the iron-blue as No. 2 dropper. The water is as clear as gin. In the first half hour I land, or rather carefully unhook, about a dozen samlets. Presently, as my line was passing a curl, caused by a large piece of rock rising from the bed of the river, with line quite tight, I feel a strain. "Hallo," say I, "a grayling for a pound," but with my fine cast and light rod I could not get the fellow up to say one word, not even "steady my pet;" no, not he, but lies shaking like a bull dog down at the bottom of about four feet of water, but at last he thought he would see what he could do in the rapid water, and like an arrow he darts up stream. "Steady," say I, "you are wanted, my silvery friend, with your golden bars along your sides." After about ten minutes' play, the prize is landed, and proved to be as fine a grayling as I ever looked upon; it was 1 lb. 4 oz. A little later on, and I land another; the two, side by side, make me feel proud, as they will take some trouble to beat as a brace, either for weight or beauty. I am quite sure that there are many large grayling in the Teme, and I unhooked near twenty, and returned them as under size. In all I weighed-in 7 lb. 8 oz., nearly all were taken with the red ant.

J. A. GRIFFIN.

WHERE TO FISH IN NORFOLK.

WE may now be said to be in the midst of our fishing harvest here, for not only do reports of good catches come to hand, but some immense fish have been taken of late. I have just had submitted to me a bream taken in the Waveney by our respected postmaster, and which scaled 6½ lb.; it is indeed a handsome fish, and is now in the hands of the preserver. By its side lay a magnificent specimen of the hybrid, weighing just 2½ lb.

Some large takes of bream have come in from REEDHAM, and the fish are all in splendid condition. Being extremely deep water here the ledger is mostly used, the bait being good lob worms, with boiled maize and barley meal for ground bait.

Those who like choice roach-fishing should try at CANTLEY. Here is some splendid water, some magnificent scenery, plenty of fish, a capital inn (the Red House) a minute's walk from the railway station, and about half way between Norwich and Yarmouth. Here many London gents resort, and should you come across any one who has had the pleasure of staying here, they will corroborate my statements. Some of the finest roach swims

on the stream may be found here, and the fish are certainly the best to be had. Very rarely any are taken under 6 oz., and very often up to 1½ lb. each. Three and four stone per boat, per day is no very uncommon occurrence.

BUCKENHAM FERRY, about 2½ miles higher up, is also another capital spot. The Ferry Inn is the anglers' rendezvous, and a snug little "crib" it is, too, and if one is not too thin-skinned to mix with the villagers, who assemble there, many an interesting "yarn" may be listened to. Plenty of roach are being taken here; two gentlemen bagging no less than 6 stone weight in one day. The Norwich Angling Club are holding their annual contest there to day, the result of which I will report next week.

A little further up we come to the BRUNDALL FISHERY, better known as Coldham Hall. Any amount of sport may always be reckoned on here, but the roach are not nearly so good as those lower down. Between this place and Cantley is considered to be the best parts for pike, and up to the present several good fish have been landed; the spoon bait being the bait used. Hewitt, the water bailiff, informed me that there is every prospect of a good pike season.

For the first time in my life I have seen some of the bream taken from the FRITTON DECOY BROAD. I had always heard these fish spoken of as being extremely worthless, owing to their being so inactive when hooked, and likewise with no weight about them, and were, in fact, always called "razor backs" so very thin were they. Since seeing about two stone, which were caught by two members of E. A. P. S., I am quite altered in my opinion, for they were as clean and plump as any I have ever seen taken out of the rivers.

The Bure also seems to be just as prolific. The most marvelous take for two anglers this season, comes from WROXHAM, they were fortunate enough to land fourteen stone of bream in one day. Any of our metropolitan friends will find most comfortable quarters at Host Whittaker's, the Three Horse Shoes Inn, Wroxham. I can quite picture this hostelry as one that would just have suited Isaac Walton, for it is indeed "a cleanly alehouse." SOUTH WALSHAM, on the same stream, is also an excellent place for bream, roach and rudd, the latter being the best specimens I have noticed, come from this spot. The Ship Inn is the best house to "put up" at, but is at a great disadvantage, as it is two or three miles from the fishing grounds.

We next come to ACLE, or Acle Bridge. Now is the best time for this place, as many Norwich Anglers have experienced of late. The only disadvantage is, as yet there is no railway to it, and to get there, it is necessary to drive; but once there, it repays for all trouble and expense. Here also will be found a most excellent inn, and indeed a most courteous host and hostess, with plenty of good beds, and always substantial fare.

But above all this the fishing is rather more than the average, as bream of a most unusual size are being taken. Host Rose, who is himself an expert angler, is always eager to show gentlemen the best parts, either for bream or roach. It was from this place that the enormous eels which gained a Diploma of Honour at the Fisheries Exhibition were captured and exhibited by Mr. A. Palmer, of Norwich.

Many gentlemen stayed here last summer, and many testimonials have been received by Mr. Rose, both for his catering, and also for the amount of sport obtained; these "mine host" is always proud to show.

The club contests in the city are now nearly over, and anglers are settling themselves down to business in earnest—when I say business, I mean they go in now for big takes, and on the quiet.

ANGLER.

["Angler" sends us a capital photograph of the members of the East Anglian Piscatorial Society just starting for a fishing excursion.—ED.]

SOME HINTS AS TO WHERE TO GO.

AS the Hertford line follows the course of the Lea river, the angler will find himself, by alighting at any of the stations, particularly at Broxbourne and the Rye House, within an easy distance of the waters, which are all open to him, with one or two exceptions, by the payment of a reasonable fee. The exceptions are Captain Sander's water and the Government Ordnance, at and near Waltham, both private. There is, however, Clark's fine stretch of the river here, which is open by annual or day tickets. The Amwell Magna Fishery, near Ware and St. Margaret's, is likewise exclusive.

The line from Broxbourne to Bishop Stortford keeps pretty close to the railway and there is little difficulty of obtaining a day's fishing from the respective millers.

Between Barking and Rainham stations is the Dagenham Reach Fishery, free by day tickets.

CHELMSFORD.—Good angling in Can and Chelmer. Enquire of Station agent.

WITHAM.—Good angling from this to Maldon, protected by Society.

BURES.—Excellent angling in the Stour, protected by Society; House, Five Bells, Joseph Cousins. Day tickets.

SUDBURY.—Excellent angling, protected by Society. Day tickets.

MELLISH.—Good fishing; open.

CAVENDISH AND CLARE.—Angling protected by owners. Particulars at Bear Hotel, Clare; Deeks, proprietor.

BIRDBROOK.—Great Yeldham, Castle Hedingham, Halstead, Colne Chappel, and Colchester all have waters containing fish. The river at the last-named is now preserved, but Mr. Papillin almost invariably grants leave by application. Good whiting fishing off Mersea Island.

IPSWICH.—Bramford and Claydon on the Gipping, angling preserved. Day tickets.

MELTON.—Campsey Ash and Woodbridge on the Deben. Fishing mostly open.

DARSHAM.—On the Top. A little fishing.

CREEL.

AN UNSOLVED PROBLEM.

[By YE PILGRIM FRY-ER.]

AS I lay a-thinking, one of the swelterest of the many sweltering nights we have had this summer, when sleep was delayed till the dawn of day, I tried to realise how many, and what weight of fish that particular brace of big pike had killed and consumed since changing quarters from the duck-pond at Kew Gardens for the river Thames? I got into the three figures, and then into "anglers' weights," and the "half-hundreds" and "hundreds," and then—fell asleep in despair! Now, this is a problem the approximate solution of which would entitle the successful one to rank almost with the great Dr. Zukertort, the Champion Chessist. You might depend upon it that this brace of new pike, after eating up all Dr. Hooker's young ducks, had got an appetite far above mere coarse fish; and therefore, when turned loose, unfortunately, in the Thames had begun upon the trout. The poor roach in the duck-pond, when ducks ran short, had had such a horrid time of it, that when they found themselves in the river had migrated *en masse* to the lower waters, and had brought away with them all their Bohemian-inclined brothers and sisters, and their first cousins, the dace, into the tideway or estuary! How is it that the captures by anglers of Thames trout should be so comparatively small? The eels that Mr. Harrington Keene has now pronounced sentence upon—late enough, though!—are not more destructive of fish spawn, &c., than are such large pike that prey upon the spawn-producers, and as for the table, why an eel is, as compared with a pike, like a partridge to a sparrow.

But big pike, I repeat, must prey upon the Thames trout, and trout turned into it, that all have been so anxious should increase and multiply.

Now, I ask in all seriousness, if even one London angler out of every five hundred has this year captured a Thames trout, little or big? If this surmise be about correct, how can we reasonably expect that future years will be any better while the destructive pike and the eels are allowed to roam about, brigand-like, and prey upon the highly-prized fish. Coarse fish can never suffer in a comparative or proportionate degree to the Thames trout, considering the value set upon the latter and who can tell that the big Kew pike had not gone ahead to the Marlow water, or even to that paradise of the "pretty ones"—the Caversham Cashmere—(with a "Butler" ready to hand to see to their wants)?

Instead, then, of turning any more large, or any pike, into the Thames, let as many as possible already in the river be netted out—and the big 'uns, such as that big brace from the Kew duck pond, should be turned for instance into the Serpentine, just to give Mr. Marston an opportunity to delight the eyes of the Londoners by giving a practical lesson of how to artistically hook, play and land a monster pike. Half a cartload of roach from some duck-pond or other might be thrown in the Hyde Park water for these sharks to quarrel over and eat. Just wouldn't there be excitement in Rotten Row after the grouse and partridges had been thinned down, and some of the great folk had got back to town; wouldn't there be a pulling up of horse's heads by fair and "gentle" hands close to the railings in the Row at the exultant cry of "He's got un," and people rushed to the spot from all parts! And when the Big Pike was landed, and the cry was raised: "To Marlborough House—the Big Pike for the Prince of Wales!" (Hurrah!)—then will commence the unique procession along Piccadilly, &c., and among the shouts of astonishment at the great prone pike would rise, above all, that of the *gamin*: "Oh, ain't he a whopper I say!"

SPRING SALMON.

A FRIEND writes me from Toronto: "There is rising here a great discussion upon the habits of salmon. Two gentlemen here, who hail from the Land o' Cakes, maintain that in their own country there is not a month in the year in which a fresh-salmon could not be obtained in the Ness or in the Tay, if it should be worth the expense of capturing, and that there are no two rivers in Scotland that correspond alike in the time of hatching out their salmon. They maintain that the time is not far distant when the hampering trammels of legislation will be thrown aside, and the proprietors of fishings be allowed to follow the instincts of their common sense in the management of their affairs; that is to say, if they were permitted to bring wholesome fish to market when they are in season, and made liable to be punished, as butchers are, if they send to market unseasonable food. There is, they urge, no such restriction on sheep, cattle and poultry, which enter much more largely into the dietary of the public, these being left to the management of proprietors and servants, who know their own business and attend to it. The period required for developing salmon ova is now quite well ascertained, and varies only a little, according to the temperature of the season and the water in which they are hatched. An article in the *Toronto Globe* would, it seems, advocate the same line for the conduct of the salmon fisheries on that side of the world, wholly ignoring the injunction, which they endorse, that proprietors (and why not nations?) should mind their own business. We glean, however, something worth quotation from the following extract:—"The spring salmon here ascend only those rivers which are fed by the melting snows from the mountains, and which have sufficient volume to send their waters well out to sea. Such rivers are the Sacramento, Rogue, Klamath, Columbia and Fraser Rivers. Those salmon, which run in the spring, are chiefly adults (supposed to be at least three years old). Their milt and spawn are no more developed than at the same time in others of the same species, which will not enter the river until the fall of the year. It would appear that this contact with cold fresh water when in the ocean, in some way causes them to turn towards it, and to "run" before there is any special influence to that end exerted by the development of the organs of generation. High water on any of these rivers in the spring is always followed by an increased run of salmon. The canners think, and this is probably true, that salmon which would not have run till later, are brought up by the contact with the cold water. The cause of this effect of cold fresh water is not understood. We may call it an instinct of the salmon, which is another way of expressing our ignorance. In general, it seems to be true that in those rivers, and during those years, when the spring run is greatest, the fall run is least to be depended upon."

F.

HOW TO TAKE GREY MULLET.

A CORRESPONDENT asked the other day the best bait and way of taking grey mullet in fresh or brackish water. We find in *Salter's Angler's Guide* some very useful information on this matter. He commences by what appears at first sight somewhat of a bull.

"GREY MULLET.

"So called from its silvery, white, blue, and green colours. Mullet visit the south and west coasts of England in the beginning of summer, and enter the creeks and rivers, particularly about Arundel and Chichester, in Sussex, and Barnstaple, in Devonshire, and leave them generally in the latter end of August. At those places, mullet are seldom caught, by angling, of more than two pounds, though they are occasionally taken weighing six pounds. When angling for mullet your tackle must be strong, for they struggle very hard. Your line and rod, also, must be long, unless you use running tackle; in the deep holes and pools you will succeed best by letting your baited hook hang about three feet under water, use a hook of the size No. 6 or 7, and a cork float. The best bait for mullet is the sand, or sea-worm, which should be drawn as much up the shank of your hook as you can, that little of its tail may hang loose; for mullet are a sucking fish, and apt to get the tail end off the worm, without taking the hook within their mouth.

"This fish is considered fine and delicious, being esteemed both by the moderns and ancients. In shape, they are long and thick; head, square and flat; nose, blunt; sides marked with dusky lines; the body is covered with larger scales than other sea fish I know of; the back is of a dusky blue and green; the scales are of a silvery white; the whole appearance is, I think, like an overgrown dace. Mullet are very lively and sportive in fine weather, and show themselves in shoals, and are then frequently caught with a fly, in Sussex. Mullet spawn in the sea, and come into fresh water to recover and strengthen themselves."

TRAVELLING IN WALES IN BYEGONE TIMES.

IT is sometimes of interest, if not of use, to compare the present with the past. Here is a bit from "A Walk through Wales in August, 1797, by the Rev. Richard Warner, of Bath, with a friend." "Dolgelly, August 9th. Nothing strikes the traveller who passes through Wales more forcibly than the extreme reasonableness of the bills at houses of entertainment. Our supper last night was superb: it consisted of a sole, a trout, and a garmad (a delicious fish, somewhat like the trout, and peculiar to Alpine countries) with every proper accompaniment; mutton-steaks, vegetables, excellent bread and cheese, and three tankards of London porter—

"With toast embrown'd,
And fragrant nutmeg fraught—divine repast!"

"Our beds were comfortable, and the breakfast this morning was fit for a monarch. You will scarcely credit me, when I assure you the charge for this sumptuous fare and admirable accommodation, amounted to only five shillings and two pence, which sum was divided into the following items: Supper, 2s.; porter, 1s. 6d.; breakfast, 1s. 8d.; total, 5s. 2d. This appears the more extraordinary, as the prices of provisions between Wales and England do not differ in anything like the same proportion in the charges at the inns in the respective countries. We have hitherto found good butchers' meat not to be gotten under 6d. per pound, bread as full as dear as in the south, and butter little less expensive; these indeed, are unnatural expenses in Wales."

Shortly after the above date, in 1807, I find in "Wood's Itinerary," "Till within these six years, mutton in Wales was to be bought at 2d. and 2½d. per pound, and other meat in proportion; now, 5½d. and 6d. are commonly given for joints from Usk to Conway."

It will be noticed that the Rev. Mr. Warner does not make mention of any charge for the beds of himself and companion; the custom formerly being, "throughout Great Britain," to "throw the bed in." And there exist those travellers who can recall the period when the change gradually took place, arising from giving a dole to the bedmaker, until the small fee was looked upon as regular, and found its place in the bills, where, like a grain of mustard seed it has gradually increased some hundredfold. Indeed, I have had in my early days, upon angling and other excursions, as good a chamber, with every accommodation, for 6d., as I have now to pay from 2s. 6d. to 4s. for, and this charge not including that modern imposition, "attendance." A ninepenny bed was then thought a luxurious extravagance, and a "one-towelled room" not known.—CREEL.

SEA-FISHING OFF THE EAST COAST.

THERE is good sea-fishing off Walton-on-the-Naze. Ask Dorling, of the Hotel; he has an old salt who goes out with visitors and can be thoroughly depended upon. Off Yarmouth, Lowestoft, Cromer, &c., are all good in their season.

CREEL.

BY THE THAMES-SIDE.—The "PILGRIM FRY-ER" writes:—From being a chronic invalid, the invitation of a friend to drive me to the Thames-side near Walton Bridge, for a day's pic-nic, was most gratefully accepted. We pitched on the greensward opposite to the towpath, in full view of the river. I didn't envy the poor fish, that must have gone through a continuous see-sawing from the swell of the very numerous steam launches. The occasion was before the late "freshets;" and possibly some of those big trout lately found in the river had come by their death from wounds caused by those curses to all angling—the launches. I don't wonder, however, that the Thames trout, &c., had suffered from parasites. A largish fly flew into my room the other day, and pitched, or fell, upon my writing-pad, and tried ineffectually to wriggle or rub off a number of diminutive crab-like parasites that had got fixed and were preying upon its body. This was only another proof, I suppose, of the well known "*ad infinitum*" theory. What magnificent elm trees may be seen, in pasture or other fields, from Kingston Vale to Walton. Many anglers are so intent on their float or their flies that they can find no time or pleasure in searching for wild flowers by Thames-side. My friend, observing some beautiful wild myosotis (forget-me-nots) growing half concealed in the hedge close by, gathered a bouquet for me as a *souvenir*. The line in Gray's "Elegy" occurred to my mind of many a flower being "born to blush unseen," for these lovely wildings had to be closely sought for, like many others that literally "waste their sweetness on the desert air."

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

MRS. F. Y. BROCKAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

RIVER REPORTS.

MID-THAMES.

"A fish should swim thrice—in water, in sauce, and in wine."

I had two "physicians" the other day, and they, for a wonder, did me a deal of good—in other language, a piscatorial friend presented me with a brace of tench caught from the Thames. My previous experience of tench was that it was a flabby, muddy blanket, one very much akin to chub; but in this instance, after the bronzy bellows had been made to "swim thrice," the result was "beguiling," and tench in future will be estimated at their real worth. The Thames is now in prime trim for gudgeon, chub, roach, perch, and barbel, and all those kinds of fish are fairly on the feed in most of the well frequented stations on the Thames. Of course, some of the stations being more particularly adapted to a certain class of fish—for instance, Bray and Monkey Island for barbel and perch; Maidenhead for barbel, trout, and chub; Cookham for roach and jack; Bourne End for roach, perch, and jack; Marlow, good all round; Hurley for perch and chub; Medmenham for gudgeon and chub; Henley for barbel and chub; and Maple Durham, especially, for splendid perch. In consequence of the rains, lob worms are easily obtainable, so perch and barbel have proportionately to suffer. I would advise all thrifty piscators to lay up a stock of those enticing luxuries for a dry day.

THURSDAY EVENING: Good news from most parts of the Thames—too lengthy, however, to report. Weather fine, with slight breeze from N.W.—MARLOW BUZZ.

Thames (Goring).

Water in good order for all sorts of fishing; roach, perch, chub, biting well. Prospects better; weather fine. Four days, about 40 lb. of roach and chub; 1 roach, 2 lb.; 1 barbel, 5 jack.—JOHN RUSH.

Thames (Halliford).

River in good order for all round fishing. Different gentlemen fishing with me during the last week, their takes have been as follows:—viz., 1st, Mr. Palmer jun. fishing with me took 13 lb. of roach, and a barbel nearly 5 lb. 2nd day, Mr. Hutchinson and friend 8 dozen roach and dace. 3rd day, Mr. Emmett and friend, 19½ lb. of roach and dace, 1 bream and a perch. 4th, Mr. George Palmer, about 40 lb. of roach, barbel, bream and chub.—GEORGE ROSEWELL.

Thames (Kingston).

The fishing in this district has improved. The best day we have had is 32 lb. of roach, one rod. The rest of the fishing averaged from 12 lb. to 18 lb. of fish per day. Some roach, one 1 lb. 15½ oz., and one 1 lb. 12 oz. Some good roach have been taken from the bank; and at the Sewers, 18 lb. were taken by my son; also a few good chub, ranging from 3 lb. to 4½ lb.; and a few good barbel, best 6½ lb. I have seen three good trout feeding, and bream in any quantity, but will not feed. Water very bright, the finest tackle is required. We hope to have the bream and barbel on the feed.—J. JOHNSON.

Thames (Richmond).

The river is in fine trim now, the late rain having improved it very much, and the fish are feeding very fairly, each punt has averaged between eight and twelve doz. good size fish a day during the week. We have been very well patronised this last fortnight. Most days there have not been punts enough. Toby Brain had a fine lot of perch yesterday, Wednesday, six fish giving 7½ lb.; and one roach, 1½ lb.; one eel, 2½ lb. I, like all the rest of the fishermen, have been doing very well. My best lot was this afternoon, Thursday, in six hours, 33½ lb. of barbel and dace, all taking with worms.—JOHN BUSHNELL, Fisherman.

Thames (Shepperton and Weybridge).

Water is higher and much better for fishing. Fishing prospects are very good for the next few days. F. Purdue, two days, one barbel, seven dozen roach and dace, five dozen gudgeon; and one roach, of 1½ lb. H. Purdue, two jack, of 1 lb. each, and three dozen of fine roach and dace, in three days. C. Broadhead, two days, two and a half dozen roach, one bream and one barbel. Myself, two days, nine dozen roach and dace, six barbel, two bream and one chub. Mr. King, with a fly, caught another small trout, of 1½ lb., which he returned to the river again.—W. ROGERSON.

Thames (Twickenham).

Business prevented writing full report. Thirty-five punts out this week, doing well. Sorry to send customers away, but they should write or wire.—A PERRIN.

Ancholme.

Since the sending of my last report, there has been some good all-round coarse fishing. One gentleman, in addition to other fish, had seventeen bream, weighing on an average, 3 lb. each. Another individual was the fortunate captor of a 5 lb. fish of the same species. I had a turn on Saturday last in the Cantor Canal, a feeder of this river. It was too cold to sit by the water-side, watching a float, so I took out a collar of flies, Ford's favourite freckled dun, and baited the tail hook, which had no fly on, with a well-scoured gentle. I then threw amongst the shoals of roach and dace, and had some fine fun, sometimes hooking two at once. It is only fair to state that I caught more with gentles than with the fly, but this system with a very fine collar, is a most taking one, and I commend it to brother anglers as a more congenial method than

bottom fishing. Some more trout have been seen near Harlem Hill Lock, and a boy caught another of my runaways, near South Kelsey, the other day.—THOMAS FORD.

Avon (Binton).

There has been some good baskets made here since the rain, the river being now in first-class condition, J. Bennet and friend taking 20 lb. of roach, averaging ½ lb. each; Mr. Avery, 29 lb. bream, largest fish bumping the scale at 9 lb., two others over 6 lb., and the rest averaging 4 lb. each; my brother, G. E. Warner, 21 lb. roach, thirty fish taken, as usual, with stewed malt; H. Warner, 14 lb., twenty fish. If the rain continues the river will be bank high, but at present it is scarcely coloured.—ARTHUR W. WARNER.

Barle and Exe (Dulverton).

These rivers are now in splendid condition for angling, both with fly and minnow. Some large baskets of trout were taken during the flood that came down last Friday, and very good catches have been had since with fly and minnow. Monday last I caught thirty with the blue upright coudung and sand-fly. If we do not have much more rain the prospect for next week is good. No salmon have been caught yet, but I hear they have been seen at Tiverton.—W.

Cam, Ouse, and Lark.

Some good trays of fish have been taken from these waters during the past week, more especially the Cam. Andrew Antony fishing with Mr. William Howlett, of Newcastle, took on Wednesday last close upon six stone of bream, average weight, 4 lb.; also three very pretty tench that scaled 9½ lb. the three. Roach are not feeding well at present. Mr. William Howlett, however, managed to make up a nice tray from the Ouse, on Thursday last, 34 lb.; largest fish, 1½ lb. Some splendid dace have been taken from the Lark. Mr. J. Rae and Mr. Crick, one day last week took no less than six dozen splendid fellows, several of them nearly 1 lb. in weight each. The fish do not, however, bite freely. There certainly is an enormous lot of weed this season; and, in consequence, much more animalculæ than last year; which, perhaps, accounts for the delicate or obstinate way the roach bite. We may just add, in connection with fishing, it is a capital year for partridges, the coveys being very large and strong. All through Suffolk and Norfolk, ground game, Mr. Howlett informs us, are as plentiful as the winged.—J. C.

Dove (Derbyshire).

This river is now in capital condition for either surface or bottom fishing. We had more heavy rains all the week, and there is a strong current on, but not sufficient to interfere greatly with angling operations. A great many good baskets of trout have been captured since my last at Mayfield, Rochester, Ilam and Ashbourne. The apple-grey dun is on the water, and the best dishes of trout have fallen victims to it. One basket of 9½ lb. brace was a particularly fine sample. These were caught near Mayfield. The Gregory and the Derby killer have proved the most successful in the way of spinning. The bottom fishers have been catching great quantities of coarse fish daily. The worm and wasp-grub have "fetched" the finny ones best. Barbel, chub, and bream are all well on the feed. A splendid lot of chub were captured near Rochester on Tuesday with the wasp-grub, some of them scaling 1½ lb. each. Weather still dull and showery.—THE SPODGER.

Exe (Exeter).

Very little to report this week. The upper portion of the river is very low, and trout fishing almost nil. Rough fish, such as perch, roach and dace, plentiful; and for those who prefer ground fishing, there is first-rate sport. Salmon plentiful as ever, and the peal are more numerous than for many seasons past; these are, of course, in the tidal portion of the river, where there are plenty of small bass, plaice, dabs, &c. There has been a good downpour of rain during the night, consequently the rodsters may look forward for a good innings.—FRANK GOSDEN, Exeter.

Exe (Tiverton).

The river is in excellent condition for the fly and trout are sporting well. Some very fair baskets have been taken during the past week, the largest number I have heard of being forty-seven, all with the artificial fly. The ones killing best are the usual spring flies (No. 3), blue upright rat's fur silver twist, half stone, and heron's body blue. Report says that there are some salmon up; none have yet been caught.—W. MUDFORD.

Medway (Tonbridge).

The water is in excellent condition for angling, the rain in the early part of the week having greatly improved the condition of the water. There has been a good number of anglers out to-day (Thursday), and some good bags have been made. Mr. R. A. Dallas Beeding has been busy amongst the roach, grassing some of 1½ lb.—YE MEDWAY WATER-RAT.

Ormesby Broad.

Some friends of mine have been to Richmond, at the Sportsman's Arms, Ormesby Broad, and had capital sport. Richmond is very civil and obliging, and his charges are reasonable. He owns a portion of the water, and looks well after it. I have caught my largest fish on his water, both perch and pike.—ESOX LUCIUS.

Ouse (Bedford).

The members of the Bedford Club have sent me a very kind invitation to fish their waters. I hope to avail myself of the privilege in about a fortnight. In the meantime, I would point out a very pleasant kind of fishing, which I always practise when at Kempston (*vide* Ancholme notes). Two years ago, on this system, I had some rare sport with dace, chub and roach, catching two or three scores daily. Should my hatching operations prove favourable this season, I purpose sending a small supply of trout fry to Kempston, in return for the compliment paid me.—THOMAS FORD.

Ouse (Oxford Darcy).

I had not fished here for the last four years until last week, and I find the river is much improved. The roach being very abundant, and bream plentiful. The weather left much to be desired, and three days of the week were practically nil. I fished on the other three, and my catches totalled 250 roach, most of them being of good size, fifteen bream, largest scaling over 3 lb. (one much larger succeeded in breaking my tackle and getting away) two jack and a few eels, dace, &c. The river is most conveniently situated to the railway station, good fishing places not being distant more than one or two hundred yards. I hear that some anglers were there from Nottingham on Bank Holiday, and had a tremendous haul of bream and eels; I daresay how many, for fear some

of your readers should think I am overstating it. Accommodation is good and cheap, and I should recommend anyone visiting the place to hunt up a well-known fisherman, named Amos Hinsman, who will bait up places for them, and show them some favourite haunts. The bait I found most killing for roach was boiled wheat; it must be slowly cooked for three or four hours and not strained, but allowed to be in the liquor—bream refuse lobs, but take brandlings freely.—ROVER.

Severn and Teme (Worcestershire).

Water in fine condition for angling with fly or any other bait. There are many trying their skill upon the Teme. There are plenty of fish upon the fords, and my opinion is the autumn fishing will be excellent. Mr. Emos Bosworth has weighed-in at the Boughton Club some fine chub, best fish over 3 lb.; Mr. W. Pitt, a few perch, half-pounders; myself, a few grayling, best brace 2 lb.; Mr. Guillhan, 4½ brace and 2½ brace. The red ant and blue dun are the best favourites for trout and grayling.—J. A. GRIFFIN.

Suir and its Tributaries, Clonmel (Ireland).

The floods which we were so anxiously expecting have come at last. On Saturday the river was bank high, and the fish were rising in all directions; since then every stand has afforded good sport, and peal from 4 lb. to 8 lb. have been killed by the rodmen. The cot fishing closed yesterday, so the rods for the remainder part of the season will have to themselves, as the river was never in better condition or more fully stocked with fish; this is owing principally to the protection afforded to the spawning beds during the past two seasons, and if now during the coming season the tributaries are well watched the Suir will soon recover its former prestige, and the effects of the past two months' poaching be fully compensated for. We trust this will be the case, as it would be a pity to see such a river given over to destruction. The trout fishing has considerably improved during the past week or ten days, good baskets were made on both river and stream. Capt. Palliser had good sport on the Suir with flies and Devon minnow, with the latter he killed some very heavy trout. On the Suir, especially at Kilshulan, Charley Milne, Tom Rower, B. Tape, W. Magrath, and others, were more than successful on different occasions. The favourite flies are principally worms, grouse, red and black hackles, the smaller the better, as the trout are inclined to rise rather short. Wind, North-west.—DORA.

Swale.

The very heavy rains of the past week have proved a godsend to worm-fishers, who have had some nice catches. The Swale is a very rapid river, and soon runs down to the ideal coffee colour. There ought to be some very heavy baskets made up-dale, when the river fines down a little. The black drake (snipe and crimson) is a capital fly after a flood. Any of the following may now be added:—Checkwing, claret drake, cinnamon drake, freckled dun and grey goose fly. The above are numbered in my shilling manual, respectively, 34, 21, 44, 45, 52, 65.—THOMAS FORD.

Trent (Alewias).

Although we have had very stormy weather in this locality, it has had little effect in discolouring the water, which has been in capital order for all round angling. Large roach particularly has been feeding freely, in fact, better than any previous week this season. The following are a few of the many takes of our members this past week. Mr. T. Thornton 15 lb. large roach and perch, Mr. Savatard 12 lb. roach, Mr. C. Rickett 10 lb. roach and a nice trout 18 oz., and your humble servant 19½ lb. of fine roach. The latter were principally taken with gentles at the Canal weir at Wichnor, and were exceptionally good in both size and condition, 8 of the best fish weighing 7½ lb., and there were none less than ½ lb. I hooked the best perch it has ever been my good fortune to lay hold of, but unfortunately it broke away from the small roach hook when I thought the fish was dead settled; as the fish could not have been far less than 4 lb., it will take me some little time to forget my ill-luck. Mr. Reynold, our crack angler, is reported having a good catch on Tuesday, but particulars are not to hand. The river to-night is reported in grand order, and next week's prospects with finer and more settled weather are of a most cheerful character.—JAMES GREGORY.

Trent (Newark).

The water is still low and bright, and in capital order for general angling; weather has been very unsettled this last week; heavy rain has fallen accompanied by thunder, but the much needed fresh has not come down the river. Sport during the past week has only been very different, except in a few instances. A few nice chub have been had with wasp grub, and a few barbel and bream with worm. Roach and dace have been had with gentles, bread paste, and creed wheat and malt; but, as I have just said, only indifferent sport has been had. An all-England fishing match took place last Saturday close to Newark, when the first prize was won by Mr. David Slater, the celebrated rod and tackle maker, of Newark. I might say that a new fishing club has been started at the house of Mr. Slater; further particulars next week.

THE TRENT OTTER.

Trent (Nottingham).

The weather this week has been very unsettled, and much rain has fallen, but the river was scarcely affected up to Wednesday morning, the water remaining as low as ever it has been for the last six months, and it certainly does surprise the anglers why the fish continue to bite so well; and the accounts of sport this week are quite as good as we might expect, considering the unfavourable state of the weather and the old, stale water that has been in the river so long. The first item of news comes from Collingham, where one angler managed to bag 25 lb. of bream and a fair number of flounders and eels. The bream in this locality seem to be better on the feed than in any other part of the river, and the places where the principal part of the fish have been caught are, in my opinion, worth a baiting of worms, which might bring off a great catch. The noted bream water at Weston Cliff, where this fish abounds, has scarcely produced a basket worth mentioning, though some of our best rodsters have tried their best to get them on the feed. The bream are continually rising to the surface, but any quantity of worms thrown in will not keep them on the bottom. Then I should say keep the worms out altogether, and wait until the fish are ready to feed. It certainly is a bit of a puzzle to the fishermen, who cannot decide on what is best to do. I have often found it a good plan, when both bream and barbel refuse to take a whole worm, to fish for them with a fine dace tackle and a small piece of tail end, and this will sometimes answer the purpose. Some of our rodsters will doubtless be surprised to hear of a catch of 70 lb. of roach in one day from Clifton Hill, a locality that was thought to be fished out. I believe, however, there were three rods at work; but nevertheless it was a good take; maggots were employed. The water still remains low and clear, and all the fish are biting well.—W. BAILEY.

Waveney (Beccles).

There has been plenty of sport here during the past week, notably in the morning and evening, and the prospects for the coming week are very inviting. The water is rather brighter than we could wish. A goodly number of very nice jack have been taken in the last fortnight, but no sooner did the news get abroad that a few had been taken, and they were evidently on the feed, than a host of trailers of all descriptions might be seen trailing about up and down the river from morn till night. We have noticed lately a goodly number of gentlemen anglers, strangers to this district, who have been spending their time on this pretty little river this season, and we have not heard one complain of dearth of sport. P.S.—Good accommodation for gentlemen fishing in the neighbourhood, and every information, may be obtained at the club house of the Caxton Anglers, the White Swan, Beccles, Thomas Wright, proprietor.—C.B.

Wye and Derwent (Derbyshire).

Most of our Derbyshire anglers have left the rivers and gone to the moors for grouse shooting, and I am very pleased to say that from what I can hear they have had first-class sport amongst the grouse, the birds being both plentiful and very fine ones. The past week has been a very bad one for angling of any description, and very few fish have been killed, owing to the air being loaded with electricity all the week, in fact, thunder has been heard on most days. We got a nice little flush on the Derwent last night (Wednesday), which caused a good number of bottom fishers to turn out, but I am sorry to say their takes, as a rule, were only small. Fish never feed kindly in any our Derbyshire rivers when there is thunder hanging about. To-day (Thursday) the thunder seems to have left us, and some handsome dishes of both trout and grayling have been killed with the bottom on the Darley Dale Club waters below Darley Bridge with gentles, worms and wasp grubs, one angler having a brace of good fish. The Derwent has a most beautiful nut brown colour on it, a most killing water for all kinds of angling. The killing flies for either the Wye or Derwent are the honey dun bumbles, red-grey goose, and sand flies. Fishing prospects are looking first-class for next week.—GEORGE JAMES EATON, Starkholmes, Matlock Bath.

DOWN IN THE WATER-MEADOWS.

IT is just possible that some of the fair readers of the FISHING GAZETTE who had admired the pretty contrast the red-jacketed crayfish made against the double parsley in garnishing a fore-quarter of cold lamb, or a dish of ducklings, or a couple of forward chickens, during the late "sweltering" season, are doubtful whether the little fish came from the sea or from our own freshwater streams. Crayfish are now at their very best; and a few evenings might be profitably wiled away in the glorious harvest time, down in the Water-Meadows.

A walk to the river valley through fields of golden grain on either hand, is a treat not soon forgotten, and when enhanced by a little sport, renders the enterprise all but unique! If the nets have been already baited by keeper, or even by yourself, you can commence operations as soon as the beetles and the moths and bats are winging their earlier flights. When the dozen, more or less, of nets have been laid in the stream, you and your companion—for the companionship of a "country cousin," or one far dearer, is desirable on such an occasion—will be able to look around in the gradually departing twilight.

As the dew falls lightly upon yonder clover-field (and good boots should be worn), the incense of the red blooms is redolent of honey, with which not even Charley's "Princesa" or mild "Intimidat" can at all compete. The true sportsman's (like the poet's) eye is accustomed to every passing incident. It is also surprising what a lot of crayfish can be caught of a night in a fairly preserved, or not over-fished stream. Of course, if it should be private water, only the largest fish should be kept, and there will probably be enough of these to satisfy any reasonable person for one night—say in three hours' fishing.

If the moon should be near her "full," as she will be early in September, the pleasure would be much enhanced, for then you can the better observe the various insects that are on the wing, the passing fowl, and hear, and perhaps see, the little reed sparrow, rattling away his protest at his home being invaded. Most all now live such an artificial, follow-my-leader sort of life, that it is only the comparatively few who will turn aside and enjoy the simple pleasures of rural life during the present beautiful period; and a moonlight walk, combined with a little cray-fishing, to and from the Water-Meadows might afford food for contemplation, and even thankfulness towards the great Author of All Created Life.

THE PILGRIM FRY-ER.

REMARKABLE CAPTURE OF OTTERS.—Mr. James Bromley, of Sonning, has received from the hon. sec. to the Reading and District Angling Association £2 reward, under the rules of the association, for the destruction of two otters. The poachers were both bitches, one being very large and the other about half grown, and it is very remarkable that they committed suicide within a week of each other by diving into Mr. Bromley's eel-bucks.

A CORRECTION.—In "Pixie's" report of the Surrey Piscatorialists on Aug. 13, he states, "Mr. Pugh was out on Bank Holiday with Hoblyn, of Henley." This naturally would lead one to suppose Mr. Hoblyn was a professional fisherman. He is a gentleman on the Stock Exchange, and entertained Mr. Pugh at his residence at Henley.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

In re THE NORWICH FISHERIES EXHIBITION.

SIR,—For the information of your correspondent Mr. T. R. Sachs, I may state that Mr. Alfred Jardine was awarded a silver medal, and three diplomas in addition to £15 for his unrivalled exhibit, and £5 for his 26 lb. trout (*Salmo Eriox*). Mr. Jardine also had the honour of an invitation to the “de-juneur” given to their R. H. the Prince and Princess of Wales.

The ten specimen pike in Mr. Jardine's exhibit (weighing together 249 lb.), included his 37 lb. and 36 lb. pike, and several others caught by himself, weighing from 20 lb. upwards. Also the 28½ lb. pike captured by Mr. J. Lodge (not G. Ledger) and Mr. J. Knechtli's three weighing together 62 lb., caught within two hours in Suffolk waters.

Among other fish caught and shown by Mr. Jardine, were the following. The 26 lb. (*Salmo Eriox*) taken by him “spinning,” an 8½ lb. Thames trout, and a case of 6 trout *Salmo fario*, weighing 22½ lb., taken by him with artificial fly—also six perch 16½ lb. selected from two of his successful days on Thames and Colne—and a brace of roach close on 4 lb., &c. Also casts by the late Frank Buckland, painted by H. L. Rolfe of his 36 lb. pike, and a smaller one of 27 lb. In his exhibit were also a fine Thames trout of 12 lb. caught by Mr. R. King, two carp of 15 lb. and 10 lb. by Mr. Alfred Nuthall, also a 12 lb. barbel, and 6 lb. chub, by Mr. Gant.

I understand the Piscatorial Sub-committee appointed to select specimens for the Norwich Fisheries Exhibition, for some reasons did not send the 21 lb. Thames pike caught and presented by Mr. Jardine to their society. This fish is considered the best “*Esox Lucius*” in their museum, but they showed some smaller and inferior specimens.

Mr. T. R. Sachs's remark as to the division of the £20 prize awarded Mr. Jardine, whose friends lent the before-mentioned fish for his exhibit, seems altogether out of place; as the Piscatorial Society borrowed several specimens to add to the importance of their collection.—I am &c., J. LODGE.
21, Noble Street, E.C., 16 Aug., 1881.

THE NORWICH EXHIBITION.

SIR,—There is in my notes last week an omission I regret. At the end of the *Norwich Argus*' extract I wrote the following:—

“The award to the Piscatorial Society was £15, a silver medal, and two diplomas. Mr. Jardine received £15 for his exhibit, £5 for his 26 lb. Irish trout, a silver medal, and a diploma.”

The two last items the printer has omitted, and it looks unfair to deprive Mr. Jardine of these honours. Will you kindly rectify it in your next?—I am, &c., T. R. SACHS.

THE PROPOSED “FISHING GAZETTE” TROUT-FLY AND SPINNING BAIT TOURNAMENT.

SIR,—Why not arrange to hold the above on Walton Sale or some similar still water; as it would be much easier to judge how an artificial fly falls, as to accuracy and delicacy, than if thrown over a lawn, however smooth it might be? The same remark will apply to casting with baits, either spinning or otherwise.—I am, &c., ALFRED G. JARDINE.

[How can you measure the distance?—ED.]

FISHING AT PURTON, WILTS.

SIR,—I shall feel obliged if any of your correspondents will favour me with information as to what fishing there is, and how to be obtained, in the neighbourhood of Purton, Wilts.—I am, &c., R. WINSTONE.
47, Marylebone Road, Aug. 16.

FISHING AT SCARBOROUGH.

SIR,—Will you or some of your numerous subscribers kindly inform me if there is good sea-fishing from the shore at Scarborough; also if apartments are to be obtained easily.—I am, &c., AN OLD ANGLER.

[There is first class sea-fishing at Scarborough; and apartments, a friend informs us, can be had easily and reasonably.—ED.]

FISHING NEAR BUSHY PARK.

SIR,—I would be greatly obliged if you would tell me what kind of fish are in the unenclosed waters of Bushy Park, and the likeliest baits to use for the coming month of September?—I am, &c., HINDMAN.

[Will some friend kindly answer this?—ED.]

FISHING IN SUSSEX, &c.

SIR,—I have again had the pleasure of fishing at Stellingly in Sussex, and had very fair sport during my fortnight's stay, I went down on the 9th of last month, and was able to go by the new line which is now open via Groombridge. I was, if I remember, rather doubted last year in my statements in regard to the fish I caught round and about Stellingly. This year I caught tench weighing 2½ lb., roach to ½ lb., trout 2½ lb. Any one going to Stellingly can find out the places themselves, ponds, streams, and the river Cuckmere. I am sorry to hear since I left that there has been some netting going on down there, by people I suppose who are too lazy or too ignorant to fish with rods, &c. Cannot this system of netting be put a stop to, it will soon put a stop to fishing. There caught, I think, be a fine imposed on those caught fishing with nets in our streams, rivets, &c., why should nets be allowed to be used. Another great nuisance is the steam launch on the Thames. Since my return from the country, I had a day's bank-fishing at Teddington (it was on Bank Holiday), I had very

fair sport, largest I caught was a barbel a little over 4 lb., and four roach about ½ lb. each. If these horrid steamlaunches, or steam devils, had not been going, I am certain I should have caught more, but as soon as I got the least bite, one of these horrid things came along and spoilt my sport; it washed the water right on to the bank, and it was like fishing in the sea with a float; I could not tell whether I had a bite or not. I caught the fish named by ledgering.—I am, &c., SUSSEX.
August 13.

JAPANESE RODS.

SIR,—In confirmation of the well merited praise you bestowed on the above rods, may I be permitted to add my testimony? I was roach fishing without a mate at Elstree reservoir on Tuesday, the 9th inst., with a 7 feet telescope Japanese rod, and I had the good fortune to hook a very handsome 4 lb. tench, minus 2 oz., and after a long and severe struggle I succeeded in landing him safe and sound in my punt, and I hope to have the pleasure of seeing it in a case on my wall in commemoration of the long and exciting struggle we had together. I may add my line was a tight, fine gut, and above all a hair hook, and the bait a marsh worm. I enclose my name and address.—I am, &c., MARSH WORM.

P.S.—The truth of the above can be confirmed by the keeper, who, many of your readers will regret to hear has been cruelly ill-treated by night poachers who were caught by him laying night lines. One of them bit him in a savage manner on one ear. He is going on favourably.

August 10.

[What a pity the rascals were not caught! By the way, we noticed some Japanese telescope rods for sale at Messrs. Gee and Co.'s shop in Gray's Inn Road the other day at 1s. each.—ED.]

YACHT FOR THE BROADS.

SIR,—One of your correspondents inquires after a pleasure-yacht and a man for the Broads. Let him inquire of Curtis Aldred, blockmaker, North Quay, Yarmouth, and if he cannot supply him, let him call upon me.—I am, &c., R. R. NORMAN.
Collingwood House.

A GOOD TAKE.

SIR,—Will you kindly insert the following catch of fish made by me on Friday, August 12th, viz., 62 lb. of perch, roach, and chub.—I am, &c., FRED. HURLEY.
Elmview, Coley Avenue, Reading,
Aug. 17, 1881.

A CURIOUS COINCIDENCE.

SIR,—In my report in the FISHING GAZETTE of the 6th inst., on the rivers Barle and Exe, an error in printing occurred. The word “roach” being substituted for the word “trout.” In last week's number I referred to it, and stated that, as the former fish do not frequent these rivers, I mention it, as some ardent roach anglers might be led astray. Strange to say that on last Friday, the day your valuable paper is published, Mr. Heath of this town brought me a fish, which he asked me the name of, “having caught it whilst fishing for trout with a worm during a heavy flood which we had down on that day.”

I at once saw that it was a roach, which fish has never been known by the oldest inhabitants here to have been caught here in either of these rivers.

Now to account for it. About eighteen months ago a friend of mine, the Rev. G. Jellicoe, a most enthusiastic and good all-round fisherman placed a large box drilled with holes, in which he used to keep his live bait for pike fishing in—such as roach and dace, &c.—into the mill stream here which runs into the Barle.

I must here say that there is no pike fishing in the immediate neighbourhood, but he used to keep his baits here.

The box having become broken, or come to grief in some way, he took the few roach that remained, put them in a can and deposited them in the river Barle, hence the appearance of that species of fish in the above rivers. The place where the fish were caught was on a sandbank near the junction of the two rivers at a distance of nearly two miles from where they were deposited into the Barle.

I shall be glad to know if these fish are likely to propagate in such rapid streams as the above mentioned.—I am, &c., W.

[Yes, they will probably do well; we know several streams containing roach and dace. There are plenty of long deep pools on the Barle near Dulverton which will suit them exactly. We do not think, all the same, that white fish of any kind improve a trout stream; they eat the trout spawn if they can get it. There are numbers of “white fish,” roach, dace, &c., in the Exe at Taunton and lower down.—ED.]

THE FENCE MONTHS.

SIR,—I have no doubt I should have experienced much pleasure in undertaking a ramble with “Creel,” through Westmoreland and Cumberland in pursuit of reliable information in relation to the abundance and wariness of fish; but as this practical analysis of facts appears to be deferred indefinitely, and as I cannot speak with certainty as to the time, &c., at my disposal in April and May, I shall be glad, if “Creel” speaks from personal experience, to learn to what streams and districts his practical exploits allude. So that, in case we have each traversed the same arena with rod in hand, we may lay before the readers of the FISHING GAZETTE facts—the results of our experience—of value in deciding the question propounded.

It appears that I may have misunderstood “Creel,” for in this gentleman's letter of August 13 I find the words “those becks in Westmoreland and Cumberland to which I refer as being once declared as ‘fished out’ by rod and line.” These lines lead me to infer that “Creel's” statement was based on mere hearsay, or on the authority of another; which, in a case of this kind, renders all such evidence of little value, especially if no attempt has been made to rebut errors that have arisen from misconceptions, however plausible.

I am fully impressed with the fact that a ramble of two months with the rod through a mountainous district would not only be delightful, but also requisite in a wholly unknown region, if those who had the task of gleaning the facts were previously absolutely ignorant of piscatory matters. Having lived a considerable period in two different parts of Westmoreland, and fished many seasons in this county, besides at times making incursions into Cumberland, I have had at

least fair opportunities of ascertaining personally the nature of the fishing, the practices peculiar to poachers of the districts, and the capabilities of the miscreants to elude detection.

Turning in another direction, I must call the attention of Mr. "L. B." to the article of "B." on "Fishing in the Tideway." Let Mr. "L. B." read the figures given there relating to weight and number of fish caught by numerous individuals in a single week in a hard-fished river like the Thames. After such figures does "L. B." think that any reasonable angler can be so insane as to believe one-hundredth part of the fictions relating to scarcity of fish in the Thames; or is it only fish by the hundredweight per day, for every rod, that can satisfy the greed of the famishing gross-weight London fisherman. Mr. P. Geen's 140 lb. of barbel in three hours stultifies his own arguments.

ROBERT BALDERSTON.

ANGLING BOOKS: "THE ANGLER'S MUSEUM" AND "COUNTRY CONTENTMENTS."

SIR,—The "Anglers' Museum" of 1784 has the name of Thomas Shirley on the titlepage, and contains a portrait of William Kirby, the celebrated angler and quondam keeper of Newgate. Shirley's name disappears from the second and third editions, while Kirby's portrait remains. Was the latter the writer of the book?

It may interest your readers to anticipate the new edition of the "Bibliotheca Piscatoria" by stating a circumstance which appears to have escaped bibliographers. The second edition of the "Museum" demanded, says the preface, "by the rapid sale of the first," is, I find, really a reissue of the unsold copies of the original impression with a new titlepage, new preface, and "the sermon of St. Anthony" prefixed. This trick was successful, and led to the production of a third edition, which is a paginary reprint of the so-called "second" as far as page 122, when, without verbal alteration, ten lines are saved by reducing the "spacing," and the book ends with page 135 instead of page 136, as in the former impression.

The bibliographers do not mention an edition of Markham's "Country Contentments," published in 1623. A portion of the work bearing this date is in the Museum. It is the second part, and I am anxious to ascertain whether the first part was also issued in the same year. The first appearance in "Country Contentments" of the prose version of "The Secrets of Angling," which was originally published by Markham in his "English Husbandman," under the title of "The Pleasures of Princes," was in the edition of 1631. It is not in that of 1615. If there was an impression of 1623, did it contain this "Art of Angling"?

Regarding the authorship of this treatise, it has just occurred to me that although published by Markham, it may have been prepared by William Lawson, who was associated with Markham, if not in authorship, certainly in his engagements with the same stationer, who repeatedly issued a tract by Lawson with others by Markham, under the collective title, "A Way to Get Wealth." Lawson, we know, had acquired a kind of property in the "Secrets" by "augmenting" them; and he may possibly, as I have said, have reduced them to prose, and thereby earned a better right than the augmentation afforded him to a place in the triumvirate mentioned in the verses prefixed to "Barker's Delight"—

"Markham, Ward, Lawson dare you
With Barker now compare."—I am, &c.,
THOS. SATCHELL.

Downshire Hill House, N.W., August 17, 1881.

CLUB REPORTS.

AMICABLE BROTHERS ANGLING SOCIETY.

The pegged-down match at Dagenham Lake for twelve prizes, was competed for by twenty-three of the members, with, I regret to say, but little success, only seven of them were taken. Mr. Harding, first prize; Mr. F. Arnold, second; Messrs. S. Patrick and A. Plumstead tied for third and fourth; Mr. C. Robinson, fifth; Mr. F. Plumstead, sixth; Mr. Farebrother, seventh. Several of the other members fished, but got very little takes. Mr. Wood, Shepperton Road, Islington, provided the two conveyances in a very satisfactory manner. Mr. Wood had a very nice tray of roach and dace, weight 6 lb. 9½ oz., from Blackheath.—J. WORLEDGE.

Aug. 15.

[In future, please send your club report to our office at 12, Fetter Lane, E.C., and not to the old address at Crane Court.—ED.]

ANCHOR AND HOPE ANGLING SOCIETY.

On Sunday 14th, several members went to Amberley and the Colne, returning with some good shows of fish. R. Smith, bream; H. Scott, bream; C. Daniels, roach and dace; T. Bowling, roach and bream; D. Davis, roach; A. Shakell, roach; W. Streeton, roach; D. Leston, roach and dace. A match will take place at Windsor on Sunday 21st.—A. SHAKEL, sec.

August 16th.

[In future, please send your club report to our office at 12, Fetter Lane, E.C., and not to the old address at Crane Court.—ED.]

BRIGHTON ANGLERS' ASSOCIATION.

Our members generally have been out of luck this week. Several of them have tried hard, but until we have a good flood I fear no great takes will come to hand. Mr. Ash, the crack at roach, will take them somehow or other. He weighed 5½ lb. in one catch, whilst Mr. Anscombe, G. Saunders, Mr. Tree, and Mr. Hassell could not average their previous doings. It is very remarkable that Mr. Anscombe, Mr. Ash, and Mr. Olliff on Sunday all took dace from the Ouse, which will stir the members up for dace-fishing, a sport quite new in this river. Mr. Olliff, who never expects to go out without taking a jack, still kept up his charter by killing one on Sunday. I myself only took three roach after a hard day's fishing. Three members went to Chichester, but to no purpose. As I stated before, the river is full of weeds, and not at all adapted for fishing yet. On the 21st a peg-down takes place at Barcombe, between the mills, and a good muster is expected. I may also mention that several members have been trying for the monster jack that broke Mr. Saunders a fortnight back, but to their dismay they have only captured his offspring. On Monday it was decided that no roach be weighed less than 4 oz. in any competition.—GROUND-BAIT.

BOSTONIAN ANGLING SOCIETY.

On Sunday last we had a fair show, the following members weighing-in fish:—Mr. Seymour, trout and barbel from the Thames; Mr. Jennings, roach and dace; Messrs. Troughton, Harris and Hurlock, roach.—H. TAYLOR.
August 16.

CAXTON ANGLING CLUB, BECCLES.

The members of this little club held the third of their prize competitions for this season on Saturday last. Fishing commenced at three and ended at half-past six, the time being hardly long enough to give the members a chance of obtaining a very heavy take. The weather was beautifully fine, although the wind was rather high. Upon meeting at the club room the following takes of roach were weighed-in as the result of the three-and-a-half hours' angling:—A. Piper, 2 lb. 15 oz.; C. Chase, 2 lb. 11½ oz.; J. Hooker, 2 lb. 10½ oz.; G. Holland, 2 lb. 10 oz.; F. Ulph, 2 lb. 4 oz.; C. Bumstead, 2 lb.; W. Peachey, 1 lb. 12 oz.; T. Palmer, 1 lb. 11½ oz.; W. Lee, 1 lb. 4 oz.; H. Godbold, 1 lb. ¾ oz.; and G. Pye, 11½ oz. Mr. F. Ulph also secured a special money prize for the largest roach, which scaled 14 oz.—C. B.

CITY OF BRISTOL ANGLING ASSOCIATION.

The second angling contest of the above association came off on Bank Holiday, on the Canal at Limply Stoke, for prizes to the value of about £10. As there were no entrance fees a good number put in an appearance to take part in the contest, with the following results:—Messrs. Sampson, 1st prize; Fake, 2nd; Edwards, 3rd; Jones, 4th; Hovey, 5th; Parrey, 6th; Iles, 7th; Clutsona, 8th; E. Hoskings, 9th; Bird, 10th; Mellor, 11th; Oxenham, 12th; Skuse, 13th; F. Hoskings, 14th; Lewis, 15th; Yearbley, 16th; and Headford 17th prize. On Monday, August 8th, that being the quarterly general meeting, the prizes were given to the successful competitors by the president, Mr. J. A. Jones, who has taken a very great interest in the association since its formation. He also spoke a few words of encouragement to the members. Five more members were then enrolled in the association. Mr. J. H. Champion then proposed, and Mr. R. Hill seconded, a hearty vote of thanks to those gentlemen who had given the prizes. Mr. J. H. Stantial responded on their behalf, and said that though not much of an angler himself, he was pleased to see that angling was a noble art to learn, and should advise all men, especially young ones, to learn it. Some capital songs were then rendered by some of the members, and one of the pleasantest evenings since the formation of the association was brought to a close.—J. H. STANTIAL, hon. sec.

CITY OF LONDON ANGLING SOCIETY.

The following members weighed-in fish on the 14th:—Messrs. J. Chambers and Castell, roach and chub from the Roding—roach are still in very bad condition in this river; Messrs. Martin and Perry had roach from the Wey; and Mr. Fowler, roach from Windsor.—CAS.

EDMONTON AND TOTENHAM ANGLING SOCIETY.

Our members have been out in full force lately, and our trays were well filled both on Sunday and Wednesday last. Although our members have been in all directions, those who stopped near home fared best, the roach from the tea gardens being greatly admired by all who saw them. On the 10th Mr. J. Hasler weighed-in perch and roach, Mr. B. Lowin roach, Mr. Robinson perch and roach, Mr. Dick Money perch and tench, and Messrs. Selwood and Tracey, perch. On the 13th Mr. B. Lowin had a fine show of roach, tench and perch, the roach being specially admired, six of the largest weighing five pounds.—D. G. M., secretary.

FIRST SURREY ANGLING SOCIETY.

Brother George G. Taylor, 13 lb. 6 oz. of tench from Tring, on the 11th inst.; one chub, 6½ lb. from Hampton, while fishing with Charlie Davis, said to be the finest fish taken for several years past, and it was sent to Mr. Miller, of 257, East Street, Walworth, to be preserved; also 7 lb. of roach; Brother Perkins, 41 lb. of bream and roach from the river Ouse; Brother Bates, three barbel from the river Thames; Brother Rudkin, bream from the Welsh Harp. Members of the above club are requested to attend on Wednesday next to arrange a match for some valuable prizes presented by Brothers Harrison and Bates.—GEORGE G. TAYLOR, sec.

August 17.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

Only six members weighed-in on Sunday last, but we had a very fair show of fish. From the Wey Mr. Theobald had 9 lb. 15 oz. bream and roach, one bream, a splendid shaped fish, weighed 4 lb. 9 oz.; Mr. J. K. Fitch, 3 lb. 3 oz. roach from the same river; Mr. J. Fitch, 5 lb. 8 oz. of roach from the Thames, and a nice dace 9½ oz.; Mr. Stammer, three jack from the Welsh Harp, one fine fish weighing 9 lb. 15 oz.; Mr. Painter, a pretty show of roach from the Colne weighing 4 lb. 12 oz.; Mr. Young, 1 lb. 3 oz. roach from Grand Junction Canal.—J. A. FITCH, jun., sec.

P.S.—The concert for the benefit of the widow of the late C. Perkins will take place at the club-house on Monday, August 22; chairman, Mr. W. Phillips, vice, Mr. C. Watling, jun.

August 16.

GRESHAM ANGLING SOCIETY.

The weekly meeting of this society took place, as usual, on Thursday, and was well attended. The secretary announced that letters had been received from Mr. E. Birkbeck, M.P., Mr. Marston and Mr. Wheelton, expressing their sense of the honour done them by the society in electing them honorary members. Mr. Bryant gave notice that at the next meeting he would propose an entrance fee for all members joining after the present month. A number of specimen fish were weighed-in during the week. Perch, roach and dace, from the Thames, by Messrs. Crumplen, Bennett and White; Mr. Bennett also weighed-in some magnificent roach, several going 1½ lb., taken by himself on Thursday, with Lowe (of whom he spoke very highly), at Thorney Broad. Two of these have gone to Mr. Alfred, of Moorgate Street, to be preserved. Dr. A. C. Tucker also produced a fine roach, taken with Lowe from the same water. This society now takes rank as one of the first angling associations, and promises to be of great service to the piscatorial world.

GLOBE ANGLING SOCIETY.

The third annual dinner of this society took place on the 14th inst. at the White Horse, Bury, near Amberley, Sussex, and proved quite a success; the members doing ample justice to the very excellent viands prepared for them by the host (Mr. Cooper), everything being of the finest quality, and served in a manner that gave satisfaction to all the company. Among the guests present

were Messrs. A. Clout and W. Sutcliffe, of the Brothers Well Met. After dinner some took a stroll among the hills, while others went to the river and succeeded in capturing some very good roach and bream. The members arrived safe at the club house by 9.30 p.m., having spent a most enjoyable day.—J. CHURCHMAN.

Aug. 15.
[Will Mr. Churchman in future send his report to our new office, 12, Fetter Lane? He has got some old report forms.—ED.]

HAMMERSMITH UNITED.

On the 11th, Messrs. Geen, Hoole and Penny had a good show of barbel, roach, bream and perch; M' Mackness, dace and roach. The result of the gudgeon match for three prizes was as follows: Mr. Arnold, first; Mr. Lewis, second; Mr. Hitchcock, third. We have also had a very fair show of trout, carp, &c., by the following members: Messrs. Aldridge, May, Walters, Steadman, Dean, and Reynolds. Most of the above takes were from the Thames at Shepperton, and some from the Wey.—VORTEX.

Aug. 15.

HULL PISCATORIAL SOCIETY.

On Monday, August 15, the members and a large number of friends proceeded to Ferriby House, in the steamer "Lady Elizabeth," to take part in an angling competition in aid of the funds of a very deserving charity, known as the Hospital for Poor and Sick Children. The society was very successful in obtaining the names of a number of gentlemen who are generally connected with any good cause that may be brought forward in the town. The committee, having thrown in a good deal of energy, will be able to congratulate themselves on the happy results of their labours. A good number of prizes had been obtained as gifts towards aiding the cause, and were satisfactory to the respective winners. Upwards of fifty entered on the list for the match, and, though only very light weights were obtained as a rule, those who did make a good catch were able to show a very nice sample of fish; the roach in one or two instances were exceptionally fine fish, and proved most conclusively that the Ancholme contains some of the finest roach to be obtained in this district. The 1st prize was obtained by Mr. Noble; 2nd, Mr. Crossland; 3rd, Mr. Hall; the other prizes falling to next lowest weights. In addition to the angling competition, the committee had thoughtfully provided for the non-fishing part of the company. A brass band accompanied the trip and played some good selections of music. Athletic sports, in the shape of running, jumping, sack racing, combined with a variety of other somewhat novel arrangements, made a day's programme seldom produced and carried out with so much general satisfaction; and it is to be hoped that some considerable benefit will be derived from the proceedings.—F. J. H.

Aug. 18.

HULME ELLESMERE FISHING CLUB.

The members of the above club fished their annual match on the 14th inst., in the river Weaver, at Barton, near Northwich, Cheshire, under most trying circumstances, the wind almost blowing a gale, and the rain coming down pretty freely, which made the macintoshes and leggings very acceptable. There was a very good muster of the members, thirty-seven of the forty-eight met to do battle for the seventeen prizes which were to be competed for, and also to decide the annual dinner, which is fished for by odd and evens taking part in the match, Mr. William Taylor, the treasurer, as usual, giving three prizes; Mr. Jos. Parker, of Heatly, a prize for the heaviest fish; Mr. Thomas Foibank, a prize; besides which the club give two fishing rods, bronze reel and silk line, landing net (complete), bait can, tackle book, two hanks of gut, fishing stool, and brass reel. The following are the winners:—1st, T. Rock; 2nd, J. Hampson; 3rd, T. Pilling; 4th, J. Coxon; 5th, A. Whittaker; 6th, J. Heywood; 7th, J. Bradley; 8th, J. Rawlinson; 9th, J. Proctor; 10th, J. Holmes; 11th, T. Bailey; 12th, W. Eaton; 13th, T. Beaty; 14th, T. Pilling; 15th, T. Beaty.—T. B.

IZAACK WALTON ANGLING SOCIETY.

On Wednesday, the 10th inst., Mr. G. P. Rolt, the president, had a tray of nice perch, which weighed 5 lb. 9 oz. in all, the heaviest one being 1 lb. 3½ oz. Mr. G. Rolt had a fine jack; Mr. J. Hilliar, sen., was quite up to his old form, having 13 lb. 14 oz. of bream, the heaviest weighing 2 lb. 3 oz.; Mr. J. Hilliar, jun. (who gets more like his dad every day), had 9 lb. ¾ oz. of bream. On Sunday, the 14th, Mr. B. Crook had some fine roach, the heaviest 12 oz.; he had also some chub, the heaviest of which weighed 1 lb. 9 oz.; Mr. W. H. Mecham had roach; Mr. J. Barnes had perch and roach. Wednesday, 17th, Mr. G. P. Rolt was again well among the perch, having 5 lb. 3½ oz., the heaviest one 1 lb. 8½ oz. This makes 29 lb. 14½ oz. of perch this gentleman has weighed-in on our Wednesdays. Mr. G. Rolt had some good roach; Mr. C. Green also had roach; Mr. G. Bliss had 5 lb. 12½ oz. of bream. The heaviest one, which weighed 3 lb. 4 oz., was a remarkably fine specimen. He also had some good roach. Mr. J. Hilliar, sen., again had a show of bream 3 lb. ½ oz. This gentleman also had a very fine perch, which weighed 2 lb. 4 oz., which he took with ordinary roach line. Mr. J. Barrett, of Diss Street, Hackney Road, who is renowned for the preservation of this class of fish, has this specimen to preserve. Mr. J. Hilliar, jun., had 7 lb. 14½ oz. of capital bream. There are five special prizes in hand waiting for the members to name time and place where they shall be fished for.

LARKHALL ANGLING SOCIETY.

Since my last report on August 1 we have had no less than 206 lb. 12½ oz. of fish weighed-in, special attention being paid to the barbel. Mr. G. Watkins 62 lb. 14 oz. in three days' fishing, 35 lb. 5 oz., 18 lb. 14 oz., and 8 lb. 11 oz.; Mr. G. Spencer, 3 lb. 14 oz.; Mr. T. Boyce, 21 lb. 4 oz.; Mr. E. Watkins, 5 lb. 12 oz.; Mr. G. Nicholson, 8 lb. 10½ oz.; Mr. C. J. Morris, 6 lb. 3 oz.; and Mr. G. T. Penn, 9 lb. 15 oz. The balance made up with roach, perch, dace, bream, and chub, with the assistance of Messrs. J. Green, W. Spencer, A. Morris, jun., W. C. King, F. H. Dean, C. Doveson, and F. Kerry.—W. TUCKER, hon. sec.

August 13.

LITTLE INDEPENDENT ANGLING SOCIETY.

On the 14th several of our members tried their luck, but met with indifferent success. The following weighed-in:—Mr. Hopton, bream, 7 lb.; Mr. G. Watson, roach, chub and dace, 4 lb. 6 oz.; Mr. Grey, roach, 1 lb. 13 oz., and winner of a prize for heaviest roach; Mr. Watts, roach and dace, 1 lb. 8 oz.; Mr. Wightman, roach, 1 lb.; Mr. Heelas, roach; Mr. Hurwood, roach; Mr. Scott, roach; Mr. Banfield, jack.—W. BROWN, hon. sec.

August 15th.

LIVERPOOL ANGLING ASSOCIATION.

The date of the excursion to the Vyrnwy has been changed from the 6th to the 8th Sept., in consequence of the alteration of the date of H.R.H. the Prince of Wales's visit to this city. The name of the donor of the one guinea prize, mentioned last week, was Mr. T. W. Haigh not Mr. Hugh.—R. WOOLFALL.

Liverpool, August 17.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

The members of the above society were well again to the fore last Sunday. Messrs. J. and G. Drew, Long, and Gorsuch had roach, dace, chub and perch from the Thames; Mr. Neagus, roach and perch from the Stort; Mr. Laundry had jack and roach from Pulborough. Mr. Ward's prize was won by Mr. Neagus.—THOS. WM. LUCY, sec.

Aug. 16.

PRINCESS OF WALES ANGLING SOCIETY.

Our members have been working very hard during the past week, but have met with but little reward. On the 12th instant, Mr. Percy weighed-in a small jack about 2½ lb.; and on the 14th, Messrs. Porter, Wyeth, and Glaister had decent shows of roach. We hope to meet with better luck on the 4th of September, when the whole of our members will sit down to fish for several valuable prizes, at Weybridge. Gentlemen desirous of joining this society are requested to attend the club house, the Prince of Wales, Great Barlow Street, High Street, Marylebone, any Thursday evening, between nine and eleven, or to communicate with the secretary, Mr. F. Robson, at the above address, when he will gladly forward all particulars.—F. ROBSON.

PORTSMOUTH WALTONIAN ANGLING SOCIETY.

The members of this very flourishing club are taking advantage of all the fine weather, and in their many outings this month have had some very good catches. Ever since the club has been formed Chichester has been "the happy hunting ground" of the Portsmouth Waltonians; but alas! what with netting and other unfair means of fishing, the canal has been pretty well "skinned out." Still there is fish there, but not as in times gone by, and they, too, want a deal of catching. Consequently this season the anglers have been compelled to seek "fresh fields and pastures new," and they have been amply rewarded by some good bags of roach, carp, bream, and dace from Midhurst, Selham, Aldingbourne, Tichfield, Wickham, and Baffins. The latter, an extensive pond in the vicinity of Portsmouth, which for some years has been well stocked by the members for their own sport. This is the first season of fishing there, and some splendid carp and roach have been taken. Next Wednesday (24th inst.) is arranged for an afternoon contest. Several valuable prizes are in hand, and they intend giving Chichester another turn.—DAGGERWOOD.

READING AND DISTRICT ANGLING ASSOCIATION.

At one of the weekly meetings of this association (which are held at the head-quarters, Great Western Hotel, on Saturdays), it was decided to organise a river excursion, and the trip came off most successfully on Monday. Twenty gentlemen embarked at Caversham on board the "Wild Rose" launch, and, stopping to pic-nic in Quarry Woods, had tea at the Ray Mead Hotel, Maidenhead, in the evening, returning to Reading by train.

SIR HUGH MYDDELTON ANGLING SOCIETY.

The undermentioned members were out on the 14th inst. to angle for a prize of a guinea, given by our worthy member Mr. A. G. Allard, for gross weight of all fish. Mr. G. Caborn proved victorious with a nice little trout of 3 lb., taken with single hair while roach-fishing, also 4 lb. 12 oz. of roach; second, Mr. John Allard, 5 lb. 2½ oz., bream and roach; third, Mr. J. Billings, perch and bream, 2 lb. 9 oz.; fourth, Mr. H. Duncombe, roach and dace, 13½ oz. On the 7th inst., Mr. J. Billings weighed-in a handsome chub of 6 lb. 5 oz. The members of the above society purpose going out on the first Sunday in September to Goring, Pangbourne, for a series of prizes; all start by first train from Paddington. Although I am no paste angler, I beg to state that I tried Mr. King's natural bait, and found it a very good killer and adheres well.—J. CABORN, sec.

Aug. 15.

SOCIAL BROTHERS.

Our members continue to have a fair share of sport. On the 5th, Mr. Valler, 2 lb. 3 oz. of roach and dace. On the 7th, Mr. Freeman, 10 lb. bream from the Ouse, but was too late to weigh-in. On the 9th, Mr. Valler, 8 lb. 7 oz. roach and dace. Mr. Lockyear, 5 lb. roach and dace. On the 10th, Mr. Lee, 1 lb. 5 oz. roach. On the 11th, 3 lb. 7 oz. roach and dace. On the 13th, Mr. Lockyear, out with Mr. J. Johnson, at Kingston, 29 lb. roach, a few dace, making 30 lb., taken in four hours. Mr. Bird tried the Lea same day, only a small jack and one perch. On the 14th, myself, 3 lb. 5 oz. roach. Mr. Bromhead, chub, roach. On the 16th, Mr. Valler, 6 lb. roach and dace. Mr. Monk, 2 lb. 13 oz. roach and dace. Members compete next Sunday, at Pangbourne, for several prizes.—J. GOUBOT.

STALYBRIDGE ANGLING SOCIETY.

Another member of the above society, Mr. John Marland, paid a visit on August 9th to Mr. Wm. Vintnor's, The Ferry Boat Inn, Dogdyke (Witham), and succeeded in taking some splendid fish, he had upwards of 40 lb. of bream, roach and eel. On Saturday, August 13, one of the clubs in connection with the above society, the Stamford and Warrington, held their contest in a private reserve, when the prizes were taken as follows:—1st, John Tasker; 2nd, Henry Adams; 3rd, Tom Ratcliffe; 4th, Robert Worsley; 5th, Mathew Lee.—J. B. U.

Stalybridge, August 15.

THE STOKE NEWINGTON ANGLING SOCIETY.

Contrary to our usual good fortune of late, we had a poor show of fish on the 14th inst., none of the members succeeding in getting good takes, the result at weighing-in being as follows:—Mr. E. Morrow, 2 lb. ¼ oz. roach and bream; Mr. A. Parrott, 1 lb. 7¼ oz. roach; Mr. Thomas Millington, 1 lb. ½ oz. perch; and Mr. T. Grettton 8½ oz. roach. A complimentary visit to this club will take place on Tuesday, August 30, when brother anglers and friends are respectfully invited to attend.—THOMAS GRETTON, secretary.

August 16.

UNITED LONDON ANGLERS.

The annual dinner of the delegates will take place at the Rye House, on Sunday, September 11th, 1881, on which occasion there are three prizes, presented by the late secretary (now president) of the Kenton Angling Society,

to be fished for: other prizes are expected to be given. All the arrangements as to the fishing, time of dining, &c., will be decided at the next committee meeting, Monday, September 5th. Those delegates and friends wishing to join us on the day will oblige by sending in their names not later than that date.—R. GHURNEY, sec.

WALTONIANS.

On August 14th the following gentlemen weighed-in:—Mr. Grace 12 lb. roach and dace, Mr. Waltham 5 lb. roach and dace, Mr. Edwards 3 lb. 5½ oz., Mr. Roland, roach, 2 lb. 10 oz., Mr. Burton 4 lb. 5½ oz. roach and dace, Mr. Bowring, roach, 2 lb. 10½ oz., Mr. Good, jun., 1 lb. 13 oz., Mr. Greenfield 2 lb. 2½ oz.—A. J. MARRIOTT.

August 14.

WALWORTH WALTONIANS.

On the 12th, Mr. Weatherhead weighed-in about 25 lb. of bream that he caught at Ormesby Broad the same day, all the fish were in splendid condition. On the 14th Mr. Boalch was out with C. Brown, of Richmond, and succeeded in getting 7 lb. 10½ oz. of roach and dace. Mr. Evans, at the same place, got 2 lb. 2½ oz. of roach and dace. Mr. Boalch, jun., 13½ lb. dace. Mr. Bayley weighed roach and dace from Pulborough. The contention for Mr. Grigg's side of bacon is beginning to get warm. On Sunday evening the weighing of fish was watched very closely. Mr. Boalch now holds the situation that "M. le Pere" held last week. All members are requested to attend the society's headquarters on the 26th to vote as to how and where the following prizes shall be competed for:—1st, A Work of Art valued £10 10s., given by Mr. Schwartz. 2nd, a well known Piscatorial Work in 2 vols. (£4 4s.), given by Mr. Bansback. £1 1s. by Mr. Vicary, and a felt hat given by Mr. Sebert. This competition is down on the list for the 11th Sept. The following prizes have been given for a special competition, the date and conditions of which have not yet been fixed:—1st, two pictures of goldfinches and bullfinches, drawn and given by Mr. W. Hart, whose ability as an ornithological artist is so well displayed in the Natural History of the late John Gould, F.R.C., &c., &c., that I need not say this is a prize of great value. 2nd, Salmon, Trout, and Perch, after the painting by H. L. Rolfe, given by "Yur Umble Un." 3rd, gold scarf pin, by Mr. R. La Feuillade. 4th, two brass winches, by Mr. Bansback. As there is a lot of work to get through this evening all are requested to attend early and get it done. Now, do not forget what you have to do on the evening of the 26th, all ye members of the Walworth Waltonians, and not leave the work to be done by a few members, and grumble afterwards as to why this was done, and that not done.—PRIXE.

August 18.

THE BOVEY—TROUT STREAM.

IN the early part of the season I had occasion to call the attention of anglers to what, in my opinion, was an excellent opportunity to all those seeking new and good fishing, away from the busy haunts of men, and where the speckled beauties have so long remained unmolested, except by a certain few; the results of which have proved prolific beyond conception, as reports in the various numbers of the FISHING GAZETTE have shown. This was that portion of the River Torridge, at Woodford Bridge. Having added this portion to the angler's interest, I now wish to call further attention to the river Bovey, from Bovey Tracey itself. Not being in very good health, I have visited this little village, with its most charming surrounding scenery, for a few days, which only needs to be known to be better appreciated. The town of Bovey Tracey is small, but more than prettily situated, nestling in amongst hills; some beautifully wooded, others with the golden grain, fast falling—not to the sickle as in days gone by, but to the more modern steam and horse reaping machines—others green, and sloping down to the river side. The old church of St. John's stands at the top of the town, which is well worth a visit. The drives are very fine. Dartmoor within an hour's reach. The hotel is the Union, a most comfortable and well ordered house; and visitors will find every accommodation they can wish for. The manager, Mr. T. Wolfenden and his good lady, also his little daughter (Adeline), are most obliging—the former rendering his company; anglers and tourists also, every assistance he can; the latter in looking after their general comforts. The angler in taking up his quarters there will not have to go out of his way to see that he is in a fishing district, for, on crossing the bridge close to the hotel, he will naturally pause to look at the stream purling down, which is made of two or three tributaries. Over the centre stream hangs a fine old mountain ash whose branches embrace those of a noble horse-chestnut on the opposite side, beneath which, in their shade, the speckled beauties are "at home." These fish may be caught, so my informant stated, from the bridge, but the stream from this point upwards is strictly preserved for above a mile. Tickets may be had from the hotel at two shillings and sixpence for the season, that is for trout. On the opposite side of the bridge is a mill with an undershot wheel. From this point, some splendid pools and runs are to be found right away to where the Bovey joins the "Teign." The whole of this is free fishing. Salmon are frequently seen up this stretch. By fishing the upper waters, the angler in time would reach "Beckey Falls," one of the grandest sights on the moor; a sight alone many would come hundreds of miles to see were they to know it. It is too wonderful almost to explain how the immense boulders have been thrown together, and the grandeur with which the water comes down. It, at the present, is rather low, on account of the long drought, but at all times it is worth seeing. Anglers and others stopping at the hotel would do well in making the acquaintance of Mr. Kallaway; for a true type of man is he; he will direct you where to go, and show you what you would regret had you not gone to see. Several noted pits and pools shall be given in my next. The distance from the railway station to the Union Hotels scarcely five minutes' walk.

FRANK GOSDEN, Exeter.

CLUB AND OTHER JOTTINGS.

By L. B.

AT a recent meeting of the East Central Committee, one of the Lea bailiffs incidentally remarked that, the better to come down unexpectedly during the night upon those whom he supposed to be wrongdoers, he has often taken off his boots, and so crawled along the towing path for a considerable distance to prevent the noise being heard on the gravel. There is something in the spirit which animates men to do this sort of thing; not for hope of gain or remuneration, but for pure love of the sport, and while most of us are comfortably snuggled up in bed.

I always like to record good takes. This week Mr. G. Lancaster, the taxidermist tells me he has received for preservation two perch, heaviest 4 lb., and measuring 17½ inches; the other, he thinks, must have weighed quite 3½ lb., and measured 16½ inches. I understand they come, the first, from Southampton reservoir, the other from the neighbourhood of Littleport, Cambs.

The tench at Elstree continue to bite freely in spite of the exceedingly chilly weather we have been having during the past week. I saw a nice dish of close upon 17 lb. taken by Mr. Underwood, two or three fish scaling close upon 3 lb. each.

At the Welsh Harp, the fresh of water though comparatively slight, a rise of three or four inches has knocked the bream off the feed, a few good takes only coming to my knowledge (and these nearly all from one or two spots, viz., the Stump Hole and the Gravel Hole), where, a week or two ago, good takes all over the water were the rule, not the exception. The fresh of water has, however, set the jack moving. On the 14th, Mr. J. H. Stead secured a beautifully fed fish of exactly 10 lb., another of nearly the same weight being landed by a fortunate piscator in the same bend. On Thursday, Messrs. Hoole and Penney, of the Hammersmith United Angling Society, fishing with Mr. Geen, at Chertsey, secured some 30 lb. of fish, principally barbel.

The Committee of the Thames Rights Defence Association met on Thursday last, but, as there were only three members present, viz., Messrs. J. M. R. Francis, hon. secretary, Hall and Bonvoisin (not sufficient to form a quorum), no business was done. As this has occurred several times, it is intended shortly to strengthen the Committee by adding to its number.

The Good Intent Angling Society have their annual dinner at the Rye House on Monday next, and Mr. Secretary Murphy tells us he expects a strong muster of the members. These summer dinners of Angling Societies at riverside houses are a pleasant combination of feeding and fishing. The first is nearly always sure to be right, but when both are—well, it's too utter!

The Committee of the Anglers' Benevolent met on Friday evening last, and relieved a necessitous case by a grant of £3.

A novel style of jack-fishing comes to light from the Welch—it simply consists in throwing in a spoon bait attached to the regulation line and winch and letting it lie on bottom, the rod being quietly laid on the bank while the angler lights a long Vevey cigar and puffs contentedly. You don't believe it, dear readers? Well, I do; for I have it on the word of Mr. Putman, of the Waltonian Angling Society, and I know him for a man whose word is his bond. This style of angling, continued for several hours in the drizzling rain, is exhilarating—particularly when the angler has paid 2s. 6d. for the privilege. Mr. Balderston, in a recent number of the GAZETTE, spoke in his usual courteous style of the culpable ignorance of certain anglers, referring, beyond doubt, to one or two gentlemen, who, by other than himself, are generally considered to be careful, painstaking men, and somewhat of authorities on matters piscatorial. What would Mr. Balderston have said had he witnessed the above?—perhaps his suave eloquence would have succeeded where my friend Putman's mild voice utterly failed. I write these notes from Mr. Geen's at Addlestone, whose guest I am for two or three days. As Mr. Geen has tried to propitiate the leather-nosed gentlemen for the last few days with copious offerings of lobworms (some twelve or thirteen quarts in all), I hope next week to report a good take.

Apologies of lob worms, a man occasionally introduces a friend into his vinery, his fernery, his apiary, his aviary, &c., but it is not often one has an opportunity of inspecting a well-regulated wormery. Concerning cooking a hare, it has been said, first catch your hare, then cook him. Well, the same remark applies in part to lob worms, with this slight difference, viz., first catch your lob, then scour him. To do the first will require a lantern, a light tread, a quick eye, a nimble thumb and finger and a considerable amount of patience and perseverance; by the exercise of all these a fair number of worms may be secured, granting the earth is sufficiently moist. A method, however, more favoured by Mr. P. G.—who does not like the backache every night—is to give sundry lads in the neighbourhood, to whom halfpence are a consideration, 6d. per quart for the wrigglers. If I were to describe the scouring process in all its details I might weary my readers' patience, I will therefore condense the description of Mr. Geen's wormery as follows:—A cool cellar with a free draught, some half-dozen wooden tubs, bored with gimlet holes to prevent the accumulation of wet at the bottom; the said tubs being filled with moss and pieces of coarse sacking, both of which are changed every few days, while the worms must be carefully overhauled every two or three days to pick out the dead or sickly ones. I must not omit to mention a special tub of so-called maidens, reserved for the hook—short, hard and transparent—which I hope will materially conduce to our having a good take to-morrow and the following day, to report in next week's GAZETTE.

As I am closing these notes a few lines come to hand from Haslett, of Chertsey, one of the most persevering and civil fisherman on this station, who has been out with one customer for the last three days, the result being 8 barbel, 14 chub, 1 perch and 4 bream.

NOTES FROM SHEFFIELD.

THE club matches fished on Monday last were a great thing, so numerous were they, the railway station being literally besieged by anglers. The Angling Association alone, sending over 2400 to various fishing stations and three other excursions promoted by other parties would send about the same number. The amount of fish taken has not been very great, one great reason being that such an enormous quantity of ground bait is thrown in—each one ground-baiting as he thinks proper, and fishing about ten to twelve yards apart. Any one can guess the muddle that is made of the water; one throwing in bran and bread, others worms, gentles, creed wheat, grains, or anything that comes to hand, that I often think that if they would not use ground bait they would get more fish. I send you a list of the various clubs belonging to the association and the places they fished. To Boston went the Well-run Dimple, Checquers, Truro, Consolidated, Ecclesall, Burnt Tree, Norfolk, Why Not, Old Bull's Head, Brocco, Highfield, Dog and Gun, Vindicator. To Crowle and Keadby: the Heely Club, Forest, Carlton, the Forge, Mason's Arms, Fir View, Albion, and the Greyhound.

The following clubs went to Saxilby: The Sylvester, United Tradesmen, the Old Harrow, the First Royals, Woolpack, Gibraltar, Adwick, the Rose and Crown. To Torksey: the Bay Horse and the Old Blue Bell. To Brigg: the Viaduct and the Peacock clubs; the Pensioners' Rest, Freedom Hotel and the Albion clubs going to Sandiacre.

There was a very small amount of fish weighed-in on Sunday night, many of the anglers staying to fish in the matches on Monday at the Cup Inn, the Rose and Crown, and the Bridge Inn where several dishes of fish shown, but nothing of importance.

The waters in the rivers and canals have been of very fair colour all the week, and we have every hope that the rain we have had during the week will assist greatly in refreshing the waters and give increased sport.

I should like some of the London Anglers to imagine the scene on Saxilby Canal on Monday last; a length of water six miles long, and the banks completely crowded with anglers, and pegged down at some ten to twelve yards apart, and if they could only see it, I think that they would not forget it for a long time. Men shouting to one another and inquiring how their different friends are going on; women and children by scores on the bank running backwards and forwards to see any individual who is lucky enough to hook a fish, and completely crowding round him, a proceeding that results in driving all the fish from the poor fellow's ground; and if he intimates to them that he does not require their company, he is generally called a "grumbling owd toard," and they will walk off to see if "Arh Jack as gotten owt."

Now the anglers of London can form any conception of such a scene as this, he will not be long in accounting for the small takes of fish in these club matches.—RED SPINNER.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

If the angler be not impelled by the command of a visible queen of May, he always feels the unconquerable necessity of going a-fishing when the spring comes. It can't be resisted. He might as well try to shake off the impulse of waking in the morning and resolve to sleep on for ever.—*W. C. Prime.*

"WHERE to find ferns?" is a question which Mr. F. G. Heath will answer in a little holiday pocket volume under that title, to be published immediately by Messrs. Sampson Low, Marston and Co. It will include a special chapter on "The Ferns round London."

I give up fly-fishing; it is a light, volatile, dissipated pursuit. But ground bait, with a good steady float, that never bobs without a bite, is an occupation for a bishop, and in no ways interferes with sermon making.—*Sidney Smith.*

It is affecting to see a distant mountain top, whereon you camped for the night in your youth, still as blue and ethereal to your eyes, as is your memory of it. It lies like an owl in the far heavens, a part of earth unprofaned, which does not bear a price in the market; is not advertised by the real estate broker.—*Henry D. Thoreau.*

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Kedditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the Press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

VOLUMES OF THE FISHING GAZETTE FOR 1878, 1879, AND 1880.

On receipt of P.O.O. for Twelve Shillings, we will send any of the above in handsome cloth cover.

N.B.—ONLY A FEW REMAIN UNSOLD.

Orders to be sent and to be made payable to R. B. MARSTON (at the Fleet Street P.O.),

FISHING GAZETTE OFFICE,
12, FETTER LANE, LONDON.

OH, MY POOR CORN!

THE CRY OF THOUSANDS.

The Weir, Marshfield, near Chippenham, April 25, 1881.
Will you kindly send me another box of your Corn Salve, I have enclosed 1s. 3d. I have had very painful Corns for many years, and by using your Salve have found great relief. I will recommend your Salve to my friends.

Mrs. HARRY.

15, Leadenhall Street, E.C., June 22, 1881.

Sirs,—Kindly send me a box of your Corn Salve. I enclose stamps for same. I have already had one box for myself, and can testify to its goodness.—Yours truly,

Messrs. Bond.

H. G. MORRIS.

City Temperance Hotel, Lendal, York.

Mr. Bond.—Sir,—Will you kindly send me another box of your Corn Salve, as your last has greatly relieved my feet.

Yours truly, JOSEPH BARKER.

BOND'S MARVELLOUS CORN CURE

Gives immediate relief from pain, and in a few days entirely removes Bunions, Corns, Warts, Chilblains, Swellings, Burns, Blisters, &c. See Press opinions.

Use no other.

Plaisters entirely super-seded.

The Genuine in Pink Wrappers, and bear the Government stamp.

Sent post-free, 1s. 3d. and 2s. 11d. per box, by the Proprietor,

C. BOND,

330, High Holborn, Gray's Inn, London.

HA! HA! You should use BOND'S CORN CURE.

ANGLING.

Now ready, third Edition.

THE ANGLER'S INSTRUCTOR.

By WM. BAILEY.

A book on the best modes of Angling in English Rivers, Lakes and Ponds, and on the habits of the fish, besides all the latest practical hints on many things that have not up to now been made public, to be had of W. Bailey, 170, Kirke White Street, Nottingham. By post, 2s. 9d.

DIPLOMA OF HONOUR AT THE

NATIONAL FISHERIES EXHIBITION. NORWICH, 1881.

Hines' Spring Plummets.

BARBEL-FISHING.

By J. P. WHEELDON.

THE CHOICE OF A SWIM AND ITS BAITING.

THERE are probably more barbel in the Thames than in any other river in the kingdom, and assuredly more fish of this class in the stream just named than any other species. For all

that, a big bag is the exception, and not the rule. This may be accounted for easily, because, in nine cases out of ten, certain puntmen take their customers, if not very shrewd judges indeed, to places entirely played out; or, where by baiting badly and always imperfectly, they do much to frustrate any hope of really good sport.

Now, although I have started this barbel jotting by saying that there are any quantity of these fish in the Thames generally, it does not follow that they are everywhere alike located in large numbers. There are certain places where they literally swarm. There are others, and because they are totally unfitted in their natural surroundings and conformation, where these queer fish refuse to abide in. Take, for instance, the deep waters of the Walton reaches. I should hardly expect to get a large haul of barbel there, no matter how carefully and well I had baited. Neither should I think of baiting deep, still backwaters, "fishy" and inviting as they might appear at the first glance, because my own sense of discrimination would lead me to seek likelier places.

Where, then, the novice or learner may very properly ask—and these papers are more particularly applicable to seekers after knowledge than to him who has passed many grades—should I bait? or, which is the most likely place to find my friends, the wary leather-noses? Give me your ear, and I will tell you, to the best of my judgment—that judgment being guided by what little knowledge I have gained by experience.

In the early part of the season, and particularly if a high water prevails, barbel will, and quite late into June, be found "on the hill," *i.e.*, lying upon gravelly sharps and shallows, covered by a swift rushing stream. Their powerful conformation and immense strength enables them easily to maintain their place, even when the current is so rapid that other fish edge away into quieter nooks, or desert the place altogether. Here they lie cleansing themselves after the operation of spawning, rolling over and over, showing every now and again a flash of their golden sides in the shallow water, and "grouting" and rubbing amongst the soft silt and gravel. If this "hill" or shallow has at its head or tail a deepish eddy, marking a hole, so much the better. A careful observer will be enabled to note that the shoal of fish, every now and again, seeks the cover of this hole for a welcome rest, and then, like giants refreshed, they emerge to stem the sharp current again with apparently renewed relish.

Such a place, as a matter of course, would be entirely unsuitable for any other mode of fishing than with the leger. The merest tyro will see at a glance that where the water runs at a rate of five to six or seven miles an hour, "floating" would be simply labour in vain. That period has now, with the lapse of time, passed away, and I will, therefore, say something about "swims" for the present day. But even here, difficulties present themselves at once, owing to the extraordinary lowness of the stream, its stagnant condition in many places, and from the certainty that barbel will not lie in places now, where, under ordinary conditions, one might be certain of finding them.

Supposing, however, that the summer—I am afraid I must say now nearly past, or the brightest part of it, at any rate—had been as prolific as English summers usually are of heavy, continuous rains now and again, keeping the tributaries flooded and the bucolic mind in a state of perpetual chronic grumble. In that case, and up to the present time, fish would very likely have been found after spawning in the vicinity of deep, heavy runs of water, under clay banks, and particularly if here and there the conformation of the bank or bottom of the stream had afforded a "rest" close by. If I were passing along the brink of a river which I knew held barbel in its waters, and I came across a high, slimy-looking marly bank, with old roots of rotten trees sticking up here and there, bigger roots projecting at odd places, and so catching the floating debris, where the water was deep, heavy, swift and strong, I should say, "Some o' they cusses," to use Hawkeye's expression, was "a cavortin' around" in that neighbourhood. If a shelf of yellow marl stuck out, juttied over, in fact, the bed of the stream, itself being under water and deep down, and giving one the impression that it covered a sort of miniature Thames Tunnel, or a succession of them, under one's very feet, I would assuredly try there. If I came to a place where there were symptoms of the existence of old, decayed piles, or the remains of ancient eelbucks, either cropping up close into the bank, or rearing an ugly looking black stump here and there out from the water, and round which it foamed and fretted with impetuous haste, that water being deep, swift, and holding withal, assuredly likewise would I come to a dead stand, just to see what sort of a "shop" that was. Again, if under the boles of ancient willows, grey and gnarly, round which ivy stems tried to linger lovingly, and where massive roots ran deep down into the water until they were lost in the shadows, I found that the water ran swiftly past in a succession of fleeting eddies and dimpling curls, I should be inclined to take it prisoner and bring it to book by way of trial by a jury of lobworms. And

very likely indeed would any or either of such places pay well for the trouble of baiting. But now? Well, it is just on the cards that even such splendidly promising looking places as these, may be, owing to the dearth of water, rendered the very reverse to look at. The swift water under the clayey, marly bank may, likely enough, look just like a sombre, motionless jack lay-bye. The rush by the old eel bucks little more than the push down a little ditch after a summer shower. Yet even then I would not desert them until after fair trial. I have just had myself a marvellous day on the Thames, killing such a dose of thumping barbel as it is barely likely will be beaten this year, and many of these fish were killed in an utterly dead bit of water, under just such a shelf of marl as I have ventured to describe. This bank is not ten minutes' walk from the French Horn at Sonning. No punt is required to fish it, and I venture to say that if any one with ordinary intelligence will try it now, they may kill a good bag of fish. *En passant*, let any thinking man stroll down from Sonning to Wargrave, keep his eyes wide open, look for such places as I have been mooning about, and bait one or two carefully. If he does not get a bag of fish he is quite at liberty to call me an ass and a false prophet. I reserve the right to return the compliment if, in my judgment, his does not lead him to pick such a place as I would have chosen for myself.

At the present time I would assuredly bait the weirs, or wherever the sharpest stream can be found; and if there is any "back run" clear and decided up to the head of the fall, bait that, in preference to anywhere else, and fish as close under the fall as the tackle will lie.

Half the disappointments in barbel fishing arise from the fact that, even if a good place has been chosen, the baiting has been done at the wrong time. It is useless to bait, say, to-night, and fish in the morning. Every fish is gorged with food, therefore twenty-four hours clear should at least be given after a baiting of five thousand worms. Never use clay if it be possible to avoid it. At any rate, never use the hard, stiff stuff which puntmen are so fond of getting, in which they make a huge hole, bury a handful of worms, box them up as if they were in a clay coffin, and from which, in my humble opinion, they never escaped. Unless the stream is very wild, throw your worms in loosely and always whole. A very little judgment will suffice to determine fairly exactly whether they sink in the desired place or are washed away by opposing currents. If clay is absolutely necessary, use a soft, friable sort, easily found at the waterline of most clay banks, and which, when wet, binds just sufficiently, and no more, to make a sinking medium. A baiting pot which I possess, and which I call my "diving bell," costing something like eighteenpence in its manufacture, does away with all necessity for clay. In my next paper I will say something about it, for it is simply an invaluable acquisition to any angler's store, and one that every punt-fisher ought to possess. As a last hint, always bait for barbel at early morning and fish the swim the next.

THE BOVEY TROUT-STREAM.

IN continuance of the brief and hurried sketch of the above river forwarded to you upon my return, and scarcely in time for post, I would now wish to call the attention of tourists as well as anglers, who are now enjoying their holidays, that, if they are not in fishing mood, they may happen to cross a stream, upon whose banks "many a flower is born to blush unseen," wherein the speckled beauties haunt, and if they would kindly give the gentle craft a hint, they would become public benefactors. To be a public benefactor, even in a small way, is the height, or ought to be the height, of human ambition; and if at some time any knowledge that one possesses can benefit anglers, or any other sportsman, it should be placed at their service by one of themselves. Thus, Woodford Bridge trout-stream, on the Torridge, so often spoken of in the FISHING GAZETTE, from which heavy creels have been daily taken in all weathers during the present season. But I am digressing from my subject of further notes on the Bovey trout-stream. The angler, after depositing his rod, creel, &c., &c., with the obliging manager, Mr. T. Wolfenden, or his good lady, at the Union Hotel, should take a walk through Park Wood and the meadows as far as the bridge—it is no distance—and from thence form an opinion of the stream and the fish contained therein. Onward still, a short distance will bring him to the weir, which is a substantial piece of masonry, in excellent order, and of very easy access for *salmonidae* on their way up. After such a tempting sight, the angler will ask why the rod, creel, &c., should be left behind. 'Tis tantalising, I admit; but this portion, and for some little distance above, is strictly preserved by W. R. Hole, Esq. It is only of late it has been so; probably permission might be had for this distance, say, to the weir, following this stream, as stated in last week's FISHING GAZETTE, the Dartmoor hills are reached, and trout of a better quality cannot be found. Returning to the

hotel, the angler may equip himself outwardly, and, if he prefers, also inwardly; then hie to the bridge close to the hotel, turning to the left, through the wicket-gate, and follow the stream, if so inclined, to the union of the Bovey with the Teign. The practised eye will espy much quicker the stickles, eddies, holes and haunts much better than I can describe them, being too numerous, and wading in many parts is required. There are many other fishing stations, such as Jew's Bridge, Chudleigh Road, also free, and the immense reservoir, but there is some difficulty in fishing there, being strictly preserved, and, I believe, for the county people only. Although the Bovey is a tributary of the Teign, it is in no way connected with polluting the same, it being perfectly pure from its source to where it unites with the above river; and, to show the primitive condition of the neighbourhood, I should inform you that gas will be introduced during the present week, when fireworks will be seen the town through. During the past few days rain has fallen heavily, and no doubt Beckey Falls, the Bovey, and other streams on and from the moors will be seen to their best—from an angler's point of view.

GREY-MULLET FISHING.

HAVING often fished for grey mullet, I should like to add my personal experience to the correspondence which has already appeared in the GAZETTE. I have caught these fish in tidal waters in the following manner: A light, pliant rod, with upright rings, fine Nottingham line and winch, small taper cork and quill float, weighted with sufficient shot to sink the float, so that only about one inch of the quill is above the surface of the water. The bait, in my opinion, is better about mid-water, and not near or dragging the bottom. The mullet is a gross feeder, and appears to feed on floating baits, not biting or snatching at them, as many other fish do, but quietly sucking them in as they pass. I have used the following baits, all of which are at times good—crumbs of bread, soft fat pork, sand worms, or even a couple of fresh-boiled shrimps, shelled and put on a hook about the same size as is used for chub or barbel fishing. The bait should be about the size of a hazel-nut. Strike immediately you see a touch, as mullet are very cunning, blowing out any bait which it cannot suck down with the greatest ease. If you hook one, do not attempt to check him, but let him run, as he is very strong, yet soft in the mouth. Give him plenty of time, and play him till pretty well exhausted, when you can secure him with your landing net. Above all things, do not attempt to lift him by the hook. Mullet may also be taken in salt-water harbours and at piers. In such places I have found a piece of skate's liver, or half a small, soft crab, with the legs removed, most excellent baits. Unless the angler has abundance of patience, mullet fishing will not please him, but, with plenty of perseverance as well as patience, he will at times secure two or three in a morning or afternoon's fishing; and as they generally run from 2 lb. to 4 lb. or 5 lb. in weight, and are very good for table, he will find them foemen worthy of his steel.

T. HUGGETT.

P.S.—Mullet fishing is most frequently resorted to during the autumnal visit to the seaside, and when rivers are often inaccessible.

A SPECIFIC FOR NEURALGIA.

IF there is one "ill that human flesh is heir to," that the sufferer learns to dread like a nightmare, it is surely the terrible nerve pain—neuralgia. Anglers, from being exposed to damp and cold, are very liable to its attacks, and it is with real pleasure that we can point out to them what we sincerely believe is a real remedy, and that is "Tonga." We watched its action in a most terrible case of neuralgia last week, and, after trying everything else, including quinine, in vain, gave three doses of "Tonga." After the third dose the attacks became weaker, and gradually died away to an occasional slight spasm, and the patient could again sleep, and feel pleasure in life. It is an internal medicine, and has no injurious effect on the system, and is not narcotic. It seems to act directly on the nerves, and is especially useful in neuralgia in the face and head. In future we shall recommend "Tonga" to every one who suffers from the shooting, stabbing, tearing, crushing attacks of neuralgia. It has only recently been introduced from South America by Messrs. Allen and Hanbury, the well-known chemists.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

THE NATURALIST IN VANCOUVER ISLAND AND
BRITISH COLUMBIA.

(Continued from page 406.)

VIVIPAROUS FISH.

(See accompanying Illustration.)

"WE are so accustomed to associate the production of young fishes with eggs and milt—familiar to all as hard and soft roe in the cured herring—that it is difficult to believe in the existence of a fish bringing forth live young, just as do dogs, cats, rats, and mice—only with this difference, that, in the case of the fish, the young are as perfect in every detail, when launched into the water, as the parent, and swim away self-dependent, to feed or be fed on, as good or ill luck befalls the little wanderer. The woodcut represents the female fish with the young *in situ*, together with others scattered round her, having fallen out when the walls of the abdomen were dissected open: the drawing was made from a female fish I brought from Vancouver Island, and now exhibiting in the Fish Room of the British Museum."

The geographical range of viviparous fish, as far as came under the notice of Mr. Lord, is from the Bay of San Francisco to Sitka. Respecting its edible qualities, he says he is convinced no system of cooking or culinary skill would ever convert it into a palatable fish; he gives a most interesting account of how he stumbled upon the fact that it was viviparous, which we must quote at length:

"Soon after I arrived at Vancouver Island, I at once set to work

It happened, very curiously, that a Mr. Jackson, an American Government officer, made the same discovery almost at the same time, and he wrote to Professor Agassiz, sending the fish. The Professor was astonished, and disbelieved the possibility of the fish being viviparous, imagining some error had crept into Mr. Jackson's statement, but other fish in a similar state were subsequently sent to him by Mr. Carey, and the fact was then most undeniably established, that this and many other species are strictly viviparous.

"Now we come to a ticklish question, 'How are the young fish vitalised in the abdomen of the mother?' In this case I shall adopt what I conceive to be the most straightforward course, which is candidly to give my own thoughts, and solicit from abler, older and better physiologists their opinions or theories, for I sincerely think this is a question well worth careful investigation. I believe the ova, after impregnation, at first goes through the same transformations in the ovarium, as it would do, supposing it to have been spawned and fecundated in the ordinary spawning bed, but only up to a certain point; then, I think, the membrane enfolding the ova that have by this time assumed a fishlike type, takes on the character and functions of a placental membrane, and the young fish are supplied by an umbilical cord, just as in the case of a foetal mammal. But a third change takes place. There can be no doubt that the young fish I cut out, and that swam away, had breathed before they were freed from the mother; hence I am led to think that a short time prior to the birth of the young, sea water has access to this marsupial sac, washes over the infant fish,

VIVIPAROUS FISH.

(The illustration represents the side of the fish opened to show the young fish as they are born.)

to investigate, as far as it lay in my power, the habits and periods of migration of the different species of fish periodically visiting the north-west coast. The sole means then at my disposal to obtain fish for examination, or as specimens to send home, was to employ Indians or catch them myself, so it happened some of these fish were first brought me by Indians. Cutting one down the side (the plan I usually adopt to skin a fish, keeping the opposite side untouched), to my intense surprise out tumbled a lot of little fish! My wildest dreams had never led me to suppose a fish I then thought was a bream, or one of the perch family, could be viviparous. I at once most hastily arrived at the conclusion that the greedy gourmand had eaten them. Dropping my knife, I sat in a most bewildered state, looking at the fish. The first ray of light that shone in to illumine my mystification seemed to spring from the fact that each little fish was the model, counterpart, and fac-simile of the large one, and in shape, size, and colour were exactly alike. From the position, too, they occupied in the abdomen of the larger fish, I was led at once to see the error of my first assumption, that they had been swallowed.

"Carefully dissecting back the walls of the abdomen, I discovered a delicate membranous bag or sac, having an attachment to the upper or dorsal region, and doubled upon itself into numerous folds or plaits, and between each of these folds was neatly packed away a little fish. The bag was of a bluish-white colour, and contained fourteen fish. I had no longer any doubt that the fish was viviparous, and that it was a true and normal case of ovarian gestation. So much for my first discovery."

the gills assume their normal action, and the regular systemic circle is established. Maturity attained, the umbilical attachment snaps, and the little fish, perfect in every detail of its organisation, is launched into the deep to brave its many perils and shift for itself. The strong transverse muscles attached to the powerful sphincter (constituting the genital opening from the abdominal walls), I imagine, are in some way concerned in admitting the sea water, and it appears to me a contrivance admirably adapted to effect such a purpose; but how impregnation takes place, I may at once honestly confess—I do not know.

"The male is much like the female, but more slim, and the milt is just like that of other fish. I can only conjecture that fecundation is accomplished through the medium of the sea-water, admitted by the curiously-contrived floodgate of the female, carrying in the milt-germs and washing them over the ova. It is worthy of remark that the young mature fish are very large, when compared with the size of the mother. In a female fish, eleven inches in length, the young were three inches long; the adult fish four-and-a-half inches broad, and the young an inch."

We should like to go on giving extracts from this deeply interesting book, but our space forbids, and we trust we have given enough to send our readers to the work itself. When we mention that our notice has extended only to about the first one hundred out of its six hundred pages, it will be seen what an immense amount of matter Mr. Lord has given, and, as we said before, every page is of interest. A cheap edition of the work would sell very largely here and in America.

DEATH OF ONE OF OUR CORRESPONDENTS.

A CASE FOR HELP.

IT is with much regret that we hear of the death of Henry Comer, fisherman, of Ilfracombe, who for nearly two years past has sent us capital reports of the fishing at Ilfracombe. We have received the following letter from his widow:—

SIR,—I am sorry to have to inform you of the death of my husband Henry Comer. He has been a great sufferer for over ten years, from chronic asthma and bronchitis. He was seized a fortnight ago with pleurisy and inflammation on the lungs, which resulted in his death on Tuesday morning, the 16th inst. I have four young children under fourteen years of age, and any little assistance you could render me I should be most thankful for.—I am, &c.,

ELIZABETH COMER.

10, Broad Street, Ilfracombe, August 18th, 1881.

On receipt of this letter, we wrote to a gentleman in Ilfracombe on the subject of helping Mrs. C., and here is his reply:—

DEAR SIR,—Replying to yours of the 20th, I knew Comer, who was a very respectable man, of late a great invalid. I saw his funeral on Saturday, attended by a great number of his old comrades, as a mark of respect. The widow bears a good reputation as an honest, industrious woman, somewhat superior to her station, and any assistance which can be rendered would be real charity. I should be happy to do anything you might suggest. I think Comer's widow, with the aid any of the fishermen would gladly give her, might be able to continue the reports, if you wished it.—I am, &c.,

JOHN TAIT.

Ilfracombe Chronicle Office, Aug. 22.

We have sent Mrs. Comer a little help in the shape of money, and have asked her to continue the reports, and hope to help her in other ways. If any reader of this paper can spare a little for this poor widow we shall be very glad indeed to acknowledge it; and it can be sent either to the Editor of the FISHING GAZETTE, 12, Fetter Lane, London, or to Mr. Tait, or direct to Mrs. Comer. It is a thoroughly deserving case, we are sure.

BARBEL IN THE THAMES.

WHAT a dispirited condition the end of last year's general angling season left the barbel-fishers in! They declared that fish had left the Thames, and all hopes of their return were futile. I endeavoured to disprove their ideas, but it was of no avail. I told them of seasons when the barbel would not feed, and how they were seen lying like stones on the bed of the river; but they said it was all "gammon." I gave up all idea of converting them, and left them to the fate of time, resting assured in my own mind that all their loud theories would have to give way to the full realisation of what they would term "the return of the barbel." I am inclined sometimes to think the anglers are soon dissatisfied. They have a bad day, and they put it down to the scarcity of fish. As I have often said, the charm of fishing is the uncertainty of catching them. It may not sound right in the ears of some, but it is none the less real and true. Some friends of mine the other day engaged two punts to fish for roach at Hampton Court with "great expectations," as the fish were a day or two previously well on the feed. The atmosphere was against them—the wind was wrong and the weather the same—and they did nothing. A few days afterwards the youthful son of one of them went out for a day's roach-fishing in the same place, and with his own rod caught over eight dozen of good fish, many of them weighing one pound each. Anglers frequently forget that the weather and temperature of the water slackens the ardour of the fish to feed, and that the finny tribe feed better at one time than they do at another. It was not by any means the only year in my experience of the indifference—the perfect indifference—of barbel to feed throughout an entire season, and I would have it recorded for the benefit of others, that, bad as last year was for barbel—doubtful as the anglers were of their existence—the present season so far gives to my mind abundant and overflowing evidence those fish are still in the river. Let me isolate one or two instances that have come to my own knowledge, and that without including the large quantities of barbel already taken in roach and dace fishing. The first instance is that of Mr. Geen, who is known and respected by every true piscator—and no one gentleman has done more to make anglers true than he has. Well, in the short space of three hours, and he had only his son with him, he landed 140 lb. weight of barbel, the largest 8 lb., and he then left the fish feeding freely. He selected the largest fish, making altogether over 90 lb., and sent them to the committee of the Portsmouth Angling Society, who intend setting some of them up as specimens of Thames barbel. Some good natured people will think these barbel came to our friend Mr. Geen as an appreciation of his eminent services in the protection and preservation of their species, and were determined to give him some good sport as a slight acknowledgment. I am not going into the absolute depth of this idea, but I will contend if any angler is deserving of sport

it is the angler's true friend, Mr. Geen, the honorary president of the West Central Association of London and Provincial Angling Societies, and as one I offer him my hearty congratulations. And now for another instance of successful barbel fishing, and I have it on the authority of a good friend of mine, but I do not believe I am authorised to give names. Two anglers in one day got over 170 lb. weight of barbel! Where are my dispirited friends of last year now? They are not in the swim at all. Will they still value lightly my well-grounded belief or not? There was no theory or imagination in my assertions. They were based on the experience of about twenty-three years. I have no wish to taunt them in the realisation. If they are pleased to see their old fighting friends, the barbel, again, I am more than satisfied. I have said nothing of the bank anglers as to the quantity of barbel they have brought to grief this season, and there are two single instances of 20 lb. each. I feel that I have said enough as a notice of encouragement to all interested in barbel fishing, and I could have given more extended accounts of victories if I had liked, but I have one word to say, ere I close, to barbel anglers. While I heartily and sincerely wish them the best of sport, I would venture to suggest the return to the river again of the smaller fish. It will not, it cannot, depreciate the value of their success. If they have taken two hundredweight and they put two-thirds back again it will revert to their credit, and every true angler will praise them for it. Some people enjoy barbel as an article of food. I do not. I have tasted them once, and I shall be much in want of something to eat if I taste them again. The barbel affords first-rate sport, and I have witnessed scenes of the greatest excitement in catching them more than I have done of any other fish. There are anglers who specially lay themselves out for barbel-fishing, and I can well understand their disappointment in a somewhat blank season. In some neighbourhoods the barbel is an unknown fish. It is at Southport, where I have twice taken down some living specimens, as well as of bream, once in company with my friend, Mr. T. R. Sachs. I had a letter from Mr. Charles L. Jackson, the hon. naturalist of the Southport Aquarium a short time back informing me of their loss of the whole of their specimens, and he adds, "We greatly appreciated your kindness, and our big tank has never looked so well as it did after your visit," and he finishes up with an appeal for more barbel and bream in these words: "I should be greatly pleased if it will fit in with your engagements to pay us another visit with a similar cargo." I should very much like to do this if I could get the fish, and regarding as I do such institutions as aquariums as piscatorial schools, to teach and instruct all persons in the description and habits of fish, it would be no loss to any river to contribute some good specimens of barbel and bream, and no angler would regret doing his share in it. A little later on, when the weather is cooler, as it is a long journey to Southport, I shall be open to any offer, and, if I could not take the fish myself, some one would be sent from there to receive them at Euston Square.

B.

EELS v. PIKE, AS POACHERS—CULINARY VALUE OF PIKE—ASCRIBED MEDICINAL QUALITIES OF SAME—ORIGIN OF TROLLING—CULINARY VALUE OF EELS, &c.—BREAM-FISHING, AND HOW TO PREPARE BREAM FOR THE TABLE—CASTING TOURNAMENT.

"YE PILGRIM FRY-ER" is quite right when he denounces the pike as being generally a most destructive fish, even out-rivalling the eel. For my part, as I have before stated, I would exterminate the pike of the Thames in favour of the Thames trout, and organise a large breeding establishment for the latter fish, which should turn in thousands of young fish—old enough to take care of themselves, of course—if (ah that potent little word), if I possessed the power. A seven years' close time for Thames trout, a yearly introduction of the true trout of the river, coupled with a persevering decimation of the eels and pike, would render the river the finest trout stream in the world.

* * * * *

Jack or pike were not and are not always considered as inferior the eel gastronomically as a "sparrow to a partridge" friend "Ye Pilgrim Fry-er!" True, Ausonius despises him, saying he,

"Unknown at friendship's hospitable board,
Smokes 'midst the smoky tavern's coarsest food."

And Juvenal (5th Satire), in his denunciation of Crispinus, classes both fish in low estimation. He says: "You must put up with a muddy eel, sister of the slender snake or with a pike bred in the Tiber, spotted by winter ice, fed with the ordure of the common shore, and used to swim through the drains as far as Sabruria." In England such valuation has been widely different. In a feast given by Archbishop Neville to Edward 4th, 608 pike formed a considerable—very?—part of the banquet. Blakey says, that at

the close of the 13th century, this fish was so dear that few could afford to eat it; and other authors of equal research aver severally that its ancient price was "double that of a salmon and ten times that of a cod,"—that it was dearer than house-lamb in the time of Bluff King Hal, and a small pickerel was worth more than a fat capon.

Apropos, what curious notions have obtained in past times concerning the medicinal qualities of fish in general, and pike in particular. Nobbes (the so-called *father* of trolling) says that "the jaw-bone beaten [to powder, is good for] pleurises and other complaints; some do approve of it as a remedy for the pain of the heart and lungs, others affirm that the small bones pulverised may be fitly used to dry-up sores." A sort of brain-ivory seems to have been discovered by Gesner and others, and to it was attributed virtues of an extraordinary nature, whilst the heart was believed by Siebald, writing in the reign of Charles II., to be a remedy for febrile disorders, and the gall of extreme virtue for sore eyes.

I have said that Nobbes was the so-called "Father of Trolling." In the sense of being the inventor of this style he was not so. The following list of authors mentioning trolling before Nobbes will justify what I say:—Leonard Mascall, 1590; Aldrovandus, 1613; Barker, 1651; Colonel Venables, 1662; Cheetham's Vade Mecum, 1681. Nobbes wrote in 1682.

But to return to the culinary excellences of the two fish originally under consideration—the pike and eel. I consider that filleted pike fried, when the fish has been derived from a clear and plenteous river, is a capital dish, but certainly eels are superior, taken from a similiar *habitat*. Yet Scotchmen and Irishmen dislike and seldom eat them. Galen and Hippocrates regarded them as a medicine, but the Monks of Salerno held them in abhorrence, saying, "Doctors in every age have agreed to decry them as most pernicious to health." The author of "Ingoldsby" advises, however:

"Credo experto, trust one who has tried;

Have them spitchcocked or stewed—they're oily when fried."

Bye the bye, I wonder what were the sentiments of the raven spoken of by Glover (who quotes somebody else as having seen an eel come alive nine times out of the bird's trail), on the digestibility of the eel. Gesner suggests that small eels might be used as a purgative (as in the case of the raven). The extraordinary hint has not been acted on, I imagine, though Badham speaks of a German tailor who accidentally swallowed one, and was glad to get rid of it as did the raven.

The bream-fishing should now be "coming on," and I need scarcely remind my readers who are frequenters of the Thames, that Sunbury, Walton, Shepperton, Chertsey, and Penton Hook, are the homes *par excellence* of these fish. Why they don't get higher up the river, I know not? How is it that so very, very few are taken at Windsor and thereabouts?

This is another fish which was formerly estimated at a very considerable value from a culinary point of view. The Prioress of St. Albans speaks of it as a "noble fyssh and a deyneteous," and Chancer indicates that it was of importance.

"Full many a partrich had hee on mewe,

And many a breme and many a luce in stewe."

In 1419 it is said to have been worth 20d. a fish; and Nillson says in Sweden even the church bells were used to be stopped when they swarmed, lest they might be disturbed.

But what a difference is there between ancient and modern opinion. Blakey says, "it is very much like a pair of bellows in shape, and much the same in flavour," and Francis, Pennell, and almost everybody else, echoes the opinion. Mr. Greville Fennell doesn't go so far, however, and I have tried his recipe for the preparation of the fish with agreeable results. He says, "Lay a stratum of clean pebbles at the bottom of an earthenware pan, then a layer of fish, sprinkle well with salt, then another layer of pebbles and salt until the fish are all thus arranged. Leave them a night to purify . . . and the fish are thoroughly purified, and may fairly vie with flounders in succulence of flavour."

I cannot see how it is possible to adopt Mr. Jardine's suggestion that the casting tournament be held at Walton Sale, unless one can measure the water. In America, I believe, the "caster" retires back from the water until he decides he has gone far enough to throw, so as to allow the bait to fall, say, a yard or two in the water. Why not adopt a similar plan, Mr. Editor? The water will prevent the spinning-bait jumping, and show the delivery of the fly.

J. HARRINGTON KEENE.

SIZE OF PIKE.

AS Mr. Jardine's brace of pike, each above 32 lb. in weight, have created much curiosity amongst the brotherhood, as to what size the pike will grow, we throw together a few facts, which appear pretty well authenticated, upon this subject. In Daniell's "Rural Sports," quarto edition, we find the largest pike ever known to be caught by trolling, was in Scotland in the year 1784, by Colonel Thornton, which wanted only two ounces of fifty pounds weight. He was an hour and a quarter upon the line before he submitted to his fate, nor would the tackle have held him, although purposely prepared for large fish, had not the colonel been in a boat upon the lake, and by that means enabled to humour the pike's struggles to escape. Upon the belly, in the engraving which Daniell gives, may be seen a small speck, which was a wound from whence was taken a hook he had swallowed and broken away with ten years before, and which had then worked itself nearly through the skin, for upon the coloured part being pressed, the hook appeared and was extracted. From eye to fork this fish was 4 feet 1 inch; extreme length, 4 feet 9 inches; depth, 11½ inches.

The next pike in size we find taken by the troll, was in December, 1792, by Mr. Bint, in the pool at Packington (the Earl of Aylesford's) being from eye to fork 2 feet 11 inches; full length 3 feet 10½ inches; circumference, 1 foot 10 inches; and weight 34½ lb.

Sir Cecil Wray's pike, caught in June, 1799, at the draining of the water from the lake at his seat, at Sumner Castle, in Lincolnshire, weighed 47 lb. gross. It afforded 36 lb. of eatable meat after being cleaned; was 48½ inches long, and 2 feet 2 inches in circumference. The fish must have entered the lake when very small, and had acquired this enormous size in twenty-two years, for at that time the lake was laid dry. Sir Cecil, in a letter he wrote upon the subject, computed that this pike consumed three fish per diem, progressively more and larger as his own size increased, and that he at least destroyed 24,000, all of which in the latter years of his growth must have been valuable fish, so that the cost of his support exceeded some hundred times his own value. A river pike grows fast until he arrives at twenty-four inches, he then ceases to extend so rapidly in length, for in good water, with plenty of feed, a pike spawned in March will by the March following, be grown from sixteen to eighteen inches, and proportionably thickens. Afterwards he will be much longer arriving at his full bigness, which is about forty-six inches, from the length of thirty, than was in acquiring the first thirty inches.

In May, 1796, Mr. Bishop of Godstow, between Weir and Wytham Brook, landed the biggest pike ever remembered to be taken in the Isis, it was 4 feet 2 inches long, 3 feet 10 inches in girth; and after being disgorged of a barbel nearly 6 lb., and a chub upwards of 3 lb., weighed 31½ lb.

In the same year a pike was caught in Exton Park pond (Lord Gainsborough's), the length 42½ inches from eye to fork, and from nose to tail 49 inches, the girth 28 inches, and weighed 37½ lb. Neither this or the fish taken in the Isis were so well grown as Sir Cecil Wray's.

In 1797 a pike weighing close upon 40 lb., and measuring in length 3 feet 6 inches, and in girth 2 feet was caught in a pond at Totteridge in Herefordshire. A tench of 4 lb., and 4½ lb. of solid fat, were taken from his inside.

Allusion has been made above to a pike getting rid of hooks. The writer of this has had several cases, three of which were very remarkable. In one instance, a jack of 11 lb., we landed from Joe Heath's water, the Colne, at Wraysbury, a double gorge hook was found protruding from its vent which came readily away with the lead, and arming of gimp. The gimp was rotten, at least the silk round which the wire was coiled, was so. The gastric juice had likewise evidently acted upon the lead, which held a sickly white corrosion on its surface, but the barbs of the hooks were nearly perfect, and the points but little affected. What an incumbrance must this have been to the movements of the fish, as the gorge could not have acted as other than an anchor when it grappled with any opposing object, although it was clear that such an attachment would soon have removed it altogether, from the facility with which it came away?

The second occasion was in the same water, when we killed a 12½ lb. pike, in the throat of which, upon removing the flight, we found another flight of thirteen hooks. The latter was lost by Keen, a Thames fisherman, of Wraysbury, about half an hour before our capture, but the whole of the hooks were far down the gullet.

The third memorable occasion was at Ashford, Middlesex, where, in a pond in which eel lines had been set and lost, a dead pike was picked up with the thirteen missing eel hooks in its stomach, some of which had already approached the vent, and were slightly obtruding. But the dose of iron proved too much in this case.

We do not intend these instances of the digestive capabilities of the pike to be quoted by those members of clubs who would supplement the weight of their fish by making them swallow leaden plummets after death, or stuff them out with a few ounces of wet sand in the way that geese are sometimes served by itinerant poultry hawkers.

Daniell says: "the largest pike ever known to be taken with a trimmer was by Messrs. Hitch and Major Rhode in Dagenham Breach; it weighed 35 lb."

We do not think much of large pike for sport. We have unvariably found them, when above 12 lb., sail about deep down like logs; and the largest pike of 25½ lb. we ever killed reminded us more of the erratic motions of a barge in a whirlpool than a well-behaved, respectable fish; while pike of from 5 lb. to 7 lb. in a river will fight like salmon, and take more time to subdue than these.

RIVER REPORTS.

MID-THAMES.

"Better half an egg than empty shells."

"The rain it raineth every day," would possibly, under present circumstances, have been a more appropriate line than the above, but as "half a loaf is better than no bread," and as piscators are "thankful for small mercies," I am glad to have to report many pretty catches have been had at all the likely stations in Mid-Thames. The weather, however, has been so pitilessly wet and windy, that none but the brave have deserved or obtained the fair beauties sought after, the "better half" of the bites being, even with these braves, obliterated by rude Boreas, or wiped out of recognition by blobs of rain. Henley, Streatley, Wargrave and Sonning kindly send me reports of decent takes of roach, perch, and chub, with glowing anticipations of the cheap acquirement of "buckets of lob-worms," and the consequent future sport accruing. At New Lock weir a gentleman whilst spinning hooked and ran a fine trout, but the run was of such a long and determined nature, that the piscator was eventually "left lamenting" with a running from his eyes. At Hurley, Mr. Allard, fishing from the East Arms, a few days ago, took some nice chub, and amidst the crowd four beauties, going exactly $2\frac{3}{4}$ lb. each. Two gentlemen, staying at the Bell, Hurley, and fishing under the able direction of Townsend, have had a pretty take of miscellaneous fish, inclusive of roach, perch, chub, one barbel and an eel, in all some 20 lb., and another gentleman, in the same district, has been the fortunate captor of two trout, going respectively 4 lb. and $4\frac{1}{2}$ lb. Mr. and Mrs. Brooksbank, fishing the Harleyford waters, have again been amid the perch, a reward of some 10 lb. going to two hours' fishing, best fish scaling $2\frac{3}{4}$ lb.; but it had evidently got "something on its mind," or in its stomach, for, from its length, it should at least have gone another pound. Cliveden waters are not giving much voice this week, and Bray is not noisy as usual. The river is still in fine trim for summer angling, but if this heavy rain continues will be soon rising and getting coloured.—MARLOW BUZZ.

Thames (Goring).

The water is in good order for roach and chub worm-fishing. Prospects look bad at present. We want fine weather; if we have much more rain it will make the water too thick. Roach have been biting well here. All the boats have been doing well, 10 lb. and 12 lb. having been taken a day. My best day was 14 lb. of roach and chub, some of the roach going over 1 lb., and four jack, the largest being 4 lb.—JOHN RUSH.

Thames (Halliford).

The river is now in good order for ledgering and roach-fishing. Different gentlemen have been fishing with me since my last report. Their takes have been as follows:—First day, Mr. George Palmer, ten barbel, two bream, and three roach, altogether weighing 29 lb. Second day, Mr. Yarborough, nine barbel, two roach, and three eels. Third day, Mr. R. Robin, thirteen barbel, weighing 27½ lb. Fourth day, Mr. Hughes, two barbel, three roach, and a chub of 3 lb. 14 oz. Fifth day, Mr. George Palmer, 60 lb. of barbel, one bream of 3½ lb., and some fine roach. All the above fish were taken ledgering, and weighed at Mr. Robert Stone's, Ship Hotel.—GEORGE ROSEWELL.

Thames (Kingston).

The river is in good form for all sorts of fishing—a nice colour in it. I should say that if care be taken and proper tackle used, now is the time to bag. Weather changes every day. Plenty of roach and dace from 10 lb. to 20 lb. a day, fair fish. I got 12 lb. of roach and dace with one rod on Wednesday after four o'clock. There has been a few nice perch taken; I saw thirteen nice fish up to 1 lb. My son got nine dozen good roach on Wednesday, and a few barbel and roach from the bank.—JOHN JOHNSON.

Thames (Richmond).

The rain of the last four days has swollen the river considerably, and by the time this is in print the water will be thick, but it is not too thick for fishing yet. With the water a little higher we shall be able to give our patrons a little bream fishing. The dace fed well up to Monday night, since then we have not been able to fish when we liked on account of the heavy wind, which has been blowing S.E. The sport during the week is—Job Brain, 42 perch, 9 eels, averaging 1 lb. each, all taken with live bait; H. Mansel, out every day, average 7 doz. roach and dace each day; H. Howard, out every day 7 to 9 doz. fish each day; G. Howard, four days, 20 doz. dace; J. Bushnell, Friday 27½ lb. of dace, with Mr. Bachuss; Saturday, 22 lb. dace and barbel; Sunday, 25 lb. dace; Monday, 18½ lb. dace and roach; out each day since without much success, on account of the weather.—JOHN BUSHNELL, fisherman.

Thames (Twickenham).

Wind S.W., rainy, water a little colour. I have had 38 punts during the week, all doing well, with the exception of a few amateurs. Spier's best two days, 26 lb. and 23 lb., and two barbel. Pert Hammerton, last Saturday with Mr. Johnson, of Cross Deep, and member of R.P.S., 38 lb., including two barbel of 1 and 2 lb. Captain Moss, of Ealing, 18 lb., and three barbel. Joe

Doben, with Mr. Howes, of Shacklewell, four barbel in prime condition, and eight dozen fine dace. Mr. Glenowen, one day, 24 dozen roach and dace, one fine barbel, 7 lb.; Spong, one day, Mr. Cook, Wandsworth, 8 dozen; one day, Captain Smith, 18 lb., two barbel; Dick Moffatt, one day, Mr. White, 10 dozen; one day, Mr. Dawson, 18 lb., roach and dace.

N.B.—I am sorry I have been obliged to discharge Jem Hammerton through inattentiveness to my customers, and I cannot be answerable for any punts engaged—except from my house, viz., the Two Sawyers. Customers will greatly oblige by writing in advance, if possible.—A. PERRIN.

Thames (Windsor).

The late heavy rains have had the effect of rising and colouring the water very much, it now being the colour of that to be seen over London Bridge. Worm fishing will be good, and eddies under clay banks will yield a great variety of fish if the bait used is lob worm, either small or tail end of good sized ones. Jack fishing is out of the question, though whilst ledgering I took one with a worm, besides four barbel and two eels. Barbel have been feeding better, though large bags are scarce, but now a high and thick water has come shall expect to see some good takes. Roach are biting well and several good baskets have come under my notice, some containing heavy specimens. In the Old Windsor Weir a brace of trout have been had lately, one by Mr. T. E. Adams, of 47, St. James' Square, Notting Hill, going 3 lb., and one of just over 7 lb., which he landed for another gentleman. At the same place twelve barbel were had one day, largest 7 lb. At Egham a trout has been picked up below the Weir in a dying state, over 10 lb. James Gray has been getting fair bags with patrons, though I have only two days' takes, consisting of one jack, 5 lb., and two dozen roach and five perch on 14th inst. On 15th inst. he had between four or five dozen roach and seven perch. Mr. Herbert, of Windsor, with a friend, took seven jack, spinning, in one day, largest 5 lb. Richard Gray, with Mr. Hockley, of 84, Old Kent Road, had one day thirteen dozen gudgeon, four barbel, six perch and one chub of 3 lb. Much rain falling now, every prospect of very high water.—B. R. BAMBRIDGE.

Ancholme.

The waters have been too thick for angling of late. When fine weather again obtains, we must look for some good pike-fishing. Bream and other scaly fish will then also feed well. I am unable to state what has been done during the past week, owing to absence from home.—THOMAS FORD.

Avon (Binton).

The river is bank high, and if the rain continues we shall have a heavy flood. The members of club have had some very good sport with the roach and chub, but cannot give full particulars, excepting in one case. Mr. Bennet, 17 lb. roach, forty fish, all with stewed malt.—ARTHUR W. WARNER.

Barle and Exe (Dulverton).

These rivers are at the present moment (5 p.m., Aug. 25) in a state of flood, owing to the heavy rains we have had during the last few days. Of course, everybody who can raise a rod, line, hook and worms is out fishing. I was induced to go out this afternoon, but, after an hour's experience, returned home minus a fish. The reason given me for my bad sport by the local authorities was that the water was still rising. However, I had had quite enough of worm-fishing, which I must add I never cared for. Some very good baskets of trout have been taken during the past week, with fly, minnow and worm. With the worm, of course, fishing up stream in clear water. Yesterday, Mr. F. Marsland caught a beautiful basket of trout, with the minnow and worm, which weighed over 6 lb.; and several other anglers have also been very successful. The flies killing best are the blue upright, coddung, sand fly and the blue dun.—W.

Dove (Derbyshire).

"Ye gentel Dove," as an old writer calls it, is no longer gentle. It is a seething torrent, bank high, and threatens to flood the district. Angling is now practically stopped. Our farmers are greatly alarmed about the state of the weather. Thousands of acres of corn are cut, and some of it is now a foot deep in water. I don't think the river will get into fishable order again for a week or more. Previous to the floods the apple green and the golden dun flies were killing best. One rodster got seven brace with the apple green near Uttoxeter, while others caught such dishes as four and five brace with the whistler and golden dun. Both these are capital lures in discoloured water, being sufficiently gaudy to be seen by the fish through the thickened liquid. The bottom fishers were doing well on Saturday, Monday and Tuesday, with worm and wasp-grub, but it has been quite unfit to go out since, rain having fallen every day—not in little drops either, but in big beads, sufficient to wet a man through in less than five minutes.—SPLODGER.

Exe (Exeter).

We are now in receipt of some heavy downfalls, and our hitherto sluggish river is on the rise, and it is to be hoped we shall now see that life and disturbance, which gratifies the angler's mind to satisfy him that fish are and will be there in the forthcoming season, and even allow him some degree of sport ere the season closes, which, up to the present, has been very indifferent in the upper waters. Salmon and salmon peel are abundant in the lower waters, and good catches are made, but as the season will close very shortly, if these freshets continue, we may say the net fishermen's season is at end, the river being too high for them to pursue their calling. I do not remember such, I may say, universal annoyance, if not disgust, having spread through the angling community, as was felt by nearly every one on reading the news, and seeing the spoil of fish (salmon and trout) destroyed lately by poison or dynamite; and, up to the present, I have not heard of any commitments. Perch, roach and dace, plentiful; the former, of fine size. A few rudd have come to hand, and several fine pike. It is raining now in torrents, accompanied with thunder and lightning. Wind, due south. We had the same this morning early, but the wind was due north, so this is possibly a return visit, and, to be hoped, a finale.—FRANK GOSDEN, Exeter.

Ferry Boat Fishery (Tottenham).

Some excellent sport has been had this week among the roach, perch and jack. Mr. Hanstock, one barbel, 5 lb. ½ oz.; Mr. Drew, one jack, 7 lb.; Mr. Hughes, basket of roach, 9 lb.; Mr. Hobinstock, three jack, 12 lb. The water is in excellent condition for roach. The bream have been showing in large numbers in the pool.—J. L. GAY.

Ilfracombe (N. Devon).

Any gentleman visiting Ilfracombe for the purpose of angling would find some sport along the streams at Bickless Combe bottom, the property of Mr. Henry Camp, of whom you must ask permission. Length of stream about 2 miles. Then

adjoining that is Ocerage bottom, a splendid stream for fishing. I have known young lads go there and take from about 40 to 50 trout in one hour an average weight about five to the lb. Sea fishing: the weather here for the last fortnight has been very unfavourable, the wind blowing strong from the N.W., then shifting round to the S.W. The fishermen here have been watching the weather with great anxiety; whenever an opportunity offered them they embraced it, and returned with very fair catches of bream, codlin, whiting, pout, &c. On Thursday last was a fine day for fishing, but the fishermen were all too busy with the regatta which took place on that day, the wind blowing a steady breeze from the west made the weather everything that could be desired. Capstone Parade the favourite resort for spectators was splendidly decorated with flags, which gave a very lively appearance to the scene. Weather at present very unsettled, no likes of fishing for the next few days. There is as usual good sport to be had with rod and line, or hand lines from the piers or jetty for rock whiting, grey mullet, dabs, &c.—E. COMER.

Lea (Cook's Ferry).

The last two Sundays and during the week that has just past we have been favoured with a great number of anglers, and there has been good takings; perch in great numbers, as to tench, up to the present time, the takes have been small, but those that have been taken were in fine condition, and the large rains that we have had has greatly improved the water, which is high. The members of the Edmonton and Tottenham Fishing Club have had their day out for prizes, the winners being:—1st prize, a pair of lustres, Mr. George Stephens, for roach; 2nd do., a money prize, Mr. Collyer, for jack; 3rd do., a jack rod, Mr. Hustler, for jack. The three above-named members have laboured hard, and they being the winners has given great pleasure to all the other members of the club.—T. SEWELL.

Medway (Tonbridge).

The heavy rains of the last few days had made a slight run of water, which is all the better for angling generally, but the weather has been so terribly unsettled, and the wind so high, that very little angling has been done during the week. Our secretary, fishing before breakfast on Saturday, running near the Old Weir, grassed a dozen roach, the largest weighing 1½ lb. The ground baited with cotton cake, and fished with the tail end of a lob, trying for bream. The latter fish did not hang in at all, and just now the lobworm appears to be the particular vanity of the roach. There will be excellent sport when the weather clears up.—THE MEDWAY WATER RAT.

Norfolk.

Notwithstanding the many drawbacks during the past week respecting the wind and weather, good sport still continues to reign predominant amongst our local sportsmen. Great catches of bream and heavy bags of roach are constantly being shown at the various club houses in the city, and any angler is considered to be very much in the background at the present time if he is not able to show after a day's sport at least two stone weight of fish. So well on the feed and so prolific are they, I have had during the last few days some splendid baskets of fish submitted to me, some from the Bure and others from the Yare. The fish appear all to be in perfect condition, no signs of disease or sickness being in any way apparent. I have just seen at the club house of the East Angling Society a fine catch of roach taken at Cantley. The fish averaged from 8 to 18 oz. each, and were as level a lot as ever I had the pleasure to inspect. These, I was informed, were taken mostly with King's natural bait which is evidently a most killing bait, for whilst eight other boats did comparatively nothing, the gentlemen using this paste landed in two hours no less than 2 stone of roach 84 in number. Although hitherto a sceptic in these patent baits, I certainly must admit that there is a something about the one in question. The manufacturer of it (whose address is New Road, Commercial Road, London), will, on application, and for 1d. stamp, send sample packet, and I should advise all those who have any doubt about the matter to give it a trial. The George and Dragon club held their annual match at Ranworth on Tuesday last and met with the same success as most other clubs have experienced during the season—getting comparatively nothing. The heaviest catch not exceeding 12 lb. Mr. Pearce, one of the gentlemen contesting, succeeded in landing one perch weighing 2¼ lb. During the day the club, under the able management of host Moore had a most enjoyable day, the arrangements being most creditable.—ANGLER.

[We are glad to see our experience of Mr. King's bait borne out by that of other anglers.—ED.]

Ormesby Broad.

The weather at Ormesby Broad for the past few days has been very unsettled, with much rain, and the fish have been slightly off the feed. If the weather should be fine I shall expect to see some good sport. On the 18th inst., Mr. Peacefull and Mr. Ockleford, of London, were at Ormesby, and caught ten bream weighing 20 lb. in two hours. All particulars regarding fishing obtainable of S. RICHMOND, Sportsman Arms, Ormesby Broad.

Ouse (Beafield).

On the first three days of the week I fished in a very deep stretch of water from Finlake to Cardington, and had some excellent sport, all kinds of fish biting freely. The weather was rough and stormy, and on one day I was fishing in the face of a strong wind, yet the roach continued to feed, and I had a good take. On Thursday afternoon I fished for three hours, the wind blowing a perfect gale at my back, and succeeded in taking 17 large roach, one over 1 lb., and the rest over ½ lb. and ¾ lb. each. On Saturday I had a day at Milton, and although the bream would not touch, managed to land eighty-two roach. A large bream, weighing 4½ lb., was caught in an adjoining field with a wheat kernel on a roach line—a splendid fellow. My total for the week, fishing four and a half days, was 281 roach, four bream, four perch. Again raining hard whilst writing this.—ROVER.

Severn and Teme (Worcesterhire).

The tempestuous weather has, together with the continued rains, swollen the streams; in fact, to-day it is only fit for roach fishing, unless you try the brandling worm upon the brooks, as the water has been so clear and low so long. The trout will come well for the next day or two, then fly-fishing will be best if no more heavy rain falls.—J. A. GRIFFIN.

Suir and its Tributaries, Clonmel (Ireland).

We have only one salmon to tell of being killed since last I wrote, by the Hon. Hely-Hutchinson, on Lord Donoughmore's preserves, weighing 12 lb. We have had constant floods all the week, and to-day we have a regular harvest flood, so that the river won't be fit for some days. There has been some good trout fishing on the different streams, spider wrens being the favourite fly.—DORA.

Swale.

Continuous rains have put an end to fly-fishing for a time. Worm-fishers have had good sport, both in main stream and becks. On the return of fine weather, the needle brown will come out in force, and remain a good fly until the end of the season.—THOMAS FORD.

Trent (Alrewas).

Instead of enjoying bright days, and hot sunshine, and grand blue skies, and August splendour, we are the victims of a pitiless downpour, of a murky firmament, of cyclone disturbances, of swollen rivers, and drenched lands. Under such unfavourable circumstances I have nothing to relate of the deeds of my piscatorial brethren. The past week has been an entire blank; both our rivers, the Trent and Tame, were reported this morning as being bank full and much discoloured. Rain has fallen the whole of the day, with such a cruel persistency that a most disastrous flood is imminent. Angling is completely out of the question before the commencement of the next week.—JAMES GREGORY.

Trent (Newark).

The very heavy and long-continued rain of last Tuesday had the effect of bringing down the long-hoped-for and much-needed fresh into the river. The water at the time of writing is rather high and discoloured, but it has been slowly going down to-day; but it has been raining heavily all day, and so in all probability the water may again rise to-morrow—if it does not, the water will be in middling trim for bottom fishing by Sunday or Monday—but I am sadly afraid we shall have another heavy and thick water by the end of this week. I ought not to complain, however, as these freshets will clean out the river, sweep away the troublesome flannel weed and cause the fish to come on the feed—at least, I hope so. Worm fishing will be the order of the day for the next few days if the water goes on all right. Bream have been the fish that anglers have found to have been feeding the best during the past week, some very nice catches of that fish being had from various swims in this locality, worms being the bait. I must not forget a brace of nice jack being had by a friend of mine, Mr. Gregory's Clipper doing the trick. Messrs. Thorpe, in their nets at the mill weir, took last night upwards of 3 tons of eels, a most extraordinary catch, the rise of water after the long continued lowness bringing these fish down in immense quantities, as indicated last week. Mr. Slater has taken the publichouse next door to his rod and tackle establishment, and started a fishing club, 'yclept "The Newark Piscatorials." Mr. Slater has already decorated the walls of his bar with an 18 lb. pike, a 10 lb. barbel and a 5½ lb. chub—at least I believe the pike and the chub are there, and the barbel will be ready in a few days. The new club has started under very favourable circumstances, and numbers already sixty-two members. It is worked on a very sound basis, and I have had no hesitation in causing to be placed on the books of the society the name of the—TRENT OTTER.

Trent (Nottingham).

When there is a great amount of electricity in the air and a thunderstorm is close at hand, it has a wonderful effect on all the animal creation, and more especially on the finny tribe. I have frequently observed this when the weather and water was all in our favour for rod fishing, and the fish have gone off the feed all at once without any apparent cause. One day last season I and a gentleman were fishing, a noted barbel swims at Swarkston Bridge; the fish had been biting well, when at once they stopped feeding. My friend said, "What is the matter?" I answered, "The chances are we are going to have a thunderstorm," and I proposed to at once retire, which I did, leaving my companion to fish on; but he was soon obliged to come in, and a more dreadful night I never experienced, and I guess the reason the fish did not feed so well on Saturday and Monday, was what was going to follow. The heavy thunderstorm on Tuesday night quite put a stop to rod fishing, although the fish excepting barbel had been biting well, and the fresh that is now on the river will doubtless be a good thing for the rodsters during the remainder part of the season as there is just sufficient water on to sweep the flannel weed away. It is raining heavily at the time of writing, and the chances are we are going to have a flood.—W. BAILEY.

Wye and Derwent (Derbyshire).

We have had continual rises on the Derwent since my last report, which has given the ground-bait fishers a rare time of it, and I am pleased to say that some baskets of mixed fish have been killed—chiefly trout, grayling, roach dace and a few chub. The best baits have been the gentles and wasp grubs. The Wye has not been so much out of condition for fly-fishing as the Derwent has, owing to the rain falling more in the woodlands than the Peak, and it has chiefly come out of the south. There have been some very nice baskets of fish killed off of different parts of the Wye during the week. We have a great many fishermen down here for angling, most of the hotels being full of anglers. The best killing flies are the honey dun bumbles, reds, grey goose dun and sand flies. Grayling fly-fishing ought to be on next week if the rain will only keep off.—GEORGE JAMES EATON.

P.S.—We have had a very great quantity of heavy rain to-day and Thursday, both rivers are rising at 6 p.m.; floods expected. Next week will be a first-class one for the bottom fishers.—G. J. EATON.

Yore (Yorkshire).

A great deal of rain has fallen during the last week, so that the rivers have been in a continual state of flood for some days. During the early part of last week some fair dishes of trout were killed, a friend of mine getting eight beauties in the Wharfe with maggot. He only fished from two o'clock p.m. until four, but there was a nice brown water and the fish were "well on." Grayling have not taken well, but in my opinion you cannot have the water too low or clear for successful grayling fishing, and I have never found them take freely in either a rising or a falling water. An angling match was held last week at Skipton Bridge on the river Swale; there was a nice water and a good many fish were killed, but none of any size, as may be judged from the fact that the first prize, value £8, was taken with 5 lb. 5 oz. of fish, comprising roach, dace, perch and gudgeon. The winner of it was Geo. Watkinson, of Harewood, who is a noted all-round angler on the Wharfe; the total value of the prizes was £25. To-day (Wednesday) it has rained without intermission, so that all angling prospects are at an end for the present.—FRANCIS M. WALBRAN.

That's the sport, to throw the fly, and in half a minute take it quickly out. Though the whole earth is given to the children of man, none but we jolly fishers get the plums and raisins of it, by the rivers which run along the hills.—Charles Kingsley.

ANSWERS TO CORRESPONDENTS.

NORFOLK.—On the Norfolk Broads and rivers you must, as a rule, fish from a boat (1s. a day). It is also best to do so in the Thames. Punt on Thames costs 10s. a day with a fisherman, and you will have to give him his beer as well.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

HUNTINGDON FISHING ASSOCIATION.

SIR,—With reference to certain remarks in your paper of the 2nd July, I hope, in justice to the Huntingdon Fishing Association, that you will allow me to give an explanation. I knew nothing whatever of the matter until the account appeared in your journal, which was shown me a few days since. I find, on enquiry, that the supposed keeper was simply a man who is occasionally in the employ of the Association. On the date in question he was not in our pay, and made no report whatever; neither did any one else, or the offending parties would most certainly have been prosecuted. It is now too late to collect evidence. I regret very much that your correspondent did not make further enquiries of myself or the committee before making public a statement calculated to do damage to a deserving society.—I am, &c.,

July 12.

T. M. HOWSON, hon. sec.

[We regret that a previous letter to this effect from Mr. Howson must have been lost in post.—ED.]

ANOTHER PRIZE FOR THE "FISHING GAZETTE" TOURNAMENT.

SIR,—I think your idea of the Fishing Tournament in aid of the Anglers' Benevolent Society a very good one, and trust it will be a great success.

I shall have much pleasure in giving one of my Improved Freke Fishing Bags as a prize.

The conditions to be as follows, if they meet with your approval:—

The line to be a fine Nottingham line, with one triangle hook attached, the bait to be cheese bait—i.e., bread and cheese mixed—which must remain upon the hook at end of cast.

The cast to be made from the reel in the Nottingham style, or from the line laid upon the ground.

No shot or weight beyond the cheese bait to be allowed.

The rod not to exceed 10 feet in length.

Each competitor must use the same rod, reel, line, hook, and bait.

The measurement to be from right toe line.

The longest and most direct throw to be considered the best.

If two or more tie for distance, the prize to be given to the straightest cast.

No wool to be used in mixing the bait.—I am, &c.,

F. MALCOM.

40, Ludgate Hill, August 20.

P.S.—The softer the bait is made the more skill will be shown. The trial might easily be carried out upon a lawn, and three casts only allowed each competitor.

[Many thanks for the prize, and also for your suggestion as regards this new competition. The bait would hardly stand the shock of falling on grass as it would on water.—ED.]

OTHER PRIZES.

The Proprietor of "Salveo Pedes" has kindly promised a £2 2s. spinning-rod, and Messrs. Barron and Wilson one of the FISHING GAZETTE Pliers.

FISHING AT LITTLEHAMPTON.

SIR,—Will you kindly inform me where the nearest freshwater fishing to Littlehampton can be obtained? also the best bait, tackle, and mode of taking bass and mullet.

If you will answer the above in your next issue, you will greatly oblige.—I am, &c.,

LEX.

August 23, 1881.

[Perhaps some angler who knows Littlehampton will answer the first query. For bass-fishing use a large spoon bait, but be sure the swivel and the fastenings are all brass, and use extra large, strong hooks. Sea water will spoil steel very soon, and we once lost a half-crown spoon and a ten pound bass, simply because a steel split ring had been used. If you cannot get brass fittings make shift with strong fittings of your own make. Spin the bait from a boat going slowly through a shoal of bass; you will generally find bass where you see a flock of sea-birds hovering over the sea, as both bass and sea-gulls are after the small fry. You can also take bass with large gaudy fly. For mullet fishing, see recent articles in the GAZETTE.—ED.]

FISHING AT ELSTREE RESERVOIR.

SIR,—On August 8th I had a few days' fishing at Elstree Reservoir, Herts. The first three days I did very little, in consequence of the inclemency of the weather, but Thursday turning out a fine day, I had much pleasure in taking six golden tench, one scaling 4 lb. 3 oz., a perfect picture. The gross scaling weight was 14 lb. 6 oz. A friend who was with me took two golden tench, one scaling 3½ lb., the other 3 lb. 6 oz. I am quite satisfied there is plenty of good fish there, and some excellent sport to be obtained later on.—I am, &c.,

18, Crogsland Road, Haverstock Hill, N.W.

J. W.

THE "ANGLER'S MUSEUM," &c.—FISHING IN SPAIN, &c.

SIR,—A copy I have of the "Angler's Museum" (published June 4, 1784), has on the title page, "the whole carefully collected from actual experience by Thomas Shirley." The last six lines of the preface which is signed Thomas Shirley, and addressed Richmond, Surrey, also states that the work is by him. I note that chapter 2, pages 10 and 13, are, for the most part, taken from Bowler; at least so I conclude, having only a recent edition (1839) of the latter by me, of which compare pages 6, 7, and 8 of the preface with page 12 of the "Museum." I have not met with any quotation or mention in the "Museum"

(bearing date of 1623) of the "Country Contentments." The following from the "Angler's Museum," about roach-fishing, may prove of interest to Trent anglers.

"There is another excellent bait for a roach in the winter which is a white worm with a red head, about the bigness of a cod bait (query, the grub of the cockchafer) to be found after the plough soil upon heath or sandy ground, or turning up the green sward of fresh land. I myself have taken with this bait, in the river Trent, 30 lb. weight in a morning; the roach in that river run to a large size: from three quarters of a pound to a pound and a half in weight. When you use this bait, bait the places you intend to fish, with stewed malt or fresh grains. This is the best bait for roach and dace known of, except maggots or gentles."

Is this bait in use now in the Trent?

FISHING IN SPAIN.

In answer to your correspondent M. S.'s enquiry, I should say there would be little river fishing now to be had in the North of Spain. The best months for salmon and trout being May and June, and to ensure sport particular flies should be taken.

As regards sea-fishing, the market place of Santandel was always well stocked with fish, more especially bonito, these, if caught by a strong jack rod with an imitation sand-eel or large spoon bait, would give capital sport, but it would be necessary to go out in one of the fishing boats to obtain it. At Bilbao, very large mullet are caught, and the natives are always fishing in the tidal portion of the river. I am obliged to R. Norman for his answer about a yacht for the Broads.—I am, &c.,

A TOWN ANGLER.

August 20.

P.S.—M. S. by writing to Mr. Curling (English Café), Calle de Jos Fueros, No. 10, Bilbao, would receive all information as to the tidal fishing at Bilbao, and would be lodged, &c., cheaply and well.

FISHING IN NORFOLK.

SIR,—Two young friends have been staying here a fortnight, and very much enjoyed some fishing trips. They went to Beccles, Stalham, Walsham, Oulton, Fritton and Wroxham, and much prefer Wroxham to all, but having to leave so early is a great nuisance; if not, they must take a ticket to North Walsham, and get to Yarmouth after 10 p.m. The train from Wroxham was altered a few years since, and I think might be so again, to catch the Yarmouth train leaving Whitlingham at 9. Passengers from Cromer and Reepham could leave those towns a short time earlier, as there are now only a few minutes at Whitlingham Junction before the Yarmouth train arrives. The station officials are remarkably civil and obliging, and it is a great pity the old line should lose passengers for want of a little good management; but you must now leave Wroxham at 7.8, and then stay at Whitlingham more than 90 minutes.—I am, &c.,

Yarmouth, August 25.

PISCATOR.

PERCH FISHING NEAR DAVENTRY.

SIR,—Having some friends in Northamptonshire, and hearing of the extraordinary perch they sometimes take in the reservoir near the old town of Daventry, I was induced to try my hand as a disciple of Walton and a lover of the gentle art.

While there I had but little sport, wind not quite the thing, water too bright and weedy.

With the exception of a few fine tench between 3 lb. and 4 lb. each, two or three jack, the largest about 5 lb., my take was but small.

I came away much doubting the existence of the large perch that I had dreamed of before my holiday.

On my leaving, and wishing me good-bye, my friend said, "Never mind, old boy, I will soon catch one for you and send it up," promises, I thought, like pie crust, soon to be broken, and as soon forgotten. But three days after my arrival home, strange to relate, the promise came true, for I received a box, and, enclosed, the perch I had often dreamed of, caught by my friend, weight 4 lb. good.

Such a grand fish, and in splendid condition, taken with a worm and very fine tackle, making desperate efforts for dear life, but grassed at last to the great joy and surprise of my worthy friend, he never having taken one weighing so well. It was caught in a lake belonging to Sir Charles Tempest, of Ashby Lodge, near Daventry; my only wish that I may do likewise.

The fish is sent for stuffing, and soon I shall have much pleasure in showing it to admiring friends and lovers of the gentle art.—I am, &c.,

E. H.

August 20.

FISHING NEAR BUSHY PARK.

SIR,—I have taken in the FISHING GAZETTE from the very first, but have not before troubled you with any letters; but seeing the above in your's of this week, and as no one has fished more in the unenclosed waters than myself, I therefore answer the above. Fish in the Bushy waters are jack, from very small up to about 12 lb. (twenty-five jack have been had this summer), small chub, very large rudd and carp, tench and roach; but, being over-fished, fishing far from good. Best bait gentles and lobworms. Chub take Pennell's fly, the Sweep (well). I could name each different pond where each fish is to be had, but think it best not to do so. Orders to fish are to be had of the First Commissioner of the Board of Works, but only in February. All orders for this year are out. I enclose my card, and am, &c.,

J. E. R.

Teddington, August 22, 1881.

FISHING IN THE WAVENEY.

SIR,—The angling visitors from the "big city" seem to be having very good fortune this year along the Yare and Waveney, the takes of fish being larger than for some years.

The broads and rivers are just now in excellent order through the late rains, the only fear being that we may have too much water instead of too little, as was the case a month ago.

I had a capital piece of sport among the roach and rudd last Friday afternoon and evening. Having obtained from Mr. King a 6d. packet of his natural bait, after reading your note of it in the GAZETTE of the 13th inst., and tested it beside the ordinary biscuit paste, both white and red, and found I could take with it two fish to one with the latter kinds, I fished one of my favourite swims, about 200 yards below the railway bridge over the Waveney at Somerleyton,

being at it from 3 to 7 p.m., and making only one move a little lower down during that time.

In four hours I took 19 lb., chiefly of roach, very few being less than 8 oz. each, and all in splendid condition.

I intend, if possible, to have an early morning shortly among the big bream that lie so cosily just at the entrance to the Dyke at the top of Oulton broad, when I trust to do great execution among the broad-sided fellows.—I am, &c.,

ERNEST BURROWS.

3, St. John's Buildings, Fitzwilliam Square, Great Yarmouth,
August 22.

A NOTE FROM L. B.

SIR,—At the eleventh hour an important business engagement prevented my friend who was to have gone with me to East Anglia from doing so, and, unwilling to break fresh water totally unknown, alone, I have been reluctantly compelled to forego my long-anticipated pleasure until next summer.

My two days with Mr. P. Geen after Thames barbel at Chertsey did not altogether result in the grand take we had hoped for, my total take, principally barbel, with a few roach, dace and a small chub, amounting to some 27 lb. I have since been down to Littleport, Cambridgeshire, for some days, but with very meagre results—so meagre that I left it, and am now at Elstree for a couple of days, having heard that the tench were fairly on. On Sunday, my brother club members, Messrs. Underwood and Aldis, securing some 60 lb. between them; several of the fish over 3 lb. and a well-fed jack of 6 lb. I am too tired and stiff to settle down to writing notes this week, besides having very little matter, as I have had no opportunity of gleanings. I will, however, send you an extra dose next week, with a little article on our two days' barbeling at Chertsey, which, although the sport was poor, were by no means altogether uneventful.—I am, &c.,

LEO BONVOISIN.

Elstree, Herts, Aug. 24.

HOW ARE TENCH CAUGHT?

SIR,—Until three weeks ago I was in ignorance of the existence of such a valuable weekly as the FISHING GAZETTE, a journal which deserves to be better known. I hope in future to glean some useful knowledge from its pages, and shall be pleased to learn what are the best baits and the best method of fishing for tench.

Withamites cannot boast of such aristocratic gentlemen as trout, grayling, barbel, etc. We are, nevertheless, well content with our tench, bream, roach and pike, fish possessing beauty enough for the angler who has never bagged superior. We get old Isaac's disciples from Sheffield by the train load, and natives, believing in the early worm theory, ply the rod galore, "Ere Phœbus 'gins to rise," but the captured tench are, like angels' visits, few and far between. Odd ones are secured now and again. On the 19th inst., I saw a brace of nice fish, going 2 lb. each. Yesterday Mr. W. Arnall, a Sheffield gentleman, had the luck to grass two brace, from 2 lb. to 2½ lb. each, and another Sheffielder landed one at an adjoining swim of 3 lb. In each case maggots fat and yellow proved the *pièce de résistance*. Single fish are the rule. Seldom do we hear of two brace falling to one rod, and Mr. Arnall may be congratulated upon having scored a poser for his *confreres*. The fish are here, and no mistake about it. I have seen as many in a swim as would have filled a bushel measure. But catch him—there's the rub; sly as any fox is he! A wrinkle or two from the pen of Mr. Keene would be relished by others of your Boston subscribers besides

R. H. F.

Boston, Lincolnshire.

We forwarded your letter to Mr. Keene, and he replies as follows:—

"Tench are very carp-like in their wiliess, especially when large, and the utmost circumspection is therefore indispensable if the angler would have good sport with them. By this I mean that, after the whereabouts of the fish are discovered, on no account should the angler allow himself to be seen or heard. Being ground feeders, they are curiously susceptible of reverberation, and though a heavy tread will seldom scatter them, it nevertheless will often have the effect of rendering them impervious to the seductions of any lure. This I have repeatedly observed. The sight of a human being will invariably have a similar effect. Let the first axiom in tench-fishing, therefore, be extreme quiet, and absolutely no approach nearer than half-a-dozen yards to where the fish are known to be.

"Now as to tackle. I always use the Nottingham style, *i. e.*, 'fine and far off.' Having ascertained the exact depth, begin baiting with chopped worms, not too many—say a pint. These are easily chopped up with a spade on a sack. Bait at dusk for a couple of nights. Use the finest gut, and a medium-sized hook, with no shot near it. The float should also be of the lightest. The bait is a well-scoured dew-worm or cockspur, and should be allowed to lie on the bottom, and only occasionally and gently moved. Whether in a stream or a lake this is the soundest mode of fishing. The tench takes the bait standing on its head, as it were, so give it a little time after the first movement of the float before striking.

I can say, with the certainty born of experience, that this procedure and bait will always produce good results. Some fishermen throw in an unspeakably nasty mass of grains, blood, &c., and fish with lumps of coagulated blood. This *will* take fish, but it is uncertain. I prefer the tail of a well scoured lob-worm, or a coral-hued cockspur before all such baits. Let R. H. F. try my method, strictly attending to the quietude part of it, fishing early and late, and report the result.—J. HARRINGTON KEENE.

THE FENCE MONTHS.

SIR,—My good friend Mr. Keene's equanimity seems to be considerably disturbed at one of your correspondents having had the "courage to express his convictions," whilst, at the same time, allowing his identity and position to be open to recognition. Now, Mr. Editor, your correspondent in this case much preferred a *nom de plume*, but at your special request rejected the pseudonym, and certainly thought he was as much entitled to show on what grounds he might advance his opinions, as possibly having some weight, as were his opponents to append to their signatures such terms as "secretary," "treasurer," &c., to various associations, in order to give full force to their statements, which, emanating from unknown individuals, without such goodly titles, would otherwise have been deemed ridiculous. Therefore, I approach Mr. Keene, in this matter, with all "hope, love, patience, humility, strength, courage, placability of mind (*i. e.*, contentment) and memory." Alas! "faith," I have little, as relating to the wisdom and capacity for reformation of my opponents, who, at least in Mr. Keene's case, with liberal reciprocity, likewise withhold from me

the attributes of "knowledge." This being the case, I must deal with the wayward children leniently, tenderly, but firmly. And now, Mr. Keene, let us dispense with your so-called inflated wind-bags, and endeavour to discover if, in the five paragraphs written for my rebuff, there is a single argument brought forward, supported by proof or probability, to shake my position. The first of these five sections needs no further comment. In the second, we find my opponent laying claim to his being the first propounder of the statement that a river can be "fished out," when the whole of the recent legislation has been based on the presumption that a river can be "fished out," and that this result is in a great measure due to the action of the rod. On the other hand, I must point out that "The Raven" distinctly stated, long before entering this controversy, that he defied the rod to produce such a result, and it matters not whether "The Raven" is or is not identical with myself, as Mr. Keene suggests. I, however, endorse that experience; and challenge Mr. Leo Bonvoisin, Mr. Geen and Mr. Keene, whenever they make statements as to facts or deductions from such presumed data—presumable only, because, in my opinion, the results of hasty conclusions and imperfect knowledge—to give details of the circumstances, so that opponents may be brought to see the errors of their ways, if erroneous, and relent, if having tenaciously persisted in being an obstruction to truth. The allegation, therefore, that I made an unjust assault on "Creel"—in whose various contributions I have felt much interest—is not a fact. I did not for a moment insinuate that "Creel" had misstated primary details, but I ventured to decide that his deductions from the possibly true premises, were absolutely fallacious, having myself lived in the districts named, and knowing not a little of the capabilities of the streams and the influences which affect them. However, I was so far diffident as to my own knowledge, that I did not wish the public to take my opinion for granted, but offered to meet the experiences of my opponents by my own, so that others might be able to judge for themselves whose deductions were the most fallacious. I did not claim, on the score of being a man of Science, a quondam Conservator, or an angler whose fly-fishing diary can present a record of almost unbroken success in many waters and at all seasons; I did not do this, as seems now to be claimed for some of my opponents. I merely stated that most of the assertions of my antagonists were incorrect, betraying, on the whole, gross ignorance of piscatory matters. I challenged them to prove their allegations; but, not being able to do this, they meet me with a new corps elect, an organisation perfectly novel in warfare, a legion of honour for which I was wholly unprepared. I am told that my opponents are "gentlemen," and that, therefore, whatever their vain conceits, these must be taken as absolute fact. Mr. Keene, this argument lay hidden in the breasts of controversialists till your own acute faculties brought it to light; but how will you meet the case, in which one gentleman says one, or thirty, if you like, rivers, are positively "fished out by the rod," and in which another declares with equal vehemence, such is not the case? "When Greek meets Greek, then comes the tug of war." In fact, the argument as to one's being a gentleman—a fortuitously happy circumstance, when it is found convenient to shirk the onus of essential proof—is worthy of Mr. Keene. However disposed, therefore, to accommodate myself with placability of mind to the views of my opponents, that tendency of the advocates of a close season as launched against the rod fisher, to repudiate the proofs necessary for the establishment of their case, is one which cannot be ignored or permitted; and I again challenge my opponents to give proofs of the facts which severally lead them to form opinions on piscatory matters. I am prepared to demonstrate in what respects these are incorrect, inasmuch as they have any relation to my own piscatory experiences, whilst there are no doubt others more competent than myself to fill up those blanks which otherwise must be left untouched relating to districts or departments where my investigations have not been so complete. This defiance, I give, not as a challenge to my opponents to take on myself personally the task of rebutting all they have to say, or, as a champion representative of all who hold views similar to myself, but as necessary for the vindication of my own craftsmanship; for there are many of great experience and more mature years, who have convictions similar to my own, who can argue soundly and convincingly, in a manner, perhaps, more suited to the delicate susceptibilities of their opponents, whose practical knowledge should speak for itself, and not through me or any other individual as a representative spokesman. Some of these have already advanced their opinions strongly, amongst whom appear, first and foremost, yourself, Mr. Editor, also your correspondents "Ruif," "The Trent Otter," Mr. B. J. Whitaker, Mr. J. Gregory, Mr. Alfred Palmer, Mr. E. Bicknell, Mr. T. Malcom, and many others; who, wholly, or in general details, support the position taken up by yourself, Mr. Editor. On the grounds, therefore, already mentioned, I must meet Mr. Keene and ask him, as I have already asked "Creel," for the names of the "private waters" and the nature of "the other minor causes," which have depleted them to such an extent as to render sport comparatively "nil"; the question being one of direct cause and effect, as sifted out by careful reasoning and thorough knowledge of angling, natural history, and the ways of men, especially poachers, and therefore not one to be decided by any gentleman's *ipse dixit*, but requiring public discussion. That this exposition of the case is true, in fact, must call attention to the third paragraph which Mr. Keene devotes to his consideration of me. In this paragraph, I am charged with very inconsistently putting an algebraical problem to L. B., "which has no relation to the subject in hand at all;" so runs the allegation. Well, dear Mr. Keene, it is well mine enemy has been the instrument of his own destruction, having impaled himself on my weapon without my letting drive. I am truly glad to find that two out of three of the only opponents that put in any decent fighting appearance, discard all the trouble of ascertaining, even approximately, the number of breeding fish left in a river at the spawning season—in fact, the one, the only vital fact of any moment in solving the question at stake, and on which legislation should be based. Ignorance was not attributed to Mr. L. B.'s statement, but to the fanciful expressions he used and ecstatic inferences he drew therefrom, palming them off as logical deductions to the readers of THE FISHING GAZETTE. A little rhapsody is, no doubt, enlivening at times, but it should have a rational basis. In the fourth paragraph dealing with me, I am charged with vagueness; as it happens, nothing which Mr. Keene quotes, as if in substantiation of the charge, is vague in the slightest; although the printer accidentally, in a part not quoted, inserted a dash in the wrong place, which, of itself, was sufficient to make the reading vague, yet the context shows plainly where the dash should be. Now, if Mr. Keene is so dull as not to comprehend the meaning of the paragraph to which allusion is made, and which relates to the numbers of fish in rivers and ponds of England, Wales, Scotland and Norway, I must inform him now the facts stated were meant to imply that wherever I had been—to whatever countries or districts I had directed my steps—I had always found these waters afforded good fishing, provided only poachers, the refuse from manufactories, and injurious draining, were not inordinately present. After a few comments, Mr. Keene admits the truth of all the statements made by me, but takes exception to what he calls my "windbags of bombast." If this gentleman means to say that it is by such "pin pricks," such

logic as that which I shall proceed to quote, that vapid inflations will be dispersed, I fear it is his own "windbag" theory will be the subject of dissipation. Here are Mr. Keene's own words: "The Thames has furnished good sport for a very long time, but that does not argue that it will stand the strain of the last few years," &c. Here, after we have heard lately so much of the exhaustion of the Thames, we find this exhaustion is not an actual entity, but a prospective forecast grounded on no data more reliable than those supplied to us by Mr. L. B. for the solution of his problem relating to *x*. Then, Mr. Keene, after quoting some of my words, adds: "When you do this, Mr. B., in one out of ten of the streams of England, you can prove you are right as to the stupidity of our complaint anent over fishing." In answer to my opponent, I can reply that the great point of debate seems to relate to the fishing in the Thames, and a few other rivers where coarse fish abound, as this gentleman's party have not been able to make out the shadow of a case against trout streams. This being the case, I named a few of the principal rivers where I had fished, and in which coarse fish are known as being, according to my practical experience, abundantly present. A printer's error, however, converted Yore into Yare. In relation to Mr. Keene's quotation, I must add that I have seen the proofs of abundance of fish, given in the passage quoted; that this passage had special reference to the Cam and Ouse down to Ely, besides this, to the Thames, including its waters from the Brent and Brentford, to Mapledurham, as also the Kennet, from Reading to Hungerford. I have seen the things in absolute reality, in these rivers, which Mr. Keene is pleased to represent collectively as an ideal picture taken from the happy hunting grounds of the blest.

Turning to Mr. L. B. and his remarks relating to the qualifications of my opponents as anglers, I can only assure him I shall be as glad as he to yield them praise for the presence of such endowments, so soon as they shall have given adequate evidence of its existence by the appearance of manly and logical argument in the columns of THE FISHING GAZETTE. I have been doing my utmost to incite them to do this, to goad them on. Mr. Keene might suggest, but no sign is manifested. Until the dawning of this heretofore occult effulgence, I think I may justly be pardoned for being faithless as to its existence.

ROBERT BALDERSTON.

CLUB REPORTS.

AMICABLE BROTHERS' ANGLING SOCIETY.

Mr. Say, one jack from the Arun, 2 lb.; Mr. Moir, bream, 4 lb. 7 oz., from Dagenham; Mr. G. Carrington, roach and dace, 4 lb. 8 oz., from the Lea; Mr. Farebrother, roach from Waltham; Mr. Patrick, roach and dace, 3½ lb.; Messrs. D. Thorpe and W. Wood, roach. The members are requested to attend the club house on Wednesday, 31st, to arrange the prizes left from the last match, where to be fished for.—WORLDLEDGE.

August 21.

BERMONDSEY BROTHERS ANGLING SOCIETY.

The Bermondsey Brothers fished their second series of prizes on Sunday last, at Amberley, but the take of fish was very meagre.—W. ALLEN, sec.

BRIGHTON ANGLERS' ASSOCIATION.

Nothing of any importance whatever has taken place during the week, except Mr. Anscombe hooked a fine carp in the Ouse, but could not bank him, his tackle being very fine, his only pleasure being to see him. Twenty-one members pegged down on the 21st, but owing to the wind and rain no fishing could be done with any pleasure, consequently not a single fish was taken, and the prizes will be a subject of consideration for the committee to decide as to competition on some more suitable day. The anglers' beanfeast takes place on Saturday next at West Grinstead.—GROUND BAIT.

August 23.

BRISTOL GOLDEN CARP ANGLING ASSOCIATION.

The annual general meeting of the above association was held at the White Hart Hotel, on Thursday last, under the presidency of Messrs. F. C. Morris and J. Haddon. The chairman (Mr. F. C. Morris) in opening the meeting said he was glad to say that the association was in a flourishing condition, and alluded to the work of the committee for the past twelve months. They had a most expensive and troublesome time of it in trying to obtain fishing waters for the association to preserve. Still, they had not tried in vain, for they had secured about six miles of good fishable water within a reasonable distance of Bristol, viz., from Grosvenor Suspension Bridge to and in the meadows belonging to Mr. Collinborne, at Bathampton. Great praise was due to Mr. R. D. Frost for the able manner in which he had worked for the association. Mr. Frost having thanked the members for the kind manner in which they had received him, assured them that he had worked very hard and would still continue to do so to further the interests of the association. The vice-chairman (Mr. J. Haddon), after a little discussion, called on the secretary to enlighten the members as to finance, which proved very satisfactory. The auditor then gave his report, stating that all accounts were examined and found correct. The chairman then called on the members to elect the officers for the ensuing year, which resulted in the president (Mr. F. C. Morris), vice-president (Mr. J. Haddon), secretary (Mr. L. Wride), and treasurer (Mr. W. Leigh) being re-elected. The greater portion of the committee were re-elected, the vacancies being filled by Messrs. Inch, Wethers, Pillinger and Wheeler. Messrs. Inch and Cornish were elected as auditors. A vote of thanks was passed for Messrs. Inch, Julian and Frost for their kindness toward the association. It was then proposed that there should be four general meetings during the year, viz., the last Monday in March, June and December, and the annual general meeting on the second Monday in August. It was also proposed that the association should not exceed their number (viz., 200). The committee will meet to revise and add to their rules on Tuesday next. New tickets will be ready for members on September 1.—LEWIS WRIDE, hon. sec.

Digby House, Barton Hill, Bristol.

P.S.—Mr. J. Inch will attend the club house every Saturday evening to weigh members' fish caught on the association waters.

CITY OF LONDON ANGLING SOCIETY.

The following members weighed-in fish on the 21st:—Mr. Strong, bream and chub from the Wey, the largest bream 1 lb. 11 oz.; Mr. Castell, roach from the Colne, and perch from Elstree; and Mr. Chambers, roach from the

Roding. Our annual distribution of prizes took place on the 18th, the following being the most successful:—Mr. Castell, seven prizes, including the gross weight for seventh time; Mr. Mortimer, six, including the prize for the largest roach, weight 1 lb. 11 oz.; Messrs. Hales, Plumstead, Perry, Martin, Head, Winterborne, and Chambers also had several prizes, each chiefly money, but we had a good show of useful articles such as copper kettles, tea sets, tackle, fishing boxes, &c.—CAS.

DUKE OF CORNWALL ANGLING CLUB.

The next return visit (No. 1 visiting list W. C. A.), will take place at the Wheatsheaf, Lismore Circus, Haverstock Hill, on Tuesday, August 30th, when the Cornwall Anglers will be pleased to welcome all friends, and promise them an enjoyable evening. Every convenience to return trains; busses and trams from the door to almost every available place in London.—A. CLARK, sec.

THE EXCELSIOR ANGLING SOCIETY.

The members of the above were out on Sunday last, the most successful being Messrs. Smith, Blackman, Tudenham, S. Gay, and myself. The former gentleman having a handsome tray of roach, dace, chub, and perch, about 14 lb., a very handsome fish of the latter weighing close on 3 lb. Mr. Blackman, jack and chub; Tudenham, roach; S. Gay and myself, bream and roach.—A. THOMAS.

GOOD INTENT ANGLING SOCIETY.

We had a capital show of fish at the club on Sunday last. Mr. Maybury, roach; W. Wheeler, dace; E. Pluckrose, bream, roach and perch, J. Gadbury, roach; K. Murphy, trout and dace; Mr. J. Hadkiss brought in a tray of fine bream and roach. The members held their annual dinner at the Rye House on Monday last, 85 sitting down. Mr. Teale giving every satisfaction. The poultry and meats were of the finest quality, and in fact everything was of the best, for which a hearty vote of thanks was accorded to Mr. Teale for the manner he catered for us. After the cloth was removed, the usual loyal and patriotic toasts being heartily drunk, the chairman, Mr. H. Courcha, gave prosperity to the Good Intent Society. Mr. Murphy, in responding, said it afforded him much pleasure to respond on behalf of the Good Intent Society, seeing that we were making steady progress both in funds and members. It must be a source of great satisfaction to every member to know there was in the bank, belonging to the preserving fund, £50, and the general and benevolent funds were also in a sound position. The number of members, both honorary and paying, at the present time is 140—received with great applause. Mr. R. Ghurney made a favourable appeal on behalf of the Anglers' Benevolent Society. Mr. S. Morgan returned thanks on behalf of the Central Committee. Mr. Murphy for the West Central, in the absence of Mr. T. Hoole. The weather being delightful, a most happy day was spent.—R. MURPHY.

P.S.—Please send your report to 12, Fetter Lane, in future.—ED.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

The following members weighed fish on Sunday last. From the Stort:—Mr. H. Smith, 1 lb. 3 oz. of roach; Mr. Butler, 1 lb. 3 oz. of roach; Mr. Baker, 1 lb. 8 oz. of roach. From the Wey:—Mr. Theobald, 10 lb. 12 oz. of bream and roach, one splendid fish 4 lb. 13 oz.; Mr. J. K. Fitch, 1 lb. 12 oz. From Amberley:—Mr. J. Fitch, 7 lb. of bream roach and dace; Mr. Young, 1 lb. of dace from the Lee. The concert for the benefit of Mr. C. Perkins was a great success.—J. A. FITCH, sec.

August 23.

GRESHAM ANGLING SOCIETY.

This society held their weekly meeting at 19, Throgmorton Street, E.C., on Thursday evening. Captain Alfred in the chair. Mr. E. Bennett produced two fine dace from Thorney Broad, and Mr. Jardine arrived near the close of the evening with a magnificent trout (*salmo eriox*) taken by himself in Lancashire, and weighing nineteen pounds, which excited universal admiration. This is the finest specimen fish yet shown at the society's meetings, where all weighed-in have been of an exceptional character, there being no desire to accept any of the ordinary standard. The Gresham is steadily increasing in influence and numbers, and it is now proposed to exact an entrance fee for new members balloted for after the close of the present month.

HAMMERSMITH UNITED.

The takes during the past week have been numerous but small. The excursion by road to Shepperton took place on Sunday last, but the rain sadly interfered with the day's enjoyment. A sweepstake was got up, and, as usual, Mr. Hoole had the largest show. Returning home, a bundle of rods and an umbrella were either stolen or lost from the waggonette, between Shepperton and Richmond Bridge; any information concerning them will be gladly received by Mr. H. G. Penney, 37, King Street, Hammersmith.—VORTEX.

August 23.

HOXTON BROTHERS ANGLING SOCIETY.

The annual dinner will take place at the Rye House on Sunday August 28th, at two o'clock sharp. Members will oblige by informing me if we shall have the pleasure of their company, so as to enable me to arrange accordingly.—R. GHURNEY, sec.

IZAACK WALTON ANGLING SOCIETY.

Mr. G. Manning had bream and roach on Sunday the 21st; Mr. W. Auburn had roach on the same day. Mr. J. Hilliar, sen., had 5 lb. 4½ oz. of bream on Wednesday, 24th inst.; Mr. J. Hillier, jun., had 6 lb. 14½ oz. of bream and roach on the same day. Three special prizes will be fished for on Sunday, September 11th, 1881, in the Stort between Burnt Mill and Harlow Mill. Three special prizes will be fished for on Wednesday September 14th, 1881, members to choose their own fishing water. No competitor to leave London before 5 a.m. on the mornings of the competitions; all fish weigh.

LITTLE INDEPENDENT ANGLING SOCIETY.

No good luck yesterday, although last evening our table presented a pretty show of all sorts. Mr. E. Barr caught a fine bream at the Harp, scaling 5 lb. 2 oz.; Mr. Harwood, roach, &c., 3 lb. 9 oz.; Wightman, ditto, 1 lb. 13 oz.; Scott, ditto, 1 lb. 13 oz. The following members likewise weighed-in:—Messrs. Heelas, Watts, Humphreys, Petrie and H. Moore.—W. BROWN, hon. sec.

August 22.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

Several members of the above society were well to the fore again on Sunday last. Messrs. Long, Gorsuch, J. and G. Drew, Parker, with roach, perch, dace, and chub from the Thames. Mr. Neagus, with a good show of roach from the Stort, Mr. Lucy, jun., with bream; Mr. Lucy, sen., jack; and Mr. J. Burke, with a handsome perch, weighing 3 lb., from Pulbore; Mr. Obbard had also a good take of roach and dace.—J. W. LUCY.

Aug. 23.

PECKHAM BROTHERS ANGLING SOCIETY.

The prize given by Mr. Gendle was fished for on the 13th inst., and most of the club turned out on the occasion. Mr. Duke had a pretty jack from the Thames at Hampton, and the other competitors had fair takes; the prize being won by Mr. Page with a nice basket of bream and roach from Woking. The first club match of the season will take place at Staines on the 28th inst.—W. M., sec.

ST. JOHN'S WOOD PISCATORIAL SOCIETY.

On the 16th inst. some sixteen members of the above society took part in a roach competition at West Drayton, for three prizes, presented by the following gentlemen (honorary members):—Mr. Roebuck, Mr. Hain, Mr. Turner; but owing to the unfavourable state of the weather very few fish were taken. Upon the members arriving at the club house much excitement was caused when the fish were weighed-in, as several of the members were within half-an-ounce of each other, though, when the return was given, Messrs. Harris, Bridge, and Bollington were the most successful, in the order named. Messrs. Riley, Salmon, Blackmore, and Manley also weighed-in. The last-named member landed a very fine perch.—J. EDWARDS.

STOKE NEWINGTON ANGLING SOCIETY.

We had a good muster of friends of members again on the 21st, but nothing extraordinary as regards catches of fish, although the exhibition proved better than the previous week. The following being the result, as weighed-in: Mr. T. Gretton, 5 lb. 1 oz. roach and bream; Mr. Ed. North, 3 lb. 5½ oz. roach and bream; Mr. E. Marrow, 10½ oz. roach; Mr. T. Millington, 9 oz. perch; Messrs. Webb and Robinson just saving a blank. A friend of the society exhibited 2 lb. 3 oz. roach. We have a complimentary visit next Tuesday, intended visitors will please note the address of the Club-house, the Crown Tavern, Mayfield Road, Dalton, one minute from Haggerston Station, on the North London Railway.—THOS. GRETTON, sec.

August 22.

SURREY PISCATORIALS.

On Wednesday evening Mr. Beckett exhibited nearly 22 lb. of roach, dace, and chub, some of the roach turning the scale at 1 lb. 7½ oz. The 31st being the fifth Wednesday in the month, all members are requested to attend the head quarters to discuss as to how and where the following prizes given to be competed for on the 14th of September shall be contested: 1st, silver cup, valued at £10 10s., given by the following gentlemen: Dr. Carpenter, £5 5s., and Messrs. Banskack, Beckett, Clarke, Duck and Whitby, £1 1s. each; 2nd, £5 5s., given by Messrs. Pugh and Murray; 3rd, £2 2s., pair of boots, given by Mr. Boalch, 4th, £1 1s. by Mr. Sutcliffe. In reference to my report of the 13th, anent Mr. Hoblyn, I am extremely sorry if I put that gentleman to any inconvenience by placing his name in the manner I did. The mistake occurred through Mr. Hoblyn's name being mentioned at the time of my receiving the report. Mr. Neal was the fisherman that Mr. Pugh was with on that day. Gentlemen wishing to have a day's outing in the neighbourhood at any time will do well to drop him a line.—PIXIE.

Aug. 25.

UNITED LONDON ANGLERS' CENTRAL COMMITTEE.

The dinner of the delegates and friends of the above will take place on September 11, 1881, at the Rye House. Angling to commence at 10.30 a.m. Fish to weigh-in the Rye House Gardens at 5 p.m. Dinner on table at 5.15 p.m.

N.B.—Members who have not already given their names will oblige by forwarding the same to the secretary not later than Monday, September 5, 1881. Dinner, 3s. each. The late secretary (now president) of the Kenton Angling Society has generously given three prizes value £1 each, and several others are expected, to be competed for on the day. Train from Liverpool Street, Bishopsgate, Bethnal Green and Hackney Downs at 8.45 a.m.—R. GHURNEY, sec.

10, Baches Street, Charles Square, Hoxton, N.

WALWORTH WALTONIANS.

On the 21st several members of this society visited Richmond, Ware, Colchester and various other places, in hopes of getting a good take of fish during the day, so as to enable them to have a chance of saving "F. Grigg's bacon." Mr. Boalch, out with C. Brown, of Richmond, headed the list with 10 lb. 4½ oz. of roach, dace and barbel; Mr. Bayley came next with 6 lb. 8 oz. of roach and dace from the bank; Mr. Hunt, H.M., introduced his maiden show of 3 lb. 9½ oz. of roach and dace from Richmond. In consequence of the heavy rain that fell Messrs. Bedford and Cain consulted a well-known weatherglass at "Bangoe," which disenabled them from weighing-in any fish.—PIXIE.

August 25.

WALTONIANS.

On the 17th we had a grand show of barbel by Mr. Phillips, 28 lb. 7½ oz.; the same gentleman also had chub, 5 lb. 10½ oz., and a roach, 10½ oz. On the 21st our worthy secretary again made himself first favourite for the society's jack prize, with a fish of 10 lb. 9½ oz., from the Welsh Harp. Mr. Waltham had 6 lb. 2½ oz. roach and dace, Mr. Burton, roach, 5 lb. 4 oz. These were the two best takes next to the jack of Mr. Packman. The following gentlemen also weighed-in fish:—Messrs. Malcom, Roland, Good, jun., Greenfield and Luxton.—A. J. MARRIOTT.

[Please put name of your club in future.—ED.]

August 23.

WEST CENTRAL ASSOCIATION OF LONDON AND PROVINCIAL ANGLING SOCIETIES.

The ordinary meeting of this association was held on Friday, the 19th inst. In the absence of the chairman (who is at present punishing the Finny-uns), Mr. Beckett, occupied the chair, Mr. Murphy being voted to the vice-chair. The minutes of the last meeting, having been confirmed, the hon. sec. stated, that, he had in pursuance of the instructions previously given, communicated with

the authorities of the Great Western Railway, and had received a reply from the superintendent, which he read. He was to see the superintendent on the matter.

It was then announced, that the working committee, had granted a reward of £1 1s. to J. Field, for the conviction of poachers, obtained by him before the Wycombe Bench. Lengthy discussion here ensued, with reference to the paying of rewards. The vice-chairman (Mr. Murphy), contended that it was against the interests of the association, that any delay should take place between the time of application received by the secretary, and the payment of the amount of reward. The matter was well discussed by the meeting, Messrs. Fowler, Noble, Adean and others going fully into the matter. Mr. Murphy ultimately proposed, and Mr. Taylor seconded, "That in future the hon. sec. be empowered to pay all rewards on receipt of confirmation of the conviction; however, the amendment proposed by Mr. Walter, seconded by Mr. Noble, That all questions with reference to rewards be first brought before the committee" on being put to the meeting was unanimously carried.

A reward of £1 1s. was also made to W. Clark for the conviction of four notorious poachers at Reading. The reading of the report of the proceedings in this case was received with marked approval.

Still more poaching intelligence, Mr. Editor, this time from the rivers Arun and Wey. The association, having been asked to try and stop the depredations of poachers in these rivers, has to acknowledge that they have no power at present in the matter, but the hon. sec. received instructions to inquire into the matter and see what could be done.

The roll was then called when the following societies replied:—Amicable Brothers, Bostonian, City of London, Cambridge Friendly, Duke of Norfolk, First Surrey Piscatorials, Golden Barbel, Good Intent, Gresham, Hammer-smith United, Hampstead, Knights of Knightsbridge, Kings Cross United, Marylebone, Norfolk, North-Western, Prince of Wales, Princess of Wales, Queens', Savoy Brothers, Sir Hugh Myddleton, South Belgravia, St. James and Soho, United Brothers, United Marlboro' Brothers, Waltonians, and Westbourne Park Piscatorials, or 27 in all.

A vote of thanks to the chair and vice-chair, brought the business of the evening to a close.—G. TREADWELL.

THE COMBINATION SCISSORS.

MESSRS. J. FOOT and Son, of 329B, High Holborn, London, have sent us a pair of their combination scissors, which combines in one no less than twelve useful tools, viz.:—

1. Button-hole Scissors. 2. Cigar Cutter,
3. Gas Pliers. 4. Nail and Fly-making Scissors. 5. Grooved Nail and Hook File.
6. Wire Cutter. 7. Small Screwdriver for the Winch Screws and Rod Screws. 8. Ink Eraser.
9. Paper Knife. 10. Pen Extractor. 11. Three-Inch Measure. 12. Ruler, &c.

We can thoroughly recommend them to anglers as being by far the best scissors for the fly and tackle book ever invented. They are well made, of good material, and wonderfully cheap. In practice, we have found them to be all they pretend to be, and that is not a little. They can be had nickel-plated, which will preserve them from rust. They are selling by thousands, and it is only because the sale is so large that they can be sold so cheaply.

A CORRECTION.—In our note to "A Curious Coincidence" last week read Exeter for Taunton, which, in the hurry, we confounded with the capital of Devon.—ED.

A CONVICTION AT TUNBRIDGE.—On Tuesday last, at the Tunbridge Petty Sessional Court, before a full bench, of which Mr. J. G. Talbot, M.P., was chairman, Joseph Wynne was summoned, at the instance of the Tunbridge Angling Club, under the 24 and 25 Vic. chap. 96, sec. 24, for attempting to take fish by angling on Lord De L'Isle and Dudley's estate, in the waters of the society. Mr. Gordon, who prosecuted, stated that on Sunday, Foster, the water bailiff, caught the defendant trolling for pike out of bounds; and as he had been several times warned and once convicted of netting, the society felt that they were bound to prosecute the defendant so as to teach him and others that they must not angle as they pleased and when they thought proper. He only asked for a small penalty. The police gave the defendant, who pleaded guilty, a bad character, and the Bench fined him 11s. and 9s. costs, or the alternative of fourteen days with hard labour.

ORCHARD AND GARDEN CROPS.—The crop reports of the *Gardener's Magazine* for the current week are peculiarly interesting. They relate to orchard and garden crops alone, but they are of great importance both as regards the welfare of the body politic and the happiness of individuals. It appears the apple crop is by no means so generally good as was anticipated, and the apple districts are in some degree worse off this year than many places that usually produce but few apples. However, the apple crop, according to our contemporary, is by no means a bad one, and in the ensuing year the importation of this fruit from America will probably reach but a small figure. The pear crop is more partial than the apple crop, and may be described as not much better than half an average, and the same may be said of the plum crop. Of wall fruits there is in most places a fair sprinkling, but from many gardens there are reports of peach, nectarine, and plum trees ruined past recovery by the severe frosts of three successive winters. It appears there is an abundance of all kinds of nuts and vegetables, and potatoes are quite satisfactory.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[Advrt.]

A COY "BEAUTY" TO BE BAGGED.

BY YE PILGRIM FRY-ER.

THERE is a big Kennet trout—some say he weighs 10 lb., others 12 lb.—waiting to be caught in the river at Newbury. All the local and a few stranger-anglers have tried their best to fascinate this coy "Beauty," but hitherto in vain. Here, then, is a chance for an expert rodsman not often met with, inasmuch as there is for certain the big fish to be caught, if only the lure, combined with tender handling, should be sufficiently inviting. It would indeed be well worth the while of some expert London trout anglers (for time presses), the moment they get their copy of next Saturday's FISHING GAZETTE, to take the first train at Paddington, then obtain trout tickets from the Secretary of the Local Angling Preservation Association (Mr. Cosburn), and try to insinuate themselves into the good graces of the coy "Beauty" that still remains to be wooed and won. Kennet trout are stay-at-homers. They couldn't find better quarters, if disposed for travel. But has some cook really taken under her loving care this persecuted beauty by slyly slipping a few tit-bits down a water-side kitchen, and thus made Master "Spots," sen., as difficult to please as a Courtly epicure? The capture of this fish in fair fight (with half-an-hour of exquisite delirium thrown in), might prove the epic of a lifetime, more especially after the repeated failures of the locals. Has that cheery, excellent "all round" sportsman, Banker Slocock tried the good old Berkshire bait upon this fish? Or Honest Thomas Newton; or that venerable, life-long sportsman, Stephen Hemsted, M.D., and his sporting son? All these gentlemen know a trout from a tadpole; and had each and all cast their baits upon the Kennet waters, and found them return after many days, big-fishless?

Talk about your Thames trout costing (*when caught*) 10s. per pound to the angler, why here is a ten or a dozen-pounder waiting to be captured, that might not cost a quarter that sum to a London or south country angler. If this very popular season of 1881 should pass without this fine fish being bagged, it won't say much for modern trout anglers. If any freshwater fish was ever worth buying a whole "side" of Berkshire bacon for, this is the one. The very choicest, pinkiest bit cut out of the mellow fat, might perhaps lure this "beauty" to his legitimate destiny—the creel of a proud and delighted angler.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

SUDDEN DEATH.

Twit-twit-twitter, all the merry morning through—
Twit-twit-twitter, from the twisted apple-tree.
Little nest among the blossom, little eggs of speckled blue,
Little mate, brown-breasted, brooding o'er them, one, and two, and three.
Twit-twit-twitter—just a little singing bird,
Just a handful of brown feathers,
That had chirped through winter weathers,
And a little heart that beat beneath the downy throat it stirred.
Chip-chip-chirrup, where the garden-beds are green—
Just a minute's crash and terror—just the firing of a gun—
She may wait and she may weary, little mate, the boughs between,
For flight of his to flash across the blossom and the sun.
Chip-chip-chirrup, just a blood-bedabbled breast,
Just a tuft of down and feather
Clinging piteously together,
And a small brown thing that never more will sing beside a nest.
MAY PROBYN.

Angling is a rest to the mind, a cheerer to the spirits, a diverter of sadness, a calmer of unquiet thoughts, a moderation of passions, a procurer of contentedness. It is like the virtue of humility, which has a world of blessings attending upon it.—*Sir Henry Cotton.*

THAMES WATERFOWL.—I should like to say word or two on behalf of the waterfowl (other than the far too numerous swans), bred upon and near the Thames. As soon as August 1 is come, some men are never happy unless they have got their breechloader along with them in the boat. Why should every poor moorhen and "runner" be slaughtered by these people? There used to be good wild-duck shooting at Great Marlow. Are some of the fowl killed by mere strangers waiting in ambush for the strong "flappers" after dusk? If I owned the ait thereabouts, I would certainly stop this sort of thing. The poor kingfishers have most all been ruthlessly shot down. Is there a dabchick left between London and Reading? A swan would, however, do more damage in one day, just after the spawning season, than the pretty kingfisher would do in the Thames for a whole year. And of what good, may it be asked in all reverence, are so many swans on the Thames? If for mere ornament, a tenth of the number would suffice. But perhaps the "Upping" feasts and the marking, and what not, are only one of the many excuses for spending money that might and certainly ought to be applied to educational purposes. The Thames ought to be as free from shooters as the Strand at mid-day.—INDIGNANT.

GREGORY'S SPINNING BAITS.—"The Gregory" the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

MRS. F. Y. BROCKAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

1st AWARD MELBOURNE EXHIBITION, 1881.

DAY, SON AND HEWITT'S
STOCKBREEDERS'
MEDICINE CHEST.FOR ALL DISORDERS IN HORSES, CATTLE, CALVES, SHEEP
AND LAMBS.

In this chest are the following matchless and world-renowned remedies, all that a Farmer can require to cure disease amongst his Stock and keep them in fine, healthy, and buoyant condition:—

"FISHING GAZETTE" OFFICE,
14, FETTER LANE, E.C.]

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 179, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 184, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 21, Lombard-market, Battersea, S.W.
Mrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.
Mr. Alfred Young, "The Golden Perch," 174B, Oxford-street, W.
Mr. T. Barnett, 26, Church Street, Lisson Grove, N.W.
Mr. J. Smith, 7, Tottenham Court Road, London.
Mr. Edwin Stevens, Newsagent, 220, Kentish Town Road.

OR

Mr. B. R. Barabridge, 74 and 75, High Street, Eton, Bucks.
Mr. Cowan, 33, South Frederick-street, Edinburgh.
Mr. H. Whitty, 15, Basnett-street, Liverpool.
Mr. C. J. Greene, 54, London-street, Norwich.
Mr. R. Rambottom, 81, Market-street, Manchester.
Mr. James Gregory, Vyse-street, Birmingham.
Mr. Wm. Bailey, Jun., 29, London-road, Nottingham.
Messrs. Nutting and Co., 70, Edgbaston-street, Birmingham.
Messrs. W. C. and J. Penny, Booksellers, Froome.
Mr. E. Perks, Evesham-street, Redditch.
Mr. J. Walsh, Bookseller, 5, Harpur-street, Bedford.
Messrs. H. and C. Treacher, Booksellers, Brighton.
Messrs. Gaynor and Son, 10, Royal-terrace, Richmond, Surrey.
Messrs. O'Handlen and Co., 48, Victoria and Temple-streets Bristol.
Mr. Wilkes, Gunmaker, Leeds.
Messrs. Cayless and Sons, Midland Tent Works, Loughborough.
Miss G. Wells, 1, Sussex-street, Nottingham.
Mr. Wm. Atkinson, Fishing Tackle Maker, Lancaster and Kendal.
Mr. John Wells, 4, London-road, Nottingham.
Messrs. Mitchell and Co., 50, Market-street, Manchester.
Mr. J. Croisdale, 56, Briggate, Leeds.
Mr. John Keeling, the Golden Salmon, 7, Digbeth, Birmingham.
Mr. John Heywood, Manchester.
Mr. John Cocks, Baker Street, Weybridge, Surrey.
Mr. Wm. Reid, Northgate, Darlington.
Mr. R. Pearsall, 11, Great Western Arcade, Birmingham.
Mr. G. T. Gibbons, 10, Bridge Street, Salisbury.
Mr. Thos. Heppleston, Manchester.
Mr. J. Perry, Minster Parade, Reading.
Mr. S. Dale, 7, St. John Street, Nottingham.
Mr. H. Booth, 88, Prospect-street, Hull.
A. W. Warner, 121, Broad Street, Birmingham.

News-vendors can obtain the journal through their London Agents.

** The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s.; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C.

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

The Fishing Gazette.

SATURDAY, SEPTEMBER 3, 1881

BARBEL-FISHING, WITH FLOAT AND LEDGER.

BY J. P. WHEELDON.

IN my last paper, being driven into a corner for want of space, I promised something in my next in the matter of a description of my baiting-pot. It is such a capital dodge, and one which is valuable alike for all classes of bottom-fishing, that I

have little hesitation in redeeming my promise. Always supposing that the stream is not too heavy, and that it is requisite the bait should lie on the bottom of a given place, it is useful beyond all compare, whether one may be baiting with worms, carrion gentles or greaves.

Now for it. In shape it is precisely like an extinguisher or a beer-warmer, such as one may see in use at the fireside of most country inns. It is made from stout zinc, and at its broad end, or the top of the pot, it is six inches across. At the point, or taper end, a stout solid ring is firmly soldered into the metal. To this ring is attached, say, thirty yards of very strong water-cord. Inside the pot, and soldered tightly down at its extreme point, is a bit of strong chain, its length being entirely dependent on the depth of the pot from the base to the lid. My own is twelve inches deep—but this is hardly deep enough, and the chain sixteen inches in length. Now, the shape of the pot being conical, it will be seen at once that every inch in its depth narrows its width. Thus the lid, with a rather deep edge of metal, must be made to fit one inch into the interior of the pot itself. On the inner, or under side of the lid, the extra length of chain beyond the depth of the pot being purposely given so that the lid may lift clear, the other end of the chain is securely fastened. Thus one end is fixed tight at the point, or narrow end, while the other is equally a fixture upon the under side of the lid. This lid must be perforated with five or six good-sized holes, say as big round as a shilling. When it is in its place the exact length of chain falls down into the narrow end of the pot, and helps to ballast or steady it when in the water. At this point, I may add that this capital contrivance is now being manufactured for sale by Messrs. Alfred and Son, of Moorgate Street.

The punt being moored in its place, the first thing to do is to have the line attached to the bottom ring unwound from its peg, and coiled neatly down free of any obstruction. Wound upon a peg or stick of wood, the line is carried inside the pot, and only uncoiled when in use. All being clear, fill your pot, but not so deeply as to cause it to fill and go down there and then, with either lobworms or any other bait which you may be using. Put it gently overboard, and in a favourable set of the stream close to the punt. Guide it clear of any eddies which may suck it under the craft, and when once it begins to move down the stream pay out line. Then, when it has arrived at the place where you want to deposit your first shipment of the anticipated cargo, pull your string. The pot "swinkers,"—it is a local phrase from my own dear Darbyshire vales—backwards and forwards, while the water rushes in through the holes in the lid. As soon as it is full it goes point first and straight as a die to the bottom. It falls over on its side, and you then pull the string smartly. Off goes the lid, and you discharge cargo, let me hope, to an appreciative circle of customers, some as big as "bulls," others as hungry as "bears."

In pulling your pot up again, always supposing that your string and chain is sound and your rings firmly fixed—do it gently. Recollect that, coming up point foremost, there is a tremendous strain on the broad under surface of the lid swaying back and forth, and held only by the chain against a heavy stream. As soon as it is in the punt again, repeat the operation at varying distances, until you have put in a sufficiency of worms. I have heard it suggested that the worms, going down in a lump, and being shot out in six or eight places do not get distributed over the surface of the swim half so well as if they were scattered in loosely. All nonsense, in my opinion. Rely upon it they get "distributed" when the barbel find them, and there is this one grand certainty. Throwing them in loosely over a swim is, after all, a matter of guesswork; and, in a river like the Thames, very much guess. Lowering them down with the pot may not be quite so quick an operation, but you know they are on the bottom, and in precisely that particular hole and corner where you want them to be. Besides, I say, very diffidently, that I know the system is right, because I take as many barbel as most folks who go a-barbelling on the Thames, and the proof of a pudding, &c., does not depend upon what sort of plate, willow pattern or otherwise, which one uses in the eating, but in the eating itself. Therefore, in a burst of confidence, and remembering Eatanswill, I beg to say "Hoorah, Pot!"

I am frequently asked which is the most killing style of barbelling—float or ledger. I unhesitatingly pin my faith to the "little bit of lead." Mind, I admit at once that floating is far the prettier, and inasmuch as one is obliged to use much lighter tackle, the sport obtainable stands at a greater ratio. But in a river like the Thames, where the depth, save in a very few instances, is never the same, or anything approaching to it for twenty yards together, give me the ledger—always supposing that the object is a big bag of fish, a matter which most of us are uncommonly tender to. Besides that, I do not lean with any degree of confidence to the Nottingham, or, rather, general Trent, notion that one can fish a varying depth of water by using a line of such a depth from the bottom tip of the float as covers the extreme depth of the swim. The theory of "holding back" from the top

of the float, the bait travelling in advance meanwhile, is a very pretty one, but, to my mind, is, at the best *but* theory, with very little certainty in its operation. It may be that on the Trent, and where the depth of the various swims are known to an inch, it works exceedingly well. I am prepared very willingly to admit that it does, while several of the Midland experts have proved conclusively that on *certain swims* on Thames side it is just as valuable as on their own famous river. "As witness my hand," quoth the great Bailey, "at Sonning, Monkey Island, Shillingford, &c." For all that, and fancying as well that we Thames men can hold a fairly good candle to most of the Trent practitioners, even in the matter of barrelling, I find, although plenty use the float, and love it too dearly, that the ledger line, as a rule, beats them hollow. Occasionally in a very bright, low water, and on a very level swim, the delicate float tackle holds its own triumphantly. Take it all in all, however, the ledger wins ninety-nine times out of a hundred; whilst, with it, one can fish water where the float, owing to its turbulence, is absolutely useless.

I have often wondered how it is that barrelling or its successes on Trent or Thames varies so strangely. On the Trent, if there is an extremely low, clear water, with a hot, dry summer, folks say, "Now, then, lads! We shall get some barbel!" On the Thames it is just the reverse. Bright water there means almost hopeless fishing, unless a place has been both very well chosen, ditto baited, and a first-class man handles the wheel. But let a flood come down, with a high, thick water, and then every man-jack of them on the Thames waxes correspondingly jubilant, singing, "Hey, ho! for barbel, boys!" The reason is very readily found. On the Trent it is nothing but float, and on the Thames little else but ledger. Assuredly the Thames men kill weighty bags in thick water, and, two years ago, during all those terrible summer floods, such a barbel year had been known hardly in the recollection of the oldest inhabitant. Lads and children caught them with the ledger, at street corners, in any little eddy, or along any bank close into the side, with no matter what bait, so long as it was something eatable. On well-baited swims good anglers effected tremendous slaughter, while even "duffers" could not help some of them "hanging on," although the sacrifice of tackle thereby brought about was a thing to make puntmen desire heartily for sackcloth and ashes, in lieu of beer and 'bacca.

All this on a thick, heavy water, mind, with a tremendous flood. Yet what so natural? Your barbel is a grovelling, rooting, boring sort of cuss, always grubbing about with his pig-like snout, and prepared to appreciate any little delicacy, from a fat worm to a chunk of fatter bacon, so long as there is no apparent danger in the confiscating operation. On the Trent, a man going barrelling under such conditions would have been looked upon as little short of a lunatic, yet the nature of the fish in both rivers is absolutely identical. It may be, after all, that our Trent brothers have depended a little too much on the float, and that that is the reason why the lovely Midland river does not shine as brilliantly as does our own broad Thames.

MY TRIP TO BLOATERLAND.

THE JOURNEY.

THE morning of Friday, the 20th of August, soon after ten o'clock found me on the platform of the Great Eastern Railway in Liverpool Street in plenty of time for the 10.25 newly-arranged express train to Yarmouth, which was, after calling at Ipswich and Beccles, due at Southtown at 1.40, or in little more than three hours, performing the journey most comfortably and in punctual time. There are other express trains besides this, the latest addition being one at two o'clock, arriving in Yarmouth at 5.10. The journey, therefore, to the city town of Bloaterland has been made by the general manager of the Great Eastern one of comparatively small distance in time from the great metropolis of London.

THAMES ANGLERS IN YARMOUTH.

As a proof of their appreciation of the facilities of getting to the Broads, the Thames anglers are mustering in unusual numbers at Yarmouth for the purpose of enjoying the excellent air of the place and practising their favourite sport. I never remember meeting them in such force before. Of the committee of the Thames Angling Preservation Society there were Messrs. Alfred Nuthall, C. P. Wheatstone, and James Pattisson, and I might add several well-known Thames anglers, such as Messrs. B. Newstead, W. Edwards, A. Duckit, and G. Manning. All these piscators are bent on visiting the Broads for freshwater fishing and the Roads for sea fishing.

A GUIDE TO YARMOUTH.

A very excellent publication has been issued by Messrs. Jarrold and Sons, of Norwich, entitled "The Visitor's Illustrated Guide

to Great Yarmouth," which gives a full description of the East Anglian Broads and the river fishing, and should be in the possession of every visitor to Bloaterland. It is to be procured from the well-known booksellers in Market Row, Messrs. A. and W. Hake. I have had the opportunity of perusing it, and strongly recommend all my friends to get a copy. It is very neatly printed, and affords abundant information on all subjects.

THE FISHING.

There is a constant stream of piscators any day wending their way to the railway stations, and as far as I could ascertain by experience and information, the anglers, both in the broads and rivers, were getting some good sport. Fritton Decoy, which closes in September, has been yielding some fine bags of bream, estimated locally by so many stones weight. The Ormesby and Wroxham broads always appear the most popular, and the latter being approached from Wroxham Station by a passage through the river Bure, gives the angler some fishing on the way. The charge for angling is half-a-crown a day, which the proprietor liberally appropriates to charitable objects. There has been some good sea-fishing in the roads; but that from the piers was not very satisfactory. One morning the anglers—male and female—were getting principally gannets and crabs. I hope shortly to receive some practical reports from my numerous friends as to their doings in matters piscatorial.

THE BRITANNIA PIER.

This is considered the best for angling purposes, and is the popular pier. Mr. Dunn, both morning and evening, gives his attractive concerts, and on the occasion of my visit, held a benefit one for one of his staff who had gone away for his health, which had given way in Yarmouth. The combined liberality of the proprietor of the pier, and the gratuitous services of Mr. Dunn and his staff produced a result of £25. This is about the fourteenth season of Mr. Dunn in Yarmouth, and his popularity is only equalled by his benevolent and philanthropic character. Mr. Doolan occupies his old post at the entrance. The pier, altogether, is a capital lounge—an extensive promenade—and fishing parties are always to be found in the underneath portions at the end, where oysters are supplied to consumers direct from their beds beneath.

THE AQUARIUM.

The banks which were last year noted for the total absence of fish are, in many instances, now tenanted with fish-life, both of salt and freshwater fish, and "old Charlie," the seal, is still in existence, and looks remarkably well. Major Forman, the manager, is away on account of ill-health, but his place is admirably supplied by Mr. C. Greenhead, the business manager, who in addition to the Cremona Musical Union of male and female *artistes* (who are of themselves a great treat, and exceedingly clever) introduces a host of other talent; such as, during my visit, of Mrs. John Wace, Mr. C. Colborn, and Mr. J. Barnam in impersonations and comic songs, and the Brothers May with their spider-like legs as contortionists. The general management of the building in all departments (for there is a skating rink, magic mirror, &c.) is of the most satisfactory character, and I have personally to thank Mr. C. Greenhead and Mr. Whitby for their kind and courteous attention. The future of the building as an aquarium has got to be determined.

THE BEACH.

There is much to amuse both young and old on the sands—the photographers do an enormous trade—the gipsies in profusion are actively engaged in telling the future of the young ladies—the chairs and seats are filled with visitors enjoying the breezes of the sea and watching the rolling waves—the youngsters are paddling in the water or digging in the sands—dealers in rock, for which Yarmouth is famous—vendors of fruit and flowers—fresh shrimps, new milk buns in variety—are to be found in all directions. In fact, there is no beach in my experience where there is greater life, and all calculated to drive dull care away. For those that enjoy the water there are boats of all sizes, taking out pleasure parties for one hour's trip, and there are plenty of rowing boats engaged by time for fishing and other parties. On the drive, adjoining the beach, there are open carriages, goat carriages and donkeys without number. An angling friend of mine, who has been an invalid, and spending a month in Yarmouth to recruit himself, says, "The splendid air of the place, and the multitude of enjoyments in it, fishing and otherwise, have completely set me up again."

B.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

CLUB AND OTHER JOTTINGS.

By L. B.

AMONG the North-Western Anglers some grand shows have filled the trays of late. Among others, Mr. Stead, on Thursday having a splendid mixed dish, nearly 30 lb., from the Ouse, near Bedford, roach, bream, perch, chub and dace, all taken with lobworms. Mr. Bonvoison, some 25 lb. of barbel, and between 4 and 5 lb. of roach, dace, etc., from Chertsey; on another day, 20 lb. of tench from Elstree Reservoir, heaviest, 3 lb. 6½ oz. Messrs. Underwood and Aldis, some 24 lb. and 20 lb. of tench, respectively, from the same water. Mr. Underwood having also two nice little jack, 5½ lb. and 2½ lb., all taken with marsh and lobworms, the former for choice. On the 28th, again Mr. Underwood had two nice jack, 9 lb. 2 oz., and 7 lb. 14 oz., also tench weighing 4 lb. 8 oz. Messrs. Aldis and Marshall, tench, the latter having also a jack, the exact size of which I did not take down, but which, on being prepared for cooking was found to contain nearly half a pint of lobworms.

Bell weir, at Egham has once more broken away.

On Saturday 27th, and Sunday 28th I was all round the water between Dumsey and Staines, including the famed Penton Hook. Neither punt nor bank anglers were meeting with any sport, yet the weather was all that could be desired; the water, though a little high, was sinking fast, and was of a grand tint. A professional to whom I spoke, unable to account for the sulkiness of the fish any other way, supposed it must be the sodden water, which had so unfavourably affected their appetites. During the terribly rough weather we had last week, the Chertsey fishermen piloted those of their customers who were willing to brave the elements to some really well-baited barbel swims, where they secured takes ranging from 40 lb. to 60 lb. On Wednesday afternoon, 24th, a relation of Mr. P. Geen, fishing with that gentleman, took nearly 40 lb. of barbel, and a few good roach from Penton Hook. I must not forget to mention the capture, among other fish, on the same occasion of a handsome chub, exactly 4 lb., by Master Phil Geen, who handles a rod as his father's son should.

At the Welsh Harp, the water has risen, and I am sorry to say, thickened considerably, which has, as it was sure to do, knocked the bream somewhat off the feed, but as soon as it settles down a bit, they will very probably come on again, until the near approach of winter driving them into winter quarters.

The annual summer dinner of the Brothers Well Met Angling Society took place at the Black Rabbit, Amberley, Sussex, on Sunday last. Jolly little Mr. Clout, the host and treasurer of the society, and the manager of these popular excursions, presiding.

I recently had three days' fishing in the neighbourhood of Littleport, Cambridge, but the roach would not hang on at all. The fishing here this season has up till now been very indifferent the roach seeming only to feed for a few hours at a time, and at rare intervals, while the bream fishing has been a total failure. Charles South who is the great piscatorial authority down here, and has fished the water for over sixteen years, says it is all owing to the enormous amount of floating weed, from which the fish have fairly gorged themselves with natural food. The fact that in the main water above the junction of the river Lark, from which this weed principally comes the fish have fed somewhat better, and a few fair takes of bream having been had, makes this explanation sound most plausible.

A grand trout 19 lb. has been shown, and weighed at the Gresham Angling Society. I have no reliable independent particulars concerning the fish, where captured, and by whom. I append, however, paragraphs from two contemporaries; perhaps the Editor will have particulars direct from the sec. of the "Gresham," if not, the readers of the GAZETTE can, like the little girl in Barnum's, they having paid their money, take their choice of the following:—

"THAMES TROUT.—At the meeting of the Gresham Angling Society, on Thursday evening, Mr. Alfred Jardine produced a magnificent trout (*salmo trutta*), weighing 19 lb. It was taken spinning, was beautifully spotted, and in prime condition."

"There was a large meeting at the Gresham Anglers. Captain Alfred presided. Mr. Bennett weighed-in some splendid dace from Thorney Broad, and Mr. Jardine came up smilingly from Lancashire with a glorious trout (*salmo trutta*), scaling 19 lb., and it was really a marvel. It is to be preserved."

I am glad to hear, on the best authority, that of my friend B., that the movement to rescue a portion of the tidal water below Richmond Bridge from the netmen, and add it to the 21 miles stretch looked after by the T. A. P. S., is progressing favourably. Of course, in common with my brother anglers, I am aware that such desirable objects as this are not attained immediately they are pointed out; but this particular one has now been agitated for some years. That not only the anglers, but the professional fishermen, have set their heart upon it, I know for certain, and the only reason their hopes are not more loudly expressed is to be

found in their belief that the committee, though silent, are nevertheless surely making energetic efforts towards its accomplishment.

Speaking of the tidal waters, there was recently a dace competition for three prizes among the members of the Richmond Piscatorial Society, now numbering some 120 members, the winners being:—1st., Messrs. Johnson, 19 lb. 5 oz.; 2nd, Harwood, 10 lb.; and 3rd, Jones, 8 lb. 2 oz.; the dace were in splendid condition, and few finer shows have been seen this season. The fish were more like herrings for size, and had the competition been on any other day than Saturday, my correspondent believes the weights would probably have been still heavier.

Apropos of suburban angling societies, is it true that a member of one of them—a subscriber to the T. A. P. S., brought into the club room a number of undersized roach, taken in the tidal water, and that, when spoken to on the subject, he attributed the fault to the fisherman; and is the fisherman the same whom my friend B. only, a short time since, spoke of as one of the best men on the river?

What did the chairman and members of the Piscatorial do in this case to vindicate the honour of their society? I don't know what is the practice in a society *d'elite*, but I know several rough and ready working men's clubs where every undersized fish subjects the shower to a fine, and where the production of a quantity would entail far more serious consequences. There is an old French saying: "*autres temps autres mœurs*" (other times other ways). If *gens* (folks) be substituted for *temps* the rhyme will be preserved, and it may supply the explanation we want in this case. I believe the matter came under the notice of the T. A. P. S., but though the moral evidence was clear, the legal evidence absolutely necessary to procure a conviction was wanting, and they wisely determined, rather than risk a failure, to take no action; but does not the whole affair point clearly to the necessity of increased vigilance on the part of the river protection societies? My firm conviction is, that the system of partially paid keepers is a perfectly worthless one. A large portion of the Society's income is annually frittered away in grants to fishermen keepers, varying, I believe (I have not the Blue Book by me as I write) from £5 to £30 more than sufficient to pay another wholly paid keeper, probably with a small addition, too.

Again, why not inspect anglers' baskets and fishermen's wells as the punts come in at the close of the day. I hope my friend B. will take my remarks in good part. He knows they originate from a sincere desire to see his and his colleagues' good work prosper, and are not made in a carping, fault-finding spirit.

The West Central Association, No. 1 district, visit was paid the Duke of Cornwall Angling Society, at the Wheatsheaf, Lismore Circus, Haverstock Hill, N.W., on Tuesday evening last. Eleven clubs were represented, the room was well filled, and the harmony was excellent. The next visit in this district will be paid the Duke of Norfolk Anglers, Norfolk Terrace, Bayswater, on Monday evening next.

Mr. Hoole informs me he has had a complaint from the Great Western Railway Company, that certain persons holding privilege cards are in the habit of booking to Pangbourne, but get out at Reading, and re-book to other stations on the Company's system. They say that unless the practice is discontinued it may cause the withdrawal of the concession altogether. A further complaint is made by the Great Western and London and South-Western, that certain persons are in the habit of trying to obtain the issue of two railway tickets by the exhibition of one privilege card; and, lastly, that others use the privilege tickets for business purposes. These gross infractions of the regulations printed on each privilege card must be stopped; and it behoves the three Associations to take energetic action, and, if they can discover the selfish and unprincipled persons who are guilty of these mean actions, to show no squeamishness, but in the interest of thousands to whom the concessions are a great boon, to punish the wrong-doers as severely as possible.

I am sorry if Mr. Howson, the sec. of the Huntingdon Grayling Association, is hurt at anything I said. The facts of the case, however, remain the same, excepting that the man Rout appears to have been only occasionally employed as keeper, and I sincerely hope the Association will this season employ such competent permanent keepers as will effectively prevent such flagrant and broad daylight poaching. Theirs is a grand stretch of water, and well worth preserving efficient.

I would close my notes this week with just a line to my friend Mr. Balderston. The difference of opinion between us is that he wishes to fish all the year round, he considers it sportsmanlike—he does not consider that angling all the year round will materially diminish the stock in a river, although year by year the numbers fishing it go on increasing with almost alarming rapidity, while there is no compensating advance in resources of the said river—that is Mr. B.'s opinion, stripped of all the roundabout, sophisticated arguments with which he has hedged it, and

very ugly it looks; while I hold directly opposite views. For, did not the necessity for what Mr. Balderston is pleased to call the protectionist policy make itself clearly felt to the thousands of working-men anglers of Sheffield? Have not the London club and other anglers almost to a man taken up the cry, to be re-echoed back clearly and unmistakably from all the preservation societies—from Newark, Portsmouth, Cambridge, and its fen country; from numberless associations on the river Ouse, etc. I could show Mr. Balderston scores of letters, each representing, not merely the opinion of an individual, but the unanimous opinions of large and influential bodies. There is, I feel sure, but little fear of Mr. B.'s pernicious doctrines making any converts among these, yet, in spite of all the kind things Mr. B. has said about myself and the thousands who think like me, having heated and liquid brains, and being guilty of culpable ignorance, etc., I would, in all kindness, and hoping from my heart for his conversion to more orthodox and sportsmanlike views, ask him to try and honestly answer the following question:—

How do you account for the alarming decrease of jack and perch in the Thames?

Please weigh well the following, and kindly inform us what is the deduction to be drawn from it:

"At the last meeting of the Waveney and Oulton Protection Society, a sub-committee was formed to consider the necessity of appointing fence months for pike and perch, caused by the wholesale slaughter of the one when out of season, and the scarcity of the latter."

We have here the clear working of the laws of extermination. This is Nemesis with a vengeance, that this cry should so soon follow the intolerant and loud boasting recently inflicted upon us from East Anglia.

SEVEN AND A HALF DAYS' OUTING NEAR WORCESTER.

UPON our local streams two Worcester anglers thought they would spend part of their holidays, noting all their takes each day, and at the same time not fishing two days in the same stream, and on no day did they draw a blank. This will, there is no doubt, be interesting to many readers of the FISHING GAZETTE as I am often asked the question which is the best place for the angler to spend a day or two in the Worcester district. The two jolly anglers took with them each morning from their homes enough uncooked meat; either walking eight or ten miles, or riding as the chance may be. After a few hours' fishing they take out their portable stove and lamp, cook their meat, gather a salad of land cress and dandelion, take a good lunch, swill it down with a drain of Scotch whisky—no time to lose—light the pipe, and on to business again, first a trout, then a perch, then a roach as they choose to come up to scratch, many samlets, and a small trout were found wanting—that is, as regards size, and in this way seven and a half days are spent. I will not trouble to analyse each day's take, but will give the total of each sort or kind of fish: one brace of grayling, 14 dozen of trout, 147 perch, 10 roach, and 10 chub, 197 fish all told, 59½ lb. The game fish were taken with flies, Griffin's recommended, and the other fish with worm or wasp grub. I will also give you an account of other takes this week: Mr. Porter, over 4 dozen roach, dace, and gudgeon; Mr. Amos Bosworth, 2 dozen roach; Mr. Henry Carey, 23 roach. These two anglers left Worcester together, and returned to the Boughton Club House to weigh-in. Carey had a few eels; Mr. Fred Fowler landed 23 brace of trout and grayling with flies I sent him. In three evenings, fishing on the Teme, near Stanford This angler resides close upon the Teme, one of the best fords running opposite his house. I have seen fish rising from his door. step.

J. A. GRIFFIN.

REPORT OF THE ANGLERS' BENEVOLENT SOCIETY.

WE have the pleasure to present to the angling world the Annual Report of the above most useful and deserving society. We are doing all in our power to help it, and have done so since its establishment, as we think it is an institution which every angler should support. It is only in its infancy at present, but it is on a thoroughly sound footing, and it has a most efficient staff of officers. As a little inducement to get club anglers who are already members to induce others to join, we will give, through Mr. Ghurney, a pair of the FISHING GAZETTE pliers, value 4s., to the first twelve members who each introduce twelve new

members. Any club angler can become a member by the annual payment of the small sum of one shilling.

THE ANGLERS' BENEVOLENT SOCIETY,
Committee Room—Foresters' Hall, Clerkenwell Road, E.C.

President:

THOMAS SPRECKLEY, Esq., Treasurer of the Thames Angling Preservation Society.

Vice-Presidents:

S. MORCAN, Chairman of the United London Anglers' Central Committee.
L. BONVOISIN, Chairman of the West Central Association of London Angling Societies.

Committee:

G. MANNING, Izaak Walton Angling Society.

Steward, G. H. FIELD.

General Secretary, R. GHURNEY,

10, Baches Street, Charles Square, Hoxton, N.

ANNUAL REPORT.

In submitting the foregoing statement of accounts of the Anglers' Benevolent Society for the year ending April 1881, the Committee have much pleasure in drawing the attention of members, donors, and annual subscribers to the Society's increased sphere of usefulness as exemplified by the larger number of cases of distress relieved during the last year as compared with the one preceding it, but regret that they cannot felicitate the angling community upon having received from it a proportionate increase of support in the shape of donations, annual subscriptions, and members; for, if a careful examination of the accounts be made, especially with reference to the number (increased or decreased) of members supplied from each angling society, it will be seen how small a proportion of the members of certain societies have enrolled themselves among those we have to thank for assisting the beneficent objects of our society. This strangely enough is most manifest among those angling societies which are mainly composed of gentlemen, whose social and pecuniary position forbids the supposition that the trifling annual contribution can be any bar to membership.

We make an earnest appeal to these and others to thoroughly consider and investigate the objects and proceedings of the Anglers' Benevolent Society, when we feel assured that there will be few who will fail to enrol themselves with a society whose sole object is to succour the sick and needy among our own, in the sense that anglers are bound to one another in the brotherhood of congenial pastime.

The Committee beg to impress upon the secretaries of angling societies the paramount importance of urging their members upon every seasonable opportunity to join an institution whose benevolent aims must commend it to every right thinking man.

We remain, Gentlemen,

Your obedient Servants,

THE COMMITTEE.

N.B.—Collection boxes for the receipt of small donations will be supplied to angling societies desirous of placing such in their club rooms, and may be had on application to the Secretary of the Anglers' Benevolent Society.

The Committee meet the second and fourth Fridays in each month.

STATEMENT OF ACCOUNTS

For the year ending April 30th, 1881.

FRANCIS J. T. MOORE, Chartered Accountant, 98, Cannon St., E.C. }

AUDITORS' REPORT ON ACCOUNTS.—1880-81.

	£	s.	d.
Comparing the income of this year to April 1881 with that of the previous year, 1880, it will be found, after allowing for dinner tickets in 1880, that there is a decrease in donations this year of	33	10	1
And the Piscatorial Exhibition not having been held causes a further falling off this year of	24	2	10
	57	12	11
But there has been a slight increase of the annual subscriptions of	3	4	0
And of the members' subscription	6	6	9
And interest	1	11	10
	12	2	7
Thus there is a net falling off in receipts of 1881	46	10	4
As to expenditure I have to report that the grants to members this year are more than previously by	35	0	0
But expenses decreased by	9	16	0
	25	4	0
In the present year a saving of only	3	6	8
has been made, through the before mentioned grants, and the fact of the income having fallen off, whereas in the year 1880	75	1	0
was the saving effected	71	14	4

REPORT ON LONDON CLUBS SUBSCRIBING.

In the year ending April 1881, the members of the London angling clubs who subscribed to the Anglers' Benevolent Society numbered	546
And in the year ended April 1880 they numbered	429

Being a net increase of (subscribers to the Anglers' Benevolent Society)	117

THE annual sale of the Belhus hunters is fixed for Thursday, Sept. 22nd. This will be the seventh year that Sir Thomas Barrett Lennard, Bart., has offered for public competition some of the finest hunters that one of the keenest judges of horses in England brings annually together at a great expenditure of time and money for the sole satisfaction of witnessing their dispersion by public auction, for it is no secret that, in a financial sense, these sales do not pay the spirited and energetic originator, the courteous baronet of Belhus. The sale list this year comprises some splendid specimens of the equine race, and to those of our readers in search of a good hunter we cannot give better advice than to purchase, as they can obtain a really good mount at the approaching popular sale,

RIVER REPORTS.

MID-THAMES.

"I know a nose, a nose no other knows,
'Neath starry eyes, o'er ruby lips it grows;
There's beauty in its form, and music in its blows."

I know a bank just at the present time, whereon the wild thyme grows, and whereon a piscator may locate himself, and out of the mignonette tinted water obtain a delicious extract of roach, perch, chub, and other fish of which Father Thames is not ashamed to be the paternal. The river, in consequence of the continued rains has become bank high and much coloured, but excellent fishing can be obtained amid the smaller fry by using lob-worms as bait, and the judicious choice of an eddy for a swim. Bank ledgering is now one of the best games out, and will assuredly result in a capital account of the day's gains, nothing floating, but all well sunk: there may be a chance of a run on the bank, but the liability is limited and the security *real* in Nottingham fashion. Streatley: Mr. G., 15 lb. of barbel and 9 lb. of perch and chub in one day. Maple Durham: Mr. Felton 19 lb. of chub, all with fly, and every fish under 1 lb. returned. Hurley: Mr. Barker 20 lb. of miscellaneous fish, Mr. Barker was fishing for the Piscatorial Club prize for barbel, but failed to come across the sogdollagers. Mr. Harrison fishing from that comfortable anglers' retreat the Bell, Hurley, on Monday got 21 lb of various fish, but roach going 1½ lb., and ditto perch 1 lb. 14 oz., with two eels 3½ lb. together. Thursday Evening.—Roach fishing, good, but other classes knocked off in consequence of high colour and flush.—MARLOW BUZZ.

Thames (Goring).

Water in good order for all sorts of fishing, Jack coming on better, roach biting very well, prospects look better, Jack ought to bite well in this cold wind. We had some good takes of roach last week, 10 and 12 lb. a day. My best day was on Saturday with two gentlemen from London, Mr. Clarke and Mr. Denn about 12 lb. of good roach and dace.—JOHN RUSH.

Thames (Halliford).

Owing to the late rains the river has risen considerably, but in good order for ledgering. Different gentlemen fishing with me since my last report their takes have been as follows, viz.:—First day, Mr. Palmer, jun., took a fine basket of fish, consisting of barbel, bream, perch, several fine roach (some over a pound weight), and a trout 3½ lb., all ledgering. Second day, Mr. Plimpton 3 dozen roach (ledgering). Third day, Mr. Leman 4 dozen roach and dace with gentles. Fourth day, Mr. George Palmer, belonging to the Friendly Anglers' Society, took some nice barbel, fishing with me to-day (Wednesday), weighing 37 lb. (ledgering), which were weighed at Mr. Robert Stone's, the Ship Hotel, Halliford.—GEORGE ROSEWELL, fisherman.

Thames (Kingston).

The river rose about 18 inches yesterday, and run off about 10 inches in the night, it is in good form for fishing, for all sorts of fish got a nice colour in it. The north and north-east wind has stopped us fishing some of the best places. We have been getting plenty of roach and dace, and a few stray barbel, but the bream do not come well, some nice perch have been had at times. The bank fishers have been getting some good roach with paste or bait. My son had hold of a fine jack for over thirty minutes; he was a fish over 20 lb., and can give you the names of the two gentlemen that were with him.—JOHN JOHNSON.

Thames (Richmond).

The water is a little cooler and in good fishing order. The fish are not feeding at all freely, but without any more rain the prospects are good for next week, when I shall be disappointed if we do not have some good baskets of fish to report. The sport of the week is—G. Howard, three best days, 19 lb. dace; H. Howard, out each day with average of six dozen roach and dace each day; H. Mansel, out each day with average of 10 lb. roach each day; Job Brain, out each day, from four to six dozen roach and dace each day; J. Judge, out each day, average five dozen dace each day; J. Bushnell, out with Mr. R. Baker on Friday, five dace and barbel, 9 lb.; fishing in private water on Saturday and Sunday, seven dozen dace, one barbel, 2 lb.; Tuesday, 21½ lb. dace; Wednesday, 11 lb. dace, one barbel, 1½ lb.—JOHN BUSHNELL, fisherman.

Thames (Sunbury).

The river is in good condition for all round fishing. T. Stroud, two days, best day, 4 dozen roach and 2 barbel; A Stroud, 3 days, best day, 8 barbel, 2 bream, 5½ lb. each, and 7 eels and 2 dozen roach; J. Stroud, 5 days, average per day, 6 dozen roach; Abram Stroud, 4 days, best day, 4 barbel and 3 doz. roach.

Thames (Twickenham).

Wind, N.E.; river a little discoloured, but water falling fast and no rain this day. If the weather continues fine, anglers may expect some good sport. I am pleased to say, with all the rain we have had, the river has not been discoloured with the usual chalk from the river Colne, which is our greatest enemy. We have this week been doing well with the barbel; next week the tides will suit for all days' fishing. The cold winds have stopped our business to a certain extent. I have this week only had twenty-five punts out, and I pleased to say each have taken some good baskets of fish. Within the last twelve days my punts have been the means of taking no less than six club prizes.—ALFRED FERRIN.

Thames (Windsor).

Directly after sending you my last report, water fell considerably, owing to the gates being taken out at the weir, and those who expected to see a high and thick water on arrival here, perhaps could not understand my report, but this often happens at the time of writing; now water is an average height, and slightly discoloured. Bank anglers get good shows of roach, but other fishing if very queer, the barbel refuse to come in any quantity, only a few being had in a swim. I saw some six or seven fish taken from the Windsor weir last Friday, but none large, though there undoubtedly are some fine fellows there, if baited in the right place. I had a good bit of sport Saturday last, whilst fishing with worm on gut tackle for barbel. A jack, which weighed 8½ lb., patronised the worm; he was a very game fish, and as I never use a landing net, had all I could out of him. Water is looking well for jack, and they ought to be had, though weeds are still very troublesome. Another brace of bream have been had this week, one by James Gray, fisherman, going about 3½ lb., and one by Mr. Parsons, of Windsor, going 4½ lb. I should very much like to know if any of your readers have tried the sea mussel for barbel, as I lately baited a place with them, but could do no good, perhaps a big jack was laying in the swim, which might account for it. After my experience of last Saturday, if barbel do not bite, shall try if John has taken up his abode in my swim. This makes the fourth jack I have taken fishing for barbel.—B. R. BAMBRIDGE.

Ancholme.

Despite the very heavy downpours of rain, the fishing in this river has been unusually good. The bream fishing is the best, and there are certain places where the supply of this fish seems practically inexhaustible. Two anglers have each captured over 300 lb. this season, and it is no unusual thing for an angler to get a mixed catch of two stone in a day, but reports come to hand of some individuals taking from 40 to 50 lb. in a day. This stream is well patronised by many of the Sheffield clubs.—THOMAS FORD.

Barle and Exe (Dulverton).

All the week these rivers have been in a state of series of floods, and very little fishing has been had. A few baskets have been taken with the worm and minnow. The weather now seems to have set in fine, and if so, when the waters fine down a bit, we shall have some good sport I hope, although late in the season, for a week or so. On Thursday the mill seat here was emptied owing to some alterations to one of the mills, and, unfortunately, numbers of good trout which found refuge in the seat have been captured, which I was sorry to see. Trout, I hear, were taken up to 2 lb. weight.—W.

Dove (Derbyshire).

Surely the second deluge is at hand. Rain by day and rain by night—our world seems of late to have been made up of moisture and moisture only. I sincerely pity the many visitors from a distance, who have come down to the angling hostleries on our river, hoping to get well among its large tribes of finny wonders. When of late the river has been in right order, the weather has been wrong; and, on the contrary, when the river has been wrong the weather has been right. This week weather and water have been alike—both wrong. The water has been at the top of the banks, and as thick as a puddle, while there have been rain storms every day. Nobody has been able to do anything much with the fly either amongst trout or grayling. There has been next to no rise on at all; in fact the fly out has been extremely limited, and that only in the middle of the day. Those who were plucky enough to face the beastly bad weather did pretty well on Saturday and Monday amongst coarse fish—such as chub, bream, roach and dace, but nothing in the particularly heavy came to hand. The best baits have been creed wheat and malt, worm, and, where obtainable, wasp grubs. Eels have been running well both day and night, and some big ones have fallen victims to night line fraternity. When the water begins to recede and fine down a trifle, I fancy both fly and float fishers will find things remunerative.—THE SLODGER.

Exe (Exeter).

At length we have arrived at the end of another most successful salmon season—that is with the net fishermen. But in reality they were closed at the end of last week. The continuance of such heavy rains had swollen the river to such an extent that it was impossible to use the seines, and the pounded and weir-bound fish are making upwards in splendid form. In fact they have been in really good condition the whole of this season, and as a rule much larger, therefore much heavier. Grilse were earlier, and decidedly more abundant. Numbers of them are seen miles away up stream, which is good news for rodsters, because during almost the whole season through their tempers have been sorely tried, the river having been so low that it was impossible for the fish to get up. We now trust that during the next two months left for their sport they will be able to report their successes equal to, if not better than, many past seasons. Trout have been very shy, owing, no doubt, to the freshets. We shall be getting some good rough fishing now, in the way of roach, dace, rudd, chub, also jack. Perch have been very much off the feed the past few days, disappointing many who have stood a good soaking rain for a few hours with "luck," but "no" attached.—FRANK GOSDEN.

Ilfracombe (N. Devon).

Gentlemen desirous of trout fishing will get some good sport at our reservoir. Some fine fish are taken from there. Anyone wishing to fish there must apply to the Local Board of Health for a weekly or quarterly ticket. Sea fishing: The weather up to Monday was very unfavourable. On that day there was a steady breeze from the N.W., when several boats put to sea to try their luck, returned in the evening with very fair catches of bream, shad, mackerel, whiting pout, &c. Tuesday weather very moderate. Boats with their fishing parties put to sea, their catches varying from 20 lb. to 50 lb. per boat per tide. Wednesday all boats to sea, and some good sport was had of pollack, bream, whiting pout, samlin cod, shad, mackerel, and a fine crayfish was also caught with hand-line. Boatmen all watching for the carts to come with mussels, as that is their favourite bait now. Weather still fine, with good prospects for the next few days. A young gentleman, fishing from the jetty with rod and line, took from 20 to 30 pollack. Anyone fond of shellfish would find great pleasure in rambling at low water over the rocks adjoining the lantern hill and parade; there are some fine lobsters and crabs taken from the holes occasionally.—E. COMER.

Lea (Cook's Ferry).

On Sunday we had a great number of anglers here, and their takes were large, with perch, roach, and eels all in fine condition. The rain that we have had has greatly improved the waters.—S. SEWELL.

Medway (Tonbridge).

The rain made the water very thick so that very few votaries of the gentle craft have been out, but a few devotees have made small bags of bream and roach. The water is now fining down, and if the rain keeps off, by Saturday it will be clear for bottom fishing, and no doubt with a bright sun and fine tackle good sport may be had.—YK MEDWAY WATER-RAT.

Ouse (Bedford).

The weather during the past week has been very bad, the rain pouring in torrents nearly every day, and bringing down such a lot of land water that the fish have been quite off the feed, and the river in many places inaccessible. I succeeded on Tuesday in getting two fine eels, one 2 lb. and the other a little over 1 lb. I fished on Friday for three hours and captured 92 roach and one bream. The river is now getting down to its usual level, and I should think there ought to be some good sport obtainable during the coming week. The following totals may be interesting to some of your readers:—Fished eighteen times, many of them only half days, total 791 roach, 26 bream, 15 perch, 10 eels, 2 pike, 5 sundries; average 48.—ROVER.

[Rover should mention weight.—ED.]

Suir and its Tributaries, Clonmel (Ireland)

List of the salmon taken by the Clonmel boatmen during the season:—1881—February, 89, price 1s. 8d. to 3s.; March, 72, price 1s. 5d. to 2s. 2d.; April, 32, price 1s. 6d. to 2s. 2d.; May, 12, price 1s. 6d.; June, 41, price 1s. to 1s. 4d.; July, 37, price 9d. to 10d.; August, 1 peal, price 8d. Total, 284. First peal, May 19th. 1881—February, 69, price 1s. 6d. to 2s. 3d.; March, 66, price 1s. 7d. to 2s. 3d.; April, 84, price 1s. 5d. to 2s. 2d.; May, 7, price 1s. to 1s. 9d.; June, 7, price 1s. to 1s. 5d.; July, 58, price 9d. to 1s. 2d.; August, 7, price 10 to 1s. 3d. Total, 298. First peal, June, 23rd. We have had no salmon fishing since, owing to the river being much too heavy, but those two fine days cleared the water considerably, and it is now fit for the upper rods; large quantities of fish were seen ascending the river, so good sport may be expected for the remaining part of the season. The trout fishing has been at its very best since last I wrote; Captain and Mr. Massy got five dozen and eight splendid trout on the Anner, weighing 32 lb.; Mr. Hughes, eight dozen, on the Finisk; Mr. Luther, twenty-eight trout, on Glenarry. The spider wrens were the killing flies on all occasions.—DORA.

Swale.

The incessant rains of the past week have kept this river in such a state of high flood that fishing with the fly has been quite impossible. The waters have even been too big for worm. I am sorry to say a little netting has taken place in the neighbourhood of Gunnerside, but owing to the state of the waters not many fish were caught. One gentleman who went from London mainly to fish did not even take out his rod. Should the waters abate the fishing will be good to the end of the season. The second hatchings of the spring flies will then be in full force.—THOMAS FORD.

Trent (Newark).

The Trent has been in a state of flood all the week, and at the time of writing the water is slowly going down; but it is still high and discoloured. The weather has been very adverse to sport this week, and the wind in the north; so I think the prospects for the next few days are not very good. I have not heard of a deal of sport being had these last few days; except Mr. Cubby, who had a nice catch of roach on Monday. A fishing match, with a very extraordinary result, took place close to Newark, last Saturday; nineteen competitors took part in it, and after fishing some three hours, only one had caught a fish, and it was so very very small that it required a very powerful microscope indeed to magnify it into the size of a respectable minnow.—THE TRENT OTTER.

Trent (Nottingham).

The fresh of water we have been expecting and anxiously looking for, for several months past has come at last; and although there has been a great quantity of rain fallen throughout the Midland counties, it did not bring on a flood, as some of the anglers expected; however, sufficient extra water came down to remove a great quantity of the flannel weed, and the water was only a few hours out of condition for rod fishing, but it quickly got right again, and by Tuesday morning the water was in splendid order for worm fishing. Of course, the extra colour put a stop to angling with malt, wheat and scratching, the sport, however, being bream, chub and roach, the anglers using worms for bait. Mr. John Thacker, of this town, with a gentleman, tried the Weston Cliff length, and succeeded in taking 35 lb. of chub and bream without a baiting; another rodster got the roach well on the feed at the cockspur worm at Snarks-ton Bridge; roach and bream took the same bait freely, though the latter fish do not run so large as they do in some other parts of the river. The anglers at Collingham have been fairly beaten with the discoloured water, and when they found worms were no good, called out for maggots, which unfortunately at the present time are very scarce; but I am surprised at some of our Trent fishermen going fishing without worms when they ought to know it is the best bait for bottom fishing in a coloured water. There is plenty of colour in the river to-day, but not too much, and I should certainly recommend them to find suitable places and go on with worms, as I believe, at this time of the year, there is no better bait for Trent fishing.—W. BAILEY.

Waveney (Beccles).

Notwithstanding the great amount of rain that has fallen lately, the river still remains bright. Several very good catches have been made by those anglers who have ventured out, notably one made by Mr. Piper, who in one hour and a half took two dozen splendid roach. Jack continue to be had in pretty good numbers. C. E. Holford, Esq., who has been staying in the town for a few days' fishing, being so fortunate as to land seven of them, the largest scaling 5½ lb. He has also enjoyed some good sport among the roach in the river, and the bream in Fritton Decoy. Some beautiful perch have also been taken lately.—C. B.

Wye and Derwent (Derbyshire).

The incessant rain that has fallen this last week has very much swollen these rivers, and sport with the fly has been quite out of the question. The bottom fishers on most tracts of the Derwent have done fairly, and some have some baskets of good sized fish; have been killing chiefly large trout, and some good graylings and coarse fish. There has been a good, well-fed trout killed in the deeps at Matlock Bath, that was over 2 lb., with wasp grubs, besides five more trout that were killed near to Matlock Bridge, that weighed 1½ lb. each these fish were also killed with the wasp grubs. There have also been several trout and grayling taken with both gentles and worms, cockspurs, off of the

the Darley Dale club waters that would weigh something like a pound apiece. Bottom fishing is much followed on the Derwent, in Derbyshire. The anglers should be provided with a good bag of maggots and worms, and then go to the water and pick a nice sandy or gravelly bottom and stream, where it is shallow and makes a backwater, or eddy; then take a few handfuls of both kinds of bait, and well bait the places you intend fishing. Use a small No. 2 or 3 Kendal hook and fine tackle, and not to have your bottom too heavily leaded. In baiting your hook with maggots for either trout or grayling one should be quite over the arming, and the point of the hook should be passed just through the thick end of the other. If a fall-water, fish the shallows; if a low water, fish the deeps. Always strike when the float runs or moves away, but not when it is bobbing. Always strike sideways if you can, not upright. This is my plan, and I find it answer well. Today (Thursday) the weather seems more settling, with a cold N.E. wind prevailing. If the weather will but continue fine, both trout and grayling ought to feed well next week at both top and bottom. Every week now grayling fishing keeps improving. Both rivers, especially the higher lengths, will be in first-class condition for fly-fishing by Monday. Sport on the ponds has been A1 during the week with bottom fishing. I hear of a few small jack being killed in the Cromford Canal by spinning with the spoon bait, the fish running small—about 2 lb. each fish.—GEORGE JAMES EATON.

Yeo.

During the past week some heavy creels of trout have been taken from this river, near Lapfold Bridge, Messrs. Howe and Moore of Exeter being very successful, several of their fish weighing over one pound each, and numerous others over the half pound. The former gentleman was also fortunate enough to secure a fish, which in Devon, that is in the Exe streams, only a few years since were considered a rare occurrence; in fact, I believe there is but one in the Exeter Museum, which was presented by myself several years since. A few small ones have been seen in between times, but this is really a fine, full-grown and in excellent condition, "Gudgeon," which is to be seen, suspended in spirits with numerous others of the finny tribes. What will the Thames piscators say to this, when they are taking their twenty and thirty dozen per diem?—FRANK GODSDEN.

Yore (Yorkshire).

Incessant rain has fallen almost daily since my last report. The rivers throughout the whole county are bank full and in some cases over them. Farmers are bemoaning their lot on all hands, and well they may, as the damage done to the crops is irreparable. I need hardly, therefore, add that angling in all its branches is at a complete standstill, and, what is more, is likely to be for some time to come.—FRANCIS M. WALBRAN.

THE RECENT DESTRUCTION OF FISH IN THE WENSUM.

It will be remembered that in the month of July last attention was called through the press to the fact of a considerable number of dead fish being found in the river just below the city, and it was suggested that they had been killed by some deleterious matter being put into the river—"Blue Billy," a refuse from the gasworks, being especially mentioned, which it was alleged was dropped from the lighters engaged to transfer it from the gasworks to the marshes. In consequence, the committee of the Yare Preservation Society met to consider the matter, and engaged a person to make a thorough inspection of the river, and the adjacent factories, dye works, &c., with a view to discover whether any, and if so, what matters injurious to the fish were put into the river. The person so engaged submitted his report to an adjourned meeting of the committee on Friday night, R. Burroughes, Esq., in the chair, the result being that with the exception of some very much diluted acid from the works of Messrs. Boulton and Paul—the passage of which into the river that firm has promised to stop, and the effect of which upon the fish is very doubtful—nothing objectionable could be discovered. The inspector had made inquiries of all the old fishermen along the stream, and the general opinion was that the mortality among the fish had been caused by the extreme heat of the weather, accompanied by unusually low tides. This opinion is corroborated by past experience; and is, of course, sustained by the fact that the fish are not found to suffer at other seasons, which would be the case if the mortality was caused by deleterious matter foreign to the river habitually discharged into it. With respect to the "Blue Billy," no evidence could be got to support the allegation that the lightermen either intentionally or carelessly allowed any of it to go into the river; on the contrary, it is asserted by Mr. Hobrough that nothing of the kind takes place. The report of the inspector was unanimously approved by the committee, the more especially as it confirmed the opinion the members themselves had formed as to the cause of the destruction of fish complained of; and we may add that the Yare Preservation Society is entitled to the thanks of the anglers of Norwich for the attention it has paid to the subject.—*Norwich Argus*.

A FISH MARKET READY MADE.—Whilst there is a lull in the fish supply question, attention may be directed to the new fruit and vegetable market in the Farringdon Road, which seems to offer a short and easy way out of the difficulty. The application of the new building to its original purpose is not of so pressing a nature as is the matter of finding a market supplementary to Billingsgate; and it does seem worth while to give the new building a trial. For one thing, it is at the very spot where a new market for fish has frequently been proposed to be established; and another recommendation is that it is surrounded by good wide thoroughfares.

How in youth I used to gallop to the glens, over a hundred heathery hills; how leaped my heart to hear the thunder of the waterfall and, at last, the dim, shallow line of music, teaming with swift-shooting, silver shining scaly life, most beautiful to behold, at every soft alighting of the deceptive line.—*Christopher North*.

SUBSCRIPTIONS FOR MRS. COMER.

We beg to acknowledge, with thanks, for Mrs. Comer, 10, Broad Street, Ilfracombe, from

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

THE "FISHING GAZETTE" TOURNAMENT.

SIR,—In the coming competitions, would it not make the affair more real and artistic if some big branches from withy pollards be stuck in a reclining or natural position on the casting ground? We all know that some big and best fish love to bask or lie under the shade of the weeping willows or overhanging pollard heads. To drop a baited hook cleverly and tenderly just under a bough, without entanglement, requires a nice judge of distance, "nack" and strength of wrist.

In the old coaching days, I have seen, when a youth, a crack "whip" touch a "leader" in a four-horse drag on the ear or head, as if only to cut a small fly off with his long whip, and neatly and cleverly recover the "ribbands." The bank angler should certainly be encouraged in these competitions; for how often has he, to avoid a dwarf edge, or wall, or trees, to throw his line obliquely up stream?—I am, &c.,

THE PILGRIM F.

MORE PRIZES FOR THE "FISHING GAZETTE" TOURNAMENT.

SIR,—I see that a competition is to be arranged for the benefit of the Anglers' Benevolent. I will give books (Thackeray's "Vanity Fair" and others) to the value of half a guinea, to be allotted either as a separate prize or in addition to any other prize. Conditions I leave to editor of GAZETTE or any committee that may be formed to carry out arrangements.—I am, &c.,

Aug. 30.

A. J. MARRIOTT.

[Many thanks. There is no better novel than "Vanity Fair," and if the winner has never read it, he will doubly bless his star when he does read it.—ED.]

FISHING IN THE OUSE.

SIR,—Many thanks for your kind and prompt reply to my letter, but as it does not quite answer what I wish to know, I should be much obliged if you would put a query in next Saturday's issue for me.

Which is the best fishing station on the Ouse, in Huntingdonshire, and what accommodation is there?

I always have the "Anglers' Diary" by me, and have fished most well-known waters mentioned in it. I have, however, never fished the Ouse, in Hunts, and about this the diary is very reticent—not even mentioning Huntingdon.—I am, &c.,

H. H. W.

Aug. 29.

FISHING AT BEDFORD.

SIR,—Owing to absence from home, I have only just seen your paper of the 13th inst., in which your correspondent, "Rover," informs the public that day tickets to fish this club's waters are 1s. 6d. only. As this statement is calculated to mislead people into the belief that any one can come here and fish for 1s. 6d. per day, perhaps you will kindly explain that these tickets are intended for members' friends only, and are by our rules only obtainable by "application through a member."

If "Rover" be a member of this club, it is a great pity that he did not make himself acquainted with the rules before sending misleading statements to newspapers; but if not, I trust that his roving propensities may not bring him into trouble. In any case he will get no thanks for puffing private fisheries in your columns.

I may take this opportunity of saying that owing to a super-abundance of the poaching fraternity of late, we have put an extra keeper on our waters, and to-day we have obtained two convictions, one person being fined, with costs, £1 14s. 6d. for fishing from a boat at Kempton, and another a smaller sum for fishing from Mr. Mann's fields, near Clapham. A delusion has prevailed here for some time amongst a certain class that any one may fish with impunity from a boat. The present salutary conviction will probably act as a persuader to the contrary.—I am, &c.,

E. BICKNELL,

Bedford, August 27, 1881.

Hon. Sec. Bedford Angling Club.

FISHING AT BRIGHOUSE, YORKSHIRE.

SIR,—Will you oblige me by allowing me to ask in your valuable paper if there is any fishing near Brighouse, and what there is to pay to fish?—I am, &c.,

R. G.

A LARGE ROACH.

SIR,—Would you kindly insert the following:—While fishing on Saturday, August 20, at a pond on Penarth road, near Cardiff, with a Japanese rod and tight hair line, I hooked a large roach and successfully landed him. It weighed 2 lb. 13 oz. and measured 17½ inches from snout to tail and 13½ inches round.

It is now in the hands of Mr. Cording, preserver, of St. Mary's Arcade, Cardiff.

The reason I have troubled you with this is that there has been a lot of discussion between myself and friends about what weight a roach will attain to, and we thought that, through the medium of your valuable paper, we might get some account of the recorded big ones.—I am, &c.,

A SUBSCRIBER.

Cardiff, August 24.

[If this really is a roach it is a splendid specimen. Is it not a rudd?—ED.]

CHARGES OF PROFESSIONAL FISHERMEN ON THE THAMES.

SIR,—Seeing that you state the charge for a Thames punt, with fisherman, to be 10s., I think it only just to a skilful and civil fisherman with whom I have

gone out for years—your correspondent, John Rush, of Goring—to say that his charge is 6s.—a rather important difference.

The beer is an extra, it is true, but I don't think any one who sees how hard he will work to give a customer sport will begrudge it.—I am, &c.,

W. P. H.

[This is worth knowing. To other "professionals" we would say, go and do likewise.—ED.]

NETTING DEFEATED.

SIR,—Another instance of the thorough efficiency of Captain Etheridge, Conservancy Superintendent of the upper waters of the Thames, comes to us from Abingdon. It would seem that the reach of water from the Great Western Railway iron bridge down to Abingdon Bridge, formerly included in the defunct Angling Protection Association, then claimed by Mr. Harcourt, of Nuneham, has passed into the possession, rightly or otherwise, of Mr. Phillips, of Culham Court. This gentleman, under a presumable conviction of his right, conceived the notion of a regular water frolic, and issued cards of invitation to a luncheon on the banks of the river; and, besides this ground bait, offered the extra temptation to his guests of seeing the Thames dragged for a little more than two miles, but

The best laid schemes o' mice and men

Gang all a-gley;

And leave us naught but grief and pain

For promised joy.

The genius of the Thames, however, or some lesser deity, sent off a special messenger to the Captain at Reading, and as this intimation of what was meditated, was supplemented by the fact that the celebrated gang of the Beasley's, of Oxford, had with their nets and punts been retained for the occasion, gave an additional whet to this unflinching sailor's appetite. For, be it known, one of the most memorable aquatic battles in the valley of the Thames against the marauders of its waters, was conducted by the Captain and ended in a complete victory, although two of these Beasley's threw the Captain into the river, and beat Superintendent Head, of the Oxford police, over the cranium with a punt pole, nearly committing murder in the very presence of the sheriff of that classic city. Those who know the Captain can believe that he turned out of his hammock pretty early, and was soon on his way to the scene of action. Here, with a true English commander's notions of "cutting out" he and his bailiffs, while hidden afloat under the boughs, saw four of the Beasley's gang arrive in two punts with three other men, and having allowed them to land with their nets, which they carefully adjusted on the tow path, the Captain to the ill-disguised "funk" of the law-breakers, crossed over to inspect these engines. He found them to consist of three illegal flue nets, with double walling laced together in length between forty and fifty yards, just the span of the river in this reach, and ten feet deep. The Captain cautioned the men against their use, and threatened to seize them if they were wetted. The leader of the gang declared his intention to persevere in the job, for which he and his mates had been hired, and if any one laid a finger upon the nets, they would throw him into the river.

However, they thought better of this, and declared they would wait until Squire Phillips, of Culham Court, their employer, arrived. This the latter did about noon, and finding what was going on, in no very gentle terms told the Captain that he was a magistrate of the county, and as he expected shortly to be made a Conservator, he would have the Captain's commission as inspector cancelled. Intimidation proved of no avail with the staunch defender of the River's Rights, or in shaking his own defined duty. The Squire then said he would spend his fortune, if these nets were illegal, in having proper ones made, and sweep every fish out of this reach of water. By this time the anglers of Abingdon had got wind of the fracas, and these remarks of the Squire were received with hisses and derisive laughter, which sent him across the river to his luncheon in a foaming passion.

The Squire became obviously mollified after his appetite was appeased, and sent a gentleman of his party to invite the Captain, with his compliments, to luncheon with him. This, of course, he courteously declined, stating that, as he was on duty, he could not quit the nets. Mr. Phillips then pledging his word that the nets should not be used, the Captain permitted this gang of desperadoes to quit in their punts for Oxford, carrying the nets with them, but sent those who could be depended upon, to watch the Beasley's, and see that the nets were not used on their way up.

We are told that the Captain did all he could to provoke the party to put the nets into the water that he might seize them, and when the gallant salt saw the formidable instruments of mischief leave, a bye-stander assures us that he thought the brave fellow was going to cry with sheer vexation. Doubtless the Captain was here too sanguine. He should have waited until the act of netting had commenced, and the nets were in use, but we believe the sight of a net enrages Captain Etheridge as does a red-rag a British Bull. Perhaps on some future occasion, he will moderate his propensity to commit so net-tle a rash act.—I am, &c.,

THAMES TROUT.

WHICH IS THE BEST ARTIFICIAL BAIT FOR PIKE.

SIR,—Will you kindly permit me, as a humble disciple of Isaac Walton, to make inquiry through the medium of your paper in respect of the manner of using artificial spinning baits for pike, as I cannot gather from "Pennell's Practical Angler," "Keene's Practical Fisherman," or any other book in my library, exactly what I wish to learn, and I have not opportunity of personal access to a practical angler who is an adept of this style of fishing. I have been a very fairly successful during the current season in fly fishing for trout, but, as this is drawing to a close, I wish to supplement it with spinning for pike, the more especially as I have a fair field or rather open water, to me for operations. Undoubtedly Mr. Pennell's opinion that natural bait is always best when procurable is in the main correct, and this I presume would apply to trout and salmon as well as to pike and to perch. But unfortunately the natural bait is not always to be obtained by purchase, and as my time for sport is much limited, it detracts too much from the enjoyment of it to have to fish for gudgeon or other small bait before commencing. I argue to myself that as fair creels of such wary and dainty fish as trout are caught with artificial bait by such an unexperienced angler as myself, certainly the less acute and more greedy pike ought to succumb to the same or a similar style of angling, and save one the trouble of seeking live bait and hiring a boy to carry the can or even encumbering myself with salted fish. I have already wooed them with "Colorado" spoon bait, and the "Totnes" and "Phantom" minnow, but so far I have not found them so confiding as I could wish. I should even be happy to present to them a "clipper" or a "Cleopatra," could I believe they would appreciate and be responsive to my polite attentions. I suppose, how-

ever that the fault lies in my method of wooing more than in the lack of trust in the fish. I sometimes troll near the bank and behind the weeds and rushes as with the gorge bait, at other times I cast diagonally across the stream and spin back again as with dead spinning bait, but unfortunately the pike, which I know are there, treat with the coolest and utmost contempt all my efforts to please. Can you, my dear, sir, or any of your skilful correspondents, give us a useful hint or two, such as are not to be found in books? One thing in particular, I wish to know: does the artificial baits already enumerated, especially the "Phantom," require to be attached to leaded and swivelled traces, or should they be attached to the running line just as they are obtained from the tackle shops? And oblige, as the commercial travellers say, one of—Yours, &c.,
A NOVICE.

THE FENCE MONTHS.

SIR,—When I accepted Mr. Balderston's challenge to accompany that gentleman to the several becks in Cumberland and Westmoreland that had been fished out, or sufficiently overfished to influence the proprietors of those grounds through which they run to close them for one or more seasons, I did so under the assurance that the offer was made in good faith and would be strictly complied with. He is now pleased to treat my acquiescence in his invitation as "an indefinite time," as I name next spring for our trip. Well, I will endeavour to gratify his desire somehow; and, to do this beyond cavil, I will accept his generous offer for this autumn, under the conditions I have laid down. He must promise to be very good, and not substantively to exhibit that cantankerous spirit which he infuses into his letters, but to cultivate a conduct and bearing in harmony with the scenery of the two picturesquely-gifted counties in which we shall find ourselves. This is the more necessary as I intend to introduce him to Long Meg and her daughters, who are never tired of bathing their feet in the Eden. We shall then not be far from the Raven Beck, which may have been named after Mr. Balderston—or Mr. Balderston after it, for it is certainly not bald-of-stone, particularly near the ruins of the old Castle of Kirkoswald. The Crow-dundle Beck may be likewise a relation of the "Raven." Well, I think I could enumerate a few becks at least on the Eden, as well as districts on the river itself, where the rod has been excluded for a season or so from the waters. But a friend whispers me that "the 'Raven' is artful, and sucking my brains." He is quite welcome, so long as my brother anglers join in the feast. But any one who is acquainted with Westmoreland and Cumberland will know the task Mr. Balderston would so modestly set me on paper, and which I would not decline if I were equal to writing the volume he so cunningly craves. Moreover, I know not in whose possession the lands watered by the becks in question are now vested, and I certainly should not like to use names and speak of circumstances, perhaps to the prejudice of such localities, without the permission of the respective proprietors, only to be obtained by a self or properly accredited introduction.

To give the indifferent reader an inkling of the cool request with which Mr. Balderston has honoured me, I will merely enumerate the names of the principal rivers in the two counties, each of which has its tributaries running down from the hills at comparatively short distances on either side.

In Cumberland, we have the Eden above-mentioned, the Lune, the Irthing, the Galt, the Wampool, the Caldew, Ellen, Waver, Greta, Eben, Cocker, Peteril, Liddal, &c. And in Westmoreland, again the Eden, the Lune, the Elmore, the Ken, &c.

I am in some fear whether Mr. Balderston's "fatal facility" of penmanship will not lead him into the very errors he would correct in others. He, it is true a very roundabout way, gives both myself and "L. B." the lie. Yet he ventures to state that he has seen fish so crowded that they jostle each other—so he can, during spawning time, in any river, but the fish in those times, in sporting slang, are "all there." This sort of tall talk may remind your readers of that very self-opinionated angler, "D.," who, boasting of the mobs of trout in some particular stream (I believe it was in the Peteril) in his own county, old Cyrus Wilder, the fisherman, of Maidenhead, remarked, "That almost beats our weir; the trout are so closely packed we cannot get our punt poles down for 'em, and the plummet, in trying the depth, rests on their backs half the time."

Let Mr. Balderston give me three days' notice, through the editor of the FISHING GAZETTE, and I will have all packed. I promise to give him a give-and-take companion, although not a very good pedestrian; but I will find my own pony for the hills, and my tobacco, and be satisfied with plain wholesome provender, eschew all wines, especially of an expensive character. But I must declare for my whiskey, undoubtedly Scotch, of a peaty flavour, small still, and, above all, a clean bed.

I have to thank the editor for his handsome testimonial, and Mr. Keene for his flattering estimate of my angling gifts.—I am, &c.,
CREEL.

FISHING FOR GREY MULLET.

SIR,—As this subject seems at present of interest to the readers of the FISHING GAZETTE, I should like to put on record what I know of it. Many years ago, I passed some weeks annually at a then little frequented place, Cardrop, in the Firth of Clyde. I make no boast when I state that, although a mere school-boy, I was already an adept with rod and gun, and at all kinds of sea-fishing. But there was one fish I could not catch—the grey mullet—there called the "half-salmon," although they swarmed close to the house in which I spent my *villegiatura*. In fact, this fish was to the people there something mythical, or at least mysterious, only to be taken by one man, who used to come from some distance when the tide was low, and always in the evening. Saving to this man, these mullet were practically non-existent. Being anxious to penetrate the mystery—for I was a keen and successful angler—I set myself to watch his movements, but he had always friends with him who stalled me off, for he made much of his secret, of which he was proud in the highest degree. I found, however, that he used a salmon rod, of some twenty feet in length, and a fly draped with a white feather, called in Scotland "a lythe fly." This was common enough, but the mullet would not take it. What, then, was the additional attraction? By dint of watching I found it out. It was the bivalved oval spout-fish, like an elongated cockle, only much larger, called on the Clyde "garrocher," the scientific name being, I believe, *Mya arenaria*, and common on all the British coasts. Part of the flesh of this shell-fish, probably the spout, which is exceedingly tough, be put on his fly. He angled only at low water from the end of a rude stone wharf, used by the ferrymen, and regularly succeeded in taking a number of mullet from 3 lb. to 5 lb. in weight. Circumstances prevented my following up my little discovery, but twenty years afterwards a near relative did so, with great success, on the identically same spot. As this mullet is a fish in every way worthy of notice, the anecdote may be of use to many anglers, hitherto baffled by its shyness, and if any find it of service, I shall be amply rewarded if they make their report in your columns.—I am, &c.,
J. D. DOUGALL.

A CURIOUS QUERY.

SIR,—Being a constant reader of your paper, and having had an all-England fishing contest and a dispute, I venture to ask you the following question:—"If a man hooks a fish, and the same breaks his line and the fish sails up the canal and other anglers can see it, through the float sailing on the water, and one of them throws in his line and it gets entangled round the aforesaid float (mind you, he throws in with that intention): Can he weigh-in the fish and claim a prize, according to the rules of angling, and providing also the rule marked in small book had been read to the competitors. Kindly answer this per letter, and also insert answer in FISHING GAZETTE of Saturday next.—I am, &c.,
THOMAS STONES.

Farnworth, August 29, 1881.

[The rule Mr. Stones refers to, is that "all fish must be *bona fide* taken with the fair and complete angle, and by no other means or device whatever, but by fair art and hands of the member, weighing the said fish in landing net to be allowed any member." We have told Mr. Stones, in our opinion, the fish was only landed by "B" for "A," who had caught it, and could himself have landed it, had "B" called his attention to it. If the fish had taken "B's" bait, after breaking "A," then it would be fairly "B's" fish. What would the Central Association judges say in a case of that kind?

Suppose "A" shot and wounded a partridge, and "B" came along, and pulled it out of a hedge, it would be "A's" bird, even if he had lost it, unless "B" could prove he shot it.—ED.]

FISHING IN CHESHIRE.

SIR,—Will you kindly inform me whether any fishing can be had in any of the meres or rivers of Cheshire?—I am, &c.,
A CONTRIBUTOR.
August 29.

THE TROUT PLACED IN THE THAMES BY THE WINDSOR AND ETON ANGLING PRESERVATION ASSOCIATION.

To the Editor of *Bell's Life in London*.

SIR,—As I understand you have recently published a paragraph in your paper, evidently written with no goodwill to this society, I trust to your sense of justice to publish also the following statement.

The trout had been bespoken a very long time, and were supplied by the same person who supplies the Reading, Maidenhead, and other Thames Associations. In fact, I cannot hear of any other person who supplies live trout at all, other than the small fry. I had also made proper inquiries respecting him, and had been assured on the highest authority that he was thoroughly reliable. When I saw him in July he told me that those he had ready were of the same size as he had been just turning into the river at Reading, and when he telegraphed to me a fortnight ago, he said he had ready for us a "beautiful lot—the last he would have this season." These I purchased and put in our waters. I am sorry your correspondent did not admire them. I did not see them myself, being absent from home; but a member of our association who was on the spot, states "that he saw the last 17 that were turned in, and the water-bailiff is not likely to have kept the largest to the last, and can assert that not one of them was under 10 inches in length, and as for their being sickly, they ate almost every gudgeon and minnow in the punt well, while confined there, and were feeding very freely in many parts of the weir stream the day after they were placed in the river.

I do not know whether your correspondent is a member of our association or not. If he is, it would have been better taste if he had written to me on the subject, or brought the matter before the committee; if he is not, he might have remembered the proverb about looking a gift horse in the mouth (for all fish turned in by the association are simply presents made by them to the angling public). In either case, I shall be greatly obliged to him if he will inform me from whom better fish can be obtained, and put us in possession of funds to purchase as many as possible.—I am &c.,

CHARLES CALDECOTT JAMES.

Chairman of the Windsor and Eton Angling Preservation Association.
The Timbralls, Eton College, Aug. 29, 1881.

"MULLER'S TOPKNOT" (*Rhombus hirtus*).—I have just received from a correspondent to the FISHING GAZETTE, who is now fishing in North Wales, a very pretty specimen of the above for diagnosis. This fish is the true "Muller's topknot," and is so much like the figure in "Bloch" that it might almost be said to have sat to the artist. These little fish have been very scarce on the Devonshire coast for some seasons past. The autumn of 1871 produced many examples, including Bloch's topknot (*pleuronectes punctatus*), which I gave to the Albert Museum in Exeter. This was also very like Bloch's figure. Both Yarell and Couch are very imperfect, and it has been said that it is almost a question if they had the same species in view. Now is the season for finding curios in the shape of new and strange fish; the warm waters of the gulf stream being intercepted by cold and storms often oblige rarities to succumb, and in many instances are found on the beach. Any assistance I can render in diagnosing am most willing.—FRANK GOSDEN, Exeter.

MESSRS. W. H. and L. COLLINGRIDGE, of the *City Press*, announce the completion and occupation of their new buildings, 148 and 149, Aldersgate Street, which have been erected upon the site of the offices destroyed by fire in April of last year.

A PLEA FOR THE BIRDS.—The Corporation of London happily wrested Epping Forest out of the hands of certain English "landgrabbers." The pleasures of a rural and woodland walk are greatly enhanced by hearing the lark sing like "an angel in the sky," or the songthrush and the blackbird, the linnet and goldfinch, or the chaffinch, and others of our small feathered friends, warble and make merry. The magistrates will do a duty to the public by prosecuting those heartless fellows who, for gain, would catch all these birds in and near the People's Forest at Epping, and elsewhere. The love of birds is a generous sentiment; it is one that might and ought to bind the exalted and the lowly in one bond of brotherhood and union for the protection of songsters everywhere, especially near the metropolis. In these wild and semi-revolutionary times, certain people think they can kill or catch any wild birds, &c., without let or control. These men must be taught to respect the feelings of the honest and respectable classes of all grades, by fines and even imprisonment. There are already far too many poor starlings and sparrows caught merely for idle persons to shoot at, slaughter, or main, and all for paltry prizes. And who, moreover, authorised these people to kill and slay the deer in the same forest?—INDIGNANT.

CLUB REPORTS.

ANCHOR AND HOPE ANGLING SOCIETY.

On Sunday, 28th, a match took place at Wraybury, 16 members competing—A. Shakel first, W. Streeton second, H. Scott third, B. C. Booth fourth, and several other members weighing-in fish.—A. SHAKEL, sec.
August 30.

CANONBURY ANGLING SOCIETY.

The members of this society were sent to the Thames last Sunday, the result being an excellent show of roach, Mr. Wellsted being at the head of the list, and taking the cake with over 7 lb. The following gentlemen had fish:—Messrs. Leach, Brooks, Barber, Money, Key, and myself.—T. BENNETT.

CITY OF LONDON ANGLING SOCIETY.

The following members weighed-in fish on the 28th:—Mr. Mortimer, bream and roach, from Amberley; Mr. Castell, some fine roach from the Roding; and Messrs. J. Chambers and Mark, roach from Penton Hook.—CAS.

DUKE OF CORNWALL ANGLING CLUB.

The return visit to the above club took place at the Wheatsheaf, Havestock Hill, on Tuesday, August 30, eleven clubs being represented, and a large number of friends were present. A capital and enjoyable evening was spent, harmony being the order. Amongst those who contributed to the enjoyment were the chairman (Mr. J. Amies), vice-chairman (Mr. R. Lealand), and Messrs. A. Sargeant and Heckford, of the Duke of Cornwall A. C.; Mr. Roxbee, N. W. A. C.; Mr. Roland, Waltonian A. C.; Mr. Huggett, Duke of Norfolk A. C.; Mr. Roberts, Prince of Wales A. C.; Mr. Blackmore, St. John's Wood A. C.; Mr. Dobell, Cambridge Friendly A. C.; Mr. Hurst, Hampstead A. C.; and Messrs. Jackson, Leith, and Barr, of the Little Independent A. C.; a duet by these gentlemen upon a miniature concertina and banjo being much appreciated. Messrs. Wm. Harrold and H. Jones also appeared to great advantage. Mr. Wm. Brown presided at the piano. The next visit will be paid to the Duke of Norfolk.—J. AMIES.

August 30.

FIRST SURREY ANGLING SOCIETY.

Brother Perkins, $\frac{1}{2}$ cwt. of bream and roach from the river Ouse; Brother Taylor, 7 dozen gudgeon and 7 barbel from the Thames. The first match will take place on Sunday, the 4th of September, at Amberley, for five valuable prizes, presented by Brothers Bates, Emms, Harrison, Rudkin, and A. Cox. Members must obtain their privilege and railway ticket from Mr. Clout, Berkeley Castle, Rahere Street, Goswell Road, St. Luke's, E.C., on Friday evening, between the hours of 8 and 10. It gives me great pleasure to inform you that since the opening of our club, which took place on the 18th of May this year, that we have been very fortunate in obtaining some extraordinary large fish, which, I am pleased to say, have been sent to Mr. Miller, of East Street, Walworth, to be preserved. I am willing to show my fish against any single member of any club in London. The fish to consist of roach, chub, and tench, and must have been caught within the present season. The amount of the stakes to be settled on arrangement.—GEORGE G. TAYLOR, sec.

August 29.

[Send report to 12, Fetter Lane, in future.—ED.]

GLOBE ANGLING SOCIETY.

On August 28 the members of this society paid a visit to the Upper Thames, but met with very little success. Mr. C. Russell had roach, dace and chub, Mr. J. J. Holmes some very nice dace; all the other takes were very small. On September 4 a sharp contest is expected for a prize given by Mr. Churchman, sen., for the gross weight of all fish.—J. CHURCHMAN.

August 30.

GOOD INTENT ANGLING SOCIETY.

There was a good show of fish at our club on Sunday night last. Mr. Maybury, roach; Haines, dace; W. Hughes, roach; Rodgers, roach and dace; J. Pluckrose, bream and roach; W. Wheeler, dace; E. Pluckrose, bream and roach. On Tuesday night Mr. J. T. Richards had a good show of roach, many of the fish over 1 lb. each; Mr. Wood had a tray of roach; Mr. R. Murphy had roach, perch, and dace—one dace 14 oz., another 13 oz., one roach 1 lb. 3 oz., one perch 1 lb., all taken from the Lea. Our distribution of prizes takes place on Tuesday, September 13.—R. MURPHY.

August 31.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

The following members showed some very fair samples of fish on Sunday last, from the Avon:—Messrs. Hutchings, Mullins and Butler, roach and bream. From the Thames—Messrs. J. Watling, C. Warren, W. Watling, Armstrong and Hewitt. From the Wey—Messrs. Theobald, J. Fitch and J. K. Fitch, some very good roach. From the Lee—Messrs. Young and Cooper, roach. Mr. Major roach from the Colne.—J. A. FITCH, jun., sec.

August 30.

GRESHAM ANGLING SOCIETY.

At the Gresham Angling Society's meeting on Thursday evening Mr. Jardine proposed a vote of sincere condolence with the family of the late Mr. H. L. Rolfe, which was very feelingly seconded by Mr. T. Crumplen, the hon. sec. Mr. Rolfe was a warm supporter of the society, and had undertaken to paint a valuable picture to be presented by himself, as their first prize. Mr. Jardine, in a touching speech undertook to present the society with a picture by his old friend, Rolfe, as a substitute for that their late member had promised to give, and his remarks were supplemented by speeches from Messrs. G. Austin, C. S. Bentley, Bryant, Captain Alfred and others, all expressing their sense of the loss the angling world had now sustained. It was also decided to charge an entrance fee to all members joining after the close of the present season, the members separating after a very pleasant evening, spent in the discussion of prizes and general piscatorial topics.

KING'S CROSS UNITED ANGLING SOCIETY.

The members of this society were out on the 28th inst. competing for a prize presented by the hon. sec. The takes, though small, made up for want of num-

bers by being of good quality. Amongst the most successful in having fish were our indefatigable member, Mr. Morley, with roach and perch from Pangbourne, 4 lb. $1\frac{1}{2}$ oz., and Mr. A. Bell, bream and roach from Weybridge, 4 lb. $7\frac{1}{2}$ oz. One bream, a veritable picture, of 3 lb. $5\frac{1}{2}$ oz., has gone to be made beautiful for ever. The competition is continued next Sunday—members of the K.C.U. please note this.—G. TREADWELL, hon. sec.

August 29.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

Several of the members were again successful on Sunday last. Mr. Obbard with roach and dace from the Lea; Mr. Gorsuch sen., with some splendid roach from Thorney Broad. Messrs. Long, L. Gorsuch, J. and G. Drew, Parker with roach and dace from the Thames. Mr. Lucy jun. had also roach from Fulborough.—THOMAS WILLIAM LUCY, Secretary.

Aug. 30., 1881.

PECKHAM BROTHERS ANGLING SOCIETY.

The first club match of the present season was fished on the 28th ult. at Staines Mr. Garrard taking first honours and Mr. Stidolph second. Mr. Williams's prize will be contested on the 4th inst., "all fish to weigh and go where you please," as the donor expressed himself.—W. R. M., sec.

PRIDE OF DERBY ANGLING CLUB.

The members of the above club held their third match this season in the Egginton Canal on Saturday last, but owing to the wet season there was very little fish taken, the first twelve members taking the principal prizes. First prize, J. Cadman, Esq.; second, Mr. W. Tunnicliff; third, Mr. W. Elliott; fourth, Mr. J. Hibbert; fifth, Mr. J. Hutton; sixth, Mr. J. Saxton; seventh, Mr. C. Hardy; eighth, Mr. J. Moore; ninth, Mr. C. Pashley; tenth, Mr. W. Torman; eleventh, Mr. C. Lewis; twelfth, Mr. T. Stafford; and Messrs. J. Grimley, J. Bland, F. Tunnicliff, J. Hodgkinson and S. Thorpe *nil*.—W. TUNNICLIFF, sec.

August 28.

ROYAL PISCATORIALS.

The members of this society have lately been having some rare sport among the barbel, dace, roach, and gudgeon in and about the tidal limits of the Thames. On the 28th they competed for prizes in the same neighbourhood, and had some excellent sport with the above-named fish. Among those members who succeeded in reaching the society's headquarters and exhibiting their fish were Messrs. Canton, Smithers, Frith, and Dale.—PIXIE.

August 31.

SOCIAL BROTHERS.

Our competition at Pangbourne, on the 21st August turned out a very poor affair, the weather being very bad and the takes very small. Mr. James Flynn taking first and third prizes, Mr. Lockyer the second; Mr. Underdown, 2 lb. 11 oz. bream. On the 25th, Mr. Monk, 20 lb. 5 oz. roach and 1 lb. 5 oz. dace; Mr. Valler, 3 lb. 6 oz. roach; Mr. Briscoe, roach.—J. GOUBOT.

STOKE NEWINGTON ANGLING SOCIETY.

Our members proved very unlucky on the 28th ult., Messrs. Gretton, North, Marrow and J. Brookman having a few roach, the largest take being 1 lb. $8\frac{3}{4}$ oz. Mr. T. Gretton wins the prize for the gross weight of fish taken during the month of August (Sunday fishing only) with 12 lb. $15\frac{1}{4}$ oz.; Mr. E. Morrow that of the heaviest roach with one of 1 lb. 1 oz.; and Mr. Thomas Millington that of the heaviest perch with one of $6\frac{1}{4}$ oz. The complimentary visit to the club took place on Tuesday, the 30th ult., and special thanks are due to the Burdett Angling Society, the members mustering in great force, upwards of a dozen being present.—T. GRETTON, sec.

August 31st.

SURREY PISCATORIALS.

On the 31st ult. Messrs. Meadway, Beckett and a friend visited the Colne, and succeeded in getting some roach, dace, chub and perch, some of the dace going over 10 oz. each; 11 lb. fell to the rod of Mr. Meadway, and 6 lb. 9 oz. to Mr. Beckett. This being the evening for deciding as to where and how the competition for the 14th September, the members mustered much earlier, and I must say, much more strongly than they have done for some time; among those present I noticed Dr. Carpenter, Mr. Pugh, Mr. Tanner, T. Clarke, and many more, nearly all of whom had some proposition to make, which made the meeting rather lively and warm. Towards the close it was proposed and carried that the members of this society go to Pangbourne, and fish from the bank for the silver cup and other prizes given by Dr. Carpenter and others for competition on September 14th.—PIXIE.

September 1st.

WALTONIANS.

On the 24th, Mr. Rushbrook weighed-in a little over 6 lb. of roach and dace. On the 28th a prize of a guinea was fished for at Pangbourne, Mr. Roland was the winner with 7 lb. $2\frac{1}{2}$ oz.; the other takes were of fair average. The following are the names of the gentlemen weighing-in:—Messrs. Bowering, Good, jun., Packman, Waltham, Jukes, R. Dodge, Giles, W. Dodge, Starr, Malcom, and Lester.

WALWORTH WALTONIANS.

On the 26th Mr. J. Collins succeeded in getting 8 lb. $9\frac{3}{4}$ oz. of roach and dace from Kingston. Mr. F. Grigg, the same day, fishing at Elstree, captured three nice tench, weighing 7 lb. $9\frac{3}{4}$ oz., the largest turning the scale at 2 lb. $10\frac{1}{2}$ oz.; he also had 2 lb. of roach. The 28th brought to a close the competition for the last named gentleman's prize for which Mr. Boalch weighed in on this day 8 lb. 3 oz. of roach and dace taken from Richmond with C. Brown. Mr. Bayley, out with Chamberlain, 3 lb. of roach and dace; Mr. Weatherhead with a boat at Hampton, 2 bream weighing 7 lb. $4\frac{1}{2}$ oz., the largest going 4 lb. 2 oz. At 10.45 the following was the result of the four Sundays' competition: Mr. Boalch, 1st., with 26 lb. $2\frac{1}{2}$ oz., in three shows from Richmond, punt-fishing; Mr. Bayley, 2nd., with 15 lb. $9\frac{3}{4}$ oz. in four shows; 3 from bank and 1 from punt; Mr. Weatherhead, 3rd., with 7 lb. $4\frac{1}{2}$ oz., 1 show, from boat; Mr. Evans, 4th, with 2 lb. $3\frac{3}{4}$ oz., 1 show from punt. Several other members contested, but by some unaccountable means never could succeed in getting to the headquarters in time to weigh-in their fish for these prizes. Members, do not let Messrs. Schwartz and Co.'s competition slip your memory; it takes place on Sept. 11.—PIXIE.

August 31, 1881.

WAVENEY AND OULTON BROAD PROTECTION SOCIETY.

At the meeting of this society, on Wednesday, 24th ult., a sub-committee was appointed to consider the necessity of setting aside certain months in the year as a fence time for pike and perch, it being now manifest that the wholesale destruction of jack when out of season, and the scarcity of perch, imperatively demand some immediate course of action to recoup the stock of these waters.—CREELE.

FISHING FOR SALMON - BASS—GREY MULLET—
LARGE PIKE—CARP IN AMERICA.

I CAN sympathise with Mr. Huggett's observations concerning in the capture of grey mullet. Some years ago I greatly astonished the good folk, frequenters of the old pier at Brighton, with my Nottingham rod and spring winch, with its 150 yards of fine silk line. I was voted mad—as I sat one very calm evening, in a small boat, moored below. However, I managed to land six splendid bass, ranging from 4 to 8 lb. with this apparatus, much to the astonishment of about three hundred people, who had heard of the supposed maniac, and had come “out for to see,” not a reed shaken by the wind, but a Thames fisherman killing fish the “locals” had no idea of trying with tackle finer than that necessary to rescue a man from the water.

* * * * *

And what splendid fellows those salmon bass are on the hook. As soon as they feel the hook, they bolt with a mighty rush, and woe to the tackle, if you are unprepared. I lost several tackles at first, but at last learnt the manners of the beast. I should not mind another little game of the same sort.

* * * * *

Wilcocks, in his “Sea Fisherman,” gives the following methods for the capture of this fish:—Fly fishing with a light coloured fly—or any salmon fly; ground fishing (*i.e.*, paternoster style), and drift line fishing. With all humility I add the above style.

* * * * *

The grey mullet swims in shoals, and Young (“Sea Fishing as a Sport”), tells of a swarm, which, on being brought to land (taken by a seine net), weighed fifteen tons. It is a ground feeder like a barbel, and as capricious in its biting. Like barbel, also, it may be baited. Carp-like again, Wilcocks says they will follow each other in jumping over the line of the net.

* * * * *

Again, *re* jack. “Leviathan” gives us a very interesting article on the sizes to which the fish has attained. He has forgotten to mention the other 36 lb. possessed now by the Hammersmith United Anglers—I think—which was taken from Rapley Lake, Windsor Great Park, in a net, by my father (the Royal fisherman) and sent for casting and stuffing to Mr. Buckland. It was, I believe, originally intended by the ranger as a present to the Queen, but it seems that Mr. Edon, finding he did not get paid for the stuffing, etc., disposed of it. I think 1871 or '72 was the date of its capture, and a full account of it is to be found in “Land and Water” of the week succeeding capture. At that time it was the largest known pike in England, and supposed to be not more than twelve years old.

* * * * *

Yarrell speaks of much greater weights; amongst others of the famous Halibrun fish, 350 lb.; of the Loch Ken capture, 61 lb.; Loch Lomond, 79 lb. Here is a catch of pike mentioned by the same writer! “Four days’ sport (in Horsea Broad, Norfolk, producing 256 pike, weighing altogether 1146 lb.” This was by “trimmering.”

* * * * *

Just another word before I finish with the subject, and it is addressed to “Leviathan.” He says, referring to pike getting rid of hooks, and speaking of the Colne (Joe Heath’s water), the “second occasion . . . was when he killed a 12½ lb. pike in the throat of which he found another flight. . . . The latter was lost by Keene, a Thames fisherman, of Wraysbury.” The italics are mine.

* * * * *

Now, I don’t remember this. I am certainly the only fisherman of the name—who lived at Wraysbury—where I resided for two years, and cannot recollect fishing in Joe’s water for jack at any time. However, the matter is of trivial importance, though it is as well to be exact even in small things.

* * * * *

The Americans have found out the gameness of the carp—and also its beauties. Says a correspondent of that excellently conducted paper “Forest and Stream,” “They were pretty to look at, one of them a daisy, with dorsal fin extended, with golden splotches, and sides like the gold flashes of an evening sun, and bright silvery scales like the mail of a Naaid Queen.” How’s that, oh! poet-anglers, for a mixture of similes? Fancy a daisy with a dorsal fin!

J. HARRINGTON KEENE.

NORFOLK.

“Oh, the gallant fisher’s life!

It is the best of any;

’Tis full of pleasure, void of strife,

And ’tis beloved by many.”

—Watton.

AND all those who are in the least way sceptical about the gentle art being beloved I should advise them one fine day to make an excursion up our old river, and they will come away under the impression that there certainly is some amount of truth in the matter.

And now for sport during the past week. It is again a puzzler where first to commence. I will begin at Brundall, and I might almost have written a separate report, entitled “Pike Fishing Extraordinary,” at this place. I am extremely pleased to find that my old friend Hewitt, the water bailiff, was right in his predictions about a good pike-fishing season; for last week, in one day, there were taken in this neighbourhood no fewer than 194 pike!—two gentlemen alone succeeding in landing 42 fish out of the number.

Whether they have all migrated from other parts of the stream to this particular spot I am at a loss to know. But certain it is the river teems with them, and boys have actually been seen to take them with a piece of bright tin having hooks attached to answer the purpose of a spoon.

Such a multitude of these freshwater sharks must be playing great havoc amongst the roach, &c., and the sooner a great many of these gentlemen are slain the better, for, although they afford good sport, yet, at the same time, they are exceedingly destructive. There have been also some capital takes of roach here, and I do not know a better spot on the whole stream than this for sport amongst roach.

I saw a very nice catch taken by our esteemed friend Mr. Greene, of London Street, on Friday last, although the wind was such that it must have been a difficulty to have kept the boat moored. I should like to see better accommodation for anglers at this spot in every respect, for, as I have remarked, this certainly is the favourite place on the river, and anglers often experience many rebuffs, there being only a limited number of boats kept, and some of these not very first-rate.

There is ample room near the railway station to make a splendid fishing resort, and I am informed on good authority that a spot has just been purchased with a view to establishing a place of the kind. I am also informed that it is proposed to have at least fifty boats for the purposes of angling, rowing and sailing, private hotel for refreshments, such as tea, coffee, &c.; to erect a structure for accommodating clubs and outings of all kinds; to keep and let out for hire all kinds of fishing tackle—in fact, to be the very *beau idéal* of the real angler, for, although an angler is supposed to rough it in many senses, yet no one more than he likes good accommodation and comfort.

Anyhow, I wish the projectors every success in their undertaking; and as it is only ten minutes’ ride from Norwich, and one minute from the Brundall railway station, I do not see in what way it will lack success.

I have seen many good catches, both from Buckenham and Cantley, chiefly roach, which are in splendid condition. Not much has been done amongst the bream, as the recent heavy rains have made the water thick.

I have just heard of a fine tench being taken in the Waveney, weighing over 6 lb., but like a great many more fine specimens, found its way into the stewpan instead of into the preserver’s hands.

ANGLER.

VARIOUS SUGGESTIONS.

THOUGH many hints are thrown out from time to time, and heartily endorsed by our respected editor, that the numerous correspondents of the FISHING GAZETTE would, in their reports, state what baits and flies are used, they have produced but scant results. Where you have no personal knowledge of the various parties named, how very wearisome many of those river and club reports are, being just like so many repetitions of when and where A. B. C. took so many fish weighing so many pounds. It is no doubt very flattering to Messrs. A. B. C. to see their great achievements so chronicled, and I doubt not but that those reports are cherished lore to their friends; still, it may be questioned, are they of any practical use to the great body of anglers? Did they but give us a dash of the water they fished in, and report the various baits, natural and artificial, by which the fish were taken, they would convert a tiresome report into one of general interest; at least such is the view taken in a part of the country where clubs are not. Some writers so far forget their nationality, as not even to name the weather! Seemingly, all that is valuable in their eyes is the great take and heavy weight, but the reader, wearied by the ever recurring figures, passes them rapidly by. Ah! here is a nut with a kernel, though it is only a few lines from D., who has been down at Blank

river, which was clear as gin. Your reporter had stated that no fly equalled the March brown for that river, yet he, fishing from early morn until dewy eve with a large and beautifully dressed specimen of that fly failed to catch a single fish, adding that the day was bright and fine too. The kernel is in the lesson taught by this statement, and which may even dawn on D., and perhaps on the rest of the alphabet, that there are better flies for a clear water and a bright day, than even a large March brown. Had those important items of weather, water and fly been omitted, all the knowledge gained would have been that D. was a duffer. By the bye, those "Notes by the Editor," are a capital idea, embodying as they do the practical knowledge of an experienced angler on all novelties, as well as other fishy subjects, as they are brought before the public.

Now for another suggestion, though, perhaps, not an original one. Have we no publisher enterprising enough to bring out a Fisherman's Entomological Companion? It should be an illustrated work, with the flies drawn life size, beautifully, and coloured to nature, as may be seen in many of John Van Voort's entomological works, as well as, no doubt, in those of many other publishers. In those specimens in which varieties occur, two or more coloured drawings may be required, noting the districts where such varieties occur, drawings of both male and female, their various synonyms and life history. It might be urged, If you wish to know such particulars, why not study it out for yourself, and make a collection of such flies as you may think fit? There are many negative reasons. To name some, such a collection would be too local and limited. Then there is the difficulty experienced in retaining the extremely delicate colours in both bodies and wings, both of which are addicted to shrivelling up past all kenning, in spite of all the care you can use in drying. (Note, all illustrations must be coloured from the living insect). Then, too, of what use would any collection, private or public, be to the angling world, or to the professional fly tier? Should the question be asked, Is such a work wanted? I say, yes, both by the angler and the professional fly tier. By the angler, who generally is much better acquainted with the artificial, than with the natural fly. By the professional fly tiers, who, to judge by their products, must more frequently work from written or trade instructions, than from any personal knowledge of the flies they seek to reproduce. I do not here allude to any "entered apprentice" in the craft, but to those who are rapidly approaching their 33 degree. Neither do I seek to disparage their works of art, as, until we have a series of strictly accurately coloured flies, how, in the name of reason, can better results be attained. Their work is in many cases perfection, so far as their knowledge of the fly extends, and I allow that with those flies good results often follow; but, at the same time, have we not also too often to record a total failure, when the fish are well on the feed on some special fly; a failure entirely to be laid to the charge of fishing with an unnatural artificial fly. Is my reader still dubious. Then catch any dun or spinner you please, examine it by means of a low magnifying power, then look at your artificial fly with the same power. Are you still satisfied? Does the eye of a fish magnify in any such manner? That I cannot say, but lucky is the angler, whose eyesight can compete with that of the fish he seeks to capture.

W. S. L.

Barnard Castle.

THE "WOODCOCK" OF THE THAMES.

(By YE PILGRIM FRY-ER.)

THE sportsman sets a greater store on his first woodcock of the season than on several pheasants and partridges. Why? Because the "cock" is a far rarer bird, very highly prized for the table, and is migratory, coming with the October full moon. The native trout is the "woodcock" of the Thames, as is the red mullet that of the sea. The Thames "cock" has, in the few past years especially, been a very rare fish; he is also highly prized for sport and also for the table. The coarse fish—the destructive pike and eels, and the rest—we have, like the poor, always with us. It has been the very commendable endeavour of the Angling Preservation Association, at Chertsey, Windsor, Maidenhead, Marlow and Reading—seeing that the Thames "woodcock," *i.e.*, trout, had either got so very scarce, or so very wary as seldom to be taken—to very materially increase the "spotted cocks," and render their capture worthy of the prize of the angler's highest calling. Hence the river, in this respect alone, must be strictly protected.

Your correspondent, "Leviathan," has happily given some data whereby a person well up in figures might estimate the approximate damage done by that big brace of Kew pike. Given a 3½ lb. pike (the Godstow fish) swallowing a barbel of 6 lb. and a chub of 3 lb. as a day's grub, how many and what weight of fish had the Kew old sinners dined and supped on since they had been in the Thames? Does any sane man doubt now that pike and eels should any longer be tolerated in the Thames. All jack that get flooded out into the ditches should be either turned into the ponds in London parks or sold to "gate-money" pools and lakes, or given to the poor.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—[ADVT.]

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing tackle shops in the world, and wholesale from Messrs. S. Alcock and Co., Standard Works, Kedditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

1st AWARD MELBOURNE EXHIBITION, 1881.

DAY, SON AND HEWITT'S STOCKBREEDERS' MEDICINE CHEST.

FOR ALL DISORDERS IN HORSES, CATTLE, CALVES, SHEEP AND LAMBS.

In this chest are the following matchless and world-renowned remedies, all that a Farmer can require to cure disease amongst his Stock and keep them in fine, healthy, and buoyant condition:—

- "CHEMICAL EXTRACT," for Wounds, Swollen Udders, and Ewes Lambing.
- "GASEOUS FLUID," for Colic, Scour, and Debility.
- "RED DRENCH," for Cleansing Cows and Ewes, &c.
- "RED PASTE BALLS," for Conditioning Horses.
- "BRONCHOLINE," for Husk, Hoarse, or Cough.
- "GASEODYNE," for Heaving or Paining.
- "ALCOHOLIC ETHER," for Colds and Chills.
- "CARMINATIVE CHALK," for Diarrhoea in Lambs and Calves.

Price of Chest, with "Key to Farriery," £2 16s. 6d., carriage paid. Each article can be had separately.

Patronised by Royalty, and used for over 40 years by the Leading Agriculturists of the British Empire.

CAUTION.—See that the Name of DAY, SON and HEWITT is on all Bottles and Packets.

DAY, SON AND HEWITT,

22, DORSET ST., BAKER ST., LONDON, W.,
AND WANTAGE, BERKS.

GREAT EASTERN RAILWAY.—SEA-SIDE.—The Summer Service of Fast Trains is now running to Yarmouth, Lowestoft, Walton-on-the-Naze, Weeley (for Clacton-on-Sea), Harwich, Dovercourt, Aldeburgh, Felixstowe, Southwold, Hunstanton and Cromer.

Two months', Fortnightly, and Friday or Saturday to Monday (First, Second and Third class) Tickets are issued by all trains to the above stations at reduced fares.

Broxbourne and Rye House every Sunday by any train before 3.30 p.m., and every week day by any train before 3.0 p.m. Fares: 3s. 6d., 2s. 6d., 1s. 6d.

For full particulars see hand bills and time-tables.

WILLIAM BIRT, General Manager.

London, Sept., 1881.

GREAT EASTERN RAILWAY.

On Monday, 5th September, 1881, a Special Train will leave Liverpool Station for YARMOUTH at 7 a.m., returning from Yarmouth (South Town) at 6.0 p.m. the same day.

Fare there and back: Covered carriages, 7s. No Luggage allowed.

WILLIAM BIRT, General Manager.

London, August, 1881.

VOLUMES OF THE

FISHING GAZETTE

FOR 1878, 1879, AND 1880.

On receipt of P.O.O. for Twelve Shillings, we will send any of the above in handsome cloth cover.

N.B.—ONLY A FEW REMAIN UNSOLD.

Orders to be sent and to be made payable to R. B. MARSTON (at the Fleet Street P.O.),

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Ino-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 107, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 97, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 188, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 21, Lombard-market, Battersea, S.W.
Mrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.
Mr. Alfred Young, "The Golden Perch," 174B, Oxford-street, W.
Mr. T. Barnett, 26, Church Street, Lisson Grove, N.W.
Mr. J. Smith, 7, Tottenham Court Road, London.
Mr. Edwin Stevens, Newsagent, 220, Kentish Town Road.

OR

Mr. B. R. Barabridge, 74 and 75, High Street, Eton, Bucks.
Mr. Cowan, 33, South Frederick-street, Edinburgh.

Mr. H. Booth, 88, Prospect Street, Hull.
A. W. Warner, 121, Broad Street, Birmingham.

Newsvendors can obtain the journal through their London Agents.

** The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s.; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C.

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

The Fishing Gazette.

SATURDAY, SEPTEMBER 10, 1881.

NEW BAITS FOR ROACH.

IT is somewhat remarkable that we should have had two new and quaint baits for roach during the last two years. "Stinking Gladwin," said to be of Chinese origin, and worthy of its name, had but a short existence, and all the puffing could not hold its fragrance in favour; although, had it been effective, with the ardent fisher its odour would not have proved an insuperable objection to

its use. King's Natural Bait, which appeals to our patronage as "white, sweet and tenacious," appears to be destined to have a longer reign, its value being endorsed by several truthful anglers, including the testimony, after trial, of the Editor of the FISHING GAZETTE. The signal failure of the one nostrum, and the proved success of the other, has, it would seem, turned the attention of the caterers of piscine food to the likelihood of there being something in the belief of the old writers upon angling literature, upon that *veraxio questio* the utility of oils and scented baits which has in later times been so prolific a source of controversy and exaggeration, and in which it is now suggested there may have been both truth and fiction.

Again arises the question, Have fish the sense of smell, and to what extent? It is conceded, says Greville Fennell, in Pennel's "Fishing Gossip," that almost all animals have this power, more or less; and that in some the gift takes the characteristics of the marvellous; and until it is proved to the contrary, it would certainly seem, according to all the accepted laws of logic, that creatures with nostrils should be admitted into the category of smellers. We might, indeed, thus easily settle the question, and say, in approved parliamentary language, the "noes" have it. But against this prominent feature of the argument, we get the somewhat sophistical blow, that there exist individuals, who, like the blind deprived of sight, the deaf of hearing, and it may be added, the unfeeling of the sense of touch, are those equally bereaved of the olfactory attribute. Man, as a general rule, possesses a greater perceptive sagacity in this facial organ for the detection of coarse and objectionable odours than the gentler sex; while the latter, apparently ignorant of the presence of much that is offensive to the ruder nature of man, can analyse shades of difference in the essential odours arising from a flower, almost to the extent of determining thereby the exact period of the day. There are few of us but are acquainted with some one or other of our fellows who will faint at the smell of a rose, become pale and sick in the too close proximity to a melon or pineapple, who cannot sit down to table if there be vinegar at the board, and, on the other hand have a vigorous relish for exhalations unbearable to the rest of the community.

Fennell then goes on to show by a reference to reliable authorities that bait is rejected by different descriptions of fish according to its staleness, and instances that it is easy to get an affirmative to the assertion that mouldy bread is repugnant to the delicate palates of trout, roach, chub, &c., either used as ground bait or in the form of paste. The same objection to a dead or putrid worm may be noticed in reference to trout and perch. It may be urged that the aversion is arrived at by a close ocular inspection on the fish's part. But, if this were the case, we must give the fish a feline power of seeing in the dark. But, says this writer, "Smell in fact is less fallible than sight, if we argue from our own perceptions; for there are a great many things that look repulsive which are good to eat, while there are few things, if any, that smell objectionable, which, while in health, the stomach or the palate will tolerate." Nature has soldered the links of her chain with admirable simplicity. When fish take to eating stale or corrupt baits, either by day or night, it will be so much the worse for the abundance of diet of the aquatic beetles and larvæ destined to take wing in a lighter sphere.

As the FISHING GAZETTE has already had several articles upon baits, I will endeavour in these contributions to avoid going over the like ground, and at the same time not quit the path upon which I started, which was directed to the important question: Whether or not there exists in the proxed success of this novel new bait of Mr. King any evidence that fish are really sufficiently susceptible, and to be moved and won by

"Ethereal airs ever present, but intangible."

I have no faith in theorists and dreamers, but I place my faith in men of practice and action—men who accept nothing that personally concerns them and those around them, as granted; who take themselves the two jugs to the door, and tell the milkman to put the water in the one, and the last issue from the cow in the other—that he, the recipient, may mix the opposing ingredients, if he so desires.

I had written thus far when I received the following letter from a friend and veteran angler staying at Lechlade. "We, Sam and I, fished for roach about two miles from this, all Monday and Tuesday, with gentles, paste and red worms. Our takes were not grand, the gross weight of our two bags being 35 lb., which included chub, dace, perch and gudgeon. Upon leaving off on Tuesday night to avoid punting against the stream—now somewhat more than usually strong from the recent rains—we left our craft, as we thought, well hidden by bush and sedge in a little creek, and trudged back to our inn. We were down on the water early and afloat over a swim we had previously baited, when, to our mortification, we found that the locker of our punt had been broken open, and our baits 'borrowed' with a few miscel-

laneous articles, of no use to any but their owner. What was to be done—worms we might get by pulling up the flag-roots; gentles, perhaps, by going back to the butcher's in the town; and paste we could have made had we brought other than brown bread with us for our breakfast and lunch. We might search under the alder leaves for maggots of its flies, scratch deep under cow-pats for beetle larvæ, paddle in the river and manipulate with our toes for mussels—all these suggestions occurred to us, but we did not adopt any. A pipe of the aromatic weed was our only resource and consolation, when, after its inspiration had had its influence on Sam, he suddenly startled me by crying, 'Eureka!' and, seizing the nose bag in which we had brought our daily provender, he brought forth two tins, one of Lazenby's lobsters, the other of shrimp paste. After thanking our stars we had not left our tackle in the punt to the mercy of the natives, we went to work with our novel bait. We both tried the shrimp paste for about an hour without a nibble, not altogether with a prejudicial result, as we felt assured that had it been less salt, it would have been more effective. But when we both together proffered a nice square piece of the lobster to our quarry, the effect was simply extraordinary. We had nothing else to do but attend to ourself, with the landing net between us, seldom out of hand of one or other, and before 2 p.m. we had filled both our bags with splendid roach, up to 1½ lb. each, and a dozen or so of chub, three of which weighed together 13 lb. 2 oz. I ought to say that the tail of the lobster was the best, if not the only part we could use, as, it being firm, it adhered to the hook. And now comes the singular part of the business, which, at the same time, I consider, involves a natural consequence. The next day, having been provided with a tin of the same brand, and the day being still more apparently propitious than the former, our takes were below the average of the three others. Sam sapiently accounted for this by suggesting we had fished out the swim, and that we could as well expect to get any more fish out of it as we could expect to find another lobster in the tin we had so profitably emptied by ourselves [and the assistance of the roach. It was useless my attempting to maintain that to fish out a hole was absurd, and to quote the highest authorities in favour of my opinion. Sam was obdurate—if not rude; and in his turn referred to those instances in which immense takes of barbel had been made at a single sitting, the fame of which being spread, the swim made famous, not a significant capture had followed. Not satisfied with this, he thrust upon me an old anecdote of the late Mr. Sumner, the well known sea-fisher, who being importuned by a friend to visit him in the country, was only induced to do so by telling him that something in a pond close to his house could be heard floundering about during the night. Sumner could not resist this. He went down with his tackle, and after leaving his card at the hall-door, put his tackle together, arranged his basket-seat by the side of the miniature lake, and commenced fishing. Great was his success, for shortly he had grassed seventeen fine perch. When the master of the house came out to tell the ardent fisher that breakfast was ready, and his family were only waiting for him: 'You must, my dear sir, really, excuse me,' said Sumner. 'I had a cup of coffee and a rusk before quitting town, and the fish are biting—no angler under such circumstances can quit the water.' 'I see,' observed his host, counting the fish with his cane as they lay upon the lawn, 'You have already taken seventeen. Pray come in, to oblige me, and leave the other fish until after breakfast. I only put a dozen and a half in yesterday.' 'And yet,' added Sam, triumphantly, 'you would maintain that a water can be fished out.'" Here, then, my correspondent would have me conclude that the lobster's tail did not fail, but the fish did. D'ye see?

CREEL.

PISCATORIAL FRAGMENTS.

UNSIZEABLE FISH.

IN reference to the bringing into a suburban club-room some undersized fish, it is not correct that the matter came under the notice of the T.A.P.S., and that for want of sufficient evidence no legal action was taken. My good friend L. B. will excuse my just mentioning this in order to set the readers of the FISHING GAZETTE right, as it is evident he has been misinformed, and he will be as pleased as any one to have the correct version given. At the same time I may mention that where fish are brought to a club-room of an unsizeable character, it is for the angling society to take action, and the adoption of a rule which would give power of expulsion might be rigidly and influentially enforced. A preservation society has only power on the water, or on the banks, where proof can be established the fish were actually caught in the Thames. In the case referred to, I have always had occasion to speak favourably of the fisherman, as I have never found undersized fish in his well; and the few hours Mr. Spreckley was fishing with him he was perfectly satisfied. I have had other

friends out with him since, and they have also spoken well of him. If he has erred in this instance I am sorry for it.

EXAMINATION OF PUNTS.

One of these examinations took place last week; but it was an unfortunate day, as there were only about one dozen of punts out between Teddington Weir and Richmond Bridge. It was most gratifying to find the hearty welcome accorded to Mr. T. Spreckley and Mr. W. H. Brougham by the anglers who expressed themselves delighted at the movement. And it is remarkable the moment the inspector's boat draws alongside of a punt, the professional fisherman opens the lid of the well for the keeper to use the hand net to get out the fish, and with a peculiar look of satisfaction that all will be found right. In two or three instances applications were made by the anglers for a few small dace for jack-fishing which were cheerfully complied with. The head river-keeper at Twickenham has strict orders to examine the boats as they come on shore in the evening, and I have substantial evidence that he does his duty in this respect, but, of course, he cannot always be there. I may just say, in reference to partially-paid keepers, that my friend L. B., who is generally correct in his judgment, is not only right there, but the matter which he refers to has for some time been under serious consideration, and is under process of consummation.

FISHING IN THE TIDAL WATERS.

Although the river has been out of condition for angling, and the baskets of fish from 20 lb. to 40 lb. each have dwindled down to about half those weights, it is not because the fish are not there. It not only arises from the cold temperature and the discoloured water, but from the large amount of ground bait, lying in the various swims. It is no matter of chance for me to report that Mr. Dorée and Mr. Vicars, in a day's fishing last week, made a basket of barbel, roach and dace estimated at 17 lb. I am pleased, at a time when fishing is not at its best, to congratulate them on such a result, although it bears no comparison to the 30 lb. and 40 lb. baskets which have been made and verified by the river keepers, who have passed the fish as sizeable ones. I have often heard doubts expressed on the accuracy of these returns, and a wonder assigned that the Thames possesses portions of river where such marvellous captures can be made; but there are plenty of anglers ready to confirm the statements, and I have no doubt, when the gentlemen I have referred to go out again, under more favourable circumstances than last week, they will return with a heavier basket of fish.

FISHING FROM THE BANKS.

The bank anglers have had a good time of it lately, and it generally happens when the punt anglers do the least these men do the best. This arises from the fact that in discoloured water the fish are to be found under the banks. I have always felt a strong desire to do all I can for the benefit of those who fish from the banks, and it is at all times a source of gratification to me when I hear of their success. I was told the other day by a looker-on that he had seen and counted no fewer than seventy-two fish caught in the hour by an angler on the shore, and he remarked that other anglers were catching fish. Some people disregard the value of a Thames dace as an article of food, but, from experience, I think the back of a dace is not to be despised,—it is palatable and wholesome. I would like to look a little beyond the fact of good takes of fish being made by the bank anglers, and imagine the pleasurable feelings they have in taking the fish home to their wives and families; and I should not be far wrong in my imagination if I ventured to say they would be as much valued as some do salmon or other sea-fish. I remember some time ago the head railway porter of my suburban station asking me when I had any roach or dace to spare he would gladly accept them, and he added: "I prefer them to salmon or cod-fish." Here is a truism, and at once clothes my idea with correctness. The preservation of a fishery, if only to benefit this class of anglers, is a grand thing; and those who can afford to assist in the work should not be stingy in their pecuniary support.

THE LATE MR. H. L. ROLFE.

As a personal friend of over thirty years, I may be permitted to express my deepest sorrow in the loss occasioned by his removal from amongst us. England has lost one of its greatest fish painters, and a large circle of friends are left to mourn over his death. As one amongst those who paid their last respects to him at the Brompton Cemetery on Saturday last, I could hardly realize the thought that he was gone for ever; and that the old studio in 31, Nicholas Lane would be closed, after the enjoyment of so many happy visits to an old and valued friend, and where I have had the pleasure of meeting so many others, whose friendship I also thoroughly enjoyed. Happily, I am in possession of one of his fish-paintings which I received from him as a gift, and

which I shall now highly prize as a lasting memento. His name will live in his works, and will never be forgotten. I would add one closing word of sympathy and condolence to those he has left behind in his domestic circle, and who have need of much consolation.

B.

MY FIRST BIG PIKE.

THE O river and I are very old friends, though I have not fished it quite so much within the last few years. It is a coarse-fish river; but a less tame, a more charming one of its class, to my taste, and within my knowledge, does not exist. It is good—as times go, very good—for all my coarse fish, pike, perch, and chub. And it has a fair sprinkling of good trout.

My favourite haunt on the O was S, one of those rare Old English villages where the houses and cottages are all thatch, and weather-stain, and gable-end; and the streets and lanes are all nooks and turns. A leafy and a lively village, too, is S, especially in spring-time, amid its garrulous rooks, for ever flying in and out of their immemorial elms. It boasts also of its Abbey—not a ruin like Tintern, but a residence like Newstead—

“An old, old monastery once, and now
Still older mansion.”

By the courtesy of its owner—a descendant of its founder, a scion of one of the oldest and noblest families in England, and a man of science not unknown to fame—and by a like liberality on the part of the proprietor of an adjoining estate, I had the privilege of angling over some six miles of the river. So I had plenty of elbow-room.

The O has great individuality. Sinuous as a serpent, it winds and glides along, in sharp streams that alternate with deep, gloomy pits of pools. I have in places plumbed sixteen feet sheer down from off the bank. At a dead low summer-level, when the run of the river is almost dry, the effect of those black pits is very striking. Over the water, and under the water, centennial, almost millennial trees—living and dead—lean their lusty or withered giant trunks and limbs far across the water, in many a wild spot, till they make almost an Enchanted River of it. The banks are high and broken. And below—bulrush here—and water-lily there, and flag or stump here again—tell to the pike-angler tales which he would not, for all the world, were left untold. Altogether the O, round about S, is the ruggedest English lowland-river, and the awkwardest to angle withal that I am acquainted with. I speak of the best parts of the pike-water, the streams and pools. For in the long, deep mill-dams the river is more open, and on the level, and is easily enough fished. In those dead reaches, however, for some reason, unknown to me, though certainly not peculiar to that river, a pike of any decent size is very rarely indeed caught, even, they say, on a trimmer or a night-line. And yet sometimes, when the sun is shining, and the hay is making, a splash—as of a Newfoundland dog—will be heard, and then only a few feathers will be seen floating where a moment before the old moorhen was leading her brood across the river. Those still deeps, though, yield capital perch-fishing to the paternoster. For ugly-place-paternostering—which, to my mind, is by far the best form of paternostering—give me the O! How I have there, from the top of a high bank, with an 18 foot rod, and a line well-nigh as long, just got the reach out to the end of a sunken tree, where the tips of its branches were peeping out of the deep water, and have gently dipped the lead and minnows down right alongside of the rubbish, till I touched the bottom, only to haul up the next instant a good pounder! That's what I call paternostering—where you have to aim straight, and make a long shot, and fight hard with your game when it falls. No angler worthy of the name ever minds risking the loss of his tackle in a good cause. As for the “unnumbered and enormous” chub, what should I not have done among them, O Whiteman! slogging out the baby-frog at long-range with a salmon-rod—had I only known of that deadliest of devices—when the great, golden fellows were sailing all about the surface of the pools—like rich galleons over the Spanish Main—in those bright, hot September days. Ah! how I should buccaneer them now!

One thing about the angling at S which always sank into my heart of hearts—softly, not sadly—was its complete seclusion. I always had the river all to myself, save such times as I had the genial companionship of my old pal, Old Joe, or occasionally in later years, the accompaniment of friend F.

The Dun Cow was my inn at S. And many are—or, alas! were—the happy days and weeks which have been mine beneath its hospitable roof. I used always to meet there with that kindly, homely, unostentatious, unceremonious comfort which your Grand Hotels never can afford. Anything in reason I could always have, and what more would any reasonable mortal—in other words, any true angler—ever require? And I was all alone in my glory. I was

Lord of the Valley. I was sole angler-lodger. And—for I had got to know all the village by heart—I could give, or take, or give *and* take a glass to and a glass with one and another, whoever might chance to drop in whenever I might choose to idle or dangle a bit about the Dun Cow bar. There I could sit talking of the farmer's crops till I tired, and then saunter off, rod in hand, to look after the angler's also, by a little seasonable aquiculture. Not, reader, that I was, I hope, a very lazy angler, on the whole, or a very lushy one, all those christenings, and harvest-homes, and ploughing-matches and minnow-matches to the contrary in any wise notwithstanding.

Owing possibly in part to the fact that my visits to S were mostly paid in the early autumn, ere the summer heats and taints had died out of the water, and the frosts and the floods of the fall had rotted off and washed away the weeds, and routed out the jack, and sharpened up their appetites, I—though I at times made fair takes—never managed to get *good* hold of any of the large fish; never caught any approaching to what Patsy Ryan* of Killaloe, (or Kill-a-lot) County Clare, once, on Lough Derg †—off the Tipperary shore—aptly called “a dangerous pike.” I lost several of that species from time to time, by their leaving the bait, or by the bait leaving them, but without breakages. Old Joe, who had fished the river from his boyhood, had caught pike up to about 10 lb. weight occasionally. Once, indeed, he had had the laugh over me by catching a 9-pounder, close to my side, one August evening, on the very day I had come down from London for my holiday. He had beaten the Cockney, he said, *hollow*. But somehow he never managed to bring the larger ones to land. They were too old for him. Why, I hardly know, for much larger ones there certainly were. And Joe is the best dead-gorge-angler from the bank of a river like the O who has ever come within my notice. He is, moreover, a rough diamond of the first water, a *character*, with a dry humour as delicate of flavour as

“Chambertin with the yellow seal”

to a connoisseur. Joe had the misfortune many years ago to lose the sight of one eye. But—less unlucky than the Postmaster-General, or the poor old ferryman at Castleconnell on the Shannon, he (like the Senior Galloway of Chertsey) saved the sight of the other. And O! that other orb! I can only liken it to that effulgent single organ of vision which forms so prominent a feature in the title of *Bell's Life*. And the motto underneath that unocular illustration—“*nunquam dormio*”—how exactly that expresses the sleepless vigilance, the restless intelligence of Joe's luminary, whether he is looking round in church, or is running up and down those wild river banks and waving his magician's wand weirdly over the water, or is standing in his garden, and shying up at the weathercock over the church spire till he makes it spin round and round again, and the jackdaws on the top of the turret below all jubilantly clap their wings, and cry out “caw! caw!” For Old Joe, be it known, is, or was, one of the deadliest cock-shyers in the county. But I shall never catch my first big pike if I go on in this fashion.

Well, once upon a time, as I was coming down from Town for a day or two's pike-fishing at S, the morning's post brought me a woodcut, snipped out of *Judy*, depicting the immortal Ally Sloper and a friend as irate anglers, with one *tittlebat* and two entangled lines between them, and a puddle at their feet. And beneath *all that*, writ small in a neat (but disguised) lady's hand, were these words: “This is Mr. A. and Joe S. gone a-fishing”

“Nathless he so endured,”

as Milton says of Satan; nevertheless I set off as undauntedly as ever that Old Gentleman, the Prince of Darkness, could have done, with a couple of dozen of lively dace, in the full hope that they would effectually counterwork any machinations of the Malignant Fairy against my good piscatorial intentions, and prevent her from making them—*good for nothing*. Next morning at S. I met with a young lady who, “from information I received,” I had reason to believe was one of the sisters of that anonymous libeller of two honest anglers. But I held my peace. I kept dark as Nox or Erebus over that scandalous communication. I had just been down to “Footbridge” and had found the river in height, and in tint, and in *tofo* all that I could desire. Rain had fallen freely, but not too heavily in the night. The spinning-baits were very bonny ones. The day would *do*.

“My hopes were high, my heart was proud”

as Lucifer's. And I said gaily: “I'm going to catch your sister a good pike to-day, Miss M. Will you come and help me land him?” “With the greatest of pleasure, Mr. A.; I shall be passing your way presently, as I have to call at R (a house by the river) and I'll look out for you as I go by.” About 12 o'clock I made off to fish. “Rather late in the day,” you'll say. Well, yes, but

* His feats among the salmon—with William Fogarty—may be read of almost any week now in the *Field*.

† The Lake of the Red Eye.

that was all that Miss M.'s fault, not mine. However, once begun, I went to work with a will, I might even say with a vengeance. But yet—and with everything, apparently, in my favour—when one o'clock came, and with it Miss M. in all her smiles, I had not had a single run. "Well, have you caught that good pike yet?" I shook my head. "No? Why you know you can catch nothing but tittlebats." "What will you bet me, Miss M., that I don't catch that good pike yet?" "The usual bet." "Which is?" "A pair of gloves." "Booked," I exclaimed; "but what time do you give me for the job—till dark?" "Oh dear no! I shall be driving home through the village by 3 o'clock: so it must be done by that time or not at all." "As thou sayest, so let it be!" And away—with all the Zephyrs of Sweetnesses after her (in plain English, whilst I kept blowing kisses to her)—away scuttled the pretty Miss M. to make her morning call. I lit a pipe. I had no thought of lunch. Two o'clock came, and still never the stir of a fin. All of a sudden though, just as I had let my heavy belly-leaded bait sink down almost out of sight, where a strong stream ran into a deep pool, and by a smart wrist-action (I was pitching, not casting), had brought it back with a seductive twirl, there was a flash—and a tug. But at his very first bolt the brute had me into his haunt, one of those unseen, sunken stumps with which that chaotic river-bed abounds, and we were not long before we parted company. He broke me. I had been fishing with two lengths of the stoutest salmon gut below the treble-twisted, the spinning-flight being on gimp. And one of those single-gut lengths &c., was carried away. He was far too good a fish to lose, whatever his dead-weight might have been. And I am sadly afraid I was exceedingly like the sailor, who

"Knew not what to say, and so—he swore."

However, I knew well enough what to do, viz., to mend my tackle and make the most of the rest of my time. And that I did—doggedly. By and by I looked at my watch. "Good heavens! it's close on 3! That bet's lost, by all that's awful, and I shall be the butt of those Three Graces as a tittlebat-angler for evermore." I had just jumped over into a long meadow, at the far end of which was a noted jack-catch, where a ditch ran into the river—"Devil's Dyke," they call it. I said to myself, "I'll walk sharp across to D.D., and have a couple of casts there—it's a pet spot of that uncanny Old Joe's—and if I don't run a fish I'll give it up for a bad job and bear 'the whips and scorns' as best I can." I went. Devil's Dyke! Devil's Luck! At the second cast, or, rather, pitch—with a rush and a splash worthy of Old Scratch—he came—a good fish, to me a grand fish. "Nay, nay, my friend! This is no partnership at will, but one for life, till death do us part, I trow. There's no single gut on now, look you! And as for those hooks, you may shake your head, my honey, but they'd hold a horse." I pass over his struggles. The dance of death came to an end at last. But I had neither net nor gaff, and the bank was high, and the river deep. There was no going down stream with him, for that diabolical hedge from under which he had shot. So I towed him for a hundred yards or more to the first shallows above, and there—walking in from the shelving bank up to the tops of my fishing-boots in the water—I landed him duly—by the eyes. *He was a lump.* I didn't stop to cut the hooks out of him, nor to admire his marblings or shudder at his murderous fangs, as Maudle or Postlethwayte doubtless would have done. But I just undid the trace, and bundled him into my jack-bag, neck and crop—or rather—head out at one end and tail flopping far astern out at 'tother—and made straight tracks with him for mine inn. I had scarcely hunted out the weights, and put him in the scales (he bumped them at 11½) and laid him out in state—

"He looked so grand when he was dead"—

when lo! those sounds for which my ear was straining, those sounds of wheels and of hoofs—and up drove the very radiant Miss M.—and alit, as brilliant as an Empress-butterfly on a gravel walk. All in the rough, and looking as downcast and done-uppish as I could, I met her at the door. She gave a glance at my face. "Of course, Mr. A., you haven't caught that good pike?" "My dear Miss M.," I said, bowing very low, and speaking very gravely, "I regret to say that I never, or at least that I hardly ever, make a bet with a lady, but it's my lot to lose. The present occasion, however, I am happy to inform you, is a pleasing exception. There he lies." And I pointed to the bulk. "Good gracious! You don't mean to say you've caught that monster?" "Why not, Miss M.? You know I promised you a good fish for your sister, and I always like to keep my word. Will you kindly take him, and make my compliments to her, and say Mr. A. begs her acceptance of—a tittlebat. And mind! I've debited you with that pair of gloves. Seven and three quarters—and lavender, if you please!" And then, with many fearful and wonderful little ejaculations of amazement, and horror, and admiration (all mixed up frightfully, in the usual way) the young leviathan was lifted into the trap, after the young lady, and driven off with; yet not before Old Joe had seen him.

"Josephus," I said to him when we two were alone again together, "aren't you ashamed of yourself, to let a Cockney come down from London, and bring his bait, and win a lady's bet, and beat you on your own river—like that? Why, he's a better fish than you have ever caught in your life, old man!" The Sleepless One scintillated sadly. "And so he is."* But that was a slice of luck—a happy accident. One thing, however, was no accident. Had I been of little faith and less patience, had I not fished my best up to the very last, I should never have caught my fish, and won my bet. And, as a mere money-matter, what I would have given—what would I not have given? to win it in the very way I did! O, the sweetness of that revenge! Heaping coals of fire upon her curly head would have been nothing to it. Verily, the British Angler is like the British Soldier, he never knows when he is beaten, and so—times and oft—he contrives to turn a dire defeat into a glorious victory.

I have caught far more "dangerous pike" than that since then. I had several larger ones only last autumn in Ireland, one a twenty-one-pounder, as you know, Mr. Editor, to say nothing of salmon. But that is the story—I hope I have not exhausted your patience, gentle reader?—that is the true tale of my first big pike.

A. R. I. E. L.

London, June 16th, 1881.

CLUB AND OTHER JOTTINGS.

By L. B.

THE first chills of premature winter, while they have sent the big, crafty, brown carp, broad-sided bream, and those hard-pulling rascals, the leather-snouted barbel, a bit off the feed have had a quite contrary effect upon that bravest of all brave winter fish, the jack, or, as our provincial friends almost invariably dub him, the pike. Whether the fish weighing 9 lb. 2 oz. I reported last week as taken spinning by Mr. Underwood at Elstree was hungry or not, I must leave the readers of the GAZETTE to judge from the following facts. Though not of very heavy weight the fish was so handsome and well proportioned that Mr. U. decided to have it preserved, and sent it for that purpose to Mr. J. Lancaster of 2, Jeffries Place, Camden Town, N.W., who, when about commencing operations on his subject, discovered that this defunct cannibal had, previous to biting gimp for the last time, made a hearty, if indigestible, meal of one of his own species. This fish, having been withdrawn, was found to measure 14 inches from tip to tip; further investigation resulted in the discovery inside this glutton of a second little brother, which upon being extracted, was found to measure 11½ inches. Both these fish had been pouched tail first, the lower parts being somewhat chawed up, partially digested and smelling offensively. I saw the heads of both the little victims on Thursday last, they had been washed in some fluid, and were a little shrunken, but proportioned to the measurement given above. Extraordinary as the whole thing is, I have no hesitation in believing the particulars as given here and furnished by Mr. Lancaster, whom I have known for many years, and always found a scrupulously truthful man.

I hear—I hope it is incorrect—that the big jack, 24 lb., recently taken spinning at Walton, fell to the rod of a local professional fisherman. I hope it is not true. I hold, and always have held, that by this sort of thing the professional wrongs his customers; and though he is too shortsighted to see it at the time, he does himself harm.

Mr. W. G. Austin, of the Bloomsbury Angling Club, has taken, whilst angling in the neighbourhood of Bedford, a monster jack, said to weigh 35 lb., which has been sent to Mr. Cooper, of Radnor Street, St. Luke's, to be set up. What says the gentle Jardine to this?

A member of the Richmond Piscatorial has taken in the tidal water a jack weighing 17 lb. The fish was shown and weighed at the club house, not by the water, so the weight can be depended upon as correct.

Mr. Pears, the well known soap manufacturer of Isleworth, has joined the above society.

Mr. Bond, of the Sun Hotel, Kingston, has presented the R. P. S. with five guineas to purchase a suitable prize for a day's competition, any kind of fish, between Hampton Court and Kingston, during September; all fish to be weighed same evening at his house. Such a handsome prize should secure a large entry. At the meeting of this society on Wednesday it was decided that an hotel keeper who lets punts is not eligible to become a member of a fishing club on the ground that he is pecuniarily interested in the sport.

The father of the R. P. S., treasurer Abbott, has returned to town from Ostend after a pleasant sojourn at that watering

* Old Joe has killed some larger ones since then, though.

place, and describes a process of fishing with a windlass, which, in his opinion, was not altogether so satisfactory as with rod and line. The veteran angler received a hearty welcome from his brother members, the chairman proposing his health and the pleasure they felt at seeing him back once more. A friend of mine who has just returned has been having some grand sport among the bream and roach in the neighbourhood of Maldon, in Essex.

A special meeting of the committee of the Thames Rights Defence Association will be held at Simpson's Hotel, Strand, on 8th inst. at 4.30, when some important matters will be dealt with.

The United London Anglers' Central Committee met on Monday evening last at the Bald-faced Stag, Worship Square, Finsbury, Mr. S. Morgan presiding. After the minutes of last meeting had been read and confirmed, the hard-working secretary, Mr. R. Ghurney gave an interesting report of a recent interview Mr. Murphy and himself had had by appointment with Mr. Marston, the editor of the FISHING GAZETTE, from which Mr. Murphy and himself had come away highly pleased. I will not put my worthy chief's modesty to the test by repeating all the kind things Mr. Ghurney said, and Mr. Murphy heartily endorsed, but the gist of his remark was reminding the delegates from the numerous societies present of the great interest our editor has always shown in all matters connected with the welfare of anglers of all classes, but in particular with that of the numerous clubmen of the metropolis and suburbs, the bulk of whom belong to the working classes. Speaking of the Anglers' Benevolent Society, Mr. Ghurney reminded his hearers that Mr. Marston's handsome donation of £5 ss., was one of the—if not absolutely the first—ever sent in support of that institution that our editor's desire to promote the good work was not of a transient nature was amply proved by the friendly notices and words of encouragement which appeared at frequent intervals in the pages of the GAZETTE, and lastly by the trouble he was taking to organise an angler's tournament, the proceeds of which were to be presented to the Angler's Benevolent Association. He begged to remind those who were in a position, and felt inclined to, that they were perfectly free to present any prizes on their own conditions for competition. At all events, he added, in conclusion, it is the clear duty of our anglers to give Mr. Marston all the support in their power by not only being there themselves, but, if possible, by bringing a friend or friends with them. Some business connected with the efficient preservation of the River Lea, including a vote for extra payment to police constables for twelve nights' watching the river was then got through. A new society—"The Original Alexandra"—was duly proposed, seconded and enrolled. A number of gentlemen entered their names for the Delegates' Annual Dinner at the Rye House on Sunday next, and several more valuable prizes were given for competition on that occasion, after which the usual vote of thanks to the chairman brought the business to a close. I must not, however, omit to mention that Mr. Chambers, the secretary of the Cavendish Anglers gave a detailed account of the recent assault committed upon himself, and two brother members in the neighbourhood of Twickenham, particulars of which I forward the Editor, and which, no doubt, he will insert in another portion of the FISHING GAZETTE. Much sympathy was expressed with Mr. Chambers, and I think it likely something will be done to recoup himself and companions for the trouble and expense they were at in prosecuting those persons and getting them punished.

The Inaugural Dinner of the Society of Caxtonian Anglers took place at their clubhouse, the "Falcon," Gough Square, Fleet Street, on Wednesday evening, the 31st August; the chair being ably filled by Mr. William Cate, the host and treasurer, Mr. B. O. Colnaghi proving an efficient *vis-a-vis*. There were present, among other visitors, Messrs. Thomas Spreckley, W. H. Brougham, J. Stead (the Cure), and L. Bonvoisin. The dinner was excellent, and some good toasts and speeches and capital songs made the evening speed along only too quickly. Of the society itself, which is founded on the anti-gross-weight principle, I will have to say more on a future occasion. At present, I will merely add that, with a capital locale, a jolly host, who is himself an angler, a committee of well-known rodsters, and an excellent code of rules, the Society of Caxtonian Anglers has fair prospects indeed.

Mr. T. Hoole, the sec. W. C. A. of L. and P. A. S., has received through the secretaries of the Reading and District and Maidenhead and Bray Associations receipts for rewards recently voted to Wm. Clark and Jas. Field, who were instrumental in obtaining the conviction of persons guilty of illegal practises.

Mr. T. Hoole and Mr. Clout are in communication with respect to the alleged recent netting in the river Arun. The matter will be considered at the next monthly meeting of the association on Friday, on which occasion the complaints made by the railways con-

cerning misuse of privilege tickets by certain persons, will also be gone into. I shall be much more free to write about this after next Friday's meeting of the association has made many details which have come to my knowledge public property.

From Chertsey that careful, painstaking fisherman, Haslett, writes to me:—I have not done much this week; the cold winds have been against the barbel and bream biting. Four hours with Mr. Allen, 3 barbel and 1 chub. 4 lb.; with Mr. P. Geen, 2 barbel and 1 chub, 3½ lb.; on Saturday with Messrs. Clench and Nattress, 2 barbel, some good roach and 1 chub; on Sunday half a day with Messrs. Bonvoisin and Sanguinette, 2 barbel and some very good roach; and on Monday some three hours' fishing at the weir 2 barbel and some fine roach and dace. My correspondent goes on to say the weather has changed, and there are hopes of some good fishing next week. There are plenty of fish here—barbel and bream—the latter weighing from 3 to 4 lb. each. From Elstree some good jack and tench have been killed, Mr. Underwood on Sunday last having five of the former fish taken spinning, heaviest nearly 6 lb. Among the tench on the same day Mr. Pluney and friend did havoc to the tune of nearly 37 lb., some of the fish scaling close upon 4 lb., 3 lb. 11½ oz., and 3 lb. 12½ oz. each.

DINSDALE ON TEES.

ONE of the most interesting sights I know, is to watch the salmon leaping this weir after a flood in early autumn. The weir is an upright wall of horse-shoe shape, with the convex curve up stream, about sixty yards perhaps across, with a mill at one end and a fish ladder or pass at the other. Many of the more prudent fish go up without much trouble this way, but the majority, like the vast multitude of mankind, rush blindly and without forethought at the obstacle in their path, and, of course, fail. At any moment half a dozen aspiring fish may be seen in the air, jumping obviously short, splashing against the smooth wall of water, and carried back by it into the mighty seething cauldron below; while, about once in five minutes, a wavy line shooting upwards from the edge of the fall proclaims a successful athlete. Many make the most absurd shots, leaping perhaps a sufficient height, but some yards below the falls; others bang themselves against the masonry at the end; many try to take it sideways and cross each other's path, with occasional collisions. Both water and air are alive with them. My companion counted fifty-three jumps in one minute. All day long they are at it, and all night too, for aught I know. There must be many thousands of fish in the pool, and it is said that they all get up sooner or later.

I greatly wish I were an artist and able to paint the scene, the majestic sweep of the falling water, with the hanging woods on the further side, would make an admirable picture; while to the numerous fish in the air might be given a slightly human expression of eye and mouth, indicating the triumph, disappointment, hope, disgust, envy, &c., which they doubtless severally feel. At the top of the weir would, of course, be the conventional angler, splashed all over, and all but toppling backwards from the shock of a salmon which has just rushed up between his feet.

The Tees is subject to very rapid and violent floods. Last Tuesday morning the dam was covered some feet deep. When I visited it on Wednesday there was a fall of about 4 feet; the next day about 5 feet. Many visitors come to see the wonderful sight, and one can hardly help applauding a successful leap as you would a good hit at cricket.

Tuesday, the last day of August, was also the last day of netting on this river, and not even the famous fishmongers' shops in Bond Street could boast of a more beautiful show than did the fisherman's cottage at noon on that day. Salmon grilse (here called summer-cock) salmon trout, and a few bull-trout, some seventy of them altogether, and of the whole numbers not above four looking reddish and out of condition. The mode of fishing is peculiar. As I first approached the spot I observed what I supposed to be a hat floating down in the middle of the pool—presently more of it emerged, and it appeared to have a motion somewhat independent of the stream—next a sort of porpoise or merman landed on a shallow. This turned out on closer inspection to be a man entirely cased in one shining black waterproof garment, into which he gets through the neck. He pushes before him, at right angles to the stream, a rod 18 feet long upon which the net runs by rings. The net is that usually known as a "trammel" net, but this peculiar adaptation of it is called a "shackle net." Sometimes the fisherman goes in a little too deep; then, on landing, he calls to his mate: "Now then, Bill, hold me out like a wheelbarrow." He then plants his hands on the ground, and his mate lifts him up by the legs, and a torrent flows from the capacious neck of the porpoise, C. C. J.

RIVER REPORTS.

MID-THAMES.

"The cock shuts his eyes when he crows,
Because he knows it by heart."

I all but shut my eyes when I write "the river is in good trim for all-round fishing"—very often a guilty conscience telling me that I am treading on the thin line between fact and fiction. To the gentle reader my anxiety only is that they should come down and see glorious old Father Thames in all his radiant beauty of colour, instead of doing the la-de-da-dy whine of the "Rhine" and its wine. To the piscator, for putting a little *colour de rose* in my report, when the water is what would be called bad by a lavender-kid-gloved angler, I apologise, on the plea (well known to a good man) that the best takes are had frequently under the most adverse state of the elements. The water is now in excellent order, without any of the rose colour, as above, and good hauls are daily being had, all stations being full of business. At Hurley, Mr. Lee, fishing from the Bell, has had a capital take of fish, and Mr. Harrison 10 lb. of perch, least over 1 lb., and two best 1 lb. 14 oz. and 1 lb. 11 oz. respectively. Mr. Wilkson, one jack, 7½ lb.; and another gentleman to-day, one jack, 3½ lb. Messrs. Dotman and Nott, out with "the Boy," have been busy, but only small miscellaneous baskets made in two days. Water in good trim for barbel, perch, and roach.—MARLOW BUZZ.

Thames (Goring).

Water in good order for all-round fishing, especially for jack and perch. Prospects look better for angling for the next week or two. Roach were biting very well last week. Some good takes were had here. One day, ten dozen of good roach; Tuesday, four jack; Wednesday, some good perch and two jack, largest jack over 4 lb., taken by a lady.—JOHN RUSH.

Thames (Halliford).

The river is now in good order for all-round fishing. My takes during the week are as follows:—1st day, Mr. Palmer, jun., fishing with me, caught five barbel, one eel, and some nice roach; 2nd day, Mr. Yarborough, four barbel and a perch; 3rd day, Mr. Herman, one barbel and three dozen roach and dace; 4th day, Mr. Yarborough, three barbel, two chub, and some good roach; 5th day, Mr. George Palmer, five barbel, two chub, and a dozen nice roach; 6th day, Mr. Yarborough, 28 lb. of bream, barbel and roach.—G. ROSEWELL, fisherman.

Thames (Kingston).

The water is good for all fishing, but no one comes. I have had a lot of men who called themselves fishermen, but they came out to strike, not to fish.—JOHN JOHNSON.

Thames (Shepperton and Weybridge).

Water in very good condition for all-round fishing. Prospects of sport for the next few days are very good. Since my last report Mr. King has taken three more trout with the artificial bait, one of 5 lb.; the others 1½ lb. each, the two latter he returned to the river. The fishermen have been doing well with roach and dace; I caught from three to five dozen in a day; in two days, nine dozen very fine roach and dace, several weighing over 1 lb. each, and four perch.—W. ROGERSON.

Thames (Twickenham).

Wind S.W.; water in good condition, and I am pleased to say we have been fully employed, and I have been obliged to engage my neighbour's punts and to send some of my customers back to London without wetting a line for want of punts; but if all's well I will take care this does not occur next season. This week I have had thirty-six punts out, being eleven more than last week, and I am glad to say that each day the takes are improving, but are not so large as I should like to see them. This day the Rev. Mr. Limpus and Dr. Clark, with Joe Dobbin, took 9 dozen roach and dace, 1 perch and 3 nice barbel. Spiers, with Messrs. Wings and Hammond, Covent Garden, 8 dozen roach and dace. Pert Hammerton, with Captain William, 7 dozen roach and dace; George Coxen, with Dr. Smith, 6 dozen and 2 barbel.—A. PERRIN.

N.B.—The reports read in the *Referee* are not given from my house, the correspondent being Boycotted.

Thames (Windsor).

Water is in capital condition for all-round, angling having cleared well within the last few hours and is of average height. Barbel have been feeding better, though so far the season has been the worst I ever knew for this fish. On the 4th inst., James Gray with a patron took fifteen and one chub, largest fish 5 lb. Richard Gray on same day had seven barbel, one of which afforded capital sport being foul hooked in the tail. Bank anglers are getting nice baskets of roach and perch, all of which are in good condition and of good size. In the old river, barbel, chub, and roach have been had, Mr. Carey having a pretty show of roach taken from bank in a few hours, going 11½ lb. At Datchet barbel have been feeding better, and a good specimen of this fish has been had, going 9 lb. The Slough anglers have been tickling roach, the brothers Harley especially, one of whom took a nice chub on hair tackle, going 3½ lb.—B. R. BAMBRIDGE.

Dove (Ilam).

Fishing on the Dove this week has been uncertain; last Wednesday week the water began to clear after the flood, and the fish rose well in the afternoon, one visitor at the Izaak Walton Hotel (Mr. Thomas) getting 6½ brace of good trout. On Thursday, Friday and Saturday there was a very cold north wind, and no fly of any consequence; baskets being limited to two and three brace. On Monday I fished the Wye below Bakewell, got four brace, three fish being grayling, all taken with Foster's grey palmer. On Tuesday I fished the Dove for an hour before lunch, and got 2½ brace of fine trout, and after lunch went out again and got six brace of trout and grayling, several fish being nearly, and one over a pound weight. I threw in many small fish, and took every fish with Eaton's dun bumble, fishing up stream. I hope to get a dish from the Manifold to-day. The trout are in splendid condition, and also the grayling, which are just coming on. The rivers are in good order; Dove as clear as crystal, Wye slightly coloured, as is also the Manifold. The best flies to use are Eaton's dun bumble, Foster's intermediate and Foster's grey palmer—a favourite with the grayling. Mr. Prince, the obliging landlord of this most comfortable hotel, very wisely keeps a small stock of the flies for each month, and also some casts, and I need hardly say that this is a great boon to anglers, who may run out of any particular taking fly.—R. B. MARSTON.

Dove.

I have this week been doing the *dolce far niente* at Scarborough, so that I know little about the Dove except what my letters tell me. This, however, I can say, namely, that sport in Scarborough Bay and off the pier has been excellent. I saw a gentleman last Wednesday with a fine basket of flat fish—whiting, gurnet, &c.—which he had killed in less than two hours. I am glad to say that this gentleman is a subscriber to the GAZETTE, and little as I expected it when I got talking to him, is a well-known south-country fly-fisher, and a regular reader of these Dove notes. As to the river named, all my information is that it has now settled down into nice order for angling. Trout, grayling, and chub have been rising fairly well at the whistler, and coarse fish have been biting well at the cockspur.—THE SPODGER.

Exe (Tiverton).

The river is in excellent order for salmon fishing. The late floods seem to have brought up a fair number of fish. During the past week the following gentlemen have been successful in killing one each or more, viz.:—Capt. W. Davis, L. Smith, Esq., and Henry Mudford.—WM. MUDFORD.

Ilfracombe (N. Devon).

Streams high. There has been nothing doing in trout fishing since my last report. Sea fishing: there has been some good catches taken with hand lines this last week. On Friday and Saturday the boats had some good sport, the best boat on Friday catching between 80 lb. and 90 lb., and on Saturday over 100 lb., consisting of mackerel, cod, whiting pout, conger, shad, &c. Monday wet and stormy, with a heavy sea. Tuesday and Wednesday all boats at sea, and returned, after fishing the tide, well satisfied with their luck. There is quite a variety of fish catching—pollock, conger, cod, bream, whiting, mackerel, &c. The fishermen anticipate a good herring fishing, as the sea is all alive with fish; one can stand on the rocks and watch the shad mackerel jump out of the water. A fine conger was caught with hand line from the rocks off the Capstone Parade on Tuesday evening. I see a fine string of fish now just passing my window, over a hundred weight. Weather still fine, with good takes of fishing for the next few days. Several gentlemen, fishing with rod and line from the jetty, have caught some fine pollack, dabs, &c.—E. COMER.

Kennet (Reading).

A good day in the Kennet yesterday (September 7), Mr. Goodhead and myself taking upwards of 80 lb. barbel.—FRED STURLEY.

Lea (Cook's Ferry).

The late rain has greatly improved the waters, and those who have gone in for roach and perch together have gone away much pleased with the result of their takes. As regards jack, down here they appear small indeed, for they are so fine that anglers cannot see them. Should the weather remain fine, the waters will be in good condition and the sport improve.—S. SEWELL.

Medway (Tonbridge).

Owing to the rains the river is full and the water rather discoloured, but notwithstanding this some good sport has been had on well baited swims amongst bream and roach, which are now well on the feed. The principal catches during the week have been a 5 lb. carp at the Powder Mill Lock by Mr. West, and a pike of the same weight by Mr. Wells, the well-known All England cricketer. Prospects of sport for the next few days good, providing the weather keeps fine.—YE MEDWAY WATER RAT.

Ouse (Kempston).

I have had some excellent sport here on private water—fly-fishing for dace and chub. At the same time I landed and safely returned six yearling trout. These were caught just below Kempston Mill. Two years ago I predicted that, if trout were put into this river, they would first be found here. The Bedford Angling Club would do well to place future fry hereabouts, and not put them lower down the stream, where they have to run the gauntlet with Master Pike. They might then possibly drop down when larger, but here will always be their favourite resting-place. The swift gravelly runs are just the desideratum required by this my favourite fish. The water is rather too thick for pike and bottom-fishing, and ground baiting is necessary for the latter.—THOMAS FORD.

Suir and its Tributaries (Clonmel, Ireland).

The Hon. Hely Hutchinson had some good sport since last I wrote, killing a fine salmon of 8 lb. on Wednesday; two on Thursday, 7 lb. and 8 lb., and three on Friday, of 8 lb., 7 lb., and 4 lb.; he also got several large baskets of good trout. The river is now in splendid order, and large numbers of fresh-run fish are travelling up the river. Mr. Richard Hutchings landed a splendid salmon on Monday, weighing 25 lb.; Mr. Mansfield had also some sport during the week. On the lower waters all the rod-fishers are quite dissatisfied that the season is to close so early, as it is only now the river is in its best order for the year. The Trent fishing was very good this week; large baskets were had each day. Mr. Hughes and Mr. Helen had some sport on the Anner. Tom Rower and Billy Magrath had great fishing on the Suir at Gurteen, and Mr. Bradford, on Grove stream, caught some splendid trout.—DORA.

Swale.

I am still keeping holiday, hence my report of this stream must be meagre. Floods are still the order of the day. These mean a full larder for trout, but

starvation for the farmer. Weat think you of this, ye single-hair fishermen of the North? A friend of mine in Surrey whom I have recently visited caught in one week 130 brace of trout, nothing under 1 lb., and up to 2½ lb. He had 17½ lb. of brace in one day, which weighed on an average of 2½ lb. each. I had a turn with him, but not on the same stream. We kept nothing under 3 lb.—THOMAS FORD.

Trent (Alrewas).

Little doing in this locality worthy of report last week. The river was bank full, and so much discoloured that successful angling was altogether out of the question; while the present one, with the water in capital order for bottom fishing, only poor baskets have been made. I can only account for the bad sport anglers have met with, is owing to the flood water bringing down a lot of natural food, which has taken the fish off from anything artificial. I visited the river yesterday, but only succeeded in taking a couple of fish worthy of mention. A roach, 1 lb. and a chub, not in good condition, 4 lb., later on would have weighed at least 2 lb. heavier. Other anglers out the same day did very little better. Mr. W. Reynolds took about 5 lb. of roach and dace, and Mr. Savatard, about a similar lot. I think it my duty to bring to the notice of the Trent Conservators, the filthy state of the River Tame at Croxall, which, if my informant speaks correctly, is produced by the paper mills at Tamworth, for years this portion of the Tame was considered one of the best for angling in the Midlands. At the present time the water, although it should be clean, is of a nasty black sickly colour, and from the number of dead fish I found on the banks last Saturday, and which have evidently been left from the flood water, I can arrive at no other conclusion, but that the water is badly contaminated with some foul refuse. A friend of mine calling the attention of one of the farmers residing in the locality to the number of dead fish, he remarked "This is nothing to what I have seen. I counted over forty dead chub a few days ago." I trust these few remarks will be the means of putting the powers that be on the alert. The latest report from the river, is that the water is all right, but the sport almost *nil*—the weather, although fine, is dull and cheerless.—JAMES GREGORY.

Trent (Newark).

The water fined down more rapidly last week than I had anticipated, for by Saturday it was in fairish condition, and on that day some very good catches of fish were made. Two fishing matches took place on that day close to Newark. One was the Newark and Muskham Fishery Association's annual match, and the other the employes of the Trent Ironworks. The former was won by Mr. Cubley with 15 lb. of roach, &c., and the latter by Sam Howitt with 4 lb. of dace, gentles being the favourite bait in both cases. In fact, some very good bags have been made just lately with gentles. On Monday two anglers had 25 lb. of roach and dace, gentles in this instance doing the trick. The water is now in good condition, and anglers can ply their avocation until further orders. The weather was very wet and uncomfortable on Monday and Tuesday, but yesterday and to-day there has been a decided improvement, and anglers will find the weather and water favourable for sport if the present condition of things should continue. Gentles and worms I recommend as the leading baits just now—the former for roach and dace, and the latter for barbel and bream. A friend of mine captured a brace of nice pike on Monday, the biggest 7 lb., Gregory's celebrated "clipper" being the successful lure. Barbel should come on if the baiting is properly attended to—in fact, the prospects look very fishy for the next few days, and anglers should be fairly "in it."—THE TRENT OTTER.

Trent (Nottingham.)

Although the river has been in splendid condition for bottom fishing with worms, the fish, with the exception of one or two cases, have refused to take that bait. The best catch came from Burton-on-Trent, where on Tuesday a capital basket of barbel were taken, several of the fish weighing 6 lb. and 7 lb. each; these were taken with worms, and the roach and dace, on two or three occasions, took the same bait freely; but lower down the river the barbel fishers could not get the barbel well on the feed, though several places had been previously baited. A few fish were taken with scratching, but the barbel also almost refused this noted bait, and the rodsters were somewhat puzzled to know the reason why. I guess it was owing to there being a little colour in the water. The river is in its best form when quite clear for scratch fishing. On Monday sixteen nice chub were caught at Fiskerton, the largest being 3 lb. These were taken with wasp grubs, and maggots for groundbait. The present time is the best in all the year for worm fishing; but if the fish will not take worms use scratching, wasp grubs, or maggots. The river is still in good order for all-round fishing, and should the weather continue fine there ought to some good takes of barbel and bream made.—W. BAILEY.

Wye and Derwent (Derbyshire).

Both rivers are running down nicely, and are getting into first-class order for fly fishing. The higher lengths of both streams are now in first-class condition for fishing, and I am pleased to say that some fine baskets of both trout and grayling have been killed, chiefly with Eaton's honey dun bumbles, grey goose duns, little reds and sand flies. One gentleman, a clergyman, killed 8 brace of large sized trout and grayling in the Rowsley Meadows last Monday, every fish was killed with my little honey dun bumbles, similar baskets being made both off the Chatsworth and Derby Dale Club waters. There have also been some fine trout killed by dibbing with the small bluebottle flies, off the Derwent, same nearly 1½ lb. each. The bottom fishers on various parts of the Derwent have done well during the past week with both wasp grubs and gentles. One angler killing a brace of trout with the maggot that weighed nearly 3 lb., this was in the deeps at Matlock. There have been some good baskets of coarse fish killed in the Derwent close to Whatstandwell, some of the trout, dace, and roach being very little short of a pound a piece. Sport on the ponds has also been good during the past week with both trolling with the Derby trout killer bottom and fly-fishing. The tight line party have done well amongst the eels during the week, the large dew worms being the best baits used.—GEORGE JAMES EATON.

Yore (Yorkshire).

Although the weather still continues very dull and opposed to outdoor sports, there has been no heavy downfall of rain for some days, the rivers have had a chance of running down and there is a splendid minnow water on the Yore to-day; there have been, however, no good baskets of either trout or grayling come under my notice, but dace and coarse fish have taken the maggot freely. Next week I hope to be able to record some successful fly-fishing and will also give a few good flies to use for grayling during the autumn months.—FRANCIS M. WALBRAN.

DEATH OF MR. H. L. ROLFE.

THE editor being absent from London, intelligence of the decease of our esteemed friend, Mr. H. L. Rolfe, did not reach us in time for notice in our last Saturday's issue. By the death of Mr. Rolfe, the now vacant "niche" he so long and worthily filled in the particular branch of art he made his own will not be readily filled up, and among those friends who enjoyed the privilege and pleasure of his acquaintance a grief is felt that time alone can efface. Singularly amiable by nature, it is no wonder that all who knew him say they never heard an unkind word fall from his lips. An ungenerous thought he never harboured, and if ever a disagreement occurred among his friends he was always the peacemaker. In that "little studio" in Nicholas Lane, made so delightful by his presence and the productions of his "master hand," were often seen followers of the "gentle art" he so much loved and was almost as great an expert at, as he was in the delineation of the fish he so loved to capture. Let one be but "an honest angler," he was sure of a welcome there.

But it seems as a dream that so short a time since we passed very pleasant days with him in an old "cathedral city," arranging exhibits intended to develop piscicultural and piscatorial knowledge and art; and many visitors to the Norwich Fisheries Exhibition will remember his genial smile and tall and courtly presence, and when they hear of his death express heartfelt regret that he has gone from the midst of us never to return.

Letters have reached us from all quarters—from friends and acquaintances—one and all expressing much sorrow at the decease of our respected friend, and many of them congregated last Saturday around his grave in Brompton Cemetery to pay their last tribute of respect to his memory. "Requiescat in pace."

38, Old Change.

A. G. J.

INAUGURAL DINNER OF THE SOCIETY OF CAXTONIAN ANGLERS.

THIS society, which has only been recently established, bids fair to occupy a very prominent position among London angling clubs. It already contains over forty members, it has an admirable president in Mr. Cate, who is ably supported by Mr. John Esson as vice-president; it has a most efficient and active secretary in Mr. Stephen J. Field, and it has a thoroughly practical committee, which has framed a code of rules of a very praiseworthy character. Although pointing towards the direction of competing for specimen fish only, they have not as yet abolished the gross weight competitions, for which some of the members appear to be anxious. They have, however, laid down a standard of sizes far above those generally adopted by the London clubs, as, for instance, jack are 20 inches, perch 10 inches, roach 9 inches, barbel 15 inches, dace 7 inches, gudgeon 5 inches, and others in the same proportion. The rules altogether are framed to encourage sportsmanlike practices, and it is certain that anglers joining the society will be of a true type. The inauguration dinner took place at the club house, the Falcon Hotel, Gough Square, Fleet Street, on Wednesday evening, Mr. William Cate was in the chair, and in the absence of Mr. John Esson his position in the vice chair was worthily filled by Mr. Colnaghi. Amongst those present were:—Messrs. Thomas Spreckley, W. H. Brougham, Leo Bonvoisin, George Little (Little and Co.), J. Knighton, Thomas Matthews, George Reeves, A. Mayman, Alfred Brooks, George Reeves, jun., W. H. Cate, J. H. Stead, Walter Pelham, W. Pyne, Field, Dickinson, J. Sargeant, &c. The dinner was of a first-class character, admirably served up, and elicited expressions of great praise. The first toast was the loyal one, which anglers never omit, of "The Queen and the rest of the Royal Family," which, as the chairman justly observed, was one of mutual appreciation. Then came the toast of the evening, "The Society of Caxtonian Anglers," which the chairman good-naturedly remarked was a society of anglers banded together in a kind of brotherly feeling. He regarded the sport of angling as an innocent amusement, and he always found anglers good men. Their society was a new one, and in prosperous growth. He looked upon it as an association for the good of all and to do good to each other. The toast was drunk with great enthusiasm. The Chairman then gave "The West Central Association of London and Provincial Societies," which he was satisfied had been instrumental in doing much good and had in reality called their society into existence. Mr. Leo Bonvoisin, in an eloquent speech, replied to the toast, which was frequently applauded by those present. Mr. J. Knighton proposed the toast of "The President of the Society of Caxtonian Anglers," whom he had known for a great number of years, and he was satisfied a better man never lived. He was eminently fitted for the position he occupied, and under his presidency he was certain the society would go on prospering and to prosper. The toast was drunk most heartily, with musical honours. Mr. Cate briefly, but in well-chosen words, replied; and afterwards gave "The Thames Angling Preservation Society," which was of a time-honoured character, and both soundness and honour were attached to it. It had been engaged in increasing the stock of fish in the river and well looked after its preservation. Mr. Thomas Spreckley, who was received with loud expressions of applause, in his reply, said he regarded the society as one of a purely philanthropic nature, and he worked for it with all the energy he could for the benefit of all classes of anglers, not forgetting those who fished from the banks and who were well entitled to his attentive consideration. He then referred to the "Angler's Benevolent Society," of which he was also President, and strongly urged the Caxtonians to support it. He had seen cases relieved in sums of £1 and upwards, which he was satisfied lightened many a heavy and

afflictive burthen to their poorer brethren. After noting some of the alterations it had been proposed to get made in the bye-laws, Mr. Spreckley resumed his seat amid great cheering. The Vice-Chairman then gave "The Press," and coupled the name of Mr. W. H. Brougham with it. In his reply Mr. Brougham observed he was an old Caxtonian, having been born to the art of printing. He had been connected with the London press for fifteen years, and it always afforded him pleasure to record the doings of the angling clubs, and whether as attached to the press or with the Thames Angling Preservation Society his services and assistance would always be exercised in the interest and for the sole benefit of anglers. A number of other complimentary toasts followed, and each toast throughout the evening was interspersed with some capital singing, Mr. Sargeant ably presiding at the pianoforte. Mr. J. H. Stead, so well known as "The Perfect Cure," entertained those present with a highly amusing song, introducing a complete string of popular melodies, and Mr. Walter Pelham gave an illustrative description of a Penny Reading of a very entertaining character. Mr. W. H. Cate sang his songs in a masterly style, and was loudly encored. The evening did not close without passing a well-deserved compliment to the host and hostess for their splendid catering. The society has already some good specimens of fish as a nucleus to the formation of museum.

ANSWERS TO CORRESPONDENTS.

BREAM.—You will find a full description of the fishing at Dagenham Reach in the correspondence a week or two back.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

LARGE PIKE.

SIR,—The Rapley Lake Pike was cast by the late Frank Buckland. The cast was painted by the late H. L. Rolfe, and is in the museum of the Piscatorial Society. The fish, to quote a good authority, Mr. Edon, who skinned, "set it up," weighed 35 lb., and it was purchased by Mr. Hoole, who presented it to the United Anglers, Hammersmith.

Rapley Lake was cleaned out for a carp-stew some 17 years previous to the "netting" of this pike, and Frank Buckland's opinion was, that it had got in by some means, or been put in, soon after the lake was cleaned, and that it was, therefore, from 16 to 17 years old.

The pike caught by me, January 24th, 1877, near Leeds Castle, Kent, weighed 36 lb., measured 46½ inches in length, and 26 inches in girth. It was a female, and the roe weighed 3¼ lb.; the eatable flesh 23½ lb.

The 37 lb. pike I caught, November 4th, 1879, was 47 inches in length; 29 inches in girth; also was a female; the roe 1¼ lb.; and eatable flesh 25 lb. weight.

Mr. J. Lodges, 28½ lb. pike caught, December 27th, 1880, was 45 inches in length, and 22 inches girth.

Referring to the 12½ lb. pike, with the flight of 13 hooks down his gullet, it should have been, I think, "lost by Keene, a Thames fisherman, at Wraybury," and not of Wraybury.

In re the 19 lb. trout exhibited at the Gresham Angling Society. It was not "weighed-in," as incorrectly stated by your correspondent L. B. Nor did any newspaper report say it was, although they were in other respects inaccurate. The fish was placed in my charge by a friend for preservation, and whether caught by "spinning," or with "fly," I cannot say. It was a male "Salmo Eriox," in most beautiful condition, measured 33 inches extreme length, and 21 inches girth. I have sent it to S. F. Sanders to be "set up," and shall be pleased to show it to L. B. when completed.—I am, &c.,

September 7th.

A. G. JARDINF.

THE ANGLERS' BENEVOLENT SOCIETY.

SIR,—Having seen your remarks in last week's FISHING GAZETTE relative to the above, and also read the report, we have written to the secretary, asking him for full particulars relative to establishing a branch society in Hull, in connection with the same, if not objected to, and we think if branch societies could be formed in other towns, to work under a consecutive committee in London, the affair would eventually become a great boom to all anglers, and be the means of contributing to the benefits of the brotherhood, and also bringing forward a friendly feeling amongst all angling clubs, which has been so long looked forward to.—I am, &c.,

Hull, Sept. 5.

H. J. W.

FISHING IN NORMANDY.

SIR,—Can you tell me whether there is any good river-fishing on the coast of Normandy, and whether living is expensive there? Will you inform me of some quiet little place if you know of any? I should like you to answer me as soon as you can, as I think of leaving town very shortly.—I am, &c., J. M. H.

71, Marylebone Road, August 31.

[Being away from town, we are unable to refer to any guides. Consult the Angler's Diary (price 1s. 6d.) published at the Field office. Perhaps some reader will help you in next week's paper.—ED.]

FISHING AT PURTON, WILTS.

SIR,—In answer to your correspondent who asks about fishing at Purton, Wilts—I don't think there is any nearer than Salisbury, which is six miles distant. There is good fishing in Salisbury—both private and subscription—bottom fishing in the Hampshire Avon, and plenty of fly fishing, if you can get

leave of Lord Pembroke and other land owners. Trout, I am sorry to say, are scarce, but good grayling are abundant up to 3 lb.—I am, &c., C. E. GUEST.

P.S.—If not too late in the day, I should like to mention that as a preventive against midges I have found camphorated oil a good thing, simply rubbed on the face and wrists. I have used it for years.

THE FENCE MONTHS.

SIR,—Your correspondent L. B., evidently because it is too much trouble to reason, again launches into argument wholly illogical. It is simply ridiculous to declare that as the number of anglers increases "there is no compensating advance in the resources of the said river." Two important facts affect the result—control and define the value of x , the number of breeding fish left in a river at the end of the season. In the first place, as I have shown before, rivers are self-compensating; the more they are fished, the more they are the resort of an increased number of anglers, so much the more do the fish which they contain become excessively shy and wary. No doubt Mr. L. B. is prepared to deny this, as it conforms with the experience of all real anglers, and so does not suit the views of the modern protectionist. I have before stated that the number of excessively shy, uncatchable fish, which are of large size and therefore very prolific, are always sufficient, under normal conditions of the water, to keep up the race in absolute abundance. But there is also invariably a large proportion of younger fish which escape capture, and assist materially in the reproductive act.

Nature herself is self-protective. There is a divinity which doth hedge in the fish, for the fecundity of the latter is plainly a means provided for the consumption of a given end—the preservation of a race from unnumbered foes. Glancing casually a little deeper into this matter, we find that a fish of 10 lb. weight yields approximately the following number of eggs—a number truly marvellous: in the case of the trout, 10,000; the carp, 450,000; the pike, 150,000; the perch, 600,000. On this account, one of the main objects of the pisciculturist, after effecting the abolition of successful poaching, is to see that the internal conditions of the river are such as to ensure the hatching of a considerable portion of the spawn, and the subsequent maturation of a fair proportion of the young.

When making allusion to the subject of poaching, I have one additional clause to mention, which, by some sad oversight, found no place in the *Mundella Act*. I have been brought up in a school of angling that believes it a dishonour to one's craftsmanship to take fish by any means other than the rod with its appended bait, wielded as the experience of long years has shown to be needful.

I have always had the idea that the great test of the real angler is knowledge of the resting places of the fish in all waters and at all times, with the modes of fishing most suitable for the occasion; consequently, when I find men professing to be anglers eliminating the whole or a greater portion of this needful test, according to circumstances, I can only justly observe, they are not anglers but poachers, mere "pothunters;" and when I hear these very pothunters asking for legislation for the prevention of poaching, and conditions conducive to the multiplication of fish, I can again only truthfully answer—Why, I am with you heart and soul? I would stop all forms of poaching with the utmost rigour; and first of all we must stringently prohibit "groundbaiting," as essentially unmitigated poaching—more truly the work of a marauder than is livebaiting and trimmering. Yes, I am with you heart and soul in fish-protection, so long as your propound legislative acts the result of sound knowledge of fish, and at the same time not onesided, and giving those apparently disinterested and noisy advocates the option of fishing quietly in close time in private waters, said to be overstocked, or in waters where it is the avowed intention to decimate coarse fish. When Thames and Trent anglers abnegate the poaching luxury, the groundbait, I shall be more inclined to believe in the integrity of their desires; till such time, I hold them guilty, and esteem it a condescension to even argue with pothunters; only doing so that error may not be promulgated without refutation. I need no further assurance from Mr. L. B., in the form of letters or otherwise, that there are many who docilely follow in his footsteps. Were I not well assured of this fact, I should not now be writing, as controversy would then be needless.

"Pernicious doctrines," Mr. L. B.! I repudiate the imputation, and hurl it back with ten-fold emphasis on your own groundbaiting-confederacy. And now I must turn to another phase of the question. My opponents constantly demand a revelation from me, but the last thing that occurs to them is to reason things out for themselves. I am now asked, How am I to account for the alarming decrease of jack and perch in the Thames? In the first place, I must reply, on what data does the alleged alarming diminution of these fish rest?

As I have before stated, increased wariness causes an apparent diminution of numbers, for fewer fish then come to shore. Perhaps, however, the alleged dearth is owing to the fact that London anglers cannot poach for pike with groundbait, as in the case of many other fish; and now, as the intellect of the fish progresses, the skill of the Londoner is pitted against the shrewdness of the fish, and the latter has the best of it, being certainly the superior genius, as, despite all his efforts, the Londoner cannot contrive some new device in poaching sufficiently innocent in outer garb that can pass muster as fair angling. Viewing the matter in another light, I have never yet heard of shepherds rearing wolves in their sheep-walks, or the oriental farmer tigers for the benefit of their herds; but I do know of a proverb relating to killing a goose with a golden egg, and no sane angler who is an angler at heart, such as "Ephemera," Mr. Francis, or yourself, Mr. Editor, has ever, to my knowledge, advocated the cultivation of pike in a much-fished preserve of other varieties, except in the case of ponds that could, in case of need, be cleared of the ravenous omnivores. I was once informed of another proverb, which laid down the law to this effect, "You cannot burn your candle at both ends"—a proverb applicable in this case; for you cannot encourage pike with a fair prospect of rapid increase of other coarse fish; though if you leave the carnivorous perch and pike to shift for themselves, and increase the number of herbivorous and other coarse fish, perch and pike will likewise become plentiful, in accordance with well-known laws of nature; for will they not fatten on vast deposits of spawn, fry, and full-grown fish, to such an inordinate extent as to incite them to breed unfailingly? In relation to Mr. L. B.'s second question as to the Waveley and Oulton Protection Society, I have merely to remark that the preservation of the pike, if carried out, is a step in a retrograde direction—is a thing that would not be entertained for a moment in Germany and China, and is only the evident result of the teaching of some who, being dressed in a little brief authority, always are able for a time to obtain an acquiescent and unreasoning following. East Anglia may listen with heartfelt joy to the voice that proclaims the slaughter and absence of her carnivores; but be not too sanguine! Truly B., in a recent article, gave it as evidence of twenty-three years' practical experience

that certain fish may for a whole season appear wanting whilst actually abundant.

Finally, in answer to L. B.'s whole question, I deny the dearth on the evidence of reports. Reverting specially to "Creel," I must ask this gentleman to read again my letter of invitation. I think, if he does this, he will find that the words were not fairly intended to bear the interpretation he attributes to them. I presumed that "Creel" had already a knowledge of the streams of Westmoreland, &c. I knew that my acquaintance was considerable; I therefore desired "Creel" to visit the places named in the FISHING GAZETTE, by requesting him to name the thirty streams. Why should either of us visit the waters again, when we already know them well? However, as "Creel" appears to advance an argument that I desire to shift from my position—and as he will make the most of such a verbal misunderstanding—I am prepared at the present time to meet my opponent's arguments in the FISHING GAZETTE, whilst I will endeavour to contrive some expedition of the nature "Creel" desires; but I fancy this gentleman's modesty is rather considerable, when, after accepting what he deemed a free invitation, he was so unabashed as to propose that the excursion should extend through a period of two months, the whole to be at my expense; an expense which could not be less than £60 for the two self-appointed, disinterested—feeling, at least on my part—piscatory commissioners' walking-distances. I can manage up to fifty miles in the day, with the requisite impediments on the back. Shortly, my courses of lectures recommence next week; I have no time available for the trout streams of Cumberland, &c., until after next Easter, when three weeks are at my disposal. Perhaps Mr. Keene would be willing to take me at Christmas, for a period of four weeks, to investigate the coarse fish of the stream to which he alludes. Until nearer these periods, adieu. Mr. "Creel," I consider it "coolness" to presume to adduce facts in this paper without adequate proof. It is likewise coolness to misquote, and render "jostling each other almost," simply, "jostle each other." The cases named were not at spawning time, with "the fish all there," but were as follows:—I only append a few cases from various countries and districts—Norway, Laerdals Elf: trout, April 11th and July 7th, 1878. Thames, October, 1874: dace, &c., as stated. Kennet and affluent waters: trout, chub, rudd, and perch, June, 1873. Cam and Ouse, 1873. Cam and neighbouring waters, 1874: dace, bleak, chub, roach, rudd, bream, eels, pike, and carp. Wales, certain rivers all throughout the summer, 1875. I might multiply occasions, but this is needless.

The last sentence of the first paragraph of "Creel's" letter, relative to his own want of knowledge of the present proprietors of the Westmoreland streams, seems an evasion of an answer; and where is Mr. Keene ruminating?—I am, &c.,

ROBERT BALDERSTON.

SIR,—Is not Mr. Bonvoisin in his attack upon your correspondent, Mr. Balderston, and all who think with him, trying to draw an untrue premise. Allowing Mr. Balderston and his friends the wish to angle all the year round, does it follow that they wish to take fish out of season?

I do not believe it, as I know several anglers who think with you, Mr. Editor, and they are old practical fishermen, who would scorn the idea of *taking spawning fish*. Might they not point the finger at Mr. Bonvoisin, and say, are not you, and your followers doing worse by angling directly the Act allowed you, viz., 16th June?

Why rush at unclean roach, bream, barble, &c.?

For your favourite Act is still the failure it always was.

If ever it is altered it will be mainly through the publicity given to its defects in the FISHING GAZETTE. And not by Messrs. Geen, Hoole, Bonvoisin and Co., who seem perfectly content to let the thin end of the wedge remain.—I am, &c.,

ANOTHER WHO WOULD LIKE THE ACT ALTERED.

A NEW ANGLING CLUB.

SIR,—Yourself and readers of FISHING GAZETTE will be glad to hear that a club has been formed at the above hotel, by thirteen residents of Acton. At a meeting held, August 30, it was resolved that the club be called the Acton and Ealing Society. The necessary officers were appointed. Mr. Bocking, chairman; Mr. Eydmann, vice-chairman; Mr. Brooks, host and treasurer; Mr. Williams, hon. secretary. On Sept. 5, Mr. Eydmann, jun., weighed-in dace; Mr. Dean, weighed-in a small trout.—I am, &c.,

BLACK BAG.

NATURAL BAITS.

SIR,—In your issue of the 13th August, there is an article headed as above, and signed by Mr. J. H. Keene. No one having in any way questioned the contents, I take the liberty of quoting several authors who differ from Mr. Keene, in the hope of obtaining well authenticated information on the several points in the natural history of the insects which I have ventured to dispute and also to contradict a claim of Mr. Keene's, that he is the only writer who has estimated the freshwater shrimp at its real value as a bait.

1st. The caddis, Mr. Keene states, is chiefly, in the Thames, the larva of the alder fly. One page 193 of his fourth revised edition, Mr. Francis Francis writes in his "Book on Angling":—"the caddis has nothing whatever to do with the Ephemera; it is the home of the Phryganidae exclusively, and their plenty will determine the abundance of sand, garron, edge, cinnamon, and other flies of that class only." And again, on page 192, Mr. F. F. writes:—"Among the Neuroptera are the Ephemera, as the May flies, duns, and spinners; the Perlidae, as the stone and willow flies; and the Sialidae of which we have but one sample, though that is a host in itself, viz., the alder fly. The Trichoptera used for the most part, include only the family of Phryganidae, if we except the silver horns." Mr. Ronalds, in his 7th edition of "The Fly Fishers' Entomology" states that "the alder is one of the Neuroptera or nerved-winged flies; and comes from a water pupa," of which class, he only gives one (the Cinnamon) as belonging to the Phryganidae (query, derived from the Greek word for a dry stick?) family, and the order of Neuroptera, the other members of this family belonging to the order of Trichoptera, and being the sand-fly and the garron. The Rev. C. Kingsley in "Chalk-Stream Studies" says:—"these live sticks are the larva cases of the caperers—Phryganidae—of which one family, nearly 200 species have been already found in Great Britain." He then refers in the next paragraph, to larvæ of water flies having the sides fringed with what look like paddles, but which are gills. Of these, one part have whisks at the tail, and swim freely. They will change into ephemera, &c."

The following paragraph reads:—"Some, again, have the gill, on their sides larger and broader, and no whisks at the tail. These are the larvæ of Sialis, the black alder, Lord Stowell's fly, &c. Methinks, from the above authorities, one

might draw the conclusion that the alder is not a Phryganidae, and therefore does not come from a caddis.

However, in confirmation of Mr. Keene, Theakstone, in his "Flies of the Streams of Ripon," gives No. 43, the light dun, as the ore fly, or alder, and states that this fly is the produce of the caddis, and are plentiful in May and June, and in autumn (query, does the alder appear in the autumn, as I do not ever remember to have seen it after June?). Also an article of H. C. Pennell's "Fishing Gossip," Etymology of Bait, by W. Pinkerton, states that the alder fly comes from a caddis, and also that "in this state (in its case) the larvæ of the Phryganidae are the caddis, case worms, or caddis of our old writers on angling." Mr. Francis, page 493, in his list of baits, gives the caddis or caddis, as the same insect, whereas, Mr. Keene, says that the caddis or creeper is the larva of the May fly (query, is not stone fly here referred to?).

2nd. The caddis or creeper is stated by Mr. Keene to be "the larva of the May fly, and is as ugly as its imago is fairy-like and beautiful." He has previously stated that "it is, as the readers of the FISHING GAZETTE must be aware, the larva of the May fly" (and continues as above quoted). Has not Mr. Keene confounded the stone fly, which is the May fly of Scotland and the North of England, with the May fly or green drake of the South, the creeper of the stone fly being much used as a bait for trout, but as far as I know the larva of the green drake (or May fly) is not referred to in any angling work. Indeed, in Mr. Keene's own work, "The Practical Fisherman," and which I believe first appeared in sundry numbers of the *Exchange and Mart*, on page 236, one reads "in the case of the stone fly, after leaving its case, it creeps to the shore, and there passes several days before it becomes a fly proper. In this state, it is the creeper of Northern anglers," &c. Again, on page 241, of same work, under the "stone fly." This fly comes from a water larva, called the crab or creeper, which is often used itself, and is a capital trout bait. Mr. Francis also states that the caddis or creeper is the larva of the stone fly, see pages 218 and 494. In "Chalk Stream Studies," Mr. C. Kingsley makes the same statement.

Mr. Keene, in writing about the freshwater shrimp claims that "it has never been estimated by any writer (except myself) at its real value as a bait for trout, perch, chub, roach and dace."

If he will refer to the "Book of the Roach," by Greville Fennell, and published in 1860, on pages 71-2, he will find quoted a portion of a letter written by Josiah Heath, of the Wraybury water. "The roach feed greedily on them, as do dace, chub and eels. . . . Do you think these shrimps will do to bait with? I certainly believe, sir, if they could be imitated artificially, they would do well to whip for dace." These shrimps have been tried with great success. They are readily caught in dozens with a small gauze landing net. Again, on page 77, "Freshwater shrimp, if alive, should be hooked through the tail, the point coming out at the upperside."

In the newspaper called *The Country*, referred to by Mr. Keene in his remarks about the horse leech, and issued on February 1, 1877, in reply to a query of mine, I think Greville F. gives, on page 130, directions how to use the freshwater shrimp for perch. Reference is again made to this shrimp in the issue of February 15, 1877. I have also a strong impression that an article appeared, I fancy in the *Field*, within the last twelvemonth; but after searching more than once for it have not been successful.

Perhaps some of your readers may have noticed this article which described fishing with the freshwater shrimp in Holland.

Might I also ask Mr. Keene if he still adheres to the statement made in "The Practical Fisherman," page 213:—"It is seldom one gets even a Chers, Colne, or Wick trout above 3 lb." I ask the question mostly in respect to the last-named stream, which, I presume, is that which flows through High Wycombe.—I am, &c.,

J. B. J.

TO ANGLERS.—Taken by mistake between Watford and London, a 20 feet roach rod, a jack rod and landing-net stick. I will bring the same on producing the one I lost.—Address, T. Wyatt, 106, Princess Street, Edgeware Road.

"I wish to ask the court," said a facetious barrister, who had been called to testify as an expert, "if I am compelled to come into this case, in which I have no personal interest, and give a legal opinion for nothing?" "Yes, yes, certainly," replied the mild-mannered judge; "give it for what it is worth."

ANGLING CONTEST.—Last Monday week an angling match took place at Malton amongst the members of the Wakefield Tradesmen's Angling Club, the scene of the contest being the Old Derwent, above Old Malton, permission to fish in which had been kindly granted by the Hon. H. W. Fitzwilliam, M.P. for the South West Riding. Thirty-four members of the club took part in the contest, and as to each 30 yards were allotted a good space of river bank was covered. The men fished with varying success until four o'clock, and when the secretary of the club went his round with the scales, the following was found to be the result:—1, Mr. Hebden, 4 lb. 11½ oz.; 2, Mr. King, 2 lb. 15 oz.; 3, Mr. Taylor, 2 lb. 12½ oz. Out of thirty-four competitors twenty were successful in catching fish, the day being favourable for the contest. After the match the club sat down to an excellent meat tea at Mr. Rawlinson's the Sun Hotel, where they concluded an enjoyable day.

THE NEW FISH MARKETS.—In view of the applications which will be made to Parliament next session, for powers to build additional or enlarge the present fish market at Billingsgate, the City authorities have already retained counsel to appear on their behalf; while the Metropolitan Board of Works have also selected the counsel who are to appear and promote the Bill, of which they will shortly give public notice.—*City Press*.

FORGET-ME-NOTS.—The peat in the Kennet Valley is said to give that dark and rich golden tinge to the big trout in the river. It does something more besides that—it lends additional beauty to the exquisite colouring of the wild forget-me-nots that form a flowery fringe to certain ditches, or small water-courses, here and there between Woolhampton and Thatcham. These flowers can be sometimes seen from the railway looking south. The large, yellow, waxen-like buttercups also flourish in places along the valley earlier in the summer; and the lapwing—the layer of the much-prized "plover's" eggs—is here permitted to bring forth her young in peace, and now and then a brood of snipe are bred in one of the small island-like bogs. Good coveys of "birds" also in the grass. No prettier decoration for the mantel-piece can be found than the mingling of a bunch or two of the heather growing on the grand old Berkshire commons, with the heath grasses that all seem to be in their beauty when partridge-shooting comes round. Wild flowers, too, were never more sought for and loved for their own sakes than now. Fashions may change, but the unheeded children of moor and dell, and hedgerow and bank, and cornfield, will always be popular among all the wayside wanderers from hamlet, town or city.—THE PILGRIM FRYER.

CLUB REPORTS.

AMICABLE BROTHERS ANGLING SOCIETY.

Mr. Wood, roach, 11 lb.; Mr. Thorpe, roach and dace; Mr. C. A. Medcalf, roach, 3 lb., dace $\frac{1}{2}$ lb., one roach weighing $1\frac{1}{2}$ lb., from the Avon; Mr. Larkman, bream and roach, $5\frac{1}{2}$ lb., from Dagenham; Mr. Moir, bream and roach, $5\frac{1}{2}$ lb., from the same water; Mr. Farebrother, roach and gudgeon, $1\frac{1}{2}$ lb.; Mr. G. Carrington, roach $3\frac{1}{2}$ lb., dace $1\frac{1}{2}$ lb., and one chub 2 lb. 11 oz.; Mr. Howlett, roach and dace. On Wednesday, September 7th, a roach fishing basket and a large bleak preserved in case, the property of the late William Bath, will be disposed of by chance for the benefit of his widow.—J. WOLLEDGE.

August 28.

ANGLERS' PRIDE ANGLING SOCIETY.

The members of the above society visited Amberley on Sunday last, and competed for three prizes given by the following gentlemen:—Mr. Dawe gave a splendid winch and running line, Mr. E. Mallett gave an inkstand, and Mr. J. Deeley, sen., gave a pair of pictures. After a spirited contest the result was as follows:—Mr. T. Wall won the first prize with 2 lb. 1 oz. of bream; Mr. T. Fiddes won the second with 1 lb. $14\frac{1}{2}$ lb. bream and roach; and Mr. Jones the third with 1 lb. 9 oz. of bream. The following gentlemen also weighed:—Messrs. Deeley, jun., Hines, Soar, Hayes, Dodson, Marshall, &c.—H. MALLET, sec.

BERMONDSEY BROTHERS.

Some of the members of the above club were out on Sunday last, and were rewarded with fair takes of fish, the following gentlemen in particular, Conn, Hulse, and Allen, the latter having one roach 1 lb. 2 oz.—WM ALLEN, sec.

BRIGHTON ANGLERS ASSOCIATION.

On Saturday, the 27th of August, the members held their first annual outing at Westernsted, which consisted of cricket, fishing, and athletic sports. The first part of the programme was the cricket match, which proved the members could use the white cane better than the willow. The sides were:—W. H. Clarke's and Mr. Noah Clark. First innings, W. H. Clarke's side, 12; Noah Clark's, 8; second, W. H. Clarke's, 38; Noah Clark's, 38; W. H. winning by 3 wickets. Next was a walking match against time, $\frac{1}{4}$ mile in $3\frac{1}{2}$ minutes, by Mr. Ingram, age 74 years, lost by $\frac{1}{2}$ minute. Next a walking handicap, $\frac{1}{4}$ mile, won by Mr. Artis; second, Mr. Park. Next came the race of the day. Mr. Tree and Mr. Gambling (the worthy chairman of the society) 100 yards, both gentlemen weighing 17 stone 4 pounds; a dead heat at the finish, and pumped out. The tug of war ended the sports, Mr. Noah Clark's side winning by two overs. The fishing competition was the last on the board, in which Mr. Anscombe was declared the winner; Mr. Noble, second; Mr. Ash, third; and Mr. Taylor, fourth. Next came the dinner, which was amply provided by Host Brown at the Old Crab Tree. The members, numbering between 20 and 30, paid their due respects to it, and after speeches and songs they all returned home, to all appearance the better for their day's enjoyment. On Monday, the 5th, a peg-down took place at Barcombe, but, owing to the thick water, only nine members put in an appearance. The first prize was taken by Noah Clark; Mr. John Upton, our honorary treasurer, second. Mr. T. Tree, who did not compete, and whose reputation as an angler is good, brought to bank a fine bream weighing 5 lb. $\frac{1}{4}$ oz., which was at once sent to Mr. Saunders, of London, to be cased for the room.—GROUND BAIT.

September 8.

CENTRAL ASSOCIATION.

The Central Association's return visit took place on Monday last at the Convivial Angling Society, Bull and Bell, Ropemaker Street, City. The attendance was very good. Seventeen clubs were represented. The next visit will be paid to the Canonbury Angling Society.—J. A. FITCH, jun.

CITY OF LONDON ANGLING SOCIETY.

The following members weighed-in fish on the 4th:—Mr. J. Chambers, roach and dace from Penton Hook; Mr. Castell, roach and chub from the Roding; and Mr. Pratt bream and roach from Amberley.—CAS.

CONVIVIAL ANGLING SOCIETY.

The members of the above club met at the Bull and Bell, Ropemaker Street, where the following gentleman weighed: Messrs. E. Whitehead, Hewett, Sparrow, West, Hodge and Adams. Mr. West had a nice show of fish, the best of which was a fine trout caught in the Lea, which weighed 3 lb.—W. E.

DALSTON ANGLING SOCIETY.

The members of the above society met on Sunday, September 4, when the following members had roach and perch:—Messrs. Anderson, Fuller, Bunn, Malley, Eagles, W. Richardson, Vale, Barson, James, Venour, Midson, and Fortescue. Total, 47 lb.—S. MALLEY, secretary.

EAST ANGLIAN PISCATORIAL ANGLING SOCIETY.

A general meeting of the above society took place at the club-house (the Great Eastern Wine Vaults), on Tuesday evening last. Previous to the commencement of the usual business the secretary (Mr. A. Palmer) read some letters which he had received from Edward Birkbeck, Esq., M.P., and W. H. Grenfell, Esq., M.P., both gentlemen having signified their intention of becoming hon. members of the society. The purport of Mr. Birkbeck's letter was that although he had many claims from his own division, he thought the East Angling Piscatorial Society worthy of all support, and should, therefore, be proud to be enrolled as one of its members, and promised at all times to do his utmost to further the interests of the society. W. H. Grenfell, Esq., M.P., also said he should, whenever occasion required, use his influence in aid of anything for the benefit of anglers. The latter gentlemen inclosed a cheque for £1 1s., to be devoted to the prize fund. The wind-up match of the season was arranged to take place at Honing, on Monday, the 12th of September. Fourteen new members were elected, and prizes to the value of about £10 were promised.—Norwich Argus.

EXCELSIOR ANGLING SOCIETY.

Several members of the above society were out on Sunday last. The fish being considerably more numerous than the members that went out, Mr. Smith showing up with a good tray of roach and dace of about 11 lb. Mr. S. Gay

bream of about 3 lb., also a grey mullet of $1\frac{1}{2}$ lb. from Amberley; myself about 6 lb of bream, and a nice dace of 5 oz.—A. THOMAS.

EXCELSIOR ANGLING SOCIETY.

Some fine trays of fish were exhibited at the society's house on Sunday last, Mr. Blackman having a nice tray of barbel (nine fish), scaling 26 lb., the largest being a beauty of $5\frac{1}{2}$ lb.; Mr. Smith also a nice show of roach, dace, chub and perch, about 15 lb.; one of our new members, Mr. Gay, hooked on Sunday (while fishing at Staines with a tight line and hair hook) a splendid bream, which was calculated by several that saw it to weigh between 6 lb. and 7 lb., but through the top joint breaking before any one could assist him with the landing net the fish was, I am sorry to say, lost; several other members and myself were pretty successful.—A. THOMAS.

The Hope, Bird Street, S.E.

GLOBE ANGLING SOCIETY.

The trays of this society were well filled on Sunday, September 4th. Mr. J. J. Holmes winning Mr. Churchman's prize with a good basket of handsome roach, dace and perch from the Wey; Mr. C. Russell making a good second with roach, dace and perch from the Thames, and Mr. W. Moore third, with some excellent perch. On Sunday, September 11th, a valuable prize given by Mr. C. Russell will be fished for.—J. CHURCHMAN.

September 7th.

GOOD INTENT.

There was a capital show of fish on Sunday last. All our trays full. Mr. E. Pluckrose, bream, one fish scaled 4 lb. 6 oz.; Mr. Howe, jack; Mr. Philpott, bream; Mr. Haines, roach; Mr. W. Hughes, roach; Mr. Donovan, roach; Mr. W. Wheeler, dace and roach; Mr. Maybury, 15 lb. of fine roach; and Mr. Gadbury, ditto. Our distribution of prizes takes place on Tuesday, the 13th inst. Our worthy treasurer has given his annual donation of £1 to the Anglers' Benevolent Society. The club has voted the same amount.—R. MURPHY.

September 8.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

We fished at Woking on Sunday last for three prizes. Mr. J. Fitch won the first; Mr. Theobald second; Mr. Juker one for the heaviest jack. The following also had fish from the same place:—Messrs. Parkin, J. K. Fitch, Young, Butler, J. Watling, and C. Warren; Mr. Stanmer, jack from Welsh Harp; Mr. Major, a fine tray of roach from the Colne; Messrs. Reynolds and Armstrong, roach from the Colne; Messrs. Warne and W. Watling, roach from the Thames; Hutching, roach from Amberley.—J. A. FITCH, jun., sec.

GRESHAM ANGLING SOCIETY.

The weekly meeting of the society held on Thursday was numerously attended, and some fine roach were weighed-in by Mr. Graham Bennett, a member of the committee. The present meeting room having proved too small for the purposes of the society, it was determined to remove to larger premises in Bishopsgate Street, where every accommodation could be afforded. Mr. Thompson will still be host, and continue his functions as treasurer. Three new members were proposed for election. The prize committee held a meeting previous to the general assembly, Mr. Field very ably presiding. The society's prizes, and also those privately offered, were then discussed and arranged, Messrs. Jardine, Austin, Crumplen, Cartwright, Parker, and other gentlemen, taking part in the proceedings, which did not terminate until a late hour. A very hearty vote of thanks was passed to Mr. Field for his conduct in the chair.

HAMMERRSMITH UNITED.

It seems that friend L. B. has not quite emptied Elstree Reservoir, as two of our members gave it a trial with very fair success on Sunday, Mr. Pinney taking five tench, weighing 14 lb. 8 oz., largest 3 lb. $8\frac{1}{2}$ oz.; Mr. Peachey seven tench, 19 lb. $9\frac{1}{2}$ oz., all taken with worms. Several members weighed-in fish also.—VORTEX.

September 5th.

A large number of our members have been out during the past week with varied success. The best takes are—Mr. Rackstraw, two days, barbel, roach and dace, also a fine lot of brook trout; Messrs. Hobden, Walters, Stedman, Hitchcock, Lewis and Smith had perch, roach, dace, gudgeon and eels. Messrs. Green and Hoole, as usual, had some big fish—barbel and chub. Messrs. Permy and Peachey took on Sunday last a dozen fine perch, the lot weighing over 34 lb., the largest going nearly 4 lb.—T.M.

IZAAK WALTON ANGLING SOCIETY.

On Sunday, September 4, Mr. C. Green had some pretty roach, Mr. J. Barnes and Mr. E. W. Turner also had roach; Mr. H. Butt perch and roach. The three special prizes given by Messrs. A. Salmon, G. Wood and W. H. Hawkes will be fished for on Sunday, the 11th inst., between Burn Mill and Harlow Mill. Also the three special prizes given by Messrs. G. Rolt, A. Salmon and C. Hambridge will be fished for on the 14th inst., competitors to choose their own fishing water. Mr. J. Barrett has given a handsome cup to be fished for, the members to name their own conditions. Major Twohey will also give a prize to be fished for on the same conditions as the cup.

September 7.

KING'S CROSS UNITED ANGLING SOCIETY.

On the 4th inst. the members of the above society were out with varying success. The competition for the secretary's prize was concluded, the winner turning up in the chairman, Mr. Woelfell. The following are the takes: Mr. Woelfell; roach from Pangbourne, 7 lb. 9 oz., Mr. Morley, roach from Staines, 1 lb. $6\frac{1}{2}$ oz., and Mr. Bell, roach from the Wey, $15\frac{1}{2}$ oz.—GABRIEL TREADWELL.

September 6.

LITTLE INDEPENDENT ANGLING SOCIETY.

We had a pretty show of roach, perch, dace, gudgeon, and some fine eels, on Sunday. The following members weighed-in:—Messrs. Letch, Hurwood, Petrie, Wightman, Grey, Raine, H. Moore, Mead, Scott, Humphreys, and Heclas.—W. BROWN, hon. sec.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

Full trays again predominated at the above society on Sunday last, the three w's making no difference to the members. Mr. W. Edwards had roach from the Ouse; Messrs. Laundry and Lucy, jun., roach and bream from Pulborough; Messrs. G. Drew and Parker roach, dace and perch from the Thames; Mr. T.

Longman had 15 lb. of roach and dace from the Kennet; Mr. Neagus with 6 lb. of roach from the Stort. Mr. Obbard was the winner of the monthly prize.—THOS. WM. LUCY, sec.
September 7th.

PECKHAM BROTHERS', ANGLING SOCIETY.

Mr. Williams's prize was fished for on the 4th, and won by Mr. Stidolph, and the prize given by Mr. Pritchett for the largest jack taken during the month of August, to the share of Mr. W. Matthews. Three prizes given by Messrs. Garrad, Minard and Stidolph, will be fished for on the 18th, in the River Lea, from the Rye House, one mile towards St. Margaret's.—W. R. M., sec.

PHŒNIX ANGLING SOCIETY.

Last month a prize of half-a-guinea was given by Mr. W. B. Clark, for the gross weight of all fish, which was won by Mr. Bentley with 57 lb. 13½ oz. of fish. Last Sunday three prizes half-a-guinea each were angled for at Pulborough; about 30 lb. of fish were caught. The first by Mr. Milton, Mr. Parker, second; Mr. Upton, third. G. Bently, G. Barr, H. Parr, Maynard, Crisp, Hamilton, Titmus, and Ward having a nice show of fish. The gross weighed-in up to last Sunday being 469 lb.—W. ELBOWN.

P.S.—I enclose our list of prizes. [Not enclosed.—ED.]

SIR HUGH MYDDELTON ANGLING SOCIETY.

The undermentioned members fished for a series of prizes at Pangbourne, on the 4th inst.:—1st prize, won by Mr. Duncan, roach, 5 lb., but was disqualified; second member took 1st prize, Mr. E. Smith, roach, 2 lb. 15 oz., 10s. 6d.; 3rd, Mr. J. Rogers, roach, 2 lb. 3 oz., 10s. 6d.; 4th, William Fowler, roach, 2 lb. 1 oz., 7s. 6d.; 5th, J. Caborn, roach, 1 lb. 8 oz., 5s.; handsome scarf pin and 5s., not being won, will be fished for on a future occasion. The weather and water was all that could be wished, and we fully expected heavy creels. The roach begin to get into deep water this month. On the 28th ult., Mr. Caborn was the only member who weighed-in fish on the above date. Other members were out but did not weigh-in through being late. Mr. Caborn had a nice little show of fish; one trout, one chub, one dace, one perch, the remainder roach; four of the fish weighed 4 lb.; total, 11 lb. 5 oz.—J. CABORN.

Sept. 5.

SOUTH LONDON ANGLING SOCIETY.

On Thursday last Messrs. Goodey and Cook fished in Virginia Water, but owing to a rough wind the sport was poor. They had some 3 lb. roach, 5 lb. perch (one 1¼ lb.), and a small jack. On same day Mr. Boorman brought into club 22 lb. bream, and on yesterday (Sunday) took 15 lb. more bream, both from Dorking. Mr. Head, from same place, yesterday, 12 lb. bream and 2 lb. roach. Mr. Buck, from Cookham, some nice roach and dace.—G. H. FIELD.

September 5.

P.S.—Mr. Sarjent was at Datchet yesterday and took some chub and barbel, but could not get to club house in time to weigh-in.

STALYBRIDGE ANGLING SOCIETY.

On Saturday last one of the clubs in connection with the above society, The Waltonians, held at the house of Mr. John Duckworth, the Wharfe Tavern, Albert Square, met for the fourth contest of the season in the society's reserve, Ridgehill Lane, when some useful and ornamental prizes were competed for, but owing to a drizzling rain and strong wind the catches were not up to the average. One of the old anglers of the district, Mr. Wm. Sidebottom, officiated as weigher with his usual ability. After angling for one hour and a half, time was called, and they retired to their meeting house where the president, Mr. Wm. Thorpe, presented the prizes to the successful competitors as follows:—1st, copper kettle, William Jackson; 2nd, copper kettle, Samuel Greenwood; 3rd, knives and forks, Ellis Sidebottom; 4th, china, William Thorpe; 5th, china, Thomas Smalley; 6th, set of jugs, John Simmister; 7th, money prize, William Cobbe. The remainder of the evening was spent in singing and reciting by the members and their friends.—JAS. B. UDALE.

September 5.

STEPNEY ANGLING SOCIETY.

On Wednesday evening, the 31st of August, this society held their third annual dinner at their club house, the Beehive, Rhodeswell Road, Stepney, which proved very satisfactory to all concerned, an excellent repast being provided by the hostess, Mrs. Franklin. After the cloth was removed, the secretary read the balance sheet for the year, which showed a very respectable balance in hand. The club prizes were then presented to the following:—Mr. Pross, three prizes; Mr. Marrows, two prizes; Mr. Lees, two prizes; and Messrs. Morrish, Brock, Ruston, and Williams, one prize each. The remainder of the evening being devoted to harmony, both vocal and musical. Mr. Pross, of this club caught at Amberley on the 7th of August last a roach weighing 2 lb. 1 oz., which is now in the hands of Mr. W. Brock, in course of preservation, and will soon adorn the walls of the club room.—W. PEIRCE, secretary.

September 6.

THE STOKE NEWINGTON ANGLING SOCIETY.

We had but a poor show of fish on the 4th inst., Messrs. North and Morrow being the only members weighing-in, the former gentleman having, among others a nice roach weighing 1 lb. 1 oz. The monthly prizes for competition during the present month are as follows:—Mr. Thomas Millington gives a prize for the heaviest bream; Mr. E. Morrow gives a prize for the heaviest jack over 2 lb. weight. The same gentleman also gives a prize for the heaviest perch. Conditions: Only fish caught on Sunday to weigh; start when you like.—THOS. GRETTON, secretary.

September 6.

UNIVERSAL ANGLING ASSOCIATION (HULL).

On Monday last the members of this association had their annual excursion to Watter Priory, the country seat of C. H. Wilson, Esq., M.P., for Hull. On arriving at the Priory, the party were formed and taken in a group at the east-end of the large lake by Mr. Walker, photographic artist of Hull, in angling costume, after which ten prizes given in the association's fourth match of the season were competed for. Throughout the day the weather with much difficulty kept fine, but the water in the lake was muddy caused by the past heavy rains and small takes of fish were the rule. Several well-fed golden carp were taken, one scaling 3 lb. ½ oz., together with many bream and roach; and when angling

was discontinued at five o'clock, the respective weights were announced of the successful prize winners, and out of thirty-four the following were declared the lucky competitors—first prize, W. Phillipson; second, W. H. Barker; third, W. Crossland; fourth, J. Matthews; fifth, J. Milner; sixth, W. Hall; seventh, J. Jagger; eighth, H. J. Jackson; ninth, J. Connolly; and tenth prize, J. W. Walker, of Brigg. The total weight taken was 2 stone, 13 lb. 12 oz., and worms and gentles the most successful bait. On the match being over, the members were taken to the Priory where all sat down to a well-provided tea, and after doing full justice to the same, the thanks of the association were tendered by Mr. James Richardson, the president, to Mr. Wilson, for his repeated hospitality, and the party, after viewing the magnificent grounds of their leading patron, returned home, all being highly pleased with their day's outing.—W. H. BARKER, hon. sec.

Hull, Sept. 6, 1881.

WALTONIANS.

On September 4th the following gentlemen weighed-in:—Messrs. Good, jun., Greenfield, Waltham, best take 4 lb. 4½ oz., Rosser and Roland.—A. J. MARRIOTT.

September 6th.

WALWORTH WALTONIANS.

On Friday Mr. J. Collins out with J. Johnston junr., of Kingston, succeeded in getting a nice show of dace and roach, weighing about 9 lb., On the same evening the members met to decide finally as to where Messrs. Schwartz, Bansback, Vicary and Sebert's prize should be competed. The members met in a very strong number, among whom were Messrs. Dale, Irons, Brown, Vicary, Grigg, Collins, and many more. After various places had been proposed and lost, it was finally decided that Bourne End should be the place. Messrs. Grigg and Bayley, accompanied by Mr. Fox, will start to survey the neighbourhood on Saturday morning. Members wishing to start on Saturday can do so with this understanding, "that no fish will be weighed for these prizes that have been caught before a given time after the arrival of the first train from Paddington to Bourne End on Sunday morning." Mr. Bayley will meet those members, and their friends who arrive by that time at the station. Now, my friends, you will have to be up and doing pretty early on Sunday morning, for the train leaves Paddington at 8.20.

On the 4th Mr. F. Grigg fishing at Shepperton managed to get some chub, perch and roach from the bank.—PIXIE.

September 7., 1881.

WESTBOURNE PARK PISCATORIALS.

I went barbel fishing on Sunday with a friend, and caught three above Maidenhead Bridge. About half-past twelve some one in livery said, "Caught any fish?" "Yes, three barbel." "What size?" "Don't know weight; 2 measure about 13 inches, and 1 larger." "Are they in there?" "Yes." He then goes to the bag, takes out one, two, three, and throws them in the river. "What are you about?" "They don't measure 12 inches from eye to end of tail." "How do you know? why did you not measure them before throwing them in?" The largest would have measured near 15 inches extreme length, as my friend there, who landed it, can prove. We put it down to weigh 1¼ lb." In speaking of this matter at the hotel, I find the man, whom, I understand, is an assistant bailiff, is very much disliked about there; indeed, they threaten to do for him if he usually acts in such a disrespectful manner. He certainly deserves to be disliked. I should be sorry to injure him myself, as I like to see a man well up to his work in preserving the fish, and my fancy was rather tickled at his confounded impudence; but after the feeling I heard expressed about him, I should certainly advise him to be more particular about the manner in which he carries out his duties. The show of fish on Sunday was very small, the best fish being a barbel of 2 lb. 2 oz.—H. ADEANE.

CAPTURE OF A SNAKE.—Tuesday afternoon, the 6th inst., Mr. Wales, of the Royal Oak, Lowestoft, with a party, was fishing on Fritton Decoy, when a snake was observed making straight for the boat. One of the party struck the reptile on the back with an oar, and instantly hauled it into the boat. Though evidently injured by the blow, it was very lively, and exhibited its long sting until it was further disabled. Its length is 2 feet 11 inches and a little more than an inch in diameter in the thickest part. It is also prettily marked (striped).

CONVICTION OF POISONING FISH.—The practice of "fuddling," or poisoning trout streams has prevailed to such an extent in the West Riding of Yorkshire, that the Leeds Rockingham Angling Society have determined to take stringent measures, and if possible suppress the operations of the "gang" who indulge in this form of "sport." On Tuesday, August 30th, William Noble was brought before the West Riding magistrate, at the Leeds Town Hall, and charged with the above offence. Mr. Grisdale, solicitor to the society prosecuted and George Straytor, one of their watchers, proved that on the 20th of July the prisoner was taking fish out of a stream which had been poisoned, and which the society has the privilege of preserving and fishing. The sentence was £1 and costs, or 14 days, the prisoner electing to serve the time. We hope this will act as a warning. The Leeds Royal Angling Society, is determined at any cost to put down this nefarious practice and we trust their efforts will be attended with success.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing tackle shops in the world, and wholesale from Messrs. S. Alcock and Co., Standard Works, Kedditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedeon spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. Has been tried with remarkable success, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedeon fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

SEVERE LAWS RELATING TO THE TAKING OF UNDERSIZED SALMON.

THE Scotch in early times had some extremely severe prohibitions against the killing of salmon. In the *Regiam Magistatem* are preserved several laws relating to their fisheries, couched in terms expressive of the simplicity of the times.

From Saturday night (as still upon many British salmon rivers) until Monday morning, they were obliged to leave a free passage for the fish, which is styled the *Saterdayes sloppe*—Qy. stop? Alexander I. enacted "That the streame of the water sal be in all parts swa free, that ane swine of the age of three years, well feed, may turn himself within the stream round about, swa that his snout nor tail sal not touch the bank of the water." By a law of James IV., the third offence was made capital—before that the offender had power to redeem his life. "Slayers of reide fish, or smolts of salmon, the third time are punished with death; and sic like quha commands the samine to be done."

DO FISH SLEEP?—Our own familiar friends, the freshwater fishes, must surely sometimes sleep, like the rest of the world? But when do they take their rest? The very big fish—such, for instance, as that Newbury ten or a dozen pounder trout—(a prosperous holiday to him!)—might take his rest in peace whenever disposed for a siesta. Not even a five-and-twenty pound pike that the late Mr. Fielder, of St. Mary's Hill, once caught in the Kennet, or a modern kinsman equally big, would dare do a fall with a fish like the Newbury trout, whether the latter were asleep or wide awake. I daresay there have been more young ducks and green peas on Dr. Hooker's table at Kew this summer than for many a year. The smaller shoal fish—the roach, the dace, the gudgeon, and the pretty bleak, must have a fitful sleep, if they ever sleep at all, with one eye open at least. Or do the rank and file sleep in "companies," with sentinels all round to give the "danger-signal" when the enemy is approaching? Can eels (like cats) see best in the dark? Confusion to all of 'em except in the flying-pan or pie-dish!

Down with the pike that prowl about,
In search of the pretty spotted trout;
And the swans and eels that eat the spawn
As clean as a new-mown daisy lawn!

I have seen years ago in the country, a lot of little boys set the shop bell ringing by shaking the old fashioned half-hatch door, and bring the lollipop and

"parliament" and alicamipanic vendor hurrying out, and he'd do a "chevy," after the urchins. The dash of a fine trout, or big perch among a "school" of dace or minnows, produces the same sort of skedadling hither and thither over the scour. I fancy the prowling pike, on the contrary, singles out his victim—perhaps fascinates the latter with his basilisk "blinkers," and the struggle is then short, sharp, and very decisive. But the most cheeky of all fish is, I think, a 2 ounce perch collaring a full-sized minnow or a chub of like weight "going for" a whole "maiden" lobworm! I recollect once seeing an angl—no, not an angler! but say a "hedge" Cockney, pull out a 3 oz. jack, close to the "Old Sluice House Tavern," at Hornsey, (since demolished) and he seemed as proud as possible of his handiwork! Well, most things in this world go by comparison, odious though that often is. Perhaps by this time our Hedge Cockney has done even mightier things with his angle. It used to be thought a prize if an ounce dace or gudgeon were caught in the New River. Hence a three ounce jack was a jolly catch. Only just fancy the horrid surprise of a sleeping 4 lb. pike being assaulted with a felonious and cannibal intent by a fourteen pounder! Such things do happen, we know for certain. Still, drowsy, asleep, or wide-awake, our very dear friends, the trout, and our more numerous plebeian perch and roach, &c., when not half-poisoned by the filth from factories, enjoy life probably much about the same as human bipeds. They have their days of happiness mixed with vicissitudes, and often luck in escaping from their natural and unnatural enemies. It is said that only one herring can go down the throat of a whale at a time; it would be equally interesting to know the dimensions of a pike's throat—say a twenty-pounder—without "stretching."—THE PILGRIM FRY-ER.

"MR. BOATMAN," said a timid woman to the ferryman who was rowing her across a river, "are people ever lost in this river?" "Oh no, ma'am," he replied; "we always finds 'em again within a day or so."

"FOR daily blessing most men forget to pay their praises, but let not us, because it is a sacrifice so pleasing to Him that protects us, and gives us flowers, and showers, and stomach, and meat, and content, and leisure to go a fishing."
—Isaak Walton.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 47, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

1st AWARD MELBOURNE EXHIBITION, 1881.

DAY, SON AND HEWITT'S STOCKBREEDERS' MEDICINE CHEST.

FOR ALL DISORDERS IN HORSES, CATTLE, CALVES, SHEEP
AND LAMBS.

In this chest are the following matchless and world-renowned remedies, all that a Farmer can require to cure disease amongst his Stock and keep them in fine, healthy, and buoyant condition:—

"CHEMICAL EXTRACT," for Wounds, Swollen Udders, and Ewes Lambing.
"GASEOUS FLUID," for Colic, Scour, and Debility.
"RED DRENCH," for Cleansing Cows and Ewes, &c.
"RED PASTE BALLS," for Conditioning Horses.
"BRONCHOLINE," for Husk, Hoarse, or Cough.
"GASEODYNE," for Heaving or Paining.
"ALCOHOLIC ETHER," for Colds and Chills.
"CARMINATIVE CHALK," for Diarrhoea in Lambs and Calves.
Price of Chest, with "Key to Farriery," £2 10s. 6d., carriage paid. Each article can be had separately.
Patronised by Royalty, and used for over 40 years by the Leading Agriculturists of the British Empire.

CAUTION.—See that the Name of DAY, SON and HEWITT is on all Bottles and Packets.

DAY, SON AND HEWITT,
22, DORSET ST., BAKER ST., LONDON, W.,
AND WANTAGE, BERKS.

VOLUMES OF THE

FISHING GAZETTE

FOR 1878, 1879, AND 1880.

On receipt of P.O.O. for Twelve Shillings, we will send any of the above in handsome cloth cover.

N.B.—ONLY A FEW REMAIN UNSOLD.

Orders to be sent and to be made payable to R. B. MARSTON (at the Fleet Street P.O.),

FISHING GAZETTE OFFICE,
12, FETTER LANE, LONDON.

GREAT EASTERN RAILWAY.—SEA-SIDE.—The Summer Service of Fast Trains is now running to Yarmouth, Lowestoft, Walton-on-the-Naze, Weeley (for Clacton-on-Sea), Harwich, Dovercourt, Aldeburgh, Felixstowe, Southwold, Hunstanton and Cromer.

Two months', Fortnightly, and Friday or Saturday to Monday (First, Second and Third class) Tickets are issued by all trains to the above stations at reduced fares.

Broxbourne and Rye House every Sunday by any train before 3.30 p.m., and every week day by any train before 3.0 p.m. Fares: 3s. 6d., 2s. 6d., 1s. 6d.

For full particulars see hand bills and time-tables.

The Fishing Gazette.

SATURDAY, SEPTEMBER 17, 1881.

BARBEL-FISHING.

IN this letter I shall continue my remarks on the different methods of baiting barbel places, and will endeavour to show the cause so many fail to get the fish on the feed; and I hope the Trent anglers will not be offended at what I am about to say. I will first begin with a circumstance that occurred at Farndon, near Newark, which has always been noted for its barbel-fishing. Two

gentlemen had engaged me to go down with them, and they had previously sent down to a fisherman residing in that locality a good lot of cheese, scratching and worms, to bait three places; and when we got down to Farndon, the fisherman was there ready to take us down to the first swim. On our way one of the gentlemen said: "Now, Mr. Fisherman, what is your opinion of the day, and what sport are we likely to have?" He replied: "I expect you will make a great catch." Now the reader must understand that I was well acquainted with every barbel swim in this locality, and had taken a great number of fish at most of the places. We stopped first at the head of a weir, and our fisherman said: "I threw a pint of cheese in this spot yesterday morning, and you will have to fish with a plumb, or leger as the London anglers call it." "Well," I said, "if you have baited this place with cheese, I guess we shall not kill a single fish. A stream like this, running so fast and only 5 feet, was only suitable for worms." We, however, tried it for an hour without getting so much as a bite, and I proposed to move on to the next spot, and perhaps we should have better luck. When we got to the place, which was a deep and almost a still water, which I knew to be 12 feet deep, our fisherman said: "I put in this place a thousand of worms; and I know there are plenty of large barbel in this hole, if you can only persuade them to feed." I now began to feel a little angry, and could not help saying, "Then you have done another stupid thing. Why did you not put some scratching in this spot? We shall catch nothing here with worms, excepting perhaps a few eels;" which turned out to be so, and we quickly departed to the other place, and the fisherman said: "I gave them about two pounds of well-cooked scratching in this place and cut it very small." Now this was a swim eight feet deep, and the stream ran so fast, that I never could properly fish it with anything less than a good-sized cork float. I said: "Well, I suppose, the scratching you threw in yesterday morning is by this time down at Newark, for it never could possibly stop in a stream like this;" so, of course, there was another failure. Not even a bite did we get, so the gentlemen now seemed quite disgusted, and after giving the fisherman something we bid him good day. Now these are a few of the causes why barbel-fishers so often have blank days, and I can assure them that it matters not what sort of stuff you are going to employ, it will be perfectly useless unless you select the right sort of place. So much for the doings of a Trent fisherman, number one. The next good thing came off at Wilford, near to Nottingham, where one of our old anglers baited a noted barbel swim with three pints of cheese thrown in at three different times. There was no doubt any quantity of fish in the place, as the end will show. I had baited a place just above with worms, and was going to fish it next day, and when this angler came up after giving the fish the last lot of stuff, said: "I have baited in the willow bed below. There is a lot of fish in the place, so I have given them three pints of cheese. Don't you think I shall make a good catch?" "That," I answered, "is impossible for me to tell." On the following day I got the barbel well on the feed at worms, and when they began to slack biting, and the place required a rest for an hour, I went down to our friend below and asked him what sport? "Not a bite yet," he replied, "I expect they will come on to feed shortly." But they did not, for he only caught one barbel all day. He then gave them a few handfuls more cheese. The next day he fished the place with similar result, only one fish. He now gave the place up in disgust. I told him that if he did not intend fishing it again, I would have a turn at them with worms in the course of a couple of days. Which I did by first giving them eight hundred of worms, and for three days after the fish bit well, and during the time I succeeded in killing 140 lb.; so much for the doings of another Trent piscator. Of course the reader will easily guess the cause, which was simply he had overdone the place by throwing in too much cheese, which completely sickened the fish. A few remarks on fishing with scratching, then I will close this letter. Some three years ago there was a very old stale water on the Trent, and barbel would not look at worms. Several of us took to scratching fishing, which went off very well. I was at Barton, with about half a pound of scratching, well cooked, for the day. I fished the slack places on stone work, and used a tight float, the bait being stationary on the bottom, and after throwing in a small bit of stuff, could generally catch three or four fish at each place. While I was at this work, down came three Trent anglers, who, it seemed, had been observing what I had been doing in the distance. "What are you fishing with?" said one. "Scratching," I replied. "Can you spare us a bit, for we have only got worms?" "Yes, certainly," and give each as much as I could spare, and then retired, and happened to meet the same party on the following Saturday, fishing the places they had seen me at a few days before. I asked them what sport? "Not a fish," replied one, "and we baited these three places yesterday with a stone of scratching. I said, 'Good day, gentlemen.'" Now, by the overbaiting, this favourite length of mine was completely settled for the remaining part of the season. These were Trent anglers. In my next,

among other hints on barbel-fishing, I shall have a few remarks to make in answer to your correspondent, respecting the float and leger, and perhaps after he may change his opinion, and think differently as regards float fishing for barbel.

W. BAILEY.

PISCATORIAL OPERATIONS AT GRANTHAM.

A FEW days since, as two boys were fishing in the Grantham Canal, one of them managed to hook a big fish, which he succeeded, with the assistance of the other, in keeping on the line for some time, and there was every prospect of it being so well on they would be able to land it. The fish, however, as fish sometimes will, even with the best of anglers, broke away when hopes of landing it had arrived; and in its final effort left a portion of its jaw on the hook. It must have been a last attempt at release as the fish was picked up dead a day or two afterwards with a broken jaw, and proved to be a jack of about 17 lb. The fact of such a monster being hooked in the canal, proves the water, in its preservation by the Grantham Angling Association, to hold some good representatives of the finny tribe. Great praise is due to the executive of that society in its efforts to provide for the members some good sport, and that by a subscription which all classes can afford to pay, thereby debarring no angler in Grantham from joining it. On Monday next, under the auspices of this excellent association, the Eighth Annual Fishing Match is to take place in the canal for a series of prizes. The President, Earl Brownlow, contributes the highest prize of £2, and the society offers five others, varying in amounts from 5s. up to £1, whilst the tradesmen and others of Grantham also give a number of prizes. As the portion of the canal to be fished is some distance from the town, a boat is engaged to take the competitors at the uniform rate of 1s. 6d. each, which includes the journey and the entry requisite to compete. There can be no doubt, with the encouragement thus afforded, the match, as regards numbers, will be a successful one, as some ten days previous to the time, over sixty tickets had been sold, and all that appeared to be wanted was a favourable day and a good condition of water. The efforts of Mr. W. George Ogden, as the secretary of the association, in making its work both popular and effective, is entitled to high commendation, and at a time when the angling interests need careful protection. The number of anglers are now so largely on the increase, it can only be hoped that those who have the means of supporting the association, whether anglers or not, will do so. The object is a truly philanthropic one, and should be generally recognised and encouraged; and when gentlemen can be found who will, as members of a committee, effectively conduct its operations, the general public should freely accept their claims for support. The Grantham Angling Association, by its example and efforts to obtain permission to fish, evidences what can be done in other places, not merely in providing sport for the anglers, but in the protection of the water under management from unsportsmanlike practices. The canal itself abounds with a variety of fish, and is one of those places where the working of the Freshwater Fishery Act of 1878 has proved a great benefit, as, previous to the passing of that Bill, there was nothing to prevent the anglers from fishing all the year except by arrangement. The Act was freely accepted by the Association as of necessary importance in giving rest to the fish during a recognised close period. The time will come when the Act will either be improved or superseded by one of a more complete character—including amongst other essentials in the preservation of the scaly family—the adoption of a uniform measurement of the various kinds of fish, thereby checking the disgraceful slaughter of the innocents which exists in different parts of the country where no angling associations are in existence to discourage the evil; and there can be no doubt such associations, in addition to the successful one at Grantham, would become more eminently useful by possessing an Act of Parliament which would make the taking of unsizeable fish a punishable offence. I am now on a visit in Lincolnshire to work out some piscatorial intelligence for the benefit of my brother anglers; but an opportunity was afforded me of witnessing a day's shooting near to Grantham, which I accepted, as most of my angling friends are good shots as well as skilful piscators. There were three guns in operation, which were used by Mr. Fred Burdett, Mr. Joseph Tyrell and Mr. Clixby, and the result forty-three hares, 30½ brace of splendid birds and nine rabbits. I have seen several good days' shooting in my time, but I never remember witnessing a prettier days sport, and only about 200 acres of the land was shot over. The birds were all young ones, and there were instances when over thirty got up at once. I am sure the readers of the FISHING GAZETTE will excuse the digression I have made in placing upon record so glorious a result.

B.

DINSDALE ON TEES.

No. II.

THE omission of a comma between the words salmon, grilse, &c., in the article last week would convey the impression that mature fish were not caught here on August 31; but this was by no means the case. No fish is here called a salmon unless it exceeds 7 lb.; all below this are called grilse, whether they are actually on their first matrimonial tour or not. In the course of the day referred to, about a third of the fish taken counted as salmon, and half as grilse; the remaining sixth were made up of bull trout and salmon trout. Grilse were never observed during recent years to be so plentiful as they are this autumn, which augurs well for the future prospects of the river.

The weir, or dam, is said to have been built by Emerson, a great mathematician and engineer in the early part of last century; several previous ones had been swept away, but he had observed the manner in which beavers invariably construct their dams, and his work, built upon the same plan, has stood for 150 years. One can wade along the top (when the stream is not too strong), and admire the strength of the fabric, consisting as it does of huge stones 4 or 5 feet long and 2 feet broad, clamped together with iron and lead in the old Roman style. When a fish gains the top he stops a moment as if to collect his thoughts, then a satisfied wag of his tail sends him on into the deep water above. In former days, that is to say, before the passing of the recent salmon Acts, there was a "fish lock" at each end of the dam, where the simple closing of a pair of lock-gates imprisoned all unfortunate fish who tried to discover a roundabout passage; or, tired with unsuccessful attempts at charging the cataract, sought for repose in the quiet of a treacherous side-eddy, instead of wisely falling back to recruit their strength in the safer waters of the lower parts of the pool. This arrangement, of course, enabled the owner of the fishery to secure at least double the number of fish at no trouble or expense at all beyond that of taking them out.

On September 1, the nets were off, and the angler's heart throbbed with eager hope, but alas! the water continued thick and muddy for two more days, from the turbid water brought in by the Skirm, above Croft, about which the heaviest rains had fallen. On Saturday, September 3, the keeper still shook his head at the colour, but thought there was no harm trying. The pool below the falls is about 300 yards in length, divided into the basins by a narrow but deep channel where I felt sure that there was the best chance of a fish. On the right, or Yorkshire bank, a perpendicular cliff of reddish rock, much over-grown with trees rises to about 100 feet; under this the fish mostly lie, and the nearer you can reach the foot of the rock with your fly the better. Every angler begins at the top of the pool, as close to the weir as he likes to go; it is no use fishing off the weir, as the fish are there so eager about getting up that all such inferior desires as feeding or playing are far from their minds. It would not be difficult, however, to hook one fish if you were poachingly inclined; and if a fish chooses to take your fly with his tail or back fin, many people might say it was not your fault.

I was, on that morning, the third angler on the water, and I had followed my predecessors as far as the deep channel before any signs of life had been felt at the end of any of our lines. Here I fished as slowly as possible, making my fly hang, as well as the stream permitted, over every foot of ground. A vigorous and hearty tug soon rewarded this policy, followed not by the delightful whirr of the reel, the sweetest of all music, but by the sickening knowledge that "he was off." The barb of my fly was gone! (Mem.: Examine your fly frequently if there is a bed of shingle behind you. My own fault losing him. I ought to have heard the fly strike the stones.) Well, it is no use crying over spilt milk or bewailing a lost fish, and I do not believe he can warn his brothers and sisters as a perch can; and whether a keen appetite, or a playful humour, or an irritable temper, had prompted him to seize my fly, there are doubtless others in the neighbourhood in a similar frame of mind. And as it proved; for within five minutes I was enjoying the highest human happiness—the delirious joy of fighting with a vigorous fish well hooked. The ice once broken, the game proceeded merrily. By luncheon time I had also landed his brother, and before we left off, from failing light, ten beautiful grilse had left the pool in a manner they had scarcely anticipated upon entering it.

On Monday morning the river was in flood again, and again continued thick for three days. On Thursday seven grilse were taken by two rods. On Friday the river was again turbid, and I was obliged to end my visit to this charming spot.

It struck me as curious that, of 17 fish, taken in the two days, and certainly quite 13 more lost, making not less than 30 rises, every one should have been a grilse, and not a single large fish have taken the fly, though there were any number of twelve to twenty-four pounders leaping at the falls. Is it that, like chil-

dren or puppies, the younger fish also are more inclined to play with whatever attracts their notice, and more easily beguiled to their destruction by a very slight temptation? Another puzzle: whereas on the first day I took all my fish in the narrow and deep channel above described, on the second day not a single fish was hooked there, but every one quite at the top of the pool. There must have been some cause for this.

C. C. J.

A FEW DAYS AT HICKLING BROAD.

"COME out, 'tis now September"—and we came out, but the bream wouldn't. Still, the rudd did, and though not the quarry we meant to seek, a rudd of 2 lb. or so is a formidable rival to the biggest pair of bellows, and, in my opinion, much better sport.

To come to details, it will be best to confess at once that as a bream-slaying expedition, our trip was a failure; only one little one being hooked by anyone, as far as we could learn, during our visit.

This one fell to the rod of my pupil in the gentle art, and did not tend to make him in love with bream, for it was about as lively as a toad, and weighed $\frac{1}{2}$ lb.!

Perhaps September is late for bream. They were feeding well in August, bushels or "skips" of them having been brought in and buried within a few days of our arrival.

It was on September 1st that we began, and the weather, it will be remembered, was very rough. As soon as we found what we might expect in the bream holes, we started for the sound leading into Hickling Broad, and, having found a sheltered, though shallow spot, tried once more. After taking a good perch or two, and some of the inevitable roachlings which will hang on the biggest of lobworms in the Norfolk Broads, I hooked something which seemed like a lively bream, but gleams of gold and scarlet soon showed what it was. This was indeed, an improvement. But our glee was transient, as, after a turn or two, the hold gave way. Soon fortune smiled again, and we had a warm ten minutes, taking three or four rudd in rapid succession—all good fish, from 1 to 2 lb. each, besides losing others. Then came a lull, and, looking round, we noticed that, in spite of the waves, the rudd could be seen rising at some ground bait which had floated away. Pulling up our anchor, we drifted towards the fish, and, fishing very shallow, secured several more, the largest just 2 lb. The weather getting, if possible, worse (so much so, in fact, as to be dangerous to our racketty boat), and little perch taking the place of the rudd, we started for the row back to Martham, and reached our comfortable quarters at Mrs. Dove's, Loxwood Villa, close to Martham station, in good time for the substantial meal that awaited us.

The next day was a repetition of Thursday, excepting that, knowing the spot, we got more fish, and that my hopeful pupil extinguished me (it is a way he has) by taking a rudd of 2 lb. 10 oz. or over, which was landed, by the way, with the remains of my umbrella. This fish has been sent to Price's, Euston Square, to be preserved.

On Saturday the weather improved much, but the fishing didn't, quite the reverse, in fact. We rowed into the Broad itself this time, some two or three miles, and tried in the centre, the wind having gone down; but it was of no use, and what fish we took (about sixty) were from the Sound. This was our worst day, nothing being taken much over $\frac{1}{2}$ lb.

On Sunday we went to the fine old parish church, and on Monday had a long day to finish up with, resulting in the capture of 120 fish, chiefly rudd, ranging from 1 lb. 2 oz. to $\frac{1}{2}$ oz.—of course we returned the same fish. The method by which we had best sport is worth mentioning. Finding the rudd were all near the surface, we threw out pieces of crust, and watching the rises, cast the bait at the fish as it were, only allowing about 10 inches of depth, and using fine tackle and paste. Sometimes, for a quarter of an hour together, this plan would bring a good rudd to boat at every cast. I tried artificial fly also with some success, but discontinued it finding it took small fish only. Nottingham tackle would have been very effective. Perhaps some of your readers will try it and inform you of the result.

There is plenty of room at our lodging, which was cheap as well as comfortable, the three rooms for five days coming to exactly the same as our night's lodging and board at the Two Bears, Yarmouth.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

THE "DERBY KILLER."

SOME reader of the GAZETTE asked the other day for a good spinning bait; their name is legion, and yet we thought we had seen most of them. The other day on the Dove, near Ilam, we had the pleasure of seeing Mr. John Bullock, of Firs Cottage, Burton Road, Derby, spin the bait called the "Derby Killer," which he makes, and sells, and uses. Our readers are well acquainted with the capital descriptions Mr. W. J. Bullock has given in this paper of his methods of spinning the natural minnow. We should very much like to see these two expert anglers fish a match—Mr. W. J. B. in his style, and Mr. J. B. in his. Only it would have to be some stream where the natural bait is allowed, which is not the case on the Dove. Mr. John Bullock is a perfect master of the style he likes best. He uses a stout bamboo spinning rod, with upright rings, and a fine sixteen-plait silk line, his bait is one of his own "Derby Killers," which he uses without trace—simply fastening his reel line to the single swivel which is placed on the gut a foot from the head of minnow. His objection to having to swivel at the head of the bait, is that it gets "across" sometimes and causes the bait to wobble. The "Derby Killer" is an attractive looking minnow made of gutta-percha—leaded—and it spins magnificently, the fins which turn it being similar to those of a good "Devon." Although he was not wading, and the water was clear as crystal, Mr. Bullock got five brace of nice trout. Large grayling are frequently killed with this bait. Mr. Bullock can throw it to any spot with wonderful precision. We saw him, standing on a high bank, with trees over and round him, send his bait beautifully 25 yards across the river and kill a trout which had been rising on the opposite shallows. Mr. B. makes the bait in all sizes, and we can advise our readers to make a note of his address.

THE BELHUS HUNTERS.

IN our issue of the 3rd of September, we called the attention of those of our readers—and they are by no means an inconsiderable or unimportant number—who combine hunting with angling pursuits, to the approaching sale of the Belhus hunters. The annual sale which Sir Thomas Barrett Lennard, Bart., has now carried on for the past six years, may fairly be classed as one of the most important gatherings which the revolving cycle brings together; and the hunters which are dispersed at the yearly sale can certainly lay claim to be some of the cleverest and most splendid hunters to be found in the length and breadth of the United Kingdom. The well-known judgment of the worthy owner of Belhus, together with the great care and discrimination he evinces in purchasing the hunters which are dispersed at the annual sale, have had the effect of attracting buyers from all parts, abroad as well as at home. In our advertising columns, this week, will be found the catalogue of this important sale, and the full details of the forty first-class hunters which Sir T. Barrett Lennard offers for public competition, under the hammer of Mr. Tattersall, *without reserve*, on Thursday next. Any one in want of a good hunter, and with money enough to purchase, cannot do better than make a selection here. The forty hunters catalogued are certainly a splendid lot, indeed it would be hard to find their equal. They comprise some magnificent specimens of the weight-carrying hunter, and there are few finer animals than De Merrimac, Kilconnell, C. B., Lismore, and the Brigadier. The sale is set down to commence at one o'clock; and we may mention that there are two ways of getting from London to Belhus, namely, by the 10.50 train from Fenchurch Street Station to Rainham, which is four miles from Belhus, or by the 10.30 special train from St. Pancras Station, which will return from Rainham Station at seven o'clock p.m.

CLUB AND OTHER JOTTINGS.

By L. B.

FROM Chertsey, a note comes from Haslett, the fisherman, that the wind has been back in its old quarter, due north, and that the fish have been right off the feed, barbel particularly so. He adds, "You may judge of this for yourself from the fact that three days' fishing with Mr. Abrahams, in three well-baited swims only produced five barbel, one chub, four perch, and three dozen of good roach and dace; however, the weather has turned a little warmer, and to-morrow (Wednesday and Thursday), I am going in for bream, and, I think, I shall get them." Messrs. Geen and Hoole, at Penton Hook, on Thursday, fared, if anything, worse; Mr. Geen just saving the dreaded blank by a brace, one barbel, and one roach.

All last week the sport was brisk at Elstree, but on Saturday the wind shifted, and on Sunday very few tench were killed. All

the punts and boats were engaged, and many were disappointed. Messrs. Humphries and Pearce, fishing together, succeeded in getting about 40 lb. of jack. Messrs. Marshall and Aldis got, the former a handsome well-fed jack of close upon 6 lb., and a brace of good tench; the latter, a couple of pretty jack and a small tench, the jack were feeding very fairly, and many takes were had of which I could not get particulars.

Re the 19 lb. trout. In answer to Mr. A. Jardine's remarks, I wish to state that I never wrote in my notes that the fish was "weighed-in" at the Gresham Angling Society, though I said it was weighed; and in this I still presume I was right. Indeed, it is almost impossible to imagine so grand a fish shown at an angling society without being tenderly, almost reverently placed into the scale while a group of eager piscators throng round watching the process of piling on the blocks of metal, until, amid a buzz and notes of admiration, the exact weight avoirdupois of the beautiful deceased is ascertained.

Until I saw Mr. Jardine's letter, I was in hopes it might still have turned out a Thames trout taken spinning as reported in *The Daily Telegraph*. Had it fallen to Mr. Jardine's rod, I assure that gentleman that among the many who would have congratulated him, none would have done so more sincerely and heartily than the writer of these notes.

From Goring, under the woods, the capture of a 16 lb. pike is reported. While from the Arun, Mr. A. Gunston, of The Brothers Well Met, is to be credited with the capture of a handsome roach 1 lb. 12 oz.

Complaints have been made by anglers that they pay in the requisite amount to the secretary of their society, entitling them to membership in the Anglers' Benevolent Society, but that weeks, and in some cases even months, elapse before such amounts are forwarded to the general secretary, Mr. R. Ghurney. Now this delay arises, in many cases, from a most excusable desire on the secretaries' parts to get a good batch of names and send them all at once; but by doing this they may unwittingly wrong their fellow members, as no angler is considered a member, or can be entitled to benefits in case he requires such, unless his name is on the general secretary's books or he holds one of the printed receipts, books of which are issued only to the working committee of the society who are thus able to enrol anglers at any time or place, providing they know them as members of a society. I sincerely trust secretaries will act upon my well-intentioned hint, and in justice to their members send in the names and money of those desirous of joining, as they get them. I may add that I shall be very pleased, if any secretary wishes it, and will drop me a line to the address beneath my signature on each privilege card, to run up to his society on a meeting night, and save him all the trouble of writing, forwarding cash, &c., by enrolling as many of his members as wish, there and then, and giving them printed receipt at time.

A STOCK OF FINE GUT.

CALLING on Mr. Gillett, of 40, Fetter Lane, a few days ago, he showed us part of his stock of gut. He has over five hundred pounds' worth, and some of it is as fine in quality as any we have seen for a long time. He has also got some very good rods, which he will sell cheap, as they are old stock, and of course so much the more real value, as being thoroughly seasoned.

FISHING IN THE HIGHLANDS.

MR. BULLOCK'S interesting article on "The Salmon and his Capture" which appeared in your issue of the 13th ult., has struck a chord in one who is a keener than he is an accomplished angler. Of course, I take it that the fact of a man being a Highlander and resident in the Highlands will not operate against his prospects of having an article inserted, on angling, in the *FISHING GAZETTE*. Mr. Bullock speaks of the longing eyes of the angler who looks in at Grove's or Towell's windows and sees the noble *salmo salar* of great weight and fine proportions these exhibit; but for my part, and I am devoted to angling until I get a day at the grouse, give me a look at the beautifully finished flies of Messrs. Snowie (sons of the late famous Hugh Snowie), of Inverness, or those of Mr. Hugh Morrison, Dingwall, and my imagination can picture a beautiful half dozen of grilse or salmon lying stretched on the green grass or the purple heather which is found on the banks of the Inver and Kirkaig rivers in Sutherlandshire. Yes, sir, to one who has done—done it so lately as the 30th ult. on the Inver—the landing of six good, lively fish on a bright summer's day is an achievement to make his "mouth water" in all time to come, until he can do a greater feat and land seven, and it is an ambition worthy of a worthier man. There are flies and flies. You may get beauties to look at

and pay half-a-crown or three and sixpence each for them, but the chances are that you will not get salmon with them; although, truth to say, when fish are in humour to take they will almost go for anything. Yet, after all, there is something in character, and a name is good for something even while allowance is duly made for the rose which would smell as sweetly if known by some other cognomen. For instance, I would back Mr. T. B. Snowie's "Highlander," in the evening on the Kirkaig to beat any fly whatever, but for a lure that deserves its name, let the river be in what state it chooses provided the size of the hook is properly regarded, the "butcher" is the executioner—the very Calcraft of the river.

The "black doctor" is a charmingly effective fly, and the "Jock Scot" is a universal killer. Some good anglers stick up for the "dusty miller," and I vote for the "captain"—such a captain as was made and supplied to me by John Smith, keeper to Mr. Whitbread, M.P. Smith is quite an amateur fly maker, but he is a proficient angler, and I got three salmon in less than an hour with a "captain" made by him. The Hon. C. H. Erskine, who is an accomplished and an indefatigable angler, did most execution this season with a "black doctor," but Mr. Hely Almond, of Lovett's Public School—a grand institution—the Eton, Harrow, Rugby, or Winchester of Scotland—goes for the "dusty miller"—and he is (not the "miller" but Mr. Almond plying him with his equally famous "man," Johnnie McLeod, beside him) not to be beat by any angler in all Sutherland, which is the crack angling county of Scotland. Lochinver is the angling capital of that county and it is remarkably good fun meeting at night in the smoking room of the Culag Hotel, there to fight the battles piscatorial of the day o'er again, surrounded by a choice crowd of sportsmen who have a ducal library—a most valuable one, too—at arm's length, or within arms' reach of them, to settle knotty points withal. I say, lolling at one's full length and taking it easy in the late hours, and discussing this "rush," that "rise," and the other difficult "landing;" then Rorie Grant did this; Tom Burd did that; Johnnie "Louie," or Munro Kerr, or Johnnie "Logie," or Davie McLeod, or Norman, or "Big John," or big "Murdoch," did the other clever thing in gaffing or following a fish. It is not often easy to do the latter in rough ground such as is met with on some parts of the Inver and Kirkaig; and it is little to say that the Chief Commissioner of His Grace the Duke of Sutherland—that distinguished general, Sir Arnold Kenball—has not time to notice representations courteously made to him regarding the paths on the banks of the famous streams named.

Any one known to use the worm in angling for salmon would be sent to Coventry at once in the Highlands; but it is suspected that not a few do occasionally commit the atrocity when "shades of even are closing o'er" them, and their baskets are empty. I cannot believe that such a method is pursued openly in any country, but the temptation is admittedly great when fish are seen amusing themselves in crowds, and yet will not look at your fly. My friend, little Grant, or Tom Burd, say, would as soon think of hooking his grandmother with the gaff as attempting to get a salmon with a "scoured worm—Mac's fly." Since leaving Lochinver on the 10th inst., I learn that very fair success has attended anglers there. Up to the 17th inst. the following are among the results:—Mr. Morecroft, two salmon; Major Smith, Shropshire Yeomanry, one; and Mr. Almond one on the Kirkaig on 11th inst.; 12th, Col. Pretymann, late 60th Rifles, a grilse; and Mr. Earp, the Grove, Derby, three salmon, one a 12 lb. fish on Kirkaig. 13th, Capt. Burstall, late 60th Rifles, two salmon on the Inver, 9 and 7 lb.; and Mr. Almond, three, 7, 10, 14 lb.; Major Tickle, 28 lb. trout on Loch Fewn, and a 6½ lb. grilse. 15th, Mr. Earp, a grilse; Capt. Sconce, a salmon of 11½ lb. on upper Inver; Capt. Burstall, three grilse; and Mr. Almond, two salmon aggregating 13 lb. 16th, the latter gentleman, two salmon, 10 and 7 lb.; and Capt. Burstall, who is a most indefatigable and excellent angler, had a 10 lb. salmon and a sea trout on the Kirkaig. Tom Burd with him, as the lawyers say! When salmon are being got, one does not stop to notice even first-rate baskets of trout, and such have been here omitted for fear of encroaching too much on your space.

The most extraordinary achievement of the season was that of Mr. William Neill, of Leeds, who went to the Kirkaig on a very unpropitious day with some very cheap flies, and a common tanned fisherman's line, &c., yet he landed two salmon of 9 and 8 lb. respectively.

The rivers were in heavy flood during the week, and consequently "dirty" as well, so that fishing was done under difficulties.

If you go to Lochinver, Mr. Editor, I can recommend a drink for the after dinner hours, which is superior—immeasurably so—to brandy and soda, whisky and cold water, or even toddy. Ask for a bottle of ginger ale and insinuate into it a glass of good Ord, or Clynelish whisky, and if you don't say it is *As you deserve to*

be a T.T., and thus not merit good liquor being spilt and spoilt on you.

As regards the scenery of the district, I think it can be frankly declared to be insurpassable in this mountain land. The drive along the northern bank of Loch Assynt commands a view of remarkable beauty and grandeur. There are two fine hotels at Lochinver, the Culag, until last year a seat of the Duke of Sutherland—and the Lochinver, a house of well-established fame.

CAMPBELL ROSS.

UNITED LONDON ANGLERS' CENTRAL COMMITTEE.

THE annual dinner of the delegates and honorary bailiffs of the River Lea in connection with the Central Committee, took place on Sunday last, September 11th, at the Rye House. Three valuable prizes, given by the president of the Kenton Angling Society, and one by Mr. M. Fowler, of the Sir Hugh Myddleton, were competed for by arrangement. On the arrival of the train about 10 o'clock the delegates and bailiffs mustered in the Rye House Gardens, and shortly afterwards they were formed into a group and a photograph of all present was taken. At 10.30 time was called to commence angling, the following being the conditions:—The boundary, the Rye House Fishery, with the exception of the meadow side from the bridge up stream; all fish to be weighed in accordance with the River Lea bye-laws; and prizes to be taken by the first four heaviest weights of any fish (except bleak, eels and gudgeon). At five o'clock sharp the anglers mustered in the garden to weigh; the chairman, Mr. S. Morgan, weighed the fish, the secretary, Mr. G. Ghurney, officiating at the book. Unfortunately, there were only four persons who had fish that were eligible to weigh, the result being:—Mr. W. Allen, Bermondsey Brothers, first prize, one jack; Mr. C. Walken, Norton Folgate, second prize, one perch; Mr. W. High, Alexandra, and Mr. C. A. Metcalf, Amicable Brothers, dead heat for third and fourth prizes with roach. The water was very bright, otherwise the day seemed very favourable. At 5.15 the bell rang for the company to muster at the dinner table, which was very soon responded to. The swims being well baited, business soon commenced. At the termination, after the waiters had been cared for, Mr. Teale was summoned to the room, and a unanimous vote of thanks was passed for the way that he placed the dinner on the table.

The first toast was proposed by the Chairman, "Success to the United London Anglers' Central Committee," coupled with the health of the Secretary, which was responded to by Mr. R. Ghurney by a few brief remarks on the present prosperous condition of the committee, and thanking the delegates and bailiffs for the kindness and courtesy always shown by them towards him in all transactions connected with the Central Committee.

The second toast, proposed by Mr. R. Murphy in a very appropriate speech, was "Success to the West Central Association of London and Provincial Angling Societies," responded to by Mr. W. H. Beckett, the vice-chairman of the Association, in which he expressed the great pleasure he felt in the amicable and friendly way in which the Association and the Central Committee were working together for the one great object—the benefit of the London and provincial anglers.

The third toast, proposed by Mr. Letch, of the Little Independent Angling Society, "Success to the Central Association," was very appropriately responded to by Mr. M. Phillips, of the Great Northern Brothers, in which he explained the flourishing condition of the Association, and that he was convinced that the time had arrived when the Central Committee and the two Associations would work for the general benefit of the angling fraternity, and that their interests were the same, and that he was sure there was no ill-feeling on the part of the Central Association towards either the committee or the West Central Association.

The fourth toast, proposed by Mr. Manning, of the Izaak Walton Angling Society, "The health of Mr. J. F. White, President of the Kenton Angling Society," for his generosity towards them that day. Mr. White, in reply, stated that it gave him very great pleasure in being in company of so many anglers and friends of anglers as the delegates were. They were very welcome for anything that he could do to enhance their pleasure and sport, and hoped next year to have the pleasure of acting in a similar way.

The last toast, "Health and Success to the Honorary Bailiffs of the River Lea," duly responded to by Mr. G. Oram, in which he thanked the committee for their kindness and consideration towards himself and his brother bailiffs, and they would do all in their power, as they had done before, to protect the river day or night.

The meeting then broke up, it now being close on seven o'clock, and many wishing to catch the 7.20 p.m. train to reach their club rooms to give an account of their pleasant day's outing.

Thirty-four sat down to dinner. The following delegates and bailiffs were present:—S. Morgan and R. Ghurney, chairman and secretary; J. Bunn (the Dalston), C. J. Miller (Hearts of Oak), G. Manning (Izaak Walton), Letch (Little Independent), W. Phillips (Great Northern Brothers), M. Allen (Bermondsey Brothers), J. Aldridge (Hoxton Brothers), J. T. Cundall (Alliance), C. A. Medcalf (Amicable Brothers), Chambers (Cavendish), Brookman (Stoke Newington), Peirce (Stepney), Hearn (Burdett), R. Breedon (Sociable Brothers), F. Bates (Bridgewater Brothers), W. Jones (North Eastern), D. G. Munro (Edmonton and Tottenham), G. Moore (Never Frets), C. Walker (Norton Folgate), J. Huntley (Kenton), R. Murphy (Good Intent), W. H. Beckett, vice president (West Central Association), W. Fowler (Sir Hugh Myddleton). The following bailiffs were

also present:—Messrs. G. Oram, W. High, F. Scott, J. G. Baylee, and W. Bick. There were also present, J. F. White and C. Donne (president and secretary, Kenton Angling Society), W. Sully (Great Northern Brothers), Mr. Henwood (North Eastern), Mr. T. Feetcham (Metropolitan Angling Society) was absent through illness.

SMACKOWNERS, FISH-DEALERS, AND BILLINGSGATE.

FINDING you have devoted considerable space to the interests of fish, fish-dealers, and Billingsgate, in your valuable paper, would you kindly allow me, as an old Billingsgatonian, to venture a few remarks, although, perhaps, the remarks I am about to make will not meet with the views of many concerned in the fish supply of the great metropolis? But all I wish is merely to show how I evade the trouble and expense of patronising Billingsgate at all. Old Billingsgate is within my recollection, long before the waterside was reclaimed and added to the then so-called New Market. The old portion has been remodelled and improved several times since; also the building of the Coal Exchange, and the poor fellow falling through from the skylight roof on to the tessellated pavement below; and the inadequate room and talk there was then for vehicles, not excepting the costers' barrows from the New Cut and Whitechapel, which were there by hundreds. Also the old man called "Paul Pry," who used to look after the vans and carts belonging to the dealers from the surrounding suburbs; also the narrow, dingy, dirty Darkhouse Lane, where such names as Stevenson, Russell, Foxall, and many others, used to carry on extensive trades in their dismal shed-like shops. Soles were sold at this time by the basket, called a bushel, heaped up, and called cauliflower tods; this was, in my opinion, the forerunner of the present short supply of what was then called the fishmongers' friend (soles), they being had all the year round. These baskets used to contain innumerable quantities of small soles, called slips and tongues, and great were the dissensions then as to their smallness; the best judges used to go in for the lightest baskets (as they held the largest fish), the heavier baskets being closely packed with smaller, thus the heavier weight. At this time, also, the coal bunkers and lockers at the public-houses—which were boxes made under the settles and elsewhere, and used by the bobbbers for putting their overalls in from morning to morning—were used as receptacles for the contents of the fishermen's and boys' boots, who used, when they came ashore, to thrust two or three pairs of soles, fine ones, too, into them, and relieve themselves by placing them in these places; then, standing at the bar, await a customer—of which there were not a few—would show them privately, complete a sale, and then, if possible, replenish the boots again. I have seen shoulders of mutton sold for 3d. per lb., and thighs of mutton for 5d. per lb. in the same way. I could say on, but sufficient has been said to show that Billingsgate has been known to me for a number of years. Now to the question, "Smack-owners and fish-dealers." For some few years past Billingsgate to me has been but very little known, as a source from which my supply has been procured, and of which I am not an isolated member, as many others doing immense trades have done so for many years—and whereby such expensive items as horses, carts or vans, servants and stabling for market purposes are entirely done away with; also the portage (or bobbing) for conveying the fish from the market to the purchasers' conveyance. I have paid myself as much as 20s. a morning for such. Many tradesmen pay considerably more, which amounts to something considerable during the year. I presume that it is not generally known—therefore some advantage and benefit may accrue by making it so—that at most of our fishing stations, viz., from Cornwall, Plymouth, Torbay, as far as Grimsby, and even to Wick, immense quantities of fish are sold to buyers from London, Manchester, Birmingham, &c., and even France. But there are smack owners who reserve and provide for customers supplied by them direct (before either of the above buyers can purchase) and from whom you can depend for a regular and plentiful supply of the finest and choicest of the catches, at such prices that would astonish the retail dealers of London, &c., because you have them direct from the smack owners; the best of the best sent off forthwith. No waiting for truckloads to be made up, no three or four days' delay, no commission to pay, no market expenses, no wear and tear of rolling stock. Simply the carriage to pay, and a trifle on returning each bundle of empties, kits or boxes; and the expenses paid for portage or bobbing alone at Billingsgate would go some considerable distance in defraying the above carriage. I am afraid that I have already encroached too much upon your valuable space, but should any further knowledge be required I shall feel great pleasure in answering. With regard to Billingsgate market being retained, most certainly retain it for the benefit of all whom it may concern. But when, or, rather, before, the Coal Exchange was built was the time the extra convenience, &c., should have been made; but as it is, in my opinion, only merely a matter of traffic, and if that portion of the ground facing the Custom House, or the whole site, if possible, could be secured, the water frontage would be most convenient. There would be less destruction of fish than there usually is by rail, more room for quicker delivery from the railway vans, and also a sharper sale in the market, and then old Billingsgate will stand as, and before all others, the proper and only site required even now for the metropolitan fish market.

—FRANK GOSDEN, Exeter.

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

RIVER REPORTS.

MID-THAMES.

(BY TELEGRAPH.)

River seemingly in grand condition for summer fishing, but most fish are dead off, perch affording best sport. Weather simply delightful.

Thames (Goring).

Water here very low and clear; in good order for jack and perch. Prospects look better for fine weather; jack and perch biting very well. I was out for six days with a gentleman and lady. Took about 40 lb. of jack and perch. Best day was on Saturday, 23 lb. of jack. Monday, with a gentleman, some good perch. Tuesday, three jack going 16 lb.—JOHN RUSH.

Thames (Halliford).

Owing to the river being so very low and bright the fishing during the last week has been very bad. Different gentlemen, fishing with me four days, had takes as follows:—First day, Mr. T. Abbott, one barbel, two chub, three roach and a perch (ledgering); second day, Mr. Long, five barbel, four perch, one chub, and one dozen and a half of roach (ledgering); third day, Mr. Field, one barbel, two dace, one chub and two perch (ledgering); fourth day, Mr. Palmer, two barbel, two chub, three dace, one roach and an eel (ledgering).—GEORGE ROSEWELL.

Thames (Kingston).

The water is low and bright, so wants careful fishing; should the weather keep fine perch, roach, jack, in fact, all sorts of fish, ought to feed if properly fished for. This has been an unfortunate week, one large carp lost from the bank after 20 minutes' play, 80 yards of line, one from the punt, after having him about the same time, the hook gave way. Best day, 8 barbel best 6 lb. broke 4 times, they will hold them with the fine tackle. A private boat of jack 6 lb., and a barbel 4½ lb. with artificial bait. I got some nice perch, and the gudgeons are now on the feed, and a few nice roach have been had from the bank.—JOHN JOHNSON.

Thames (Richmond).

The water a little bright, but in good fishing order. The sport during the last fortnight has not been at all up to the average for Richmond, as is always the case at this particular time of year. The fish have taken to feed a little better to-day, and I think there will be an improvement during the coming week. The sport has ranged from 3 to 5 doz. roach and dace each day. Mansel and Brain have been getting a few perch and barbel. All the punts have been out every day; some days there has not been enough for the demand there has been.—JOHN BUSHNELL.

Thames (Shepperton and Weybridge).

The water is very low and bright. Prospects of fishing not quite so good as they were last week. H. Purdue, three days, eleven dozen roach and gudgeon and two jack weighing 4½ lb.; fourth day, 12 lb. roach and dace. Mysell, fishing three days, first day, five dozen roach and dace; second day, five barbel, one jack of 3 lb. and two dozen of roach; third day, three dozen of roach, four dozen gudgeon and one perch of 1½ lb.—W. ROGERSON.

Barle and Exe (Dulverton).

These rivers have been in very good condition for fishing this last fortnight, and some very good baskets of trout have been taken, both with the fly and the minnow. Mr. E. Locke caught over eighty in three days. The weather now is very bright, with frosty nights, and the rivers are running down so that I am afraid there are not many good days left for us before the season closes. Salmon have made their appearance, but not in large numbers. The Rev. George Jellicoe caught a grise of 8 lb. on Saturday. Another of 8 lb. on Monday, and yesterday a salmon of 10 lb. The reason why the salmon have not come up in any number it is supposed through some obstruction caused by the new railway that is being constructed between Tiverton and Dulverton station. It crosses the river Exe in two or three places.—W.

Dove.

This river has now run down into nice order for angling, either with the fly or worm, though the water is pretty clear. I hear that bottom fishers have done very well during the week near Rocester, plenty of chub, roach, and bream, having been caught with the cockspur worm. Fishing has also been pretty good in the preserved water near Sutton-on-the-Hull. Barbel have been very backward at biting this season on the Dove. Few large baskets have been taken, none of them to be compared to what were caught in the autumn of last year. The Dove is not, perhaps, the best barbel river in the Midlands, but at any rate there ought to be a good few in it as many fish come out of the Trent, rather than remain to be poisoned with the filthy pollutions from the Burton breweries. Scratching is now proving the most acceptable to the fish named. Trout have risen during the week—the best time being in the middle of the day, but the small blacks on the water have absorbed most attention from the speckled ones. Grayling have likewise been well on the feed, and this beautiful fish is now getting into the very best of condition. One taken this week with the ephemera palmer scaled 2½ lb. The night line fraternity have been busy amongst eels, some big ones having been captured near Uttoxeter. In the Henmore and Manifold, Foster's intermediate and the Derby kill-devil are

getting the best fish. These tributaries are still full of water, but not at unfishable height.—THE SPODGER.

Dove (Ilam).

This river has been in good order all the week, clear, but with a fair volume of water. Mr. John Bullock, of Derby, had two brace of trout one day, all taken with the Derby killer, which I have much pleasure in recommending very strongly to all the anglers who use artificial minnows for trout. I have had some fair sport with the fly, chiefly with the grey palmer and the dun bumble. I had two grayling of about 22 oz. each, and some good trout. The grayling are rising more freely every day now. Trout still in fine condition. I got two brace yesterday in an hour and a half. There are several anglers at the Izaak Walton.—R. B. MARSTON.

Exe (Exeter).

The heavy rains of the past week have kept the river in such a state of high flood that fishing with the fly has been quite impossible; in fact, it has been too big even for worm fishing. We are getting a nice change now, although it is still high and discoloured, but prospects are now looking good. Trout, that are in the lower waters have it all to themselves, not having heard of one being taken. Salmon and peal are abundant, and some excellent sport with the former is had daily. Two and three per diem is the average, weighing from 15 lb. to 20 lb. each, several have been lost through being slightly hooked. Some five or six peal about 2½ to 3½ lb. each have come to bank. Pike are well on the feed as several have found pigs' melt not to be had at every meal. Roach, dace, perch, plentiful good creels of the latter from all parts; F. G. junr. on Friday last took 43, and 30 eels. Bass fishing should be looking up, for on Saturday about one hour before high water at Turf, there were thousands playing around the stern of a vessel moored off there; these are the first seen so far up the river this season. Bream and mullet are plentiful in the Estuary, where several sunfish have been seen; and a Fox-shark or Thresher (*Squalus vulpes*) also a Swordfish (*Xipias gladius*) both splendid fellows, were taken last week, a sunfish was also taken near Ilfracombe. Canal fishing very poor no doubt owing to the thundery weather but we may expect good sport now. Weather cool, wind N.N.E.—FRANK GOSDEN.

Harlow (Essex).

Water in splendid condition. Several pounds of roach taken in one day's sport.—J. SHIRNEILD.

Ilfracombe (N. Devon).

There has been a few fine trout taken this week from the streams known as Slade bottom, also some fine eels taken from our streams, with lob worms for bait. Mr. Hepel, a visitor, fishing with rod and line from the rocks adjoining the Ilfracombe Hotel, hooked six fine lobsters, but his landing net being so small he could not get them into it, consequently he had not the pleasure of saving either of them. Our sea fishing still continues good; there has been more fish caught this last week than there has been for the season. C. A. Teape, Esq., a resident, and J. Carter, Esq., a visitor, went out on Saturday for a fishing expedition, and returned, after three hours' sport, with 130 bream, average weight 1½ lb. each, also several whiting pout. Monday and Tuesday the boats had splendid catches of bream, codlin, whiting pout, shad mackerel, pollack, &c. Wednesday the trawlers went down in Barnstaple Bay, and returned in the evening with a few fine soles, plaice, thornback, &c., also boats out with pleasure parties, their catches of fish averaging from 80 lb. to 100 lb. per boat per tide. Any gentleman fond of sport, this is the place for them to visit, as the coast is full of fish of all kinds. Weather at present very moderate, with a little wind blowing from the south. Prospects good for the next few days.—J. COMER.

Medway (Tonbridge).

The river is in splendid condition for all kinds of angling, and fish, as a rule, are well on the feed. Several parties have been out jack fishing, and have done well. Mr. B. St. John Wagborne has caught two or three brace; Mr. F. Buley, a brace, close to the town bridge in the High Street; while Mr. G. Payne and Mr. A. J. Snelling, while fishing off the Castle on Thursday, caught a brace of pike in addition to a nice basket of bream; Mr. J. Buley, fishing below the town with a live bait, grassed four chub weighing 6 lb.; while Mr. R. Leonard, above the town, caught seven with the fly, the largest weighing close upon 2 lb. Other anglers besides those above named have been doing well, though the ground fishing is somewhat uncertain. No doubt, if the weather continues fine, there will be a good deal of execution done next week.—YE MEDWAY WATER-RAT.

Ormesby Broad.

The weather for the past week at Ormesby has been very dull, with much rain, and the fishing has been very quiet until the last three days, when some gentlemen belonging to the Gresham and Caxtonian anglers have had some fair baskets of bream, roach and rudd. If this fine weather should continue I shall expect to see some good baskets of fish brought in.—S. RICHMOND.

Ouse (Kempston).

I have had some good catches of dace and chub in the rough water below the mills, which is in the private occupation of Mr. Thorn. Sundry juvenile visitors have done but poorly bottom fishing. The weather has been too cold up to Tuesday for the fish to rise freely. I have seen four more young trout rising at the fly, but could not find it in my heart to prick their delicate little noses. I hope, if spared, to make their acquaintance at a future date. The best catch that I have heard of this week was by the Rev. H. Carpenter, who had 70 roach, weighing 17 lb. As an evidence of the large number of eels in the Ouse, I may state that 5 cwt. were caught in two traps in one night at Kempston, a short time ago. The largest weighed 6 lb. odd, whilst the four biggest bumped the balance at 20 lb. What a lot of fry catch a vast number of slimys must devour in one week. Why rod-fishing is nowhere compared to the slaughter of these water snakes.—THOMAS FORD.

Severn (Kidderminster).

The Severn is low and fine, therefore it is not in good condition for all-round angling. If the weather should continue fine, I think some good takes of dace and trout may be taken with the fly. Should a small fresh breeze come on so as to tinge the water, good baskets of fish may be expected. Mr. A. G. Tittley, of the Swan Hotel, Kidderminster, succeeded in taking six pike weighing 36 lb., being an average of 6 lb. each, spinning with the gudgeon, in the river Avon, at Bredon, near Tewkesbury, the largest weighing 13 lb., the smallest 2½ lb.; all in fine condition; caught in 3½ hours.—EDWIN LAWRENCE.

Severn (Shrewsbury).

The end of the trouting season is now fast drawing to a close, and on the whole it has been one of the best for some years past, both as regards the size of the fish and the number taken. The largest fish have fallen victims to the natural minnows, which in the Severn is by far the most killing bait for trout. With the present state of the water greying fishers have all that can be desired, and evidences are not wanting of the presence of *salmo thymalus*, as several braces of nice fish have been taken below Shrewsbury. Should the weather prove favourable, we may hope that these graceful fish will afford sport in the declining days of the fly fishing season. The "fall of the leaf" is not without fatal effects to the young fry of the salmon, and the slaughter of the innocents will continue as long as a certain class of rod and line men can follow them with any chance of success. The genuine rodster, however, cannot but look with pity and good-humoured contempt upon those who, through gluttony's vile sin, pursue this kind of amusement. Up to the present week, which, owing to the lowness of the water and other influences, has not been productive of much sport, bottom fishers have had a glorious time of it among the roach and dace (roach running large), the most successful lure being wasp-grubs and maggots; paste fishing for roach having been somewhat a failure. Perch fishing has resulted in good takes as regards numbers, but the quality of the fish have been somewhat indifferent. Chub come rather slowly at present, but they are in the river, and with a little patience and colder weather his chubship may render a good account of himself. The next two months are the best in the year for worm fishing, and anglers should not go out without them. Well-soured brandlings are best for low, clear waters, but for muddy or coloured water fresh ones have proved the most killing.—W. D.

Stow (Suffolk).

Although the weather was bad in the extreme, I made the best I could of it, for my holiday was short. On Monday I commenced in earnest to fish with a long white cane rod. I began with the roach, and, to my great satisfaction, they fed like tigers, till the rain came down, and I was obliged to retreat. Next day I tried perch fishing, and no sooner had I wet my line than down went the float and a perch of $\frac{3}{4}$ lb. came twisting out of the water. I took eight perch in as many minutes. Then a few more from another hole, and so on, till another heavy rain and a blow from the north-east told me to go home once more. On the Friday a friend from Brighton (secretary of the Brighton Anglers), and myself tried the bream. Although we were told we were three weeks late, we determined to try the lobworm, and succeeded in killing 20 lb. of bream between the showers. If London anglers do not know of such a place as Bures, St. Mary's, seven miles from Markstey, on the Great Eastern line, it is time they did, and only fifty miles from London; there is Mr. John Death, of Bures, and Mr. Webber, both having boats, and excellent anglers, and know the river well. Mr. Cousins, of the Queen's Head Inn, will provide anything the angler can wish, such as beds and provisions, at moderate charges.—A.C.

Suir and its Tributaries (Clonmel, Ireland.)

To-morrow will be the last day of the open season for salmon and trout fishing, and we cannot understand why we are cut short six weeks of the best part of the season, however we hope a satisfactory change will soon be made so as to please the anglers on both the upper and lower waters. The rivers Nore and Barrow with their tributaries remain open till the 1st of next month, which streams are about our neighbourhood. The season here on the whole has been only pretty fair, it was good to April, and then the next few months' dry weather left the river too low, however, in August the floods revived the fishing considerably, and since then it has been very good, though they take well in September; still it is a well known fact that they greedily take in October, which makes us the more anxious to get that month, especially as the fish are now and will be in the best condition till November next, when they begin to ascend the streams, previous to spawning. Mr. Luther, Mr. Hayle, and Tom Power had some very good fishing on the Suir this week.—DORA.

Swale.

This will be a good time for the autumn fly-fishing, if the waters are only right, but as I have been making a tour of four southern counties during the last three weeks, I cannot say what is doing locally. Let visitors, however, use the light brown, freckled dun, iron blue drake, and needle brown, and if they know how to throw a fly, they will not come home with an empty basket.—THOMAS FORD.

Trent (Alrewas).

The river although low and bright is still in capital form for the angler. Roach, dace, and chub have been fairly on the feed at both the small cockspur worm and gentles, the former doing the principal execution, and will no doubt prove the most favourite lure of the season. The following takes are reported:—Mr. Thornton, 8 lb. good roach, Mr. Rickett a similar lot, and a grayling over 1 lb., Mr. Reynolds some capital roach and chub, with a trout 1 lb., all taken with worms. Mr. James Gregory, a miscellaneous basket of roach, dace and chub, and Mr. Savatard 10 lb. fine roach. To-day the weather has been simply delightful; grayling are reported to be well rising at the black gnat, which, by the way, have not been conspicuous by their absence. The past week the water at times has been simply black over with the little pests, and it is really a wonder anything has been done. Bottom fishing prospects decidedly good.—JAMES GREGORY.

Trent (Newark).

The water is in grand condition for all-round angling, and the weather has been all that could be desired yesterday and to-day, although it was very wet and uncomfortable the beginning of the week. Sport has not been very good this week, as a general rule, a few odd good catches have been had, principally chub. I saw one good basket of those fish, numbering twenty-seven, taken with wasp grub, but none of them very large. Two Nottingham anglers had a few very good chub, two of the fish weighing over 4 lb. each. A few good roach have also been taken this week with worms, gentles and paste, the best fish weighing 1 lb. $\frac{3}{4}$ oz., 1 $\frac{1}{4}$ lb., and 1 lb. 2 oz. respectively. I have not heard of any catches of barbel or bream, but they should "come on." Chub with wasp grub; roach, &c., with worm, gentles, or paste; barbel and bream with worms, while a bit of white scratching may be used for a change, if the water gets very fine, will be about the programme for the Trent just now.—THE TRENT OTTER.

Waveney (Beccles).

I this day heard of a 2 lb. perch being caught in the Waveney, near Beccles, by Mr. Arthur Scott. This is good news, as perch are rarely seen in the present day.

When the weeds go down I hope to hear of some good luck, as there are plenty of fish in the Waveney. What a lovely winding stream it is; and about 30 years ago, near Horlingham, some Norwich anglers caught a splendid lot of perch, six of which scaled 15 lb.—ESOX LUCIUS.

Wye and Derwent (Derbyshire).

We had a beautiful porter-coloured water come down the Derwent yesterday (Wednesday) from the rain which fell up in the woodlands, which gave both the fly and ground bait fishers a good time of it; and I am pleased to say that some handsome baskets of fish were killed with both the fly and bottom fishings, chiefly off the Chatsworth and Darley Dale Club waters. Both grayling and trout have been rising pretty freely on both rivers during the week, but have been very difficult to be caught previous to the rain coming, owing to the great quantity of small midges and black gnats on the waters. On the Wye the small honey dun bumbles, dotteril, and little red have all taken fish. On the Derwent the honey dun bumbles, grey goose dun, reds, and small blacks, have also all killed fish, the bumbles being the favourite for both rivers. When you see a good fish rising, either trout or grayling, taking everything in the shape of a fly going over them, try them with the three different flies at the points I mention. First, dotteril; if this he refuse, try him with red fly, ribbed with gold twist; and if he still refuses, try him with the small black or lean fly. I have very often found these three changes very successful generally. Yet there are times when I believe no man can deceive the fish, especially in thundery weather; also when rain is hanging about. As soon as we get some good sharp frosty nights grayling will begin to feed freely at both top and bottom, especially when those nuisances of midges are killed, which are now out by thousands.—GEORGE JAMES EATON.

Yore (Yorkshire).

As I expected, there has been some good sport with the fly on both the Yore and Wharfe since my last report; both rivers are now in capital condition, and grayling are beginning to rise nicely. I have had two day's fishing on the Yore since last week, and met with fair success, but I killed more with the maggot fished on very fine tackle than I did with fly; but the days on which I fished were very cold, unpromising ones, with little or no fly upon the water. The following are good good grayling flies for this and the next month on either the Yore or Wharfe:—Dark olive bloa—wings, inside of waterhens, wing feather; body, lead-coloured silk; legs, dark olive hackle; tail, three small rabbits' whiskers. This fly, if dressed fine, is a capital killer on a cold dull day. Small willow fly—body, light brown silk; wings and legs, feather from inside of a snipe's wing, hackled on. Large willow fly—body, mole's fur spun on yellow silk; legs and wings, a copper-tinged grizzled hackle. It is rather difficult sometimes to obtain hackles of the right kind for this fly, but Eaton, of Starkholmes, dressed some for me last season exactly the proper shade, and they killed well. Space prevents me writing further on the subject in this week's issue, but I hope to continue the list in my next report. The above-mentioned, in addition to Eaton's bumble and little red, will prove amply sufficient for present requirements.—FRANCIS M. WALBRAN.

WALTONIANS.

On September 11th, two prizes were fished for. A guinea Thames rod (bait), given by Mr. Packman, was won by Mr. J. Dodge, with 5 lb. 12 $\frac{1}{2}$ oz.; second prize, for the largest roach, won by Mr. Starr with a roach 11 $\frac{1}{2}$ oz.; Mr. Good, jun., had 5 lb. 2 $\frac{1}{2}$ oz.; the takes by Messrs. Togwell, Waltham, Crabb, Rushbrook, Greenfield, Roland and Malcom were of the small average. On the previous Wednesday Mr. Waltham weighed in 11 lb. 10 oz. of roach, and I weighed-in a teach from Elstree 2 lb. 6 $\frac{1}{2}$ oz.—A. J. MARRIOTT.

September 14.

A pike of 22 lb., in splendid condition, was captured by a boy, with a threepenny line, in a pond near Oxford the other day. *Sic transit!*

HOW TO BE AGREEABLE.—Call upon people out of season; upon business people especially in business hours, for a long friendly chat on things in general. If you see an angler fishing a good stream, walk along the side so that all the fish can see you, and ask him what sport? Stop people in the street if they seem to be in a hurry; if they are not in the latest cut and newest garments, say you thought your friend was going to the tailor's. Always assist the teller in the midst of a story or a statement. Come in late to church, or the concert, or to dinner. Always laugh in the wrong place or about a minute too soon. Tell some anecdote that comes as near as possible to some unpleasant circumstance in the family affairs of a person present. If at a loss for conversation, the small-pox or drainage will fill up the gap.

Hauling fish through the surf is better than wasting time in the Senate.—*Daniel Webster.*

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Kedditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

ANSWERS TO CORRESPONDENTS.

G. W. G.—We understand that Cook's Ferry Fishery, on the Lea, is now in the hands of a club; if this is not the case we shall be glad to know.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

FISHING AT BEDFORD.

SIR,—“Rover” was indulging his roving propensities last week, and so far had he roamed from the abodes of civilisation that your GAZETTE did not reach him in time for this to appear in last week's issue.

The information I gave was obtained from one of the club's keepers. I was in hopes of having a day's fishing in the club waters during my recent visit to the Ouse, and I asked their keeper, whom I chanced to meet, the price of a day ticket, and he said 1s. 6d., and also told me of whom the ticket could be obtained. He said nothing whatever about having to obtain it through a member, and I therefore thought the water was open to the public at that price.

That the dear old Ouse, upon whose banks and on whose bosom I have spent so many happy days in years gone by, and whose every pool and eddy, deep reach and shallow, I know for sixty miles of its course, has passed into the hands of an exclusive club, I regret to hear; and this selfish spirit, as evidenced by their secretary, was no doubt the cause of the many hard things I had said about the club by prominent men in Bedford lately.

With regard to the latter part of your correspondent's letter, which he seems to hold in *terrorem* over my head, I beg to tell him that I am a law-abiding individual, and one of “that certain class” that angles for sport *pur et simple*; that I never fish in private water without obtaining leave, and always try to act the part of a friend to angling clubs which are formed for the common good.

The convictions stated were for fishing above the navigable part of the river, and where it passes through private grounds; had the offences been lower down the result might have been different. The first one was apparently near to where Mr. J. Ford was fishing on the 1st and 2nd, the other one, for which the fine was 1s. and 5s. costs, also occurred in a part of the river which has quite recently, I believe, come into the possession of the club. In days of yore Clapham used to be free water, except where it run at the bottom of private gardens, and the Uxbridge magistrates recently tried a test case of a similar nature, and decided against the prosecutor. I may as well state, so as not to raise the hon. sec.'s (Mr. E. Bicknell) ire, that the pike mentioned in my totals were not captured within 30 miles of Bedford Bridge.—I am, &c.,

ROVER.

P.S.—I note your remarks, Mr. Editor, about weight, and will comply another time—they did not include fish thrown back.
September 12.

THE ANGLERS' BENEVOLENT SOCIETY.

SIR,—Several members of the various clubs inform me they have enrolled their names with the secretaries of their society, and they have not applied to me for tickets of membership. I beg to inform secretaries that this may lead to very unpleasant circumstances, as no application for assistance could be entertained unless the member's name is entered on the books of the society.

I have questioned some on the subject; the answer has generally been, “I have got a few members, and I am waiting for more before I send, as I do not wish to give extra trouble.” I beg to state that nothing can be a trouble to me when I am doing my duty and benefiting my brother anglers. I hope in future secretaries will send for the cards of membership for their members as soon as they receive notice. If only for one, I shall be happy to forward it to them.—I am, &c.,

R. GHURNEY, sec.

RIVER LEA ANGLING PRESERVATION DEPARTMENT.

SIR,—Mr. A. Wheeler, King's Arms, Waltham Abbey, having issued notice that, on and after Wednesday next, September 14th, all persons found angling on the towing path at Waltham will be prosecuted by the War Department, I beg leave to issue a counter notice, on the authority of the Lea Conservancy Board, that by their permission anglers may fish from their towing path of the River Lea, at Waltham, and that they will defend any infringement of their rights, or those of the anglers to the utmost.

The War Department have no right to interfere with persons so fishing, but, if they do so, the Board will take up their cases. If any names or addresses are demanded, the persons applied to, will do quite right in refusing to give them.

A set of nets and a notorious poacher have been captured in the neighbourhood of Horse Shoe Point. Full particulars will be published, when the summons is heard before the magistrates.—R. GHURNEY.

THE “FISHING GAZETTE” ARCHIMEDEAN SPINNER, No. 3 SIZE.

SIR,—Will you kindly inform me where the above spinner is to be had? I bought one of Messrs. Alfred, but unfortunately lost it; and I have applied both at Messrs. Alfred's and Messrs. Kewell's, and they do not now keep them. I found it very successful among the pike.—I am, &c.,

L. JACKSON.

PIKE-FISHING WANTED.

SIR,—I should feel greatly obliged if you or any of you correspondents would tell me of some quiet inn on or near the Norfolk Broads where good pike-fishing may be had during the month of November next. Also the name of any similar place in Devon or Somerset where good sport may be had during the same month. I see Slapton Ley closes Sept. 30.—I am, &c.,

CROYDON.

[You will get good pike-fishing by staying at the Sportsman's Arms, Ormesby Broad (rail to Ormesby, a few miles from Yarmouth), or by staying at Coldham Hall Inn, Brundall-on-Yare, or at Buckenham or Cantley on the same river; also in Oulton Broad, 3 miles from Lowestoft; there are many fine pike. Spinning the American spoon is the best plan; Thames dace seem to have no attraction, possibly because the broads and rivers so abound with small fry. You

should also try Wroxham Broad. But, if you go to Norwich, and call on Mr. Palmer, at the Great Eastern Vaults, he will put you right. We would advise you to go to Tiverton for pike-fishing as there are heavy pike, and the canal in the neighbourhood.—ED.]

FISHING IN THE WEY, AT GUILDFORD.

SIR,—Could you or any of your subscribers inform me whether there is good fishing in the Wey, at Guildford; and, if so, whether it is above or below the town of Guildford?

Some information in your valuable paper as to the use and mode of preparation of best sorts of ground baits would, I am sure, prove acceptable to many of your readers, whose good fortune it has been—but now, alas! is no longer—to fish waters not needing these adjuncts.—I am, &c.,

MEBCATOR.

Clapton Park, E., Sept. 12.

[Will some reader kindly answer this?—ED.]

RIVERS FISHED OUT!

SIR,—In re rivers fished out. In No. 228 of the FISHING GAZETTE, your correspondent “L. B.” asks Mr. Balderston to account for the alarming decrease of pike. In this week's number we find by the same writer, “L. B.,” an account of a pike, weighing 9½ lb., feeding upon two of its own species, one 11½ inches long and the other 14 inches; not that this is any novelty, as I have seen a 6 lb. pike taken by a jack, 12 inches long, used as a live bait, at Cook's water on the Lea a few years ago.

How now, Dear Bon, you see your friend, the pike, you wish to protect, no doubt having consumed all the delicate trout, roach, &c., within his reach set to work upon members of his own species, finding it otherwise impossible to satisfy his rapacity; and yet we are asked to legislate to protect a ravenous and destructive creature like this. I trust, if another meeting of anglers is convened, the question will be the protection of roach, &c., and not so much time wasted over the pike as occurred at the last meeting held at the Society of Arts.

—I am, &c., A ROACH FISHERMAN, WHO WAS PRESENT.

P.S.—Having travelled about a good bit this season, and observed fish priming, I refuse to believe in Mr. “L. B.'s” theory, that the rivers round London are fished out. No, Mr. Editor, there is plenty of fish, but it will take better men than “L. B.,” “H. K.,” or “Creel,” to catch them.

4, Hampton Street, Walworth, S.E.,

Sept. 10, 1881.

CAPTAIN ETHERIDGE, SQUIRE PHILLIPS, AND THE BEASLEYS.

SIR,—Everybody must admire the promptness and the success which attended Captain Etheridge's movement ament the intended netting of a reach of the Thames by persons hired by Squire Phillips, of Culham. I think, however, that the nets not having been put into the water, was a good thing; because, otherwise, life might have been endangered, and a most, or more, unseemly struggle might have taken place, probably in very sight of a Justice of the Peace, and son of a former Master of the South Oxfordshire Hounds. Nor, do I think that Squire Phillips will, upon calm reflection, have any nets made to “sweep every fish out of his reach of water,” unless he is fully satisfied of his right to do so. But if this right, or allegation of right, is contested, are the Thames Rights Defence Association prepared to defend the public rights in a court of law?

I should think the anglers in Oxford, as well as those in Abingdon, must be deeply and especially interested in that portion of the River Thames in dispute. No doubt funds from outside sources—nay, even from the London Corporation, let alone the pecuniary support from thousands of anglers—would surely soon be to the fore against any assumption of exclusive right to fish or net by riparian owners.

Country gentlemen like to live at peace with their neighbours. It might have happened that men of another sort, and with nets of quite another description, had intended, a night or two before the “First” of September, to make a clean sweep of such coveys of partridges as then roosted in the few fields of barley, cleared fields, or grass lands, belonging to Squire Phillips. These poachers would of course have had no right to be upon the land for any, much less unlawful, purposes; and if, again, Mr. Phillips had intended merely to test the right, or alleged right, to a certain stretch of the river, he need not surely have sent to Oxford for netters.

The most agreeable way for any riparian owner anxious to test his right, would be by agreeing to enter into a friendly action with the Thames Rights Preservation Association, and let the question be settled once and for all by Her Majesty's judges sitting in Westminster Hall, or at the County Assizes.

I cannot help thinking that if, thirty years ago, a second or third class dealer in Leadenhall or Old Newgate Market had attempted to corrupt the keepers, or earth-tappers, or employ even poachers to steal the fox cubs in summer in the Nuneham covers, or at Waterferry Park (Mr. Henley's) or elsewhere, a jolly fine row would have been kicked up by members of the South Oxfordshire Hunt, and especially so by the late J. J. Phillips, Esq., the M.F.H. Fox-hunting would have been spoiled in the district named, and if the Beasleys had succeeded in netting the river on the day in question the sport of the angler would have likewise been seriously injured.—I am, &c.,

London, S.W., Sept. 12.

FAIR SPORT FOR ALL.

FISHING IN CHESHIRE.

SIR,—In reply to the inquiry of “A Contributor” in your issue of the 3rd inst., I have to state that there is very good fishing to be had in the meres and rivers of Cheshire. The meres being principally in private grounds, permission is somewhat difficult to obtain, but it is sometimes allowed. There are, however, two, which are free, Pic Mere, near Northwich, and Ache Mere, near Delamere. The rivers are to a great extent free, and where preserved there is little difficulty in obtaining permission.

The River Weaver is free for several miles. The Dane free at Northwich, but preserved higher up the stream. The Bollin preserved in the upper reaches, but free below Dunham Massey, after the hay is got in, and permission is readily granted by the farmers, &c., on the bank. Lostock Brook free at Northwich. Smoker Brook at Plumley, 2s. 6d. per day.

Wrenbury Brook is preserved, but I believe permission can be obtained by stopping at the Salamanca at Wrenbury. All the meres contain pike, bream,

perch, roach, rudd, eels, and in one or two fine trout and carp are found. The rivers contain pike, trout, graining, chub (small), roach, gudgeon, and eels, also small perch.—I am, &c., W. R. R.
[There is also very good roach-fishing in all the canals in Cheshire.—Ed.]

THE FENCE MONTHS.

SIR,—Your correspondent, Mr. Balderston, in his letter reaches—if, indeed, he does not exceed—the utmost limits of controversial licence. It must be evident, to those who have read this correspondence from the first, that long since Mr. B. lost his temper, and began to try and strengthen his position by calling his antagonists, Mr. Keene, “Creel” and myself, and indeed all those who dared to differ from him, some very naughty names. When a man loses his temper, whether in an argument or in a physical fight, he generally strikes out wildly, and, as a result, finally gets floored.

I would, Mr. Editor, with your permission, quote certain portions of Mr. Balderston's letter, not merely to prove that they are not couched in a language recommended by any “Polite Letter Writer” extant; but because this language is, in most instances, used to strengthen, transparently unobtainable accusations, cover misconstrued meanings, and to enable the writer to evade giving direct answers to inconvenient questions.

Mr. Editor, as you know, and many hundreds of your readers know, I have for many years devoted a considerable portion of my leisure to the question of fish and fishing. I have mixed freely with anglers of almost every social grade, and had greater opportunities of taking useful notes than most people, not only on numbers of our English waters, but on several of those of Italy, France, and particularly of Belgium. Since my connection with the anglers of London, I have spared neither trouble nor expense, so far as my limited means would allow, to become better acquainted with these subjects, particularly with that portion of them which affects the permanent interest of the sport. I have met men who differed from me on certain points, and, after fair arguments, have generally either convinced them or altered my own opinion as I saw the necessity for so doing. But it is the first time in all my life that I have been told, as I have been by Mr. Balderston, that I considered it too much trouble to reason—“evidently because it is too much trouble to reason.” Then, further on, that I am not a real angler. “No doubt Mr. L. B. is prepared to deny this, as it conforms with the opinion of all real anglers.” Then Mr. Balderston, still quoting me, goes on to say, “It is simply ridiculous to declare that there is no compensating advance in the resources of the said river.” “Nature herself,” he adds, “is self-protective.”

Yes, granted, against her natural enemies—fish of prey, spawn-devourers, as eels, aquatic birds; terrible floods, which often sweep away millions of ova, and, receding more or less quickly, leave hundreds of mature fish high and dry to perish miserably, generally in the early spring, when their lives are most valuable as spawners and millets. Then, it must be remembered that much of the female spawn is never fertilised at all and is practically lost. True, Mr. B. quotes the wonderful prolificness of fish; but he does not go into, or seem to attach anything like the importance they deserve to, these and many other natural causes which are at work in great measure to counteract it. It may be taken that only a portion the female spawn deposited is fertilised, that much of it is devoured or destroyed before it is hatched, and, in short, that, from the causes above stated and others, only a comparatively small percentage of the hundreds of thousands of eggs contained in each female fish ever develop into sizeable fish. Now it is on these sizeable fish and their immediate progenitors that Mr. B. wants us to believe the work in our metropolitan rivers of thousands of rods has no material lessening effect. I said that as anglers increased—in some waters almost to an alarming extent—there was no compensating increase in the number of fish, and I defy Mr. B., with all his sophisticated rhetoric, to convince men of sense that there is.

Mr. Balderston, in the next two paragraphs, is simply stupendously ridiculous. There is no mistaking his meaning—“all persons who use ground bait” (and 999 per 1000 do), are pot-hunters and poachers. And he “esteems it a condescension even to argue with them.” And you, long-headed men, who have thought this question carefully over for years, and arrived at conclusions identical with those I have expressed—simply because they are the only true and possible ones—are said to follow “docilely in my footsteps”—oh! it's too absurd. And you, my good masters from Trent and Thames' sides, at the bidding of the new piscatory prophet—I was almost writing Herod—Mr. Balderston—you Baileys, Guests, Woodwards, Wheeldons and Fennells, etc., forego your greaves, your grains, your delicate pellets of bread and bran, your carrion gentles and bullocks' brains, your wriggly lobs; and as for that baiting pot of yours, J. P. W., please don't mention it again, lest the somewhat raven-veiled prophet have a fit of virtuous indignation, and an obituary notice, with a border black as “the raven's wing,” appear in next week's GAZETTE.

Mr. B., then, instead of answering my question, “How do you account for the alarming decrease of jack and perch in the Thames?” first asks, “On what data does the alleged alarming diminution of these fish rest?” and in the next paragraph goes on to deny that such does exist. To the first question, and to the assertion that follows, I would reply, go for information to the societies which have the preservation of the river in hand. Ask gentlemen like Messrs. Spreckley, Brougham, Jardine, Geen, and Cleach—all on the committee of the T.A.P.S., who have some of them known the river as a fishery for a score of years, several of them residing on its banks, with hourly opportunities of making observations; and, if you are not satisfied with these, go to the professional fishermen and afterwards to the casual pike and perch anglers you may meet upon the banks. All will tell you the same tale; but if you are still incredulous, go to the river itself and try, and if you fished it for pike and perch years ago, you will, unless you wilfully close your eyes to the evidence of your senses, soon find out the truth of what you at present prefer to doubt, because you find it impossible to refute. With regard to the proposed protection of pike and perch during the spawning season by the Waveney and Oulton Protection Society, Mr. B. speaks of it, if carried out, as a step in a retrograde direction, and adds, “It is a thing which would not be entertained for a moment in Germany or China.” Then follow the usual little courtesies towards his opponent for which Mr. Balderston, like the “Heathen Chinee” he sets up as a model, is peculiar.

But, all joking apart, that's very artfully put; and, moreover, what you say about Germany and China is true and sounds very plausible. But surely, Mr. Balderston, though it might deceive some, you know the difference between our English rivers and lakes and the stews of Germany and China—you know that, though a vast proportion of the freshwater fish captured by rod and line anywhere within a reasonable distance of our large towns is consumed by the working classes, yet we look upon our waters less as food-producing mediums than as the means of affording innocent and healthy recreation to thousands, and thus we tolerate—nay, encourage—the continued existence and increase of

fish which otherwise would be outlawed—not merely jack and perch, but also chub—rare devourers of small fish, and, as I heard Mr. Willis-Bund call them, greater foes to trout fry than even jack and perch—the spawn-devouring eel, the more than indifferent-eating barbel and bream, the latter also credited with spawn-gobbling propensities. All these and several others would find little favour with the “fish farmers” of either of the countries named, whose *piece de resistance*—whether of Germany, whose scant seaboard militates against her having a good and regular supply of cheap sea-fish; or of China, where the unfortunate Celestial of the humbler class is continually warring against absolute want in his densely over-populated country—is the carp, pure and simple and the breeding, rearing and fattening of which fish for the market is reduced to a science. The difference, in short, between these nations and ourselves is that we mainly protect our fish for sport, while they cultivate fish simply for food. We forgive the bold handsome pirate who levies toll upon his smaller brothers, because we know that, by and by, when the cold north-easter blows, and most other fish are tucked up in their winter quarters, he will rush with a dash, and a swirl, and a terrible tug, at our spinning bait, causing the wind to play a (to our ears) melodious requiem upon the strained silken line, while the limber rod bends again as he ploughs away down, down, into the deeps, and anon attempts to baffle us by rushing into the swiftest run, trying the steadiest nerves, causing breath to come short and quick from between the clenched teeth. Well, in sportsmen's breasts these few words, blunt and homely, may awake an echo; on Mr. Balderston, I fear, they will only be wasted, and made the subject of ridicule.

There are, dear Mr. Editor, several other points in Mr. Balderston's letter which I would take up, but I find I have already encroached far too much upon your valuable space, and I will therefore only add that I would much rather this was allowed to be my last letter, and that Mr. B. would address his remarks to “Creel” and Mr. H. Keene, both skilled writers, whose views are identical with mine. In my opinion Mr. Balderston is trying very ingeniously to prove that two and two make five. Until there is a chance of this succeeding, I see no reason for carrying on a correspondence which, seeing the utter abhorrence in which I hold Mr. B.'s doctrines, is exceedingly distasteful to me.

Between Mr. Balderston and myself and those who think like me, including my friends Messrs. Geen and Hoole, who have been mentioned by name in this correspondence, I am satisfied, with the utmost confidence, to let the readers of the FISHING GAZETTE, and the anglers at large, judge.—I am, &c.

L. BONVOISIN.

P.S.—As a rule, I never notice anonymous correspondence, but I may tell your other correspondent, “One Who Would Like, etc.,” that he is entirely wrong in his fact. Mr. Balderston does advocate fishing all the year round; the very gist of his correspondence is that rod and line fishing should not have been interfered with by law.

Messrs. Geen, Hoole and Bonvoisin never advocated fishing in June, and they are now trying to get the whole of June closed. The first fortnight in June being included as a close season in the present Act, was mainly the result of their remarks and votes at the first meeting at the Society of Arts room in 1878, and of the evidence Messrs. Geen and Ghurney, and other gentlemen chosen to represent the thousands of London club anglers, gave before the Select Committee of the House of Commons. About getting the Act amended—while readily estimating at its real value the publicity given to the whole question in the columns of the FISHING GAZETTE—I would remind your correspondent that Messrs. Geen, Hoole, Bonvoisin and Co., as he sneeringly calls them, have taken most energetic action in the matter, as witness the late meeting at the Society of Arts, convened mainly under the auspices of the Association of which they are the principal officers, and the subsequent deputations to the House of Commons, Sir Joseph Bailey, Bart, etc.

Though of secondary importance, I may inform your correspondent that Messrs. G., H., and B. do not rush at unclean fish on June 16th, but leave the rods alone until well into July.

In conclusion, I cannot help regretting that your anonymous correspondent should have sent you a letter so utterly at variance with well-known facts; as so doing, and the unavoidable reply, are not merely a waste of your valuable space, but also a waste of the time of those upon whom the duty of replying devolves.

FISHING AT LEICESTER.

SIR,—Will you kindly inform me, through the medium of your valuable paper, where I can obtain some good fishing near Leicester?—I am, &c.,

ANGLER.

[The “Anglers' Dairy” states that there is pike, roach, perch, chub, carp and tench fishing in the Soar. The water below the town is much polluted, and of not much account. The Wreke (except close to Melton, where it is polluted) about five miles below the town, and which falls into the Soar at Syston Mill, is good, and is preserved chiefly by H. C. Woodcock, Esq. (Rearsby), who kindly gives permission to anglers for the asking. This river is noted for its chub and bream holes. There is good roach fishing between Syston and Melton Mowbray, a distance of nine miles. Perhaps some reader at Leicester will kindly inform us if this is incorrect.—ED.]

CLUB REPORTS.

AMICABLE BROTHERS' ANGLING SOCIETY.

Mr. Thorpe, roach and dace, Mr. Lewis, roach and bream from the Aun; Mr. Moir, roach and bream from Dagenham; Mr. Patrick, roach and dace, Mr. G. Carrington, roach, dace, perch, and chub; gross weight, 6 lb. 1½ oz. Some of the dace were very fine, weighing over 10 oz. each. An appeal is now made on behalf of Mr. D. Thorpe for assistance, by a complimentary ticket benefit, to be held at Deacon's Music Hall, on Wednesday and Thursday next, September 21st and 22nd. Tickets only will benefit. Tickets can be had of several well-known anglers, also of Mr. C. A. Medcalf of the above club, and of the secretary, T. WORLEDGE.

September 11, 1881.

ANCHOR AND HOPE.

A member of the above society would have much pleasure in fishing Mr. G. Taylor, of the First Surrey Angling Society, a match (bank fish), for a sum, stakes and conditions to be settled on arrangement. Sunday 11th, members went to Pulborough, returning with some good shows of fish. A. Shakel, bream; H. Scott, bream; A. West, roach; T. Bowling, dace and roach; R. Smith, bream; A. Glass, roach and bream; D. Davis, bream.—A. SHAKEL.

Sept. 12.

BERMONDSEY BROTHERS.

We had a fair show of fish from the Thames on Sunday last, the most successful being Messrs. Owles, Frost, and Ayton. Mr. Allen also weighed-in a small jack that won for him the first prize at the Rye House competition of delegates. Mr. Taylor, 1st Surrey, weighed a chub $2\frac{3}{4}$ lb., from Hampton Court.—WM. ALLEN, sec.
Sept. 13.

BRIGHTON ANGLERS' ASSOCIATION.

The fine weather in these parts have given us more sport. Mr. Sharp killed 19 lb. $11\frac{3}{4}$ oz. of bream; Mr. Seymour, 5 lb. 9 oz. of bream and roach; Mr. Ortis, two carp weighing 11 lb. $12\frac{3}{4}$ oz., and 7 lb. $\frac{1}{4}$ oz. of bream; Mr. Hassell, $6\frac{1}{2}$ lb. of roach; Mr. John Tree, 5 lb. 10 oz. of bream; Mr. Anscombe $3\frac{1}{2}$ lb.; and Mr. Ash $1\frac{3}{4}$ lb. of bream. Although the Ouse is cloudy the fish seem to feed well. Messrs. Cardy and Park both had creditable catches from Chichester, but they cannot recommend the water as fishable. Mr. G. Saunders broke away with a large carp, he not being quite prepared for such a fine fellow, as his tackle was fine.—GROUND BAIT.
September 14.

CITY OF LONDON ANGLING SOCIETY.

The following members weighed-in on the 11th:—Messrs. Martin and Perry, roach from Chertsey; Mr. Castell, 3 lb. 9 oz. roach from the Roding; Mr. Pratt, bream from Amberley; Mr. Payne, a jack from Penton Hook; and Mr. Mark, roach from same place.—CAS.

DALSTON ANGLING SOCIETY.

The above society met on Sunday, the 11th of September, when the following gentlemen had a very fine show of roach and perch:—Messrs. Fuller, W. Richardson, Forte-cue, James, Malby, Munn, Long, Marman, Slade, Anderson, Eagles, Midson and Venour.—S. MALBY, secretary.

GOLDEN BARBEL.

On the 11th inst. the undermentioned weighed in fish from the Thames, Elstree and the Arun:—Mr. J. Green, roach and dace; Lumby, roach; J. Hall, dace; T. Bigsby, roach and tench; E. Henries, roach, chub, jack and dace; T. Lee, roach and dace; G. Gough, roach; E. Harrison, roach and perch; H. Harrison, roach and perch; J. Whittridge, roach and dace; A. Duck, roach and dace; J. Trowbridge, roach; gross weight 40 lb. The members will fish a sweepstakes in conjunction with prizes on the last Sunday in September, at King's Langley, all fish to weigh but jack. Mr. L. Bonvoisin paid a visit to this society on Tuesday evening, on behalf of the Anglers Benevolent Society, and I am very happy to say that a few words from him led to an explanation as to how it was that the subscription had not been paid over to Mr. Ghurney before, therefore those thirty members who have paid up will be able to receive their tickets next Tuesday evening, upon application to Mr. G. Dixie. The next return visit to this society will take place on Tuesday evening next, on which occasion the members will be most happy to meet any of the brother anglers, to pass the evening in harmony and good fellowship.—PIXIE.
September 14.

GOOD INTENT.

We had a good show of fish on Sunday last. W. Hellens, roach; J. Pluckrose, bream; Gadbury, roach; W. Wheeler, dace; G. Hughes, roach; Haines, roach; Maybury, roach; Barrington, roach; Guntrip, bream; G. Bates, jack and perch; Dowse, jack, &c. Our distribution of prizes took place on Tuesday last, the winners being so numerous I cannot take up your space with the whole of them; the most successful being Osborn, Maybury, Bell, J. T. Murphy, Hadkiss, &c.; there were close on £100 worth of prizes to distribute. After they were distributed we had £60 given for this year, and many more to come. We had some capital singing, and a most enjoyable evening.—R. MURPHY.
September 15.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

The following members weighed some nice roach and dace from the Wey and Thames:—Messrs. J. Fitch, Mullins, Hewitt, Theobald, Inher, Hutchings, F. Watling, W. Watling, Young; Mr. Major, 6 lb. 15 oz. of roach from Colne. Mr. J. Fitch had a pretty tray of roach and dace on Monday, weight 11 lb. 10 oz.—J. A. FITCH, sec.
September 13.

GRESHAM ANGLING SOCIETY.

The usual weekly meeting was held on Thursday, 15th inst. The society's prize list being finally discussed and settled, Mr. T. Crumplen, the hon. secretary, read a feeling letter from Mrs. Rolfe, written in reply to the society's vote of condolence on the death of her husband, the late eminent artist. A fine show of fish have been weighed-in during the week; carp, by Mr. White; bream, by Mr. E. Bennett; and grayling and trout, by Mr. Jardine. The grayling were very fine samples, and in splendid condition. The society now numbers nearly 160 members, and having outgrown its present quarters, removes to the City of London Tavern, 11, Bishopsgate Street Within, from the 6th of October next.

HAMMERSMITH UNITED.

On the 6th, Mr. Walters visited Elstree and returned with tench, roach, and perch. Messrs. Penney and Green visited the same place the following day with satisfactory results; Messrs. Hobden, Chick, Aldridge, Lewis, and Hitchcock also had fish. The competition for the club prizes will take place on the last Thursday and the last Sunday in the month. Conditions, anywhere on the Thames, bank only.—VORTEX.

HULL PISCATORIAL SOCIETY.

On the 31st of August, a meeting of this society was held at the Seven Stars, Fish Street, Hull, for the distribution of prizes won at Saxby Bridge, on the River Ancholme, the following being the winners thereof:—First, Mr. John Cheeseman; second, Mr. Robert Jackson; third, Mr. F. J. Hamlyn; fourth, Mr. H. Vinson; fifth, Mr. R. Speck; sixth, Mr. W. H. Barker; and seventh, Mr. H. J. Willett, after which the third match of the season was arranged to take place at Newport, on the Market Weighton Canal, on Thursday, Sept. 8, and on which day, the weather proving favourable, a goodly number availed themselves of the opportunity of competing, but, owing to the late rains, the canal had been run off, consequently the "takes" were below the average. The successful competitors were:—First, Mr. J. Cheeseman; second, Mr. J. Jagger; third, Mr. H. J. Willett; fourth, Mr. Charles Haldenby fifth, Mr.

Robert Speck; and sixth, Mr. T. Noble. The gentlemen who have succeeded in obtaining "points" in the President's Silver Challenge Cup, 1881 and 1882, and the Society's Gold Cross, 1881, are, up to the present time:—Mr. John Cheeseman, six points; Mr. Joseph Jagger, five points; Mr. W. Hague, two points; Mr. Robert Jackson, two points; Mr. W. H. Barker, one point; Mr. F. J. Hamlyn, one point; and Mr. H. J. Willett, one point.
Sept. 1881.

IZAAK WALTON ANGLING SOCIETY.

The members competed for three special prizes on Sunday last, the 11th instant, in the river Stort. Mr. G. Wood secured first honours; Mr. H. Butt, the second; Mr. E. W. Turner, the third. The weights for the third prize was very close, Mr. Turner being only $\frac{1}{4}$ oz. over Mr. B. Crook. Another competition for three special prizes took place on Wednesday, the 14th instant. Mr. J. Hilliar, jun. was first; Mr. G. Bliss, second; Mr. W. H. Mecham, third. Messrs. J. Hilliar, sen., and G. Bliss, will give two special prizes to be fished for on a Wednesday; conditions to be named on next meeting night.
Sept. 15.

JUNIOR PISCATORIAL SOCIETY.

The Junior Piscatorial Society held their first dinner on Thursday, September 8th, at Mr. Tagg's Island Hotel, Hampton. A fishing contest was entered into by twelve of the members for a prize, won by Mr. Palmer (their President) with about 3 lb. weight to spare. Contest commenced at 11 a.m. till 5 p.m.; time stated for weighing-in the fish, after which eighteen of the members sat down to a most enjoyable dinner, provided by Mr. Tagg in his best style, and after a harmonious evening the members returned to town. Since my last report, the weighing-in has not been much. Mr. Hewitt, fishing at Hampton, on 28th August; roach, 6 lb. 4 oz.; dace 1 lb. 2 oz.; Mr. Harvey, at Teddington on 30th August, roach, 10½ oz. dace 5 lb. 5 oz.; Mr. Woodman, same place, roach, 10 oz., dace, 6 lb. 4 oz.; Mr. Hewitt, at Laleham, on September, 1 chub, 2 lb. 5 oz., roach, 4 lb. 8 oz.; Mr. Palmer, at Hampton, September 5th, perch, 3 lb. 1 oz.; Mr. Palmer, at Shepperton, roach, 4 lb. 11 oz., perch, 12 oz.; Mr. Palmer, at Hampton, 2 barbel, 3 lb. 2 oz.—ALF. H. BISLEY.

THE LITTLE INDEPENDENT ANGLING SOCIETY.

The following members weighed-in fish on Sunday evening:—Mr. Hopton, from Ouse, bream, perch and eels; Mr. Petrie, Rickmansworth, roach; Mr. Grey, Rickmansworth, roach; Mr. Scott, Rickmansworth, roach; Mr. G. Watson, Maidenhead, roach and dace.—W. BROWN, hon. sec.
September 14.

LIVERPOOL ANGLING ASSOCIATION.

A competition took place in the river Vyrnwy, at Llanymynech, on Thursday, the 8th inst. This being the day of the visit of H.R.R. the Prince of Wales, H.R.H. the Princess of Wales and the three Princesses to this city, the muster was very poor, only sixteen members putting in an appearance. The waier was found to be low and bright, and dead against angling, and this, coupled with the thunder hanging about, caused the takes to be very meagre. On weighing-in at the appointed time at the Cross Keys, the winners were found to be Messrs. H. Wood, J. Evans, R. Ellinger, R. Smith, J. Cozley, and J. Travis, in the order named. The fish weighed-in were grayling, chub, roach, and dace, with which this river abounds. We have been most unfortunate in our club competitions, having had the weather and water against us on every public outing, which is somewhat disheartening; but the members must remember that this will not be always so, and that the next excursion may retrieve the past. The quarterly meeting will be on the 29th inst., when I trust every member who can will be present, as several important matters, including the date of the annual dinner, will be discussed, and it is not pleasant or encouraging to have a scant attendance on these occasions.—R. WOOLFALL, hon. sec.
September 12.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

Several members went out on Sunday last, and met with very good success. Mr. Meagus, roach from the Stort; Mr. Lucy, jun. roach from the Lea; Messrs. J. and G. Drew, with roach, perch and bream from the Thames. Mr. W. Longman arriving too late with ten pounds of roach from the Kennet.

THE PISCATORIAL SOCIETY.

The roach competition will take place on Monday, the 19th instant. Fish caught only on the Thames can be registered. For further particulars see Annual Book.—JAMES LANDER, Hon. Sec.

RICHMOND PISCATORIAL SOCIETY.

The barbel competition in connection with this popular suburban angling club took place on Wednesday last. There were two prizes offered, the first was won by the energetic president, Mr. F. C. Clench, with 14 lb. 4 oz. of barbel, and the second by Mr. G. Nafress with 9 lb. 12 oz. In fishing for barbel at Chertsey, Mr. Clench, for the first time in his life, succeeded in catching a brace of Thames trout, both of which he would have returned to the river as being out of season, but the larger one of about 4 lb. he handed over to Mr. James Forbes, of Chertsey Bridge, for fish-hatching purposes, as that gentleman has been anxious to obtain one in order to get some ova of the real Thames fish and it was very kind and thoughtful of Mr. Clench to remember it.

SOCIAL BROTHERS.

Not a great deal doing, the last two Sundays being bad for our banksmen. On the 3rd Mr. Lockyear, 4 lb. 8 oz. roach, 1 lb. 4 oz. dace. On the 4th, Mr. Underdown, roach; Mr. Goubot, roach and dace. On the 5th, Mr. Monk, 6 lb. 10 oz. roach and dace. On the 6th, Mr. Irons brought in a nice show of rudd from private waters, of 6 lb. 12 oz., and one tench. On the 10th, Mr. Lockyear, 1 lb. 8 oz. roach and a fine gudgeon, the largest our members have seen, and it has gone to be preserved; Mr. Pike, 4 lb. 10 oz. roach and dace. On the 11th, Messrs. J. Goubot and Bromhead managed to find a stray barbel each and a few roach and dace, while my hard working friend, Mr. Underdown, was unable to find a fish. Mr. Monk takes Mr. Briscoe's prize for gross weight for the first three months.—J. GOUBOT.

SOUTH LONDON.

On my return on Sunday evening, I met Mr. Sargent, who had been fishing Windsor. He had succeeded in capturing three nice barbel, the largest weighing over 6 lb.—PIXIE.

SURREY PISCATORIALS.

A competition took place to-day among the members of this society at Pangbourne, for prizes of the following value. 1st, £10 10s. 0d.; 2nd, £5 5s. 0d.; 3rd, £2 2s. 0d.; 4th, £1 1s. 0d.; 5th, £1 1s. 0d.; 6th, 10s. 6d. Reaching Pangbourne, weather beautiful, but water very clear and bright. Perch only taking live bait, gulgeon preferred; scarcity of this article among the members. Evening, all members got fish. Society's headquarters 10.45, just arrived. Result of weights, Mr. Meadow declared the winner of the first prize; Mr. J. Howard, jun., the second; Mr. Boalch, third; Mr. Beckett, fourth; Mr. Pugh, fifth; and Mr. Langlois, sixth. Mr. Pugh informed me that he received an invitation last week from Mr. Meadow to have a day's fishing in the Colne, and he succeeded in getting 11 lb. of nice roach, the largest going over 1 lb. 3 oz. Also Mr. C. Hoblyn, with T. Neale, of Henley, lost a nice jack, going about 18 lb., though not have a landing-net. I trust that Mr. C. Hoblyn will not forget the landing-net next time he goes jack-fishing. Members of this society are requested to bear in mind that the next competition will take place on October the 12th, on which occasion Mr. C. Banskback gives £3 3s.; Mr. Pugh, £2 2s.; and Mr. Wymer, £1 1s.—PIXIE.

September 14.

UNITED BROTHERS ANGLING SOCIETY.

The members of the above society met by invitation from Mr. A. G. Titley, the worthy host of the Swan Hotel, Kidderminster, to partake of a fish supper which was caught by him in three hours and a half. It consisted of six pike, weighing 36 lb., which fish was served up in first-class style, and gave the greatest satisfaction to all parties present, it being the first fish supper given to club members in this district. The fish were caught in the river Avon at Bredon, near Tewkesbury, and were landed by Mr. William Anderson, a well known fisherman in the district, who is always ready to assist any angler at Bredon, and point out the best place for angling. He can be found on inquiry at the well known hostelry, the Oak Inn, Mr. Grainger's, where every accommodation and very moderate charges, with every information as to angling, may be obtained. The house is situated within three minutes' walk from the railway station, and the river about ten minutes, so that every facility is given to anglers visiting there; there is plenty of fish, and of a large size, especially bream and chub. After supper a very pleasant evening was spent; Mr. John Taylor occupied the chair, and gave some very useful advice to anglers in reference to the greater preservation of fish generally, and do their utmost endeavours to put down netting, and promote honest angling. Several good songs were sung by Mr. James Redding, Mr. Foster, Mr. Hughes, Mr. Yarsley, as well as speeches from other members, concluding with a vote of thanks to Mr. and Mrs. Titley for their splendid gift by musical honours. Mr. Titley thanked all kindly for the honour done them, and said he hoped it would not be the last fish-supper that they should have the pleasure of providing.—EDWIN LAURENCE, sec.

WALWORTH WALTONIANS.

The competition which took place among the members of this society on the 11th, at Bourne End, for a work of art (£10 10s.), given by Mr.

Schwartz, 2 vols of a piscatorial work by Mr. Banskback, £1 1s. by Mr. Vicary, a felt hat by Mr. Sebert, 10s. 6d. by Mr. Bedford, and 10s. 6d. by Mr. Delehaye, was well attended by the members, thanks to Mr. Boalch the worthy secretary, and the Great Western Railway, the former for arranging with the latter for one of their two-horse omnibuses to take up those members at the society's headquarters who wished to go on Sunday morning. By this means several members were enabled to go, who otherwise could not have gone without rising very early, and getting worn-out before starting from Paddington, or else incurring the extra expense of a cab there and back in order to weigh their fish in time. Societies whose headquarters are some distance from Paddington, and whose members, when they have parties of 8, 16, 24, or 32, wish to travel on this line, would do well to communicate with the company. However, I will get back to the original. The members started from the society's headquarters at 7.30, they reached Paddington, thence to Bourne End, in good time. Here they were met by Messrs. Bayley, Brown, Dale, and Grigg, who led the way to "Ye Ancient Hall where weary travellers love to call." The host of which, I must say is not a 'midget.' "Mijn avon vu D. Lambert?" he is the nearest approach to that gentleman that I have yet seen, he weighing 240 stone. Notwithstanding his size he sells some very good ale, which gave great satisfaction to all present. Refreshment being done, the drawing for swims took place. No. 1 falling to Mr. Banskback, and 25 to Mr. Delehaye, the first being situated just past the boathouse, "Down where the water lilies grow," and the other some distance along the river towards Marlow. All members were restricted to tight-line fishing much to the disappointment of several who would much have preferred using their Nottingham tackle, one member especially, he having just received 1000 worms from Nottingham. However, all had to abide the rule, and towards the afternoon, between the showers, excitement began to rise, and rumour, with her many tongues, stated this member was well to the front, and then that member had just caught several large perch, and towards the end it was generally believed that Messrs. Cain, Bedford and Collins held the first three prizes. Time being called they all returned to the worthy host of the morning, where some partook of tea and others imbibed his far-famed ale. 7.35 saw them in the train and on their way to London, and at 9.30 in the company's omnibus, by which they reached the sweet village of Walworth safe and sound by 10.30. The weighing of fish commenced, and the following is the result:—First, Mr. F. Grigg, with 2 lb. of roach, dace, and gudgeon; second, Mr. Renault, 1 lb. 8 oz. roach, dace, gudgeon, and perch; third, Mr. Cain, 1 lb. 7½ oz. roach and dace; fourth, Mr. Collins, 1 lb. 3¼ oz. roach, dace, and perch; fifth, Mr. Bedford 11½ oz. roach and dace; sixth, Mr. Bayley, 10½ oz. roach; and Messrs. Fox, Evans, Howard, Peirson, and Delhaye also had fish. This brought to a close the competition, in which, like all pegged-down affairs, there was plenty of excitement, but very little fish. The next competition will take place on September 26th, for the following prizes, the conditions for which will be discussed on Friday evening next:—First prize, £3 3s., given by Mr. W. Brown; second prize, £1 1s., given by Mr. Russell; third prize, 10s. 6d., given by Mr. Ions.—PIXIE.

September 13, 1881.

AWARDED

SILVER MEDAL AND 2 SPECIAL DIPLOMAS OF HONOUR

For Improvements and General Excellence in Manufacture,

NATIONAL FISHERIES EXHIBITION,

NORWICH, 1881.

SATURDAY, SEPTEMBER 24, 1881.

BARBEL-FISHING.

MR. J. P. WHEELDON in his article on this subject, said that he thought we Trent anglers were too much wedded to the float, and said if we were to adopt the leger business we might succeed among the barbel much better. Well, perhaps, he was right in one sense, for I do believe the Trent fishermen do prefer using a travelling float to any other method of barbel-fishing, and I will show the reason why, but before I do so, I

will just mention a funny case. I have been with a gentleman barbel-fishing for the last fourteen years, and we together have successfully fished both Thames and Trent, and although my friend always carried a small bag containing cut shot, and corking weights, I never could persuade him to find room in his bag for a plumb* or two. He would say, "No! I have never used one, and I do not intend doing so. I dislike that method of barbel-fishing so much, that if I was compelled to use one, I should be inclined to give it up altogether. It would send me to sleep, and you would one of these fine days have to drag me out of the water." Well, so far as I am concerned, I have not used a plumb for a great number of years; but I must say, I generally put a few pike leads in my bag to only use when a place had been baited, and the wind happened to turn so contrary, that it was impossible to properly fish the place with a float, or when the water had unexpectedly come down too thick for the fish to see a travelling bait—these are the only times I throw lead in the water in the form of plumbing. I certainly have a dislike for it, and I have a good reason, for, from my long experience in barbel-fishing, I feel satisfied that the fisherman who can send a float properly down a stream, and understand what he is doing has twenty chances of killing fish to the leger's one, and I am prepared to prove it, and I will give a reason what in my opinion, is the cause of so many barbel fishers on both Thames, Trent and other rivers containing barbel preferring the leger to the float. It is simply this: there is such a wide difference between the two styles of angling for barbel, and the travelling float requires such a great amount of practice before the angler can successfully catch the fish that I have known many rodsters to give it up, because they could not succeed in doing the work to their satisfaction. There are, I know for certain, a great number of barbel fishers who have no more idea of the proper use of a travelling float than the rod they hold in their hands, the method altogether beats them, so there is nothing else they can do but throw a piece of lead in the water, and wait patiently until a fish finds the baits. He may, of course, occasionally take it out and throw it in another direction, but the same thing must happen, that is the bait must remain perfectly still on the bottom, and I think that unless the fish be very eager to feed, they will not go grubbing about to find a bait that has perhaps lodged between two stones. Now in fishing a place with a float where you can get a swim, say of twenty yards, the reverse of what I have stated is the case. We will suppose the angler is fishing a swim from the bank, and the place has been previously baited with a thousand of worms; if there is any stream it is impossible for the stuff to stop in one place—some of it will decidedly go down to a distance of 20 yards or more. Then before you start in the morning, you cut up say 50 lobs and throw them in a few yards above where you intend to stand to fish. And here the angler ought to know that the head-part of cut worms sinks the quickest, being the heaviest the middle part of the worm will go a little lower down, and the small bits probably to a distance of twenty yards, so that the fish have a chance of feeding all along the swim. You now send off your baited hook which is often taken as soon as it gets to the bottom, if not, you have still a chance half-way down the swim, should these fail you have still a last chance of hooking a fish at the end of the swim. This latter part of the business, however, seldom happens, when the fish are anything like well on, which is generally the case after a baiting. You hook the fish mostly for a time at the top of your swim, and after you have killed several fish the remainder get a little shy and drop lower down. You must, however, stand your ground and hook the fish at a distance, and land them where you stand. Now we will suppose two anglers are fishing the same swim, one with the leger and the other with a travelling float. The former will sit, say five minutes without a bite; how many swims will the latter have during that time? and he also has the chance of presenting his bait every time it is sent down the stream to a greater number of fish, therefore his chance of hooking a barbel is certainly greater than the one who is using the leger. Besides a bait when travelling is always more attractive than a stationary one, because it looks more like the groundbait you have thrown in, and which the fish stop while it is going down the stream. Perhaps the readers will understand what I have stated, and must see at a glance that float-fishing for barbel properly done is far superior and much more killing than fishing with the leger. In my next I shall have something to say on the danger of losing a barbel in a baited swim, and the consequence. W. BAILEY.

OLD SCOTTISH SALMON LAWS.

IN a recent number you printed a short paragraph on the above subject. Without being a narrow-minded or super-fervid Scot, I may fairly claim for my ancestors a great deal of homely common sense, and these laws are a case in point. The capital

* Plumb is the Nottingham name for the leger lead.

punishment was probably a *brutum fulmen*, but if not, it was neither more nor less than in keeping with an age when human life had not that sacredness it possesses in these happier times. The salmon, to a poor and in those days most imperfectly cultivated country, was invaluable. Every season brought it swarming up the rivers, affording a rich and highly nutritious food. That this food was most abundant is undoubted. Searches have been made in vain for apprentices' indentures, stipulating that they should not be fed on salmon more than some three days in the week (a popular belief, however, and quite accepted in my young days), but I can vouch for the fact that when my father was a boy the fishermen of Irvine, Ayrshire, every morning wheeled their "take" round the town and sold the fish at one shilling each, irrespectively of the size of the salmon. Nay more, if they found the owner of a house absent, a salmon was deposited at the doorstep, and it was left in the option of the householder whether or not to pay for it.

The "Satterdaie's Sloppe" gave the fish a fair chance of ascending to the spawning beds. "Sloppe" does not mean "stop," but an opening. It is in modern times termed a "slap." An opening into a field is a "slap," in which there may or may not be a gate. All obstructions to the free passage of the salmon were removed entirely during close time, and during the open season the "heckles" (racks) of the "cruves" were raised from six o'clock at night on Saturday until sunrise on Monday. This was the Saturday's slap. These "heckles" or "hecks" were also ordered to be of three inches in width between the bars, to permit the free passage of the younger fish at all times, and in 1477 it was *inter alia* ordained that "they that hes cruves in fresh waters, gar keep the lawes anent Satterdaies slop, and suffer them not to stand in forbidden time; and that ilk heck of the said cruve be three inche wide, and quha that beis convict thereof, to pay five pund" (*i.e.*, Scots, or 8s. 4d. sterling). If this meet the eye of any acute lawyer he will not need to be told that, at least to me, this phraseology seems very loose, and that the "convict thereof" appears to be threatened with a fine for keeping the laws and for having his hecks of the legal width. But doubtless the judges in those primitive times knew very well what they were about, and were little bound by precise words while they interpreted the spirit of their short and emphatic laws.

J. D. DOUGAIL.

GLEANNINGS.

By CREEL.

IT is now, alas! more than thirty years ago when in the North of Cumberland, following the course of the river Line, a tributary of the Esk, and after its many-headed springs among the sombre hills of Nichol Forest, in or near which the two affluents, the Black Line and the White Line join near Stapleton, I had reached the more level country not far from the ruins of Shank Castle, and had just determined to put my rod together when a black cloud collected over my head as if by magic, and a few large drops of rain falling prepared me for what followed. Down came the rain, not as well-conducted rain generally does and ought to do, but in a perfect block, and I, being but thinly prepared for a long walk, was soon perfectly saturated. In this condition I made for a bothy across a lonely moor from where I could see fitful puffs of wood smoke issuing before the wind. This I found was inhabited by a shepherd, his wife and daughter. The latter, a strapping wench of about sixteen summers at once, made me welcome, urged me to remove my wet coat, and replace it with a dry cloak of her mother's, piled more logs upon the hearth, and left me to doff yet further my wet garments and wrap myself, Indian Warrior fashion, in the folds of a blanket while my clothes got dry. Where she went to I knew not; but as she was gone some while, I looked around for something with which to amuse myself, and found in a nook on the ingle side, a few books, the reading of which, however, was not easily accomplished from the battered and disconnected state of their leaves. Printed books are never "private,"—if they are they should be burned; but here was one amongst them with a cover of parchment and clasps of metal, a description of family scrap-book, and into which from time to time anything worth preserving had been recorded, now in one handwriting, pretty plain to decipher, and now in another, which would have puzzled an expert. I peeped into it stealthily like a cat into a cupboard, then closed it, then peeped again. "If you will kill snakes and adders," I read, "strike them with a large radish." This was too much for me. I was deep into the book at once. As the serpent tempted Eve, so did the adder raise my curiosity, and all thought that my eyes might be trespassing over forbidden secrets, being dismissed, I arranged my blankets dressing-gown fashion, and gave myself up to the contents of "Ye Familie recepteboke."

Under the head of "The Adder" I found: "If thou art bit or stung by adder or snake, take the juice of the ashtree leaves, squeeze into good wine or beer, then cover the place stung with this, and it will cure it. To handle adders and snakes without harm. Wash your hands in the juice of radishes, and you may do it without harm. If those you love are sick, take the juice of vipers made into a broth, boiled in an earthen vessel and stirred with a stick of elder tree. The fat of viper is good for sprains and inward ulcers."

"The price of snakes should be one shilling for twelve; for vipers the same, but alive."

"To catch snakes or drive them out of your garden. Take the boughs of an ash tree, while the green leaves are on them, and where snakes or adders come strew them, and they will depart. Some burn old soles of shoes upon the place where they are, and they will be gone, and come no more. Some take the roots of centaury (the popular name of various plants, generally herbaceous) and carry where they come, and they will depart, or deers' suet strewed up and down. Wormwood will turn them. Smoke lily roots, or hart's horn, burning them in a frying pan, and pass it over the place, and they will come no more."

"How to kill moles" occupied three pages of the book. Here are two or three of the means to be employed:—

"Pour the juice of wild cucumber in their holes, and it kills them. Some pour the dregs of oil into their holes, and it kills them. Some take white hellebore, bruise it small, and mix it with wheat flour, white of an egg, wine and milk, and lay little cakes of it in the mouth of the hole, then the moles will eat it, and it certainly kills them. If you take a live mole and put her into an earthen pot, stop it close, then make a fire, and set the pot on it, and if there be any moles thereabouts hearing her cry, they will come together to the place, and you may kill them."

It is clear there was no notion at that period that the mole was the natural drain-pipe layer of the land, as well as an excellent top-dresser.

There were several equally cruel suggestions for the destruction of rats. Here are the more innocent:—

"Take wild marjorum, and burn it in your rooms. It will drive rats and mice away as long as the scent remaineth. Some take the head of a rat or mouse, and pull the skin off it, and lay it where they come, and it frights them that they will come no more."

The receipts were particularly rich upon weasels.

"If you would drive away weasels, catch a hedge living weasel, cut his tail short and let him run, and the rest will go with him.—Shakespeare. To gather together weasels into one place, beat the guts of a lizard in spring water, and pour it in such places where they come. Take wheat flour, sal ammoniac and honey, make these into a paste, and lay it in places where they come and they will eat it, and it immediately kills them."

"Fig-leaf ashes cast on the root of trees kill caterpillars. Some take a gallon of crabs (apples) and steep them nine days in water, and sprinkle the trees with it, and it kills them."

It would be a humane thing to discover any remedy for the pestering visitation which cattle suffer from flies. Hitherto all nostrums appear to have failed. Here are cures upon which the writer, as a shepherd, claims to have placed confidence.

"If you would keep your cattle from injuries by flies, anoint your beast with oil wherein Bakeler (*sic*) hath been boiled, and the flies will not come near them. Some anoint them in the beginning of spring with juice of carworden leaves, and that preserves them all that year. Take origanum and allum, heat them with milk, and sprinkle them in the place where they come and it will kill them. If you would gather flies together and hive them, get a deep earthen pot and lay in it beaten colliander, and all the flies in the house will enter it; then put a close lid on."

My host was clearly a bit of a poacher, for there were several devices for taking game.

"If you would take partridges, get wheat flour, and with good wine make it into paste, then roll it into pieces the bigness of a pear and scatter them where they come, and it will make them drunk immediately, and you may take them up."

A somewhat similar practice is recommended for taking wild ducks and geese, and there was the long list of nostrums for the capture of fish contained in ancient angling works. The following, however, we do not recollect to have met with before—

"Some take nettles and cinquefoil, and juice of houseleek, and stamp them together. Then take it into your hand, and go into the water, and stir your hand to and fro, and they will come to you that you may take them."

"If you would keep birds from fruit, hang garlick down the branches of trees or cornstalks, and they will not come near."

There are others than birds who share this aversion to garlick.

"To fatten chickens in a little time, take rice ground, and scald it well with milk, mix it with ground sugar, and give it to

your chickens in the daytime, but no more than they can eat. Give it them warm, and let it be as thick as paste, give them beer to drink, and they will be quickly fat."

The writing was obviously from various hands, and written at various times, and occasionally the same receipt was repeated from some other contributor, but they all appeared to delight in capitals, which began almost every word. Now and then I came upon a riddle or a conundrum, which gave a variety to the perusal, a hint that perhaps I may follow with advantage.

"What kings and queens, and their servants, be they that are burned once a year, and are cut and torn as small as flesh to a pot? They are the kings, queens and valets among a pack of cards."

"What is that which hath a beard of flesh, mouth of horn, and feet like a griffin? It is a cock—for his beard is flesh, his bill horn, and his feet like a griffin."

"What is that which is as high as a hall, as bitter as gall, as soft as silk, and as white as milk? It is a walnut; for it groweth as high as a hall, and its shell is as bitter as gall; the rind that covereth the kernel is as soft as silk, and the kernel as white as milk."

"What is that which is as small as a nit, and serves the king at every hit? It is salt."

"What is that, the more it is, the less men fear it, and the less it is, the more men dread it. It is a bridge; for if be little, we are afraid to go over it; but if it be big, we fear no more to go over it, than to walk on the ground."

"As long as I eat I live: but when I drink I die. It is fire."

Then the volume was interspersed with dreams and their import, too free for quotation, excepting that "To dream of little rain and drops of water is good for plowmen."

"To dream of cats is to be scratched by your wife or daughters."

Then several entries had been made concerning moles on the person, and the whole of the human form divine was mapped out with extraordinary fidelity. But I may not thus skip over the fleas:—

"Take lime beaten to powder, and strew it in you chambers. Some take two or three onions and soap lees, and boil them together then sprinkle the room with it, and it kills the fleas. Boil the root of wild cucumber to a pickle and do the same. Take mustard seed and the herb daphines, and boil them in water, and do the same. Take a roasted apple, and take the skin and core from it, and beat it in a mortar with as much quicksilver as will make it into an ointment, therewith anoint the places to which fleas go. To gather all the fleas together in a room. Get a small piece of wood as big as a man's arm, rub it over with hog's grease, and all the fleas will stick to it and then slay them. Some take a dish broad and shallow, fill it with goat's blood about half full, and set the platter under the bed, the fleas will come to the smell of blood, hop into it and stick."

Many virtues are there attributed to tobacco and ale out of number. "Tobacco chewed in the mouth, but not to swallow the spittle, is a universal medicine for the dropsy, and all otherswellings in every part of the body."

There are likewise many rules for health, which for the most part inculcate the truism that the best of all secrets for a long life is "to bring the appetite into subjection to reason," and one of the tenets says, "the difficulty is in finding out an exact measure; but eat for necessity, not pleasure; for lust knows not where necessity ends," and under the instructions to find out the measure of meat and drink it gives: "Pass not immediately from a disordered life to a strict and precise life, but abate by little and little the excess; for ill custom comes on by degrees, and so by degrees must be left off."

We recollect something like this argument being used, in reference to the indulgence in an excess, by a great physician, and it was well answered by asking the doctor, whether, if a child of his fell into the fire he would pull it out by degrees?

After this we found a list of "those we may not marry;" "our grandmother, &c.," and "what we ought to remember." Amongst the latter we are wisely told that, "He that will not refer all personal trespasses to arbitrators, but will rather go to law, is accounted an unreasonable man, and no christian."

Then we plunged into a very long-winded series of hints about the weather, in which the moon, the sun, the stars, the clouds, the mists, the rainbow, animals and vegetables take their share of occult meaning. "How to write a love letter from man or woman," and "offer of marriage from man or woman." "To bring a backward man to book." "To tell whether a maiden loves you by bots on a cow's back." "To bring a wished-for letter, go up the stairs backwards."

It is told elsewhere how in Russia the soldiers and peasantry are cured from a too great indulgence in their favourite liquor; by mixing the same with all the food they take until the stomach fairly revolts against it. The following appears to be a more

speedy and simple remedy. "Steep a snake in the liquor he (the inebriate) is most fond of, and let him drink unwittingly thereof, and he will not return to the same drink." If he sleepeth in drink before dinner, smear his face, hair, and hands therewith, whether dripping, porridge, or broth. He will wake and call to eat. You will tell him he hath fed like a pig and shall have no more, and bid him look in the glass. He will feel his wattle empty and it will correct him ever after.

The cures for warts are manifold, and I recognised many as still holding their own amongst even people of education. Who does not recollect the "stolen piece of beef wherewith to rub the warts and then bury the meat"? Here is, I fancy, a new recipe: "If one do buy warts of them that have them, and gave them a pin therefor—if the party that hath the wart prick the same pin in some garment that he wears daily or commonly, the wart or warts, without doubt, will diminish and wear away privily, and be clean gone in a short time." Beneath this was written: "I have tried it and found it true," followed by several signatures.

"It is well to know if you are overlooked by wise women (witches), you can cure yourself and others by squashing a toad under a flat stone, then tearing the hind legs off—don't cut them off—then dry them in the air on a line; when hard put them in a bag made of an old man's smock (frock), and hang it round the neck. If the good woman becomes uneasy this is a sure sign the charm is working; do not speak or answer her for three weeks, and she will have a fit, when all power over you will depart."

As the storm had left off and I had turned my clothes before the blazing embers until they were dry, I closed the volume (not a tenth perused) my note-book as reluctantly, left a coin on the parchment cover by way of atonement for prying, and departed again for the Line on my way, to which, I met the lassie returning with a bowl of milk she had hospitably gone some distance to fetch for an absolute stranger she might never meet again! When I arrived at Carlisle, during dinner I recounted my adventures and read out some of my notes. Before the week was over, the parchment-covered book, with its brass clasps and quaint contents, was resting on the library shelves of Netherby. CREEL.

A RED-LETTER DAY IN AN ANGLER'S DIARY.

AWAY down in sunny Somerset, through a charming valley of rich grass land flows a little brook which joins the river Brue, a short distance below the old-fashioned town of Bruton; it is well stocked with trout, which, though small, show capital sport as they rise freely and fight gamely when hooked. On a morning in the month of August, your scribe with another disciple of old Isaac were putting together our rods, and arranging our casts preparatory to a day's fly-fishing on a portion of this stream, which is well preserved by a gallant captain whose fine mansion and pleasure grounds are picturesquely placed on its banks. The plop, plop, of the rising fish told us some of the good ones were on the feed, and hastened the completion of our preparations. A red ant and a cochybondhu was the selection I made for my first essay; and creeping stealthily within reach, I cast over, and in the twinkling of a bed-post was fighting with a game little fellow of $\frac{1}{2}$ lb., which eventually was transferred to the basket. Shortly after a shrill whistle from my friend T. gave notice that he also required the services of our attendant with the landing-net. The small stream has been made the most of, dams having been built across it here and there, thus giving a piece of deep water above, and a brawling pool below. One of these I next approached and took from it three plump little fish of $\frac{1}{4}$ lb. each. T., the meanwhile, fishing a similar pool further down, contributed his share to the contents of the basket; so we angled on until the bright August sun, so welcome to the farmer, shone out hot, and for a time put a stop to our sport, or at least made it more difficult of success. T., who was a bit of a philosopher, and whose maxim was that it was useless contending against nature, consoled himself under the shadow of a fine elm tree with his pipe and some claret and water; but as I did not often get a chance of fishing such a well-stocked piece of water, and had journeyed some miles to do so, kept on, and by dropping under the bushes where the rays of the sun could not penetrate, picked up now and then a fish, but they were mostly small, and after I had worked off a trifle of my superfluous ardour came to the conclusion that T. was the wiser man. So we commenced an attack on the provision hamper and mooned away the time watching the well-fed cattle enjoying their midday siesta under the shade of the fine timber which adorned the landscape around us, or dozing to the music of the purling stream, until about four o'clock, when we pulled ourselves together and again commenced the fray. We fished steadily up the stream until we came to a fair-sized pond formed by one of the dams before mentioned; here our sport commenced in earnest, and the services of our netsman were in continual request. I have fished in many streams with the usual varied luck of an angler, but I

never before nor since saw fish so mad on the feed as on this evening; and in a short space of time we had filled our baskets, which we sent to the inn to be emptied, whilst we fished our way back to the park, where we were met by the keeper who advised our having a cast in the sheet of ornamental water which forms its boundary. Such counsel was not to be gainsaid, and we at once followed it. Here was a sight to gladden the heart of any fisherman, the whole piece of water, some three or four acres in extent, literally boiled with rising fish, but it was difficult to approach them without being seen, as a smooth lawn sloped gradually to the water, but by creeping cautiously we each got a good fish; but the disturbance caused by our struggling captives alarmed the remainder, and we had to wait some ten minutes before the wished-for dimples again broke the surface. We caught one or two more decent ones, then passed on to the stream below. The shades of even were beginning to fall, so we each substituted a coachman for our stretcher, and took a brace or two more. We then packed up our rods and betook ourselves to the inn, where on the low yard wall we laid out in graduated order our spoil, forty-six brace of trout ranging from $\frac{1}{4}$ to $\frac{3}{4}$ lb. each, and I need not say we were contented and happy fellows, and felt on good terms with everything and everybody; and I at once mentally resolved to mark this as a red-letter day in the diary of

RED ANF.

TO

MR. JOHN BARTLETT.

ON SENDING ME A SEVEN-POUND TROUT.

Fit for an Abbot of Theleme,
For the whole Cardinal's College, or
The Pope himself to see in dream
Before his lenten vision gleam,
He lies there, the sogdologer!

His precious flanks with stars besprent,
Worthy to swim in Castaly!
The friend by whom such gifts are sent,
For him shall bumpers full be spent,
His health! be Luck his fast ally!

I see him trace the wayward brook
Amidst the forest mysteries,
Where at themselves shy aspens look,
Or where, with many a gurgling crook,
It croons its woodland histories.

I see leaf-shade and sun-fleck lend
Their tremulous, sweet vicissitude;
To smooth, dark pool, to crinkling bend,—
(Oh, stew him, Ann, as 'twere your friend,
With amorous solicitude!)

I see him step with caution due,
Soft as if shod with mocassins,
Grave as in church, for who plies you,
Sweet craft, is safe as in a pew
From all our common stock o' sins.

The unerring fly I see him cast,
That as a rose-leaf falls as soft:
A flash! a whirl! he has him fast!
We tyros, how that struggle last
Confuses and appalls us oft!

Unfluttered he; calm as the sky
Looks on our tragicomedies,
This way and that he lets him fly,
A sunbeam shuttle, then to die
Lands him with cool *aplomb*, at ease.

The friend who gave our board such gust,
Life's care, may he o'erstep it half,
And when Death hooks him, as he must,
He'll do it handsomely, I trust,
And John H. write his epitaph!

Oh, born beneath the Fishes' sign,
Of constellations happiest,
May he somewhere with Walton dine,
May Horace send him Massic wine,
And Burns Scotch drink the nappiest!

And when they come his deeds to weigh,
And how he used the talents his
One trout scale in the scales he'll lay,
(If trout had scales) and 't will outsway
The wrong side of the balances.

J. R. LOWELL.

Elmwood, 1858.

THE NETTING FRACAS AT ABINGDON.

THE following letter, which will explain itself, has been conveyed to Captain Etheridge, the Board of Thames Conservators' Inspector of the Upper Waters:—

September 7, 1881.

To Captain Etheridge, R.N., &c.

SIR,—I am instructed by my committee to convey to you the sincere thanks of over 4000 or 5000 members of the affiliated metropolitan anglers for the action taken by you in the attempted netting, with a flue net, of the Thames at Abingdon on the 24th of August.

We are very sorry indeed to hear that you, while strictly doing your duty, were subject to insults.

We have had to thank you upon more than one occasion for preventing that worst of all engines, the net, from sweeping the grand old Thames of its finny inhabitants.

The London anglers, numbering over 20,000, will ever feel indebted to you, as will their provincial brothers.—I am, &c., T. HOOLE, Hon. Sec.

The Captain's reply to the above is as follows:—

To Mr. T. Hoole,

Hon. Sec. W. C. Association of London and Provincial Angling Societies.

SIR,—I have received, with great pleasure, your kind letter expressing the satisfaction of the London anglers at my conduct in preventing a late wholesale attempt of illegal netting by a notorious and desperate gang; and I beg to assure the societies, through you, of my firm intention always to do my duty in this respect whatever may be the consequence, and an expression of approval by so vast and influential a body represented by you is indeed a cheering incentive to carrying it out.—I am, &c.,

HENRY N. ETHERIDGE,
Superintendent of Upper Thames, &c., &c.

Our readers will be glad to hear that since the threat made by Mr. Phillips to oust the captain so soon as he, Mr. Phillips, was made a conservator, as he expected to be shortly, a movement, almost electric, has passed upon both sides of the river in additional favour of this gallant defender of anglers' rights. It may be new to many that the captain is no angler himself, but that upon his appointment a certain well known and active piscatorial writer, "interviewed" him, and ere he quitted his presence so imbued him with the importance of extending his attention to the fisheries—then really not greatly insisted upon by the authorities—that he promised to do so, with what result is now no longer a matter for question.

THE PISCATORIAL SOCIETY.

THE annual competition for roach in connection with this society took place on Monday last, and a considerable number of members entered themselves as competitors. The prizes were of a tempting character, the first being three guineas, and the second two guineas, with an additional prize of one guinea for the heaviest fish. The match was confined to the Thames. In the club-room at Ashley's Hotel, Covent Garden, there were at least fifty members on Monday evening eagerly waiting for the return of the competitors, but up to half-past nine o'clock none put in an appearance with any roach. Mr. David Goodger occupied the chair, and amongst those present were Messrs. F. G. Pearce, T. Gillatt, T. R. Sachs, James Lander, W. H. Brougham, H. J. Alfred, Henry Gray, M. H. Blamey, B. Perelli-Rocco, J. Beasley, W. Forman, Thomas Huggett, &c. It was late before any decision could be given, as several of the competitors had no fish that would come up to the standard of six ounces. The award was at length declared, Mr. Forman carrying off the first prize, and the prize for the heaviest fish, amounting altogether to four guineas, and his only fish were one of 14½ oz., and another of 7½ oz. Mr. Beasley taking the second prize with something considerably less. It is remarkable that in one place where two of the competitors were fishing for roach they did not get anything but dace, whilst the bank fishers close by were getting roach up to 1½ lb. each. A proposition was made in the club-room to get up another roach competition in November from public waters, and the sum of £3 13s. 6d. was at once subscribed. Two gentlemen were proposed for election.

THAMES FISHERY CONVICTIONS.

THE following convictions have been made under the new bye-law of the Lower Thames, which relates to the laying of night lines or fixed lines in the day, Mr. Hickson Briggs prosecuting on behalf of the Thames Angling Preservation Society.

At the Brentford Bench on Saturday last George Chamberlain and William Dunn, both of Twickenham, were charged with laying night lines in the Preserves, at Twickenham. The case was proved by Henry Walters, head river keeper of the T.A.P.S. The defendants were each fined in the sum of £1. This being the first case under the new bye-law a mitigated penalty was given.

At the Sunbury Bench on Monday last, William Essom was charged with laying a fixed line in the Thames at Staines, the said

line having on five hooks baited with worms. The case was proved by river-keeper Alfred Thompson, of the T.A.P.S. The defendant pleaded guilty on the ground of ignorance. Mr. Thomas Spreckley, who, with Mr. W. H. Brougham, was present, instructed the solicitor to ask for a nominal fine, as the society was only desirous of making an example, and as a caution to others. The Bench thereupon only fined the defendant in the sum of 15s.

THE LATE MR. H. L. ROLFE—A REMINISCENCE.

THE intelligent angler should be equal to most exigencies he may meet with at the waterside, and the inventive faculty be ever at his service in the midst of difficulties. In former days the angler made his own tackle, and therefore had additional confidence in the strength of his rod and line. There are few accidents more annoying than to find your rod part company at a ferrule, and see the dismembered joint follow the line after the fly.

Upon such occasions the ingenious disciple of Cotton, instead of indulging in bad expletives, which little harmonise with the surrounding scenery, accepts the situation in a philosophic mood, and sits down on bank or boulder, takes out his knife, thread and wax, and sets to work to repair the fracture as best he may. If he gets hung up in a branch of opposite bough, he exhibits no violence, for he knows that excess of temper will only make the matter worse, but recollecting that "persuasion is better than force," shakes the line gently, and it often drops off without further entanglement. In the case of getting fast in a sunken snag, his plan is, if the clearing ring is absent, to lay hold of the line and pull straight with a moderate pressure from all available angles. But a clearing ring should be considered as necessary to an angler's outfit as the plummet or landing net. It will, however, sometimes happen that even with the clearing-ring the removal of the hook is not readily obtainable. If this be the case, and wading is out of the question, the object must be to save as much of the line as possible. Therefore the strain should be put upon it as low as can be reached, for with many lines they are not worth much, nor can they be thoroughly depended upon, after they have been subjected to so extreme a test. In salmon-fishing nothing tries the temper more than a sulky salmon, which, after getting its head well down,—perhaps under a jutting piece of rock, obstinately refuses to move. In such a strait, when fishing in Scotland with the late kind-hearted Rolfe, he suggested I should try a sheet of paper. Taking a portion of the *Field* journal, he kindly operated for me. He made a hole in the paper, to permit the reel and butt end of the rod to pass through, and the wind being at our backs, assisted by a little shaking of the tackle, the paper messenger to the "obstinate beastie," as our gillie designated the salmon, travelled down and was carried under water, following the course of the line by the strength of the current. By the time—perhaps a minute at most—when it arrived at its destination, it was well saturated, and became in a pulpy, poultice-like state, which, covering the head of the fish, to the extreme astonishment of Mr. Salmo Salar, determined him, although thus hoodwinked, to change his quarters, and off he went, helter-skelter, he knew not where, but still subject to the curb and rein which was upon him, and perfectly cured of this description of piscine jibbing. I recollect, likewise, Mr. H. L. Rolfe, who was ever great in expedients, while pike-fishing with me at Stowford, near Salisbury, having lost his last flight of hooks, rigging up another with single hooks, cut from other tackle, but then he was for the moment posed, for what was to be done for a swivel? The swivel of his watch chain and the key of his watch were at once improvised, and fish came to bank as they had done with his highly-acquitted apparatus.

Mr. Rolfe, or "Le Baron," as he was known among his intimates, supported his father until in extreme old age the latter was removed by death. He was a most excellent husband and father, and while more a man of business than are most artists, his professional transactions, and as a picture dealer, were conducted in a way that gained for him the confidence of every one.

CREEL.

EELS!

"HOLLO!" says the diligent reader of the GAZETTE, "here's Keene talking about eels again!" and he forthwith votes me a bore, and refuses to read beyond the title of the article. But by your leave, fair sir, the subject is one on which I shall again and again hold forth, till I get a great deal more interest taken in it, for the unconsidered eel is an animal which cannot be ignored from any point of view. The utilitarian will pronounce him a very important article of food even in these days of fish scarcity and overcharge, and there are many little items of

its general history of considerable moment to the aqua-culturist and sportsman.

The subject is opportune at this moment also, inasmuch as that the eel about this time makes its downward emigration. On dark cloudy, rainy, warm nights its flitting is the most numerous. Atmospheric disturbance—Shakespeare notes this accurately, as he did everything else—seems congenial, and a warm thunder shower increases the vitality of the creature to such an extent as to render its desire for seaward migration almost irresistible. Acting on this impulse it swiftly pursues its way, and it is quite probable that a journey of an hundred miles might be performed, supposing no obstacle in the way, in a few days, so rapidly and unhesitatingly do eels travel on a convenient flood.

In the tributaries of the Thames, eel-nets are often used by the fishermen. I can recollect my father having splendid catches out of the little stream called locally the "Bourne," which enters the Thames near Chertsey. The Thames, unfortunately, however, is not fished in that way, and thousands upon thousands of eels are annually lost—absolutely and utterly lost—because of this. The quantity of eels passing down into the estuary of the river with the autumnal floods cannot be estimated, because of its enormity, and no effort in the lower Thames is made to catch them. On they go, over weir and through sluices, till the reeking filth of the sewage outfall is reached. Some, I imagine, die here, and others pass out to sea. It is obvious they cannot return higher than Teddington Weir, and it is therefore fair to say they are lost to the river for ever.

Now, I ask, why is this state of things allowed to go on when the remedy is so supremely apparent? Properly-constructed traps or bricks at each weir would capture nearly all the emigrants, and if by chance a different kind of fish were caught, why, it could be returned to the water. Besides, another aspect of the question presents itself. When the eels are chiefly running, the water is generally so inconveniently high and discoloured that the fishermen have no more work to do than frozen-out gardeners. Let certain men be employed in each locality to attend to the traps or bucks, and then let the catches be vended to the said fishermen for second sale. It is seldom that one can, in ordinary times, get a dish of eels from the Thames under a shilling a pound, and even then the fish are greater in demand than supply.

If a surplus eventuates, the London market is always open. Then an autumn and winter industry might arise from which good would arise to the professional fishermen particularly and the public generally.

So much for the eels of the Thames—than which there are none brighter and cleaner anywhere. Now for a word or two as to eel-culture. I think it need not be repeated that the eel is a fish spawning in a manner similar, if not exactly like, other fish; and that for this purpose it is not absolutely necessary for it to visit salt water. No one, I am sure, will gainsay the statement that the eel is an eminently desirable fish either, for the table. These facts being granted, we may pertinently ask: why is it not grown in a systematic way? I will tell you—all whom it may concern: It is simply because we Englishmen don't like trouble. "If our ponds and streams produce these *fera nature*, without trouble," say we, "let them do it, and we will profit by the fact, in so far as the results come to hand." But why should it be so? The most barren piece of water, if it be, or can be, made constant, is more productive than the best arable land, if its resources be used with intelligence. The practical application of these platitudes in this connection is: If you have a pond or stream, howsoever barren of fish, stock it with eels, and keep it clear of excessive growths of weeds. Eels can be fed with fresh offal or worms, and then they will never desire to roam to fresh fields and pastures new.

(To be continued.)

SNATCHING OF FISH.—In spite of all the efforts of the river-keepers, this disgraceful system is carried on, and it is difficult to prevent it, as all those who have authority to stop are known and watched. The following report of William Milbourne, one of the river keepers in the employ of the Thames Angling Preservation Society, is only one instance of the kind: "On Tuesday night, at one o'clock, I was at the sewers at Surbiton with John Milbourne and Palmer Scott. We saw two men snatching at the sewer. As soon as they saw us coming, they sent all their tackle in the river and ran away. I have got their tackle out of the river, which consists of a rod, reel and landing net. At the end of the line there are two large triangular hooks for snatching."—B.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Kedditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait, the tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

RIVER REPORTS.

MID-THAMES.

"The miserable have no other medicine,
But only hope."

—SHAKESPEARE.

Thames anglers during the past fortnight have had little to comfort, except hope, for, with the water seemingly in such capital all-round fishing condition, I never knew of, or indeed experienced (for I have been daily out), such execrable luck. Roach will none of it, and perch, chub and barbel seem almost as difficult to entice, but gudgeon have been fairly on. At Streatley and Maple Durham a few nice perch and chub have been taken, but in attempting roach it was found that two or three could be extracted from a swim, and it was then good-bye. From Henley I glean from two sources of the following:—Monday, 28 dozen of gudgeon with two rods; Tuesday, 23 dozen ditto with three rods; Wednesday (half a day) 19 dozen ditto; these capital catches being had by Messrs. H., C., and J. Hodges. Messrs. Craufield and Littlewood, fishing below Hambleden (one day), 23 dozen of good gudgeon. Mr. and Miss Pritchard, out with Parrott, 22 dozen and 8 gudgeon, one jack of 5 lb., and a perch going 2 lb., all being had from one swim near Culham Court. Mr. Pritchard, again out the following day with Parrott near Bolney Court, 7 jack, scaling together 27 lb. At Medmenham, Captain Smith a barbel of 4 lb., taken foul whilst perch-fishing with minnow. Mr. Troupe, a barbel of 4 lb. and some chub. Messrs. Jarvis and Bunning, some chub and perch. Young, with two patrons, on one occasion, 5 barbel, best 4 lb., and 18 perch; and on another day 32 dozen gudgeon. At Hurley, Messrs. Lee, Harrison, and Co. have had some splendid quality roach, and an eel of 2 lb. Tom White, at Newhock Weir, a jack of 7 lb., which took a deal of reed mowing to get out. Mr. H. Thompson has been deserving success in the Hurley waters for this week past, but, beyond one jack of 5 lb., and another of about 2 lb., and a few roach and perch, has done little. Mr. Thompson on Thursday, while out with a friend (Mr. Fitch), became so tired of swim after swim without any roach result, that at last he fell asleep, to be eventually awake by the cry of "Thompson, you've a bite!" and to find the roach well on, and to land a nice one of about 1½ lb. Need I say that, while Mr. T. was napping, his friend, "like a nice," obtained a fish from the well and inserted it on the hook? Mr. T. was, and will be, perfectly innocent of the joke until he sees this in print. At Marlow, Mr. Phelps, with White, some 30 barbel, none, however, very large. H. Rockwell has been having some roaching with a patron, on one occasion getting some 18 dozen, the take dwindling down daily until nine fish alone rewarded a long day and journey. At Bourne End, Brown has had the fortune to capture a jack of 15 lb., and also another of 9 lb.; and at Cookham on Monday, Mr. Wigg got a jack of 16 lb. 2 oz., which, from its length (42 inches), should certainly have scaled some 6 lb. or 8 lb. more. Mr. Grazebrook is also credited with a 7 lb. jack, and Mr. Worboys, of the "Bell and Dragon," several decent fish from the same waters.

THURSDAY EVENING.—River in good trim for any seasonable fishing. Weather delightfully fine, with breeze from south-west.—MARLOW BUZZ.

Thames (Goring).

Water very low and clear; not much doing since my last report. Roach not on much—weather has been too fine for much fishing. Rain is wanted now. Gudgeon have been biting well here. Twenty dozen a day with one rod have been taken here and some good perch. My best day was on Tuesday, two jack—largest jack over 5 lb.—and some good perch.—JOHN RUSH.

Since sending my last report the weather has changed. Jack and perch have been biting well. I have been out to-day (Thursday) and took some good perch; largest perch 2½ lb., and 1 perch 2 lb., and a gentleman and lady who were jack fishing took 32 lb. of jack, largest jack 15 lb.—J. RUSH.

Thames (Halliford).

The late rain has improved the river very much, and is now in good order for all-round fishing. Different gentlemen fishing with me four days, their takes were as follows:—1st. day, Mr. Green, 3 bream, 1 barbel, 2 chub, and 22 roach, (legering); 2nd. day, Mr. Warner and friend, 3 barbel, 1 dozen roach and dace, with gentles; 3rd. day, Mr. Long, 1 barbel, and a dozen nice roach; 4th day, Mr. Geo. Palmer, 4 barbel, 1 roach, and a dozen fine dace, (legering).—GEORGE ROSEWELL.

Thames (Kingston).

The river is low and clear, and almost all the fish feed at times. The weather has not been two days alike for some time, and I do not think it will at least for some few days to come. We have been mostly jack-fishing. I got broke nine times in one day, next, five fish; Mr. A. Nuthall in a few hours, best 8 lb. A curious case happened to him, getting two jack at the same time, and getting foul in sunken tree, lifted the tree and saved the fish. John has been jack-fishing, four, five, and six at different days, best 7 lb. 6 oz. Some private boats have caught one or two. A private boat caught five barbel, best 6 lb. 2 oz., and a few good chub. John's best day with Mr. Bond, of the Sun Hotel, Kingston, was four fish, the best 17 lb. 4 oz. He was a fine fish. There has not been much done on the banks, the water being so low and clear.—JOHN JOHNSON.

Thames (Richmond).

The rain of Tuesday night—and it is raining at time of writing—will improve the river very much. The water was getting as clear as filtered water, and the fish were very shy; in fact, there were few fish caught within fifteen yards of the punt, but with all the energy of our puntsman they have given their patrons all their skill, and opened a few of their eyes in the matter. The Nottingham buckle can be used in bright water, and it affects every man. I have been out, I think, every day, and have caught from two and a half to five dozen roach each day with a barbel and a perch. Occasionally there has been upwards of 100 perch taken in this last six weeks, and they would average quite 1 lb. each. I had very bad luck this afternoon, after playing with a fish for over one hour. He got foul of a stump, and I broke the tackle and string to clear it, as we never saw the float after the time we hooked the fish till he was gone, I think he would have been one for Cooper to preserve.—JOHN BUSH-NELL, fisherman.

Thames (Twickenham.)

Wind south-west, rainy; water in good condition for all-round fishing. I am pleased to say the takes of fish are still improving, both in size and quantity. Mr. Cook, of the Star and Garter Hotel, St. Anne's Hill, Wandsworth, with spins took 20 lb. of fine roach and dace and two barbel, and one day with Mr. Swaby and friend 18 lb. of ditto and two barbel, and Mr. Curtiss 16 lb. of ditto; Pert Hammerton one dozen, Mr. Howse and Goodwin seven dozen, Captain Smith eight dozen, Captain Moss 18 lb. two barbel. George Coxen, with Mr. Hancock, of Tunbridge Wells, took a nice basket of fish in six hours, also two fine barbel, and Mr. Brown six dozen and 1 barbel. Joe Dobbin, in three days, 36 lb. and two barbel. The tide will suit for a whole day's fishing next week. N.B. I am sorry to have to remind my customers again not to take any notice of reports that appear in the *Referee*, as the correspondent is entirely "boycotted" by all Twickenham fisherman.—ALFRED PERRIN.

Thames (Windsor).

Water in very good order, though rain would improve and heighten it. Sport in the neighbourhood has been fair. Jack have been running, though not very large, two best fish going just over 6 lb. each; several small ones being had. In places barbel have been feeding. Sunday, Paice, of Etonwick, had thirteen barbel and one jack, 9½ lb., which was fouled with the worm tackle in Boveney Weir. At odd times, before breakfast and in the evening, I have been trying the barbel in front of Windsor Bridge, about ten yards from second buttress, and found them at times well on—taking since my last seventeen fish. Monday evening, with a customer, we found them well on, and in three-quarters of an hour had seven very plump fish out of it, darkness preventing us from fishing—though small, being only about 15 lb. weight, all the fish, with the exception of one, have been in splendid condition. Lumsden has had another bream, at Surly Hall, going 5 lb. Roach have been had in good bags where fine tackle has been used, especially from the old river. Gudgeon are still biting very free, though but a few punts have been out for them.—B. R. BAMBRIDGE.

Ancholme.

During the recent fine weather many good catches have been made, both by residents and visitors. Boiled wheat has been a good bait. I have been too busy this week with the land question—surveying—to pay much attention to the waters, but I hope to run over myself in a few days to see what the pike say. Thus far only a few have been caught, and they have been generally very small—two or three-pounders.—THOMAS FORD.

Barle and Exe (Dulverton).

These rivers are rather low for the time of year, but still are in fair condition for angling, and should the weather continue fine, we shall have at least a few days' more sport. Some very fine baskets. A trout has been taken during the past week with fly and minnow. The flies killing, the best being the female blue upright, the hare's ear, red ant and silver twist. Very few salmon have come up, and none have been caught here since my last report.—W.

Burnt Mill (Essex).

On Sunday last the water was in splendid condition after the storm in the morning. A splendid show of roach and trout was taken in one day's sport, also a splendid show of gudgeon and chub taken by J. Shimeild and Mr. Machin, jun.

Dove (Ilam).

This river is still low and fine. We could do very well with a fresh. The small blacks are still out on the water in force, and they are very troublesome. In both the main river and the tributaries the Derby killer is still "fetching" the big trout. I was glad to see an appreciative notice of this lure in the GAZETTE last week. It has been many times referred to previously in my notes under the title of the "Derby Kill Devil," by which name it is also known. Plenty of chub have been killed during the week with wasp-grub and 1 scratching, and grayling have been nicely on at the maggot as well as the fly. Roach have now got into the reed beds, where they should be fished for and nowhere else. Some capital baskets were obtained on Saturday at Rocester, while rodsters have also succeeded well at Uttoxeter.—THE SPLODGER.

Ilfracombe (N. Devon).

I have not heard of any freshwater fish being caught since my last report, and in sea-fishing there has not been such good catches with hook and line this week as last Friday and Saturday. The best catches were from 20 lb. to 40 lb. per boat per tide. Monday there were some fine codlin caught, weighing about 6 lb. each. Tuesday, all boats out, their catches varying from 10 lb. to 30 lb. each boat of whiting pout and codlin. The trawling skiffs fishing in Barnstaple Bay caught more soles and plaice than they have any week for the season. A fine ling was caught off the jetty, weighing 16½ lb., with hand line. There has been some fine pollack caught this week with rod and line from the pier and the rocks off the Capstone Parade. Wednesday, blowing strong from the south-west, so there are very few fish caught, best boat about 10 lb. Thursday, moderate, I saw some fine strings of fish taken along with a few small conger eel. Bream appear to be going, there have been very few caught. Prospects of fishing good for the next few days.—E. COMER.

Medway (Tonbridge).

The rain has made the water somewhat heavy, but in good condition for angling. There has been during the week some excellent sport. Mr. Isaac Buley on Monday took a large perch, a grand eel, and a splendid perch below the town. Mr. B. St. J. Wagborne has been amongst the jack, and Mr. Russell Owen has also been having some sport. Mr. R. A. Dallas Beeching has had

some grand bream and roach-fishing opposite Tonbridge Castle on Monday and on Tuesday he took an eel weighing 1½ lb. On Wednesday the weighing-in club had a competition near the railway bridge 'at Barden. Everything appeared favourable, but the fish were not on the feed. Only the first prize was taken, and that with three bream and a single roach. Mr. Owen hooked two pike with a worm during the contest. The first one he landed, but lost the second, which was a grand fish. To show the perversity of the finny tribe, the next morning an angler, on the same part of the river, grassed a splendid basket of bream, and a jack of 4½ lb., which he took with the tail end of a lob-worm on a gut bottom. The prospects of sport, if the weather continues fine, look well.—YE MEDWAY WATER RAT.

Ormesby Broad.

My friend, Mr. C. P. Wheatstone, the respected president of the "Stanley Anglers," writes to me from the Angel Hotel, Great Yarmouth, "Just a line, to tell you of some good sport we had at Ormesby on Friday last. Mr. Elliot, of this town, and Mr. Fowler, of Manchester, and myself, had 144 bream. Three of these fish turned the scale at 3 lb., and there were many between 2 lb. and 3 lb. We took nearly all the large ones with Nottingham lobs, and in the early morning. I am just off now to Ormesby to stop at the Eels Foot (which, by the bye, I found very comfortable last time), with a thousand splendid Nottingham worms, to try my luck to-morrow. We are taking some nice whiting, gurnards, balts, and a few codling, with rod and line, off the Britannia Pier." During my visit into Lincolnshire, I was glad to notice the arrangements of getting to the Broads from Petersborough. By a union with the Great Northern, the Great Eastern and the Midland Railways, both Yarmouth and Lowestoft are reached in through carriages in about two-and-a-half hours. I pointed out this attractive facilities to some of the Lincolnshire piscators, and who have since willingly availed themselves of getting to the Broads for some good fishing. Since the above was written, Mr. Wheatstone has sent me the result of his second day. It was 242 bream, the largest 3 lb. 2 oz.; and, in addition, Mr. Fowler caught a perch of 2 lb. 13 oz., which has been sent to London for preservation.—B.

The weather for the past week at Ormesby has been very fine, and the fish have been well on the feed, fishermen having a good time of it with baskets of fish from 10 lb. to 28 lb., the most successful fisherman being Mr. J. W. Adamson, of Great Yarmouth, with 15 stone of bream in three days—Monday, 19th, 57 bream weighing 91 lb., six of them scaling 18 lb. 4 oz.; Tuesday 20th, 47 bream, weighing 76 lb., seven of them turning the scale from 2½ to 3 lb. 1 oz.; Wednesday 21st, 29 bream, weighing 41 lb., and one jack 3 lb. All the bream were taken with marsh worm and gut lines. If any of the readers of this valuable paper are coming to Ormesby they will find the water in splendid condition.—S. RICHMOND.

Rye House (Lea).

The water is very bright. Several fishermen have been down, but no fish taken. The wind west and cold.—WM. COWELL.

Severn and Teme (Worcesterhire).

These rivers are in excellent order for angling, either with the fly or the long tackle, at the fords or swims; in fact, it is all the true sportsman can desire. There is a good supply of fish up now, and the prospects are good for autumn fishing; many good baskets of grayling, trout, dace, chub, perch and roach, but all agree that eels are scarce this season. I have not seen a good take yet of that most beautiful flavoured fish the silver eel. Mr. Wm. Hopkin has taken in two outs 2½ brace of grayling and near 12 lb. of white fish; Mr. A. Bosworth, five dozen of roach and a few large chub; Mr. F. Hopkins 1½ brace of grayling; Mr. Guillian 4 brace; Mr. B. Smith and Mr. A. Davis caught very large baskets of grayling, some fish weighing 20 oz. each. The flies for this and the next month are the pale blue, willow and red ant; some large fish are taken with the grasshopper. Trout fishing closes with this month, and the members of the Boughton Club, also the members of the City Club will close their scales for weighing trout, and sit down to their half-yearly dinner early next month.—JOHN A. GRIFFIN.

Suir and its Tributaries (Clonmel, Ireland.)

The following is a copy of the application which is to be sent to the inspectors of Irish fisheries:—"We the undersigned salmon and trout rod-fishers of Clonmel and its vicinity, beg respectfully to protest against the season being closed so early, and would ask you to call a meeting at your earliest convenience to enquire into the matter. It is the opinion of some of our most experienced anglers that October is one of the best fishing months of the year, for both salmon and trout, there being a fresh run of fish during that month which take freely, and if the season remained open until the first of November, it would encourage a good many more anglers to take out licenses, and add greatly to the preservation of the river from poachers. It is a well-known fact that the spawning fish do not run earlier than the second week in November." We have already about seventy signatures to it, amongst them some of the most influential names in the county. We understand that the rod-fishers about Cahir are also sending a similar application.—DORA.

Swale.

Operations on this stream are now drawing to a close. The season ends with this month. The falling temperature is sweeping away all but the very hardiest of aquatic flies. The needle brown (willow fly), however, continues upon the waters in full force and best perfection, but the recurrence of rain once more makes against fly-fishing. Natural fly-fishing is also ended.—THOMAS FORD.

Trent (Newark).

The water has been in capital trim all the week for all round angling, and the weather up to to-day has been all that could be desired, and sport has been pretty good, some of our rodsters having pretty good bags of various fish. Mr. Cubley had about six dozen fine roach in two afternoon excursions to the river side; Messrs. Longdon and Bulman had good bags of roach on Monday, all these fish being taken with the creed malt—in fact, some very good lots of roach have been had with creed malt this week. Chub have been taken in fair quantities from various swims up and down the river, the wasp grub being the most fatal attraction for these fish. I have heard of a few barbel and bream having been had with worm, but a big catch has not come under my notice this week. The best general bag of fish that I have heard about this week was had by Mr. Bulman last Monday, when he had three dozen roach, about half a dozen chub, and his basket was topped up with three fine pike weighing 27 lb., the biggest weighing 13½ lb., the whole of his catch weighing 4 st. Weather to-night is very wet and cold, and the wind in a nasty quarter; and, to tell the truth, I don't half like the look of the prospects for the next four days, unless a great

alteration occurs in the weather. Anglers who try the roach might take a little creed malt with them, but I think gentles and cockspur worms will be a better bait than malt under the present circumstances, notwithstanding that malt has killed some good bags of roach this week. Worms, I believe, will be found the best general bait just now, considering the present state of affairs; but I have mentioned the most killing baits that have done the most execution this week, and so anglers can have their choice. To-night the water is in capital condition, the weather in bad condition, and the hopes of the angler in a worse condition than either; but hoping against hope, there may be better weather with the dawn of another day, and the angler will not have to gloomily exclaim, "Sic transit gloria mundi."—THE TRENT OTTER.

Trent (Nottingham.)

Anglers as a rule have very queer ideas, which, when firmly fixed take a deal of convincing to the contrary. More especially does this happen among the jack fishers, who seem afraid, or do not care to commence pike-fishing before October; which I think is going a little too far, because we know that pike spawn at the end of March, and surely five or six months is sufficient time for them to recover from the effect of spawning, and be in proper condition to be angled for. There is not a doubt about this being correct; as at the latter end of last week a gentleman fished a noted spot up the river with a spinning bait and succeeded in capturing 55 lb. of jack, the largest, 11 lb., all of which were in prime condition. The water has been in splendid condition for barbel fishing, and the weather, with the exception of an occasional shower of rain, has been all that could be desired, though, as a rule, the fish have not bit well. Several places were baited with worms, and the result was eight and nine barbel, which was hardly enough. The last item of news received from Shardlow, W. Bailey, jun., with a gentleman, after a small baiting of worms, took thirteen barbel, the lot weighing 50 lb., this is, so far as I know, the best catch of the week. Chub have nearly refused to take worms altogether, but the wasp grub has proved a very deadly bait, the fish taking them unusually well. One angler in about four hours hooked out 55 lb., some of them going 3 lb. and 4 lb. each, maggots were thrown in for groundbait. Roach still refuse to take malt and wheat, but take kindly to maggots with a little bran and bread for groundbait. River still low and clear, with every prospect of good sport, if the angler will only watch what the fish are taking.—W. BAILEY.

Wye and Derwent (Derbyshire).

Sporting on all of the Derbyshire rivers has been first class up to yesterday (Wednesday), when we had a heavy thunderstorm, which discoloured the rivers, and completely took the fish off the feed on Friday last. Mr. C. Wesley took 9 brace of large fish on the Wye, in the Rowsley Meadows, all with Eaton's small honey dum bumbles. Then, on Saturday, A. N. Bromley, Esq., of Nottingham, killed 15 brace on the Dove, every fish killed with Eaton's yellow dun. On the same day, 10 brace of grayling where killed on the Derwent, near to Whatstandwell, with bumble and red flies, and baskets from 7 brace to 9½ brace per angler have been made on most parts. Gayling have been rising well, and those anglers who have had the proper flies have done well. I am sadly afraid the weather has set in for a lot more rain, as the barometer is very low, and we have had a deal of rain fall this afternoon, Thursday. The bottom fishers have done fairly on the Derwent during the week, chiefly with maggots and small red worms, killing both grayling, trout, and a number of coarse fish. The leaves are getting very troublesome to the fly fisher on both streams. Graylings are now in most excellent condition, and trout are going out of condition fast.—GEORGE JAMES EATON.

SCOTCH NOTES.

LADY ANGLERS.

WALTON CLUB.—The last competition of this club took place on September the 16th. The prizes were as follows:—First, Mr. R. Scott; second, Mr. Potts; third, Mr. MacRitchie; fourth, Mr. Grant. Mr. Scott, heaviest trout and best half-dozen.

THE TWEED—KELSO.—During the week salmon angling has been engaged in with some success on various casts. Net fishing having closed for the season, salmon have free passage up the river, and already a considerable number of fish have been seen, grilse being much more numerous than for some years back. Between five and six o'clock on Tuesday evening, his Grace the Duke of Roxburgh, fishing in Floors Castle upper water, killed two salmon, which weighed 22 lb. and 14 lb. respectively, and five grilse. The Duke and Duchess of Roxburgh angled in the same water on Wednesday, and his Grace killed four, while her Grace killed two salmon. In the Mertoun water, the Hon. H. Brougham killed a grilse on Wednesday, and one on Thursday. Yesterday Mr. Drummond, Ednam House, caught a grilse of 9 lb. in the Junction water.

STENNESS LOCH, ORKNEY.—Very good sport has been enjoyed lately on this loch by tourists, who are yearly visiting the place in larger numbers. On Saturday four of these visitors had good baskets considering the day, landing about 15 lb. of trout. The following are a few of the baskets caught lately:—One rod, 30 trout, average weight ¾ lb.; another rod, 32 fish, 14 of which weighed 29 lb. From a dozen to twenty fish have been a common take. Sea trout seem pretty plentiful at present, and the other day two fine fish were landed with the rod, the one weighing 2½ lb., and the other 5½ lb. A large number of these and heavier fish are killed with the net. A goodly number of lady fishers have visited the loch during this and last season, and one of them—a young lady from London—killed 72 fish with the rod in one day. Although nets are still being used in the loch, the "otto" has been but seldom seen this season. As showing the number of strangers who have been on the loch this year, it may be mentioned that one fisherman, who keeps a canoe and boat, has had no fewer than 116 visitors since the 12th of June. These were from all parts of Britain, and included the Duke of Marlborough and Duke of Roxburgh.—*Scotsman*.

THE angler, I think, dreams of his favourite sport oftener than other men of theirs. There is a peculiar excitement in it, which perhaps arises from somewhat of the same causes which make the interest in searching for ancient treasures, opening Egyptian tombs and digging into old ruins. One does not know what is under the surface. There may be something or there may be nothing. He tries, and the rush of something startles every nerve. Let no man laugh at a comparison of trout-fishing with antiquarian researches. I know a man who has done a great deal of both, and who scarcely knows which is the most absorbing or most remunerating, for each enriches mind and body, each gratifies the most refined tastes, each becomes a passion unless the pursuer guard his enthusiasm and moderate his desires. It is nothing strange that men who throw their flies for trout should dream of it.—W. C. Prime.

ANSWERS TO CORRESPONDENTS.

C. P. B.—We should recommend you to try Maidenhead, and if you can engage the services of Harry Wilder, as fisherman, he will give you every information.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

TROUT TAKING PASTE.

SIR,—Yesterday I received a letter from a friend who is away in Derbyshire doing a fortnight's angling, in which the following occurs:—"Sport on Monday very indifferent; took scarcely anything all the morning, so gave up the fly at noon. Having brought a little bottom tackle with me, I rigged up and made myself comfortable beside a fishy-looking creek running about thirty yards inland, with a sharp spring joining it at the end. I sat nearly half an hour, and was just beginning to despair, when—tug! strike! got you! and after much plunging and rushing I landed—what do you think?—a beautiful trout of three-quarters of a pound weight. I took two more of similar size after this at intervals of about three quarters of an hour, all, strange to say, with paste, but did not see a roach all the afternoon."

Now, as I never before heard of trout being taken with paste, I should be glad if you, or some of your correspondents, will inform me whether this is not very unusual, and if you consider there is anything in this new bait that would encourage trout to take it, or if these three were taken merely by accident.—I am, &c.,

273, Regent Street, W., September 16.

[It is unusual to fish for trout with paste, but trout are almost omnivorous. We heard of a fine Kennet fish being taken with a piece of fat bacon the other day. Fish are certainly attracted by scent, and the scent in Mr. King's bait may prove attractive to other fish than roach.—ED.]

G. MARRIS.

DIMENSIONS AND WEIGHT OF TROUT.

SIR,—In the description of a day's trout fishing in the Colne at Denham, given in Sir Humphrey Davy's "Salmonia" is to be found the following as to the dimensions and weight of trout:—

"Haliens.—Oh! no, he is, I think, above 5 lb., but not 6 lb.; but we can form a more correct opinion by measuring him, which I can easily do, the butt of my rod being a measure. He measures, from nose to fork, a very little less than 24 inches, and, consequently, upon the scale which is appropriate to well-fed trouts, should weigh 5 lb. 10 oz., which, within an ounce, I doubt not, is his weight."

"Physicus.—Oh! I see you take the mathematical law, that similar solids are to each other in the triplicate ratio of one of their dimensions."

"Hal.—You are right."

"Phys.—But I think you are below the mark, for this appears to me an extraordinary thick fish."

"Hal.—He is a well-fed fish, but in proportion not so thick as my model, which was a fish of 17 inches by 9 inches, and weighed 2 lb.; this is my standard solid. We will try him. Ho! Mrs. P.! bring your scales, and weigh this fish. There, you see, he weighs 5 lb. 10½ oz."

I have no doubt that Sir Humphrey was right, but I must confess that I cannot, taking weights of ¾ lb. and upwards, now work it out satisfactorily.

Probably many of your numerous trout fishing correspondents have made notes of the dimensions and weight of trout taken in the course of several years. If one or more of them would kindly send you some notes for publication, they would prove both interesting and instructive.

A standard weight for angling societies does not work well in practice, as so few members carry to the water-side the necessary weighing machine, they will, therefore, proceed by guess-work, and probably some member always gives himself the benefit of a doubt; unpleasantness is the result.

Our standard weight is ¾ lb., but it would be much more satisfactory if the length of a well-fed trout of that weight could be adopted as the standard; this length cannot be taken from a single specimen for obvious reasons, but the mean of several specimens must be taken.—I am, &c.,

Gaywood Road, King's Lynn,

September 15, 1881.

H. BRADFIELD.

[Some time last year or the year before, this matter was referred to in the FISHING GAZETTE, and an algebraic solution of the problem given.—ED.]

BOARDS OF CONSERVATORS AND ANGLING LICENSES.

SIR,—I have enclosed a report of the Severn Fishery Board's meeting, with the object of ascertaining the opinion of some of the readers of the FISHING GAZETTE upon the subject. You will see that they get £297 on account of the power that the Home Secretary gives them under a clause in the Freshwater Fishery Act, to charge for rod and line, licenses for trout, nets, night lines, traps at weirs, and other instruments. Now, for all this cash, there are no extra keepers on in the Worcester district. You see by the sum of £230 for rod and line licenses at 1s. each, it shows 4600 anglers who are willing to help to pay for the protection of the fish during fence months, and it is with great regret we notice that there are no extra watchers in the pay of the Severn Fishery Board. There are often strong remarks made in Worcester as to the way the money is spent, it is really public monies and a public question; and I should like to see one or two practical anglers upon the Board. I really think when near £300 is paid by them, they should have a voice in the matter. Perhaps some one more acquainted with the subject will give it, or, rather give us, the anglers, some information. I ask these few questions for the purpose of ventilating the subject. I enclose a copy of the last report.—I am, &c.,

JOHN A. GRIFFIN.

Portobello Inn, St. John's, Worcester.

[This is an important matter, and we trust anglers in various parts of the country will take it up. At least some thirty or forty thousand trout licenses are now taken out by anglers and, as Mr. Griffin remarks, their interests ought to be considered, as well as those of the salmon fisheries proprietors. Watchers ought to be on the water all the year round, and not merely "put on" when salmon are in the rivers. There is one great advantage these licenses give, they entitle the holder to stop poaching, and the Board which issues them is bound to prosecute, even if it is only a trout river.—ED.]

FISHING AT STOCKPORT.

SIR,—Could any of the many readers of your valuable paper kindly inform me if there is any fishing near Stockport, and if there is any fishing club in that locality, and you will greatly oblige,
A STRANGER.
September 18.

PRUSSIAN CARP.

SIR,—I should be glad to receive through the medium of the FISHING GAZETTE from some reader any information respecting the haunts, habits, and method of taking the Prussian carp.

If you will allow any gentleman space to give me full particulars I shall remain always yours faithfully,
JOHN J. HARRIS.

HARDY'S NEW WINCH FITTING.

SIR,—We have great pleasure in informing you and all interested in fishing that we have succeeded in making Hardy's patent winch fitting so that it can be adapted to hollow butts, and also to cane rods.—We are, &c.,

Standard Works, Redditch, Sept. 19.

S. ALLCOCK AND Co.,

RAIN AWNING FOR THAMES PUNTS.

SIR,—The many wet uncomfortable days I have experienced on the Thames punt fishing, especially winter time, has induced me to draw attention to the above subject, and see if there are no contrivances by which angling in heavy rain can be prosecuted under more comfortable circumstances. In my opinion, waterproofs are all very well, but it is the hands one wants to keep dry.

I have written to Messrs. Piggott, of Bishopsgate Street, to see if the cannot devise something in the way of a folding iron frame to carry an awning which shall cover the well of an ordinary Thames punt, which is my usual seat, and yet allow of striking freely upwards or right or left. The iron supports must be on the slant to allow of striking sideways, and the front so constructed as to be able to strike well up, as would be required when long corking or travelling for chub, &c.

Meantime, if any of your readers have had anything made similar I shall feel grateful for a wrinkle or two on the subject.—I am, &c.

B. R. BAMBRIDGE.

[Would not a sudden gust of wind upset a punt with an awning of any kind worth anything?—ED.]

THE FENCE MONTHS.

SIR,—Perhaps Mr. Balderston will pardon my remissness, but I have been so much more agreeably employed during the past few weeks in rambling about the south-west of England, rod in hand, than in arguing, that I cry guilty to not having even read his letter with the attention it deserves. I do not really see what special good can come out of a paper war on the matter. I hold the opinions held by nine-tenths of those who have been born and bred on the Thames—as I have—and its tributaries. I have watched with anxious interest the gradual decadence of the river and its various vicissitudes, and I have kept a watchful gaze on the other fishing grounds in its neighbourhood, and my opinion, notwithstanding Mr. B.'s laboured subtleties, is that under existing circumstances there is imminent danger of any or all streams being "fished out," as we understand the expression in its popular sense. I am certainly not inclined to chaperone Mr. B. during a fishing tour of four weeks, as he suggests, for the purpose of converting him to my convictions, for a "man convinced against his will holds to the same opinion still," and whilst fishing I find that the less the dogmatism the better the sport.

NATURAL BAITS.

I am truly obliged to J. B. J. for his letter on this subject. I will carefully look the matter up in a little time. At present a great pressure of other business necessitates a postponement. As to the final question about the size of Wick trout, I must confess I have considerably altered my opinion since writing the passage referred to. The articles, as J. B. J. is aware, were originally written for a bi-weekly paper, and thus the same amount of care could not be exercised as would have been taken had it been published in a different form. I hope to publish a much more careful work before I join the majority.—I am, &c.,

J. HARRINGTON KEENE.

THE FENCE MONTHS.

SIR,—However much I might wish to comply with Mr. Bonvoisin's plaint, desiring me to transfer my attention to Mr. Keene and "Creel," and to whatever extent I may be disposed to recognise one's duty towards an opponent that cries, "Hold, I have had enough," yet I find the tenour of my adversary's letter is such that I cannot ignore its existence.

A charge, which I must rebut, is brought against me by Mr. Leo Bonvoisin, an accusation to which I will not submit, as my opponent in an unnecessary and much more aggravated form had been guilty of the very offence, which, he says, is my own peculiar property; and, moreover, his own delinquency occurred long before I entered the arena of this controversy. Thus, however much I have failed in this respect—and I do not yet recognise that I have transgressed—I had an example set in high quarters, and opponents must not expect to be allowed to employ "hard names" to those who differ from them, and not receive severe epithets in return.

In Mr. Bonvoisin's first letter of April 3rd, 1880, this gentleman, with the usual arrogance of his party, evidently assumes that it is only himself and members of his clique who have "the subject seriously at heart," and at the same time insults one of your brightest correspondents by writing, "I trust it will be thoroughly ventilated in your columns, not in a 'When to Strike in Fly-Fishing' fashion," &c.; whilst the subsequent *amende* aggravates the original offence. "The fence month" fashion appears now to give as little satisfaction to this critic as did its predecessor. In the same letter Mr. Bonvoisin employs the word "pothunters," though transferring its use to the mouth of a hypothetical working man.

In a letter of April 24th, the same gentleman tells us point-blank that "the great mass" of "sportsmen" are blackguards; and no subterfuge will avail, although Mr. Bonvoisin may inform us that the literal meaning of the passage indicates that in this country there is a small percentage of sportsmen and an overwhelming mass of blackguards. This great mass is said to consist of "netters, wirers, balers, snatchers, and men armed with rod and line (we will

not call *them* anglers) who take fish out of season." I have italicised two remarkable words, for, on the same ground, independent opinion and conviction, many others, as well as myself, may withhold the word angler from ground-baiting fishermen. Not content with the adoption of the word blackguard, as calculated to deter presumptive opponents from entering the field against him a neat comparison between any dissentients from his own views and Bill Sykes, also greeted the eyes of the readers of the FISHING GAZETTE. This was a very cunningly-wrought "infernal machine," contrived to fling consternation into the camp of the enemy. Happily, it was not every opponent that was to be dismayed by such a windbag—thank you, Mr. Keene—with curiously-figured pictures of destruction painted vividly upon it!

This case of abuse is not isolated, for, if we turn to the meeting of the Society of Arts, we again observe that no tolerance was observed towards opponents of the greatest experience, but that those who courageously stood forward to speak the truth were hooted and groaned down.

Bestowing a little attention to Mr. Keene, we find, in a recent contribution this gentleman wrote that Mr. L. B. was "not such a jack—" that is, such a jackass, the minus indicating the omission; the passage by inference insinuating that some opponent might be otherwise classified. I am also accused of writing "pleonastic nonsense," and my composition otherwise vilified.

Returning to Mr. Bonvoisin, we likewise observe that this gentleman refers to my views as "pernicious doctrines," whilst in a later letter also writing, "seeing the utter abhorrence in which I hold Mr. B.'s doctrines, is exceedingly distasteful to me." Be assured, Mr. Bonvoisin, that whilst I reciprocate with the most intense earnestness the feelings which are so cordially lavished on me, and in this respect will not be a debtor, when I can so justly repay; and, holding, as I do, the ground-baiting fishermen in a contempt more deep than the abhorrence which Mr. Bonvoisin entertains towards the takers of small and unseasonable fish, I await that final flooring at this gentleman's hands, which he is pleased to inform me is about to take place; yet, withal, I might remind him that it is not well for "him that girdeth on his harness to boast himself as he that putteth it off." "Stupendously ridiculous!" and "Oh, it's too absurd!" I am perfectly aware that such is the fact. It is, indeed, too deliciously ridiculous to ask London and Trent anglers to abnegate their own vices; to put the guilty thing away from amongst themselves; it is only others must be coerced, the preponderating mass of blackguards; it is ever yonder publican. It would be of no avail for Mr. Bonvoisin to tell me that ground-baiting is a science. So are many other forms of poaching. The work of a poacher is not learnt in a day, and ground-baiting requires some tact, though essentially a more vicious practice than the battue shooting of other sportsmen.

Having reviewed the manners of my assailants, as apparent in controversy and at private meetings, from which all but an unavoidable few of those that obstruct their progress are excluded, I must glance at any small amount of argument which Mr. Bonvoisin has at last found the leisure to advance.

Referring to the first and second paragraphs of the letter of September 17, but not being aware of any passage of mine that does show loss of temper, I shall say no more on the matter. The third paragraph is devoted mainly to self-eulogium, and requires no further comment. In the fourth, I find something to the point, as here it is denied that there is any compensating advance in the resources of a river as the number of anglers increases. Mr. Bonvoisin, do you really advance such a preposterous statement, and mean the world to believe in its truth? The increased wariness of the fish has already been mentioned by me as a compensating power; but, beyond this, the slaughter of heron and other waterfowl, the persecution of otters and several varieties of aquatic animals are also certainly compensating influences, tending to the increase of the number of fish, if not indirectly doing harm by the preservation of the least wary and vigorous members of the piscine races. Man, however, in his wild state may also be considered a natural enemy of the fish; and the amount of the latter taken by civilised races must not be set off as over and above the loss to the rivers which is provided against by nature, but only the difference in amount between the quantities taken by rude races by means of the leister, light and other rude implements and the amount that falls to the lot of the fine tackle of the moderns. This difference, if worthy of any transitory attention, is more than amply compensated by the destruction by man of the other natural enemies of the fish, and it therefore only remains for us to prevent poaching and render the bulk and internal condition of rivers as nearly natural as possible, and not as they often are, wholly unfit for animal life.

With your groundbaits and composites of the fifth section I leave the London anglers, and hope they may enjoy the use of chopped or battered worms, slugs, tallowy cheese scratchings, assafetida, bullocks' blood and brains, as well as paste and grain boiled in a mass with new milk and well selected urine: these formed into balls, or used separately, are no doubt suited to the instincts of those who use them.

On arriving at the sixth section I am referred to several gentlemen, who, it is presumed, will substantiate Mr. Bonvoisin's account of the approximate extinction of the pike in the Thames. I prefer to take more disinterested and reliable sources for information—information coming from all quarters and from men of every variety of experience and qualification, as found weekly in the reports of the FISHING GAZETTE and in other trustworthy papers, such as the *Field*, &c., and which show that the actual condition of things is simply the exact reverse of Mr. Bonvoisin's allegation. Mr. Keene's, as well as this gentleman's own words in bygone letters, have already indicated that the dearth is prospective and not actual. In the letter of the latter of April 3, to which allusion has already been made, we find mention of the inspection of large numbers of jack and perch, which, if scarce, could not have been inspected in large numbers; but in further proof I quote the following words: "No doubt that gentleman would also tell them to a trifle the average number of lean, ravenous little pickerels killed by the trailers in the T.A.P.S. during the early part of even the present season, and I venture to state the total number (not weight) would startle the enquirers." After this we find the words, "and that 'Ruff's' suggestion, if carried out, would pretty nearly, in two or three seasons, depopulate the river of jack." The uselessness of quoting more is apparent, for my opponents annihilate their own arguments by constantly making contradictory statements, for here is a case of proved abundance, and then alleged dearth is the war-cry of the faction.

On the subject of the German ann Chinese fish Mr. Bonvoisin again becomes illogical, for we may presume that in those countries where fish are used as a staple article of food the abundance of the fish is of paramount importance, and that the stews therefore must be maintained with the furtherance of this object in view. The Germans, however, realise the true nature of the pike; whilst the Chinese, though using the net freely and through sheer necessity requiring the fish as food, owing to a vast population, do not find themselves driven to follow the unsound mode of protection in vogue in England—the essential difference of opinion and practice in the two countries resting on two facts. In China it is impossible for experience to teach the fish to evade the net for a

prolonged period. In England, however, the Thames fish become wise, inasmuch that some of the trout are said to know the gut emanating from every tackle-shop in the great city; and thus we discover that the Londoner cannot catch these self-same intellectual fish, but the poachers, with their nets, can and do; and rich is the harvest thereof, and great is the contentment of these individuals, who, finding the great fish that are even too cunning for the ground-baiter with his pint pot of chopped worms, reserved for his special use by Acts of Parliament, and inept anglers, whose combined efforts provide no adequate means for the capture of one of the members of Mr. Bonvoisin's "great mass of the people."

Finally, however distasteful it may be to myself to argue with those whose views are held in detestation by me, still I feel bound to proceed, having once taken the subject in hand, and therefore I stand ready, the boulder-stone as I am, to block the way, if possible, of ignorance; a mark for the weapons of my antagonists to have the satisfaction of flooring, as they so kindly predict.—I am, &c.,

R. BALDERSTON.

[Mr. Balderston is essentially a trout-angler, and has evidently no taste for coarse-fishing. We prefer fly-fishing for trout to any other angling by a long way, but at the same time, when that cannot be had, we can thoroughly enjoy fishing of the next best description that may be attainable, whether jack, perch, roach, chub, bream, tench, etc., even to eel-fishing with ledger. Our experience is that the proper use of ground-bait is essential in order to catch barbel, roach, bream, and other ground-feeders. Life is too short to permit of stalking solitary specimens of fish, or looking all day into twenty feet of water for a shoal of fish, unless, indeed, the angler has nothing else to do; but the majority of London anglers have to snatch a day, or half a day, once a month, then to go twenty or thirty miles, and have perhaps three or four clear hours for fishing. Now in the case of trout the angler knows where they are to be found, he generally sees them rising, but roach, bream, etc., which go in shoals, may be anywhere, except in the likely-looking place the angler has to chance on. It is the over-use of ground-bait which does harm. We confess we could never stand some of the ground-baits which are used—horrid mixtures, enough to disgust one with angling for fish which are attracted by such stuff.—ED.]

FISHING NEAR GUILDFORD.

SIR,—In answer to "Mercator," I beg to inform him there is fair fishing to be had in the Wey, Guildford. Pike, perch, chub, roach, dace, bream, and occasionally trout are to be had.

I have not fished the water above Guildford, but have noted the many bends, corner points, sunken trees, with overhanging boughs; also deep eddies, &c., where several of the above named fish are to be found. Have heard of the fish being plentiful at Send, near Woking. I have seen many good takes of fish near Godalming—roach and dace, bream, 6 lb. to 7 lb. specimens; chub, 3 lb. to 4 lb. ditto; also good perch and pike. Members of the Godalming Angling Society are having some fair bags and specimens of fish. I myself have had good-conditioned pike from 4 lb. to 12 lb.

As to ground bait, the ordinary clay balls, made of bran and grains, with some gentles and worms stuck in them, thrown into a stream-swim will, by their wriggling attract the fish; as also will the bran and grain set free by action of water; for an eddy-swim, a pint or so of chopped lob worms will answer.—I am, &c.,

GEORGE W. KITSON.

Godalming Sept. 22.

NOTES FROM "PIXIE."

SIR,—This week complaints are made to me that very little fish can be got owing to the weeds and the clearness of the waters of the Lea, Thames, and the Arun, the latter having an extra difficulty added to it by being netted so much lately.

Mr. W. Breewood and a few friends returned from an excursion to Yarmouth. They visited Ormesby, Rollesby, and Barton Broads, with expectations of great takes of fish, especially after they had been informed that it was from here that a gentleman well known in the London angling world a few years ago caught such an enormous quantity of bream that he had them salted and barrelled up so as to enable him to forward them to the headquarters of a well-known angling society that then existed, and does now, in the neighbourhood of Walworth Common. However, they failed to realise to the full extent of their expectations, and had to do without the barrels and the salting ceremony, and content themselves with 8, 10, and sometimes 20 lb. a day, according to the condition of the weather. They managed to obtain good beds and every accommodation during their stay at Mr. J. Powell's, the Garibaldi, St. Nicholas Road, Yarmouth. Speaking of the above house, Mr. W. Breewood says:—"You know, Pixie, we can't all stand the price of the Grand Hotel, or hire a house, when we go to the Broads; and therefore you ought to let the 'boys' know where they can be accommodated for a time at a reasonable price, and feel as if they were at home in their own drums, which I am sure they will do if they go to old J. Powell's, who is as fond of angling as anybody."—I am, &c.,

PIXIE.

THE LATE ATTEMPTED NETTING ON THE THAMES.

SIR,—Is it really a fact that Captain Etheridge had no power to seize the nets in the above case? If this is so, I trust that those gentlemen who have cavilled at the meeting of the delegates of angling societies which took place some little time ago, will now be satisfied that one at least of the clauses agreed to will prove of great utility. That the officer appointed to prevent the law being broken should act as Captain Etheridge did, is quite within reason; but it seems a great pity that he could not take proceedings against the Beasleys, and also against Mr. Phillips the first named parties for attempting to break the law, and the second for inciting them to break it. Captain Etheridge's conduct in this matter has excited a great amount of hostile criticism in those parts where his conduct as a river conservancy officer is best known; and in this particular case for the following much talked-of event. Some little time ago whilst he was passing down the river he caught sight of a cast-net on a barge. Giving orders for his little steamer to be backed, he took possession of this net, and when asked for it by the owner, to whom it was a partial means of obtaining a livelihood, the answer of the captain was to the effect, "If you want it back again you must come to Trinity House for it." Now, sir, only supposing this cast-net was of an illegal size—of which there is no proof—if this seizure was legal, common sense would surely say that the seizure of the flue nets, pronounced by Captain Etheridge to be illegal, and over which he mounted guard on the towing path,

could not be illegal. These acts, and their seeming inconsistency, make anglers and others pertinently ask the question, Was Captain Etheridge afraid of entering into a contest in the latter case because of the position of the would-be breaker of the law? As the case now stands, Captain Etheridge, the chief officer of the Conservancy Board, on one occasion seizes a net, and on another contents himself with simply warning the owners of an illegal net against using the same.

Will some of your readers who have a knowledge of the law on this point, or who have had experience in cases of seizures of nets, kindly give, through the medium of your paper, their views on this subject? In conclusion, I would state that as netting is one of the greatest destroyers of the sport of angling, it would be better for anglers to know exactly how the law stands in relation to netting than to be in the state of uncertainty which a perusal of the above facts is sure to create.—I am, &c., S. J. W.

CLUB REPORTS.

ANCHOR AND HOPE ANGLING SOCIETY.

On Sunday, Sept. 18th, a member of the above club found a Pulborough and Amberley ticket, the same can be had any night after eight o'clock at the William IV., Old Kent Road. Several members went to Amberley, the Thames, and Lea. H. Scott bream, R. Smith bream, J. Bowling roach and dace, D. Davis roach, G. Davis roach and gudgeon, A. Shakel roach. Members are requested to attend on Wednesday, Sept. 28th, to settle important business.—A. SHAKEL, sec.

Sept. 20.

ACTON AND EALING ANGLING SOCIETY.

Several members of this club have weighed-in fish during the past few days. Mr. Dudley and Slater, roach and dace (Thames); Mr. Bocking, a good eel; while fishing for barbel at Teddington was broken away with a good barbel. Mr. W. Eydman weighed-in three jack from Thames. This society now has twenty-four members. Several valuable prizes have been given by members, principally for specimen fish. Any anglers calling at our clubhouse will be well looked after by Mr. Brooks, our host.—BLACK BAG.

George and Dragon, High Street, Acton, W.

BOSTONIAN ANGLING SOCIETY.

On Sunday last we had a fair show of fish, the following members contributing:—Messrs. Hart, Bastain, Jennings, and Taylor, roach, and Mr. Harris a handsome show of roach and dace from the tidal waters.—H. TAYLOR.

September 21, 1881.

BRIGHTON ANGLERS' ASSOCIATION.

The competition of the 18th inst. was more successful than those of previous dates. Mr. Hassell took first prize with one carp weighing 5 lb. 14½ oz. and 9½ oz. of roach; Mr. Anscombe second, with 5 lb. 4 oz. of roach; Mr. Olive third, with 1 lb. 12½ oz. roach; Mr. Cross fourth, with 1 lb. 8 oz. of roach; Mr. Artis fifth, with 1 lb. 4½ oz. roach; and Mr. Collins sixth, with 1¼ lb. of roach and perch. The prizes and the donors were as follows:—Fishing boots by Mr. Artis, value £1 10s.; large photograph, by H. Spink; patent bait can, Mr. Cardy; complete anglers' knife, Mr. Saunder, Nottingham; reel and winder, Mr. Power; and a hair cushion for fishing-basket Mr. Gambling. Mr. Power fished very tight all day, but they would not take to his tempting bait. Messrs. Sharp and Ash went to Berwick; the first-named killed with tight line one carp 4 lb. 10 oz., one tench 1 lb. 1½ oz., bream 5 lb. 11 oz., and roach 10½ oz., and Mr. Ash, two bream 4 lb. 6½ oz. Mr. Sharp, who is very fond of tight line, found his mistake, he missing, unfortunately, a carp of very heavy weight.

September 20, 1881.

BURTON-ON-TRENT ANGLING ASSOCIATION.

The above association had their second field day at the water between Rugeley and Armitage on Tuesday last, September 20. The party proceeded by the 8.40 a.m. London and North-Western to Rugeley, and on arrival the members scattered themselves into small parties at the various swims. The weather was favourable, but not very large catches were made. Some good roach, trout and grayling were killed. One grayling weighing 1 lb. was taken with gentles, perch with worm, and trout with fly. Altogether a pleasant day was spent by the Trent side in the fresh air by the members, who thoroughly enjoyed the excursion. At 8.58 p.m. Burton was reached, and the landlady at the Railway Inn, Rugeley, provided a substantial knife-fork tea, which was appreciated in a manner anglers do when a good day's outing sharpens the appetite.

P.S.—It would, I think, help our amateur anglers if the club reports would say what bait the fish were taken with, for I find on reading them in your paper that many do not give that information.—HON. SEC.

CANONBURY ANGLING SOCIETY.

Several of our members who were out on the 18th succeeded in getting some nice fish, Mr. Leach heading the list with 13 lb of fine roach; Mr. Wright, roach and bream; Mr. Bennett, roach and bream; Mr. Money, roach and bream; Mr. Pearce, bream; Mr. Bush, jack, and Mr. Herbert, perch, winning the monthly prize for the gross weight. The next visit of the Central Association will take place at this society on Monday, 26th inst., at the Albion, East Road, City Road.—W. H. PEARCE.

September 19.

CITY OF LONDON ANGLING SOCIETY.

The following members weighed-in on the 18th. Mr. J. Chambers, roach from Penton Hook; Messrs. Martin and Strong, bream from Byfleet, the former 4 lb. 8½ oz., the latter 2 lb.; Messrs. Hobbs and Castell, roach from the Mole. Mr. Hales' prize will be fished for on the 25th, any water. The next return visit of the W.C.A., No. 2 District will go to this club at Cogers' Hall, Bride Lane, Fleet Street, on Tuesday next, September 27. Any club visiting us will receive a hearty welcome, and be sure of a visit in return.—CAS.

CLAPHAM JUNCTION ANGLING SOCIETY.

Several of our members have been very successful, Mr. Turner having weighed-in over 70 lb. of fish. Mr. E. Withen had a pretty barbel going 8 lb. ¼ oz.; Mr. G. Walkley, 9 lb. of roach and dace; Mr. Maslin, roach; Mr. E. Wilson, two jack, 12 lb. 5 oz. and 13 lb. 8½ oz.; Mr. E. Wakeford, some beautiful bream between 3 and 4 lb. each; Mr. Willoughby, 5 lb. 4 oz.

of bream; Messrs. T. Smith, Stock, Sutton, Blunden, Valentine, and Innes all having roach and dace. The three cases of fish will be home on Thursday next to add to our collection of preserved fish, consisting of two chub 8 lb. 12 oz., one trout 5 lb. ¼ oz., one barbel 8 lb. ¼ oz., all caught by Mr. E. Withers. Members are requested to attend on Thursday next for important business. All members are requested to be at Clapham Junction Station on Sunday next for the match. From the Pack Horse, Staunes, to the Horse Shoes, Laleham, is to be the distance of water.—E. WILSON, sec.

Sept. 21.

CREWE No. 1 ANGLING SOCIETY.

The members of this large and important society, to the number of sixty-six, held their annual fishing competition at Minshull Vernon, on Saturday afternoon last. The tradespeople of the town hold this society in high esteem, and show their appreciation by annually subscribing for and presenting to the society a large and handsome number of prizes. There were thirty-three prizes offered, and precisely that number, strange to say, were successful in catching fish. After the competition the members retired to their head-quarters, where Mr. Samuel Jones (vice president), in the unavoidable absence of Mr. Wallace Lumb (president), presented the prizes. The following is a list of the successful members:—1, James Bond, china tea service, given by Mr. Flood; 2, James Kelshaw, copper kettle, given by Mr. W. Lumb; 3, Samuel Hoole, copper kettle, given by Mr. J. Rawson, Oak Farm; 4, William Plevin, clock, given by Mr. Blackhurst; 5, Edward Dyke, knives and forks, given by the Mayor of Crewe; 6, Thomas Parker, fishing rod, given by Mr. Furber, High Street; 7, Joseph Fotherby, fishing basket, given by the Mayor of Crewe; 8, William Davenport, fishing basket; 9, Joseph Morgan, set of jugs; 10, William Massey, clock; 11, George Evans, fishing rod, given by Mr. Parsonage, High Street; 12, Robert Cole, prize given by Mr. Gladwell; 13, William Potter, landing net, given by Mr. Furber, High Street; 14, Thomas Humphries, reel and line, given by Mr. Parker, Royal Oak; 15, William Baker, pocket flask, given by Mr. Herd; 16, George Maywhort, reel; 17, Frederick Potts, line; 18, Thomas Mulliner, reel; 19, Lawrence Kenny, reel, given by Mr. Bartle, West Street; 20, William Dixon, reel; 21, Peter McCluskey, knot of gut; 22, John Lawrence, line; 23, Thomas Potts, reel; 24, Charles Barnett, line; 25, Henry Deverill, reel; 26, Henry Potts, reel; 27, Thomas Fotherby, knot of gut; 28, William Wilks, line; 29, Thomas Latham, line; 30, Joseph Williams, line; 31, Samuel Jones, knot of gut; 32, Henry Eaton, books; 33, Richard Scragg, pipe, given by Mr. J. Roney, High Street.

DALSTON ANGLING SOCIETY.

The members of the above club met on Sunday last, when the following members had a very fine show of fish:—Messrs. Fortescue, Eagles, Bunn, Nunn, Anderson, Midson, Legge, W. Richardson, Slade, Malley, Venour and Vale.

September 20.

EDMONTON AND TOTTENHAM ANGLING SOCIETY.

Our shows of fish have hardly been up to the average during the last week or two, but on Wednesday last Mr. Darley shot a fine tray of roach and bream from Norfolk, weighing about 25 lb. Messrs. Palmer, Kemp, Goode, Darley, and B. Lowni have all given valuable prizes to be competed for on September 25th, the conditions being, all members to leave Angel Road Station by the 7.58 a.m. train, and book to Roydon, and then fish in the Stort or backwaters of the Stort.—D. G. M., sec.

EXCELSIOR ANGLING SOCIETY.

Some excellent trays of fish were shown at the Hope, Bird Street, Lambeth, on Sunday last, Mr. Blackman having a good sample of barbel weighing 17 lb.; Mr. J. Smith, ditto, weighing 14 lb.; Mr. T. Gay showing up with bream, weight 6 lb.; and myself, ditto, with 12 lb.—A. THOMAS.

September 21.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

On Sunday last the following members showed some nice roach from the Colne:—Mr. S. Smith, 7 lb. 7 oz.; Mr. J. Watling, 4 lb. 11 oz.; Mr. E. Young, 4 lb 2 oz.; Mr. Major, 1 lb. 11 oz.; Messrs. Theobald, J. K. Fitch, Parkin, Baker, Inker and H. Smith also weighed roach from the Thames, Lea and Wey.—J. A. FITCH, jun., sec.

September 20.

GRESHAM ANGLING SOCIETY.

President—The Right Hon. LORD GEORGE HAMILTON, M.P.
Vice-Presidents—Major the Hon. E. R. BOURKE; Mr. Alderman and Sheriff FOWLER, M.P.

REMOVAL.—The present premises having proved too small for the purposes of this society, it has been determined to remove to The City of London Tavern, 11, Bishopsgate Street Within, E.C., where the weekly and other meetings will be held on and after Thursday, October 6th. The committee are glad to announce that Mr. Thompson has become the proprietor of that well-known tavern, and will thus be able to continue his functions as host and treasurer. The accommodation there will be in every way worthy of the society, and it is trusted that the change will result in increased attendances at the Thursday meetings. Subscription and Entrance Fees.—The subscription to the society is £1 1s. per annum; all members to be duly proposed and seconded. An entrance fee of 10s. 6d. will be required from all gentlemen elected after the close of the present year, and until June, 1882, when the fee will be raised to £1 1s. Members whose subscriptions are unpaid on December 31st will be struck off the books of the society. The society's prizes are given exclusively for the largest specimen fish, such fish having been duly weighed and shown at the society's rooms. The private prizes embrace specimen fish, and also gross weights, but in the latter case the standard of the society applies. Members are requested to note that the meetings of the society are now held every Thursday evening, and the chair is taken punctually at 7 p.m. List of prizes and any further information may be obtained of the hon. secretary on these evenings, at the society's new rooms, 11, Bishopsgate Street Within, E.C.

At the weekly meeting, held on Thursday, 22nd inst., a fine show of bream were weighed-in, taken near Yarmouth, by Mr. E. Bennett, fishing with Ward. Mr. Crumpley, the hon. secretary, mentioned that he had been deputed to represent the West Central Association on the Committee of the Anglers' Benevolent Fund, which he had only undertaken, feeling it to be a compliment to the Gresham Club, but trusted he would eventually armed with sufficient funds to make his services of some real value, a sentiment which was heartily endorsed by the members present.

HAMMERSMITH UNITED.

On the 15th Mr. Hobden, fishing at Eynsham, took a perch weighing 2 lb. 8½ oz. The same gentleman was also very successful among the barbel on the 17th at the above mentioned place. Mr. Pitts kindly gave two guineas to be fished for on Thursday 15th and on Sunday 18th, one guinea each day. Gross weight. Thames only. The Thursday match was won by Mr. T. Hoole, Mr. Green being second. The Sunday match was taken by Mr. Hitchcock, Mr. Penney being close up. Messrs. Lewis and Reynolds were also among the old sort at Windsor. VORTEX.

Sept. 20.

KING'S CROSS UNITED ANGLING SOCIETY.

This society has removed to the Prince Albert, Wharfedale Road, King's Cross—two minutes from the old clubhouse. Secretaries will please note. Brother bobs will always be welcomed by the host, Mr. G. Baynam.—G. TREADWELL, hon. sec.

September 21.

LITTLE INDEPENDENT ANGLING SOCIETY.

Our table on Sunday evening presented a fairly good show, but not by any means up to the mark that we should like. Takes as follows:—Mr. H. Moore, bream; Mr. Letch, jack; Mr. Petrie, roach; Mr. Grey, roach; Mr. Raine, roach; Mr. Mead, roach and dace; Mr. Heelas, roach and dace; Mr. Scott, roach; and Mr. Humphreys, perch.—W. BROWN, hon. sec.

September 21.

LEEDS ROCKINGHAM ANGLING SOCIETY.

The members of the above society held their annual competition on the 8th inst., at Brafferton, on Swale, when a most enjoyable day was spent. The weather was charming, but the water was rather thick, consequently the catches were not so good as could have been desired. The numerous prizes consisted of a splendid clock (given by the club), landing nets, flask, creel, books, and other useful articles, presented by members and friends. The competitors exceeding twenty in number commenced angling at noon, and gave up at 4.30. The most successful were Mr. C. H. Bradford, who took first prize with 4 lb. 4 oz.; Mr. Nettleton and Mr. Hellewell had each 3 lb. 14½ oz.; Mr. Hogg, 3 lb. 1½ oz.; Mr. Bramfitt, 2 lb. 15½ oz.; Mr. Ward, 2 lb. 9 oz., and Mr. Grant, 2 lb. 4½ oz. The fish caught were principally roach and dace, some of the former weighing upwards of 1 lb. Previous to the competition the members and several friends sat down to a magnificent lunch provided by the worthy host of the Fox Inn, in his usual inimitable style, and many thanks are due to Mr. Bannister for the splendid manner he has always catered for members of the club whenever they have visited Brafferton.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

Several members of the above society showed some excellent trays of fish again on Sunday last, Messrs. Longman and J. Edwards being well to the fore, the former with 12 lb. of roach and dace, the latter with 6 lb. of roach, not bad for a maiden show, from Pangbourne; Messrs. L. Gorsuch and Long, with perch, dace, and chub, from Taplow; M. T. Burke had also a nice take of bream from Pulbore; Mr. W. Edwards had jack, roach, and dace from the Ouse.—THOS. WM. LUCY, sec.

Sept. 21.

PRIDE OF DERBY ANGLING CLUB.

The members of the above club held their fourth match this season in the Spondon Canal, the first ten being the prize-takers. Mr. J. Hibbert, first; J. Moore, second; C. Pashley, third; Messrs. W. Tunnicliff and J. Beevers, a tie; C. Lewis, W. Elliot, C. Hardy, J. Hutton, J. Cadman, J. Saxton, F. Tunnicliff, W. Forman, S. Thorpe, J. Bland, F. Slack, T. Holmes, and J. Grimlay.—W. TUNNICLIFF, secretary.

PRINCESS OF WALES ANGLING SOCIETY.

Twenty-six of our members started from the club house, the Prince of Wales, Great Barlow Street, High Street, Marylebone, on the 11th inst., to fish for a peg-down match for several valuable prizes, at Weybridge; and, although the majority of them worked very hard all day, they were prevented from having any sport by the strong north-east wind. The only fortunate one among us was Mr. Wyeth, who landed a small bream, 13 oz. in weight, and, consequently, took the first prize, a handsome fishing-rod, presented by our worthy host, Mr. Wheatley. The whole of the members spent a most enjoyable day; so much so that they have resolved to have another day's outing together, and compete for the remainder of the prizes. It is decided to start on Sunday morning September 25, from Waterloo Station, for Egham, where the members will be pegged down, and, I hope, will meet with much better sport than they did at Weybridge. The first quarterly meeting took place on Thursday, September 8, when the members showed their appreciation of the work executed by the officers by re-electing the whole of them for the ensuing three months. Gentlemen desirous of joining are requested to communicate with the secretary, Mr. F. Robson, at the club house, as above.—MEDIocre.

Sept. 20.

SOUTH LONDON.

On Thursday last Mr. Sargent had 10 lb. of barbel from Datchet, one of which has gone to Gibson, of Barnsbury, to be made beautiful; weight, 6½ lb. He had another on Sunday of 4 lb. Messrs. Delhaye and Buck had some perch and roach from Richmond, out with Joe Brain. On Sunday Head had some bream from Amberley, but reported nothing doing there. The weather was very fine. Mr. Brown had a nice lot of chub, roach and dace from Woking, and our secretary, Mr. Palmer, some roach from Byfleet. Self was at Elstree yesterday. Caught a few roach. There was very little doing. The water is still very low. It ought to be good for fishing. They say it has risen a foot this last week.—G. H. FIELD.

Sept. 20.

WALTONIANS.

On September 18 there was a nice show of roach, 7 lb. 4½ oz., from Shiplake by Mr. J. Dodge; largest fish 1 lb. 7½ oz. Mr. Allen had the next best take with 3 lb. 7½ oz. Messrs. Good, jun., Togwell, Roland, Starr, and Greenfield also weighed-in fish; and I weighed-in a small take from Elstree, tench, 2 lb. 3 oz., and a small roach.—A. J. MARRIOTT.

September 21.

WALWORTH WALTONIANS.

The members of this society will compete on the 26th for the three prizes mentioned in my last report at Windsor. Conditions, roving commission from Windsor Bridge to Monkey Island, bank only; "Nottingham" or "Shore-ditch." All fish to be weighed according to club rules. Fish to be weighed at the head-quarters before 11.30 same evening.—PIXIE.

Sept. 22.

WESTBOURNE PARK PISCATORIAL SOCIETY.

A match took place among the members of the above society, on the 11th inst., and though the fish were by no means on a few fair catches were shown. First prize, £2, Mr. Buttery, bream, 11 lb. 4 oz., river Ouse; second, £1 10s., Mr. T. Hawkins, sen., two jack, 4 lb. 11½ oz., private water; third, £1, Mr. T. Hawkins, jun., two jack, 3 lb. 6½ oz., private water; fourth, 15s., Mr. Pink, two jack, 3 lb., Welsh Harp; fifth, 9s., Mr. Bayford, one jack, 2 lb., Godfrey's, West Drayton; also three minor prizes. On the 18th, but few went out; those who did had nothing mentioning.—HENRY ADAMS.

Sept. 19.

[In future please direct your report to 12, Fetter Lane, E.C.—ED.]

SLAPTON LEY, SOUTH DEVON.

How is it we scarcely ever hear of many London anglers visiting the famous freshwater home of big pike, and perch, and eels? I believe a man is certain of catching fish in Sir Lydston Newman's noted wildfowl decoy, with only a road separating the Ley from the sea. It is a good distance off, it is true; but while the Thames at Maidenhead and elsewhere is crowded with anglers, many of them, if desirous of first-class sport, can well afford to undertake the journey into South Devon. The pike in the Ley, like those formerly in Kew Pond, are fond of ducks. I should think if a poor moorhen, or even a coot or wild duck, brought forth a lot of young birds in the reeds and rushes, each old bird must have wondered to see a young moorhen or coot, or "quacker," suddenly do a dive, legs first, and disappear into the unrelenting jaws of the big jack? But, as winter comes on, immense numbers of wildfowl repair to the Ley, and remain there for an open *battue* by and by, after Christmas. The Ley would be the place, of all others, for a well-to-do club of anglers, like the Gresham, for instance, to journey down to Devonshire and fish for good prizes. There would, for certain, be none of your paltry 6 lb., or 5 lb., or 4 lb. winners of valuable money prizes. Besides, there is Torbay for sea-fishing; and some good sport here might be got if the Ley fishermen were to be fairly paid for their boats and time, &c.—OLD SPINNER.

PRESERVATION OF TROUT IN SCOTLAND.

At the annual meeting of the Trout Preservation Association, which was held at Glasgow recently (Mr. James Wilson, of Banterskine, in the chair) the annual report was presented. From this it appears the association has been doing good work. The watchers supply to the secretary at stated times the result of their work. The report says:—"The lochs seem to be well stocked with fish, as the spawning beds in the burns were well covered. The benefits accruing from this association are now becoming apparent on all the lochs, though your committee would wish to see the pike extirpated from Lochs Katrine and Ard. These lochs are difficult to fish with net for pike, but some mode of killing the pike must be adopted by the association if its objects are to be successful. It is known to anglers, in respect of Loch Lomond, that the nets have been taken off the Leven, and the consequence of this, and of properly watching the spawning beds, is the success which has been got on that loch this year in salmon, grilse, and salmon-trout fishing. The association, with the co-operation of the factor to the trustees of the late Sir James Colquhoun, have prosecuted the netting for pike of Loch Lomond, with vigour and success. Two complaints of poaching on the spawning beds in Loch Katrine were dealt with during the year. Neither was brought before the public court, as in the one case the offender was a boy, and his guardian paid £1 rs. to prevent legal proceedings being adopted, and in the other, on inquiry, the proof was found to be defective. Your committee were pleased with the watchers' operations, being satisfied that the burns which had been silted up during summer were cleared so as to allow free runs to the fish, and that there was no poaching on the spawning beds in the various burns watched. Your committee feel assured that so long as this association continues vigilantly to protect the trout in the various lochs, there is not any fear of these lochs being depleted, and anglers may enjoy a day's pleasant sport, free of charge, on any of the lochs under the supervision of this association."—*Land and Water*.

FINE PERCH.—Mr. G. Yarde, who is staying at Martham, in Norfolk, has been getting some fine perch; he yesterday sent us a brace, one of 3½ lb., and one of 2½ lb.; they are splendid fellows, and were taken with the American spoon-bait.

THE fisherman has a harmless, preoccupied look; he is a kind of vagrant that nothing fears. All his approaches are gentle and indirect. He times himself to the meandering, soliloquising stream; he addresses himself to it as a lover to his mistress; he woos it and stays with it till he knows its hidden secrets. Where it deepens his purpose deepens; where it is shallow he is indifferent. He knows how to interpret its every glance and dimple; its beauty haunts him for days.—*John Burroughs*.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

THE TROUT AT SLEAFORD.

I WAS in great hopes last year that my remarks in reference to the fishing at Sleaford would have raised up a local energy sufficient to resuscitate the old Angling Association; but the spirit of activity still lies dormant, and that beautiful stream which runs through the very heart of the town remains unprotected. When I was there the other morning, standing on the bridge which leads into the market place from the Great Northern railway station, witnessing the splendid show of beautiful trout, apparently up to 2 lb. each, I could not help regretting the inhabitants of the town and neighbourhood of Sleaford were so apathetic and indifferent in being without an association, notwithstanding the liberal and respected agent of the Marquis of Bristol is ready and willing to afford every facility. The sight of such spotted beauties cannot fail to be a great temptation to poachers. I was informed by a friend of mine that only a few nights previously one of the local anglers happened to look out of his chamber window near to one of the bridges which span the river, and saw two men evidently of evil design—he called out “Good morning,” when the men looked round and could not tell from whence the salutation proceeded. He repeated the sentence, and this time the window was discovered, with the earnest gaze of the speaker fixed upon them. In not very polite language they gave him their blessing and told him he ought to have been asleep in his bed. The ardent angler, for he is a well-known lover of the rod, would see the last of them before he could resume his slumbering operations. If the native influence has been discouraged in fish preservation by some supposed unfaithfulness of service in the way of protection, it should not so easily die out; but there is time now to rise from the ashes and kindle anew the flame of zeal which once fanned over the beautiful river of Sle. It is a pity to see it neglected, and, as it were, uncultivated, when the stream is so natural for trout, and already possesses a good stock of the spotted beauties. How such a river would be sought after if it were only a short distance from London—it would not then be allowed to go unpreserved and unguarded from poachers. As I have remarked on a previous occasion, the Great Northern Railway brings other neighbourhoods in close access to Sleaford, and enthusiastic trout anglers would not mind the distance they travelled if they could only get some good fishing. Besides there are plenty of influential families who would willingly contribute not to fish, but to help to preserve the trout for the benefit of others if an association was rightly and satisfactorily worked. The Grantham Angling Association can boast of having Earl Brownlow as president, with the Duke of Rutland, Sir J. Thorold, Sir E. Welby-Gregory, Sir H. A. H. Cholmeley, and Major Cust as patrons, and Sleaford could easily command similar patronage. In the course of a recent visit to Sleaford I have spoken to several disciples of the famous Izaak Walton on the subject, and the only difficulty there appears to be is that of getting a secretary of equal energy to the late Mr. Boutel to carry on the work, and everything in my long practical experience directs itself to the same point.

If only some one could be found to take that office, and a meeting was called for the purpose of re-forming the old Association, I am satisfied all would be accomplished. For the love of the work, and for my ever-growing desire to labour for the anglers, I would gladly assist in so good an object as the establishment or in the resuscitation of a Preservation Society. If I could not personally attend a meeting in Sleaford, I would gladly give all the information I possess from my twenty-two years' experience of fish preservation—only let my remarks this time stimulate the piscators of Sleaford to immediate action. I shall then feel satisfied my two or three special visits to Sleaford have been attended with some satisfactory result. I shall shortly give an account of the fishing to be had at Peterborough and other places on the Great Northern line of railway, and make some reference to those neighbourhoods to which the members of angling clubs have access by means of privilege tickets. I have made some good practical use of my trip and of the facilities which have been kindly afforded me by the purpose.

THE “True Angler,” is thoroughly imbued with the spirit of gentle old Izaak. He has no affectation, and when a fly-cast is not to be had, can find amusement in catching sunfish or roach, and does not despise the sport of any humble brother of the angle. With him fishing is a recreation and a “calmer of unquiet thoughts.” He never quarrels with his luck, knowing that satiety dulls one's appreciation of sport as much as a want of success, but is ever content when he has done his best, and looks hopefully forward to a more propitious day. Whether from boat or rocky shore, or along the sedgy flank of a creek, he deems it an achievement to take fish when they are difficult to catch, and his satisfaction is in proportion. His enjoyment consists not only in the taking of fish; he draws much pleasure from the soothing influence and delightful accompaniments of the art. God be with you, gentle angler, if actuated with the feeling of our old master, whether you are a top fisher or a bottom fisher; whether your bait be gentles, brandling, grub, or red worm, crab, shrimp, or minnow, caddis, grasshopper, or the feathery counterfeit of the ephemera. May your thoughts be always peaceful and your heart filled with gratitude to Him who made the country and the rivers, and “may the east wind never blow when you go a-fishing.”—*Thad. Norris.*

For though of all field sports the motive and origin is to kill for the table, and not to kill for the sake of killing, still the sport to be derived from them lies in the excitement of pursuit and difficulty of capture, not in the number or value of the game. Wanton butchery of useless brutes and greedy pot-hunting are the Scylla and Charybdis between which the true sportsman, and he only, steers intermediate. It is the wariness, the subtlety and caution of the salmon, rendering it necessary to use materials of the slenderest and most delicate nature, and to apply them with the utmost nicety, which makes the triumph over him so far more enthralling to the real fisherman than that over the pickerel or mascalonge of equal weight, whose great voracity and inferior intellect permit the use of gimp hook-length and a silken or flaxen line instead of fine gut, tintured to the very colour of the water, and the casting line of almost invisible minuteness.—FRANK FORESTER.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

1st AWARD MELBOURNE EXHIBITION, 1881.

DAY, SON AND HEWITT'S STOCKBREEDERS' MEDICINE CHEST.

FOR ALL DISORDERS IN HORSES, CATTLE, CALVES, SHEEP AND LAMBS.

In this chest are the following matchless and world-renowned remedies, all that a Farmer can require to cure disease amongst his Stock and keep them in fine, healthy, and buoyant condition:—

“CHEMICAL EXTRACT,” for Wounds, Swollen Udders, and Ewes Lambing.
“GASEOUS FLUID,” for Colic, Scour, and Debility.
“RED DRENCH,” for Cleansing Cows and Ewes, &c.
“RED PASTE BALLS,” for Conditioning Horses.
“BRONCHOLINE,” for Husk, Hoarse, or Cough.
“GASEODYNE,” for Heaving or Paining.
“ALCOHOLIC ETHER,” for Colds and Chills.
“CARMINATIVE CHALK,” for Diarrhoea in Lambs and Calves.
Price of Chest, with “Key to Farriery,” £2 10s. 6d., carriage paid. Each article can be had separately.

Patronised by Royalty, and used for over 40 years by the Leading Agriculturists of the British Empire.

CAUTION.—See that the Name of DAY, SON and HEWITT is on all Bottles and Packets.

DAY, SON AND HEWITT,
22, DORSET ST., BAKER ST., LONDON, W.,
AND WANTAGE, BERKS.

ANGLING.
Now ready, third Edition.

THE ANGLER'S INSTRUCTOR.

By WM. BAILEY.

A book on the best modes of Angling in English Rivers, Lakes and Ponds, and on the habits of the fish, besides all the latest practical hints on many things that have not up to now been made public, to be had of W. Bailey, 170, Kirke White Street, Nottingham. By post, 2s. 9d.

LONDON and COUNTY ADVANCE and
DISCOUNT COMPANY (Limited).

Cash advances from £10 to £500, without preliminary fees or deduction for interest, for short or long periods, repayable by easy instalments, at moderate rates, upon personal security, life policies, furniture without removal, deeds, shares, bonds, &c. Bills discounted. Forms gratis. Offices, 35, Farringdon-street, E.C. JOHN STONE, Secretary.

TROUT FISHING AND SHOOTING.

FISHING in Lakes, River and Sea, good bathing, boats. Flapper shooting from Aug. 1 on three lakes, 2500 acres of preserved shooting, with partridge and snipe in season. Free to visitors. MAELOG HOTEL, Ty-CROES, ANGLESEA, “PROPRIETOR.”

VOLUMES OF THE FISHING GAZETTE FOR 1878, 1879, AND 1880.

On receipt of P.O.O. for Twelve Shillings, we will send any of the above in handsome cloth cover.

N.B.—ONLY A FEW REMAIN UNSOLD.

Orders to be sent and to be made payable to R. B. MARSTON (at the Fleet Street P.O.),

FISHING GAZETTE OFFICE,
12, FETTER LANE, LONDON.

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.

SATURDAY, OCTOBER 1, 1881.

TROUT AND GRAYLING FISHING IN THE DOVE.

BY R. B. MARSTON.

HAVING recently for the first time visited the classic and charming river Dove, perhaps a few notes may be found useful to other anglers who may intend to fish it; and I think every true disciple of Walton should make a pilgrimage to it at

least once—let them go once and they will gladly embrace opportunities for going again.

The angler who for the first time visits a river should make a point of finding out the most convenient spot from which it can be fished by daily excursions. Having heard so much of the comforts of that home-like hotel, the Izaak Walton, at Ilam, I decided to stay there for a day or two at any rate. Leaving St. Pancras at 10.35, we found ourselves at the pleasant little town of Ashbourne at about 4.30. Mr. Prince, the proprietor of the Izaak Walton Hotel had provided a trap, and a drive of about four miles brought us within view of the lovely scenery formed by the valleys of the Dove and the Manifold, and the hills between, and on either side of them. To our right as we descend into the valley we see lofty Thorpe Cloud and its twin sister Bunster; these hills, one on the right, the other on the left bank of the Dove, form an appropriate entrance to the rocky gorge known as Dovedale. The left side of Bunster slopes gently down to the waters of the Manifold, and the Izaak Walton is situated on a gentle rise between the two rivers and right under Bunster; in the meadows at the foot of which the two rivers join. Following the course of the Manifold, to the left of our view we notice Ilam Hall, a noble building thrown into bold relief by the dark green foliage of the trees on the rising ground behind it. Arrived at the bottom of the valley we cross two streams, the first a mill stream, and then the rest of the Dove from which the mill stream has been drawn. The river before it is joined by the Manifold is more of a brook than a river, and throughout its whole course is fordable in waders almost every hundred yards or so. At the entrance to the drive up to the hotel is a signboard on which are figured the well-known monograms of Izaak Walton and Charles Cotton.

The hotel is a long, low building, having the appearance of a large farm house. There is ample accommodation for visitors; and let me here say, once for all, that Mr. Prince and his family not only understand how to make visitors comfortable, but are thoroughly successful in their endeavours to do so. We found a welcome meal ready for us, and were not a little pleased to find that the first course consisted of Dove trout—and most delicious we found them, fully meriting Cotton's praises of them, when discoursing of his river and its fish during that pleasant ride with Viator from Ashbourne. Although the hotel is visited by hundreds of tourists, the charges are most moderate. I ought not to forget to mention that A. R. I. E. L.'S charming article, "Reminiscences of Dovedale," had much to do with the reasons for our visit, and, I was glad to find that it was fully appreciated by Mr. Prince, who keeps a copy of the GAZETTE containing it for the benefit of the angler visitors who meet of an evening in his cosy smoking-room to discuss whiskey and the fishing.

By staying at the Izaak Walton, anglers, after providing themselves with a shilling fishing license, issued by the Trent Fishery Board have the privilege of fishing on some miles of the best portion of the Dove above its junction with the Manifold, and, in addition to this, Mr. Prince can generally obtain for them permission to fish on the lands of some of his farmer friends. No charge is made, and, as compared with the charge of half-a-crown a day, which is made on the upper waters of the Dove and the Wye, the Derwent, and other streams in the neighbourhood, I need not point out that this is a considerable advantage.

The only fish to be found in the Dove, from its source to its junction with the Manifold, are trout and grayling and a few eels. Now, as regards the fishing, my experience, confined to a fortnight from the 1st to the 15th of September of this year, leads me to the conclusion that although somewhat uncertain, it is, on the whole, and as compared with other rivers, very good; in fact, very good indeed, if compared with similarly free fishing on other rivers. In addition to this, there is the charm of its old associations and its lovely scenery, and then it is comparatively so near to town. It is a long day's journey to the Whitadder or the Eden, the streams I like best of all I have fished—in fact, I consider the Eden the best trout stream in the country; it is full of splendid trout, bold dashing fellows too, when you get them in the rapids. But I must not run off into too much comparison with other streams, or I shall have no space to describe the Dove. I have no experience of the river from its source at Dove Head, about eight or nine miles above Hartington, until it reaches the latter place, and, indeed, the fishing is not of much account for the first four or five miles. Starting one lovely September morning from the Izaak Walton, a drive of some nine miles brought us to the little village of Hartington. We put up at the Charles Cotton Hotel, and got tickets to fish the Beresford length, price 2s. 6d. each.

The Charles Cotton is an unpretentious country inn of the better class, and I should think anglers would find it a comfortable place to stay at—charges very moderate. Here is a copy of the rules to be observed by gentlemen fishing the Beresford Club Waters.

No. _____ of Beresford Hall.
Mr. _____ is permitted to angle in A. J. B. Beresford Hope, Esq.'s, fishery in the River Dove, at Beresford, on the _____ day of _____

No gratuities allowed to be given to the Keepers.

Permission may be obtained throughout the fishing seasons, with the exception of the month of June, from the following gentlemen, on payment of 2s. 6d. for each day, and which will be applied to the preservation of the fishery:—Rev. T. E. Heygate, M.A., Sheen, Ashbourne; Wise, Son and Cooke, Ashbourne; Mr. Joseph Gould, Sheen, Ashbourne; and at the Charles Cotton Hotel, Hartington.

Rules to be observed by Anglers in the River Dove, at Beresford.

1. The permission to fish is strictly personal, and does not extend to companions or servants.
2. No fish to be killed less than 9 inches in length.
3. No fishing after nine o'clock in the evening.
4. No bait of any kind to be used excepting the fly; trolling or bottom fishing strictly prohibited.
5. No trout to be killed between 1st day of October and 1st day of April; or grayling between 1st day of March and last day of August, and neither within the month of June.
6. This ticket to be given up to the keeper.

This ticket entitles the holder to fish for about three miles below Hartington Bridge, and also includes a field or two above the bridge. There is a mill at the bridge, and the angler should not miss this water above the bridge. The best way to fish it is to get into the stream below the bridge, and then fish up-stream carefully to the weir; there are some deep holes full of fish on this short length; I rose several good fish, chiefly grayling, but missed them; they were rising at a little black midge, and I had nothing of the kind with me, unfortunately. The banks are high, and it is no easy matter to fish this bit with the wind against you, and some fear of slipping into deep-looking holes, for you must keep down near the water, and the footing there is a sloping earth-bank. Above the weir, which is a high one, I found that the water was almost dead, very deep, and much, in fact most of it, covered by trees. It was a bright hot morning, and I do not remember ever before in a river of this kind seeing so many or such fine trout as I here saw. They seemed carefully to avoid the few open spaces where one can get a fly on the water; but under the boughs they were quietly sailing about and rising in every direction at the small black midge before mentioned, which I noticed floating down on the surface in thousands. I managed to get a very fine cast with three small flies over one or two fish without scaring them—no easy matter in a bright sun and a bright water, with a surface as smooth as glass. They turned, looked at the flies, and then contemptuously rose at a midge close to one of them. At last, by taking advantage of the splash caused by a good fish, I induced another to take it, and landed a trout of about $\frac{3}{4}$ lb. in splendid condition. It was now getting on for lunch time, and I walked back to the weir. Just under the first tree which overhangs the water on the left bank above the weir, I noticed a magnificent trout rising; I got a small palmer over him, and he took it splendidly. I gave him a gentle tug as quickly as possible, and after a splendid fight, in which he first tried to get to his hold under the tree, and then leapt twice from the water, I got him, as I thought, well in hand; in fact, I was reaching down to put the net under him, when he gave one more downward plunge, and to his good fortune got the line round a stump deep in the water, and was gone. To lose a fish between two and three pounds weight after exhausting him, is—well never mind what it is—all anglers who have experienced it will know. My collar was fast in the invisible stump, and after lighting a consol-ing pipe, I proceeded to get my running line round it and fish it out, hoping to the last that he might still be on. At last a black tangled mass of old briars and sticks came to the surface with my second fly firmly fixed in a long protruding stick, but no trout.

(To be continued.)

A PISCATORIAL VISIT.

FISH PRESERVATION AT PETERBOROUGH.

FROM a recent visit to Peterborough, I am glad to find it is not behind other places in the way of river preservation, nor is it wanting in ardent and enthusiastic anglers to maintain it in its integrity, and to keep it in full life and vigour. I have been for some time anxious to ascertain the character of Peterborough in reference to piscatorial pursuits, as in travelling through there to more northern parts, my eyes could not fail to detect the presence of anglers on the River Nene vigorously pursuing the business of the craft, but to what extent a single glimpse would fail to determine. According to my programme of arrangements for the month, as I generally prefer laying out my plans beforehand, Friday in last week was set apart for a special visit to Peterborough, but I knew of no one that I could call upon for information of the kind I was seeking. There was, however, no difficulty

in this; for I am an unbeliever in difficulties, although the first gentleman I called upon, Mr. Robinson, whom I had known for some time, but not as a piscator, informed me he knew nothing about fishing, and advised me to call upon Mr. Odan, the secretary of the Rowing Club, and here again I found that that gentleman had very little sympathy for the sport. He, however, received me very kindly, and obligingly offered to go with me to a devoted Waltonian—Mr. John Wheeler, the head master of Deacon's School (which, in pursuance of the new scheme passed under the Endowed Schools Act, 1869 to 1874, was opened in May last as a public middle-class school). I had to wait a little time in the schoolroom, as the boys were undergoing an examination in Euclid, and it was really a treat to witness the excellent discipline in the class and the readiness to obey on the part of the pupils. After the orders of "stop," "stand," and "leave" were strictly and silently obeyed, I had the pleasure of half an hour's piscatorial chat with Mr. Wheeler, whom I found to be one of the right sort, and willing to give me all the information I required without the necessity of calling upon any one else. He is not only himself a thorough angler, but his two sons, Masters J. and G. Wheeler, who are pupils in the school, are already disciples of the rod. Only a few days previous to my visit they had been angling in some private water at Peakirk, and returned home with a brace of nice jack each. It appears that the Peterborough Angling Association has only been in existence about seven years, and during that time, by strict preservation, the fishing has wonderfully improved. It possesses four miles of the river Nene, from Stanground Bridge to Allerton or Alwalton. No netting is allowed, and the anglers are limited to the use of one rod for angling with the addition of a paternoster or ledger line. There is one angling competition for prizes. Mr. Leonard Deacon is the president, and Mr. Grice is the secretary, by whom, with a good practical committee, the association is admirably worked, and it possesses 300 capital fishing members. The subscription is half-a-crown per annum. And now, as regards the fish in the preserved water: it has a fair supply of jack which have been caught up to 14 lb. each. Mr. Wheeler having taken them up to 10 lb. The bream are in great abundance, of the golden kind, and run up to 7 lb. each—perfect monsters. There is a splendid stock of roach which at times are caught in great numbers. I was informed that some of the best takes of roach have been made in the winter, when the water has been covered with ice, an opening having been made in some of the well-known swims for the purposes of angling. Perch have been caught up to 1 $\frac{1}{2}$ lb. each, and there is at times some good perch-fishing. The dace are in great profusion, but not large in size, and afford excellent sport for the fly-fishers. After a rainfall at Peterborough, which is one network of dykes and drains, the eels get into the river in immense shoals, and in the unpreserved portion they are captured by the hundredweight, and if it happens to be on the market day, they are offered for sale in the market at about tenpence per pound. The result of my visit to Peterborough was very satisfactory, and incontestably proved that it not only possessed capital fishing, but some excellent anglers. I have personally to thank Mr. Wheeler for his kind courtesy and attention, and my acknowledgments are also due to Mr. Mason, the station agent, and to Mr. Corble, the inspector, for their general civility on several occasions.

FISHING EVERYWHERE.

As I returned from Peterborough on Saturday last, on my way to King's Cross, I was astonished to witness the number of anglers out on the Nene, fishing between the two bridges, I was told, in a special roach contest. There were about half a dozen punts, and the bank had a complete link of fishers as close together as it was possible to make a swim. It was, to my idea, a really interesting sight, and besides those engaged in fishing there were numbers of lookers-on evidently interested in the match. I left Peterborough, having been a few hours previously at Grantham, by one of the excellently-arranged express trains, which comfortably performs the journey in one hour and a half; and being Saturday afternoon, about three o'clock, the anglers, who are engaged in their business all the rest of the week, were enjoying their half-holiday in the numberless pieces of water which are to be seen from the carriage window between Peterborough and King's Cross. It was a source of much gratification to me to witness, as I have termed it, "anglers everywhere," and although I have frequently noticed these stretches of water, consisting of the Ouse and other streams, I never before witnessed them so thickly occupied by my brethren of the rod. It appears that the Great Northern Railway is not behind other lines in piscatorial attractions; and results from the Ouse by my good friends Mr. Bonvoisin and Mr. Thomas Hoole, have in their club-room given on many occasions substantial proof of the quantities of fish caught in that excellent river. I remember some few years ago Mr. G. Knowles had permission to get some barbel out of the Thames for intro-

duction into the Ouse, where that fish did not exist, and that gentleman informed me two or three years afterwards they had quite become naturalised to the water, and some small fry of the species had been found. Of the stations between King's Cross and Huntingdon which are on the concession list of the West Central Association, I shall shortly have something to report.

B.

AN ANGLING MATCH ON THE GREAT OUSE.

(BY AN EYE-WITNESS.)

WELL might the poet have said, "Far from the madding crowd's ignoble strife," had he been an eye-witness to the angling match, that took place on the St. Leger day, by the shores of the great Ouse. To the criticising eye, what a contrast it would have appeared, could he have gazed on the turmoil and bustle of the surging crowd at Doncaster, and then in the same moment have viewed the group of Waltonians gathered on the green banks of the Cambridgeshire Ouse.

The match was under the auspices of the Cambridge and Ely Angling Society, who hire the river and its tributaries from the county town, down to the large, but by no means noisy, village of Littleport. Here, at the lower extremity of their property, is situated the anglers' favourite resort.

Nothing could be more enjoyable than to leave the worries and cares of business life, and spend a few quiet days in this locality, where, far away in the flat-surfaced fens, all is free from the wearying hubbub of town or city life. From this cause the lists of the members of this society embrace comers from the world's metropolis, from the busy manufacturing towns of the west, and brother anglers from both sides of Father Thames.

An hour's ride on the Great Eastern Railway brought us to the little station which, bearing the name of Littleport, notified to us that we were at our journey's end, and very near the haven of today's field. Walking along the line (though contrary, I believe, to company rules), we came to the brink of the Ouse, and ascending a little way up the river, finally arrived at the spot chosen for the day's tournament.

What would the witnesses of the tournaments of old have thought of their descendants, who could wile away a whole day in vieing with each other in the use of the fishing-rod. Doubtless they would have set them down as chicken-hearted or womanish, if such terms were then in vogue.

And now, what of the anglers who have assembled for the friendly piscatorial encounter? As in every other gathering of the human race, there are diversities. They embrace the grey-haired patriarch, and the youthful angler just commencing his teens. Here is the sage and the grave, side by side with the man who cares neither for mishap nor misfortune. There is the man who will grudge his entrance-fee if he does not win, and the man who cares not whether he catches a good basket or a solitary sprat. In form they are varied quite as much as in character. Here is the fellow-being whose head is carried at an elevation of full six feet, conversing with a fellow-sportsman who can just over-top a single joint of his fishing-rod. Again, we see the portly angler with a jolly fat face, standing by his companion, who seems to have been a prey to rheumatism and all the kindred grievances of mankind.

How easily may a man be judged and his character delineated on such an occasion as this. First of all—that gentleman who is puffing and blowing and twirling round and round, vainly and blindly attempting to extricate the fish-hook firmly fastened in the back of his coat, is a bit too hasty, a muddler—or, as some would say, a bungler. Next, that angler there, quietly gazing upon his float, perhaps contemplating the day's result, and landing his spoil without any sign of exhilaration or emotion of any kind—he is most likely a man, quietly plodding his way through the storms and vicissitudes of life. Then, he there, who has just seen his neighbour land a fish, and is enquiring what bait he is using, is a being with no staple method in his thoughts, a man ready to turn to any opinion or idea. Lastly—that person there with the brown leggings and helmet hat, surrounded with ground bait, cans, baskets, rods and tackle, enough to stock the whole community, and who has placed conspicuously in the foreground a fish of some few ounces, is what people term a "cad," or a "dandy," which, being interpreted, is a man of much consequence in his own eyes.

It is now almost twelve, the hour appointed for the commencement of the match, and the competitors are getting their baiting ingredients worked up into balls or paste, their tackle into battle array, and their baskets prepared to receive what prey may fall into their hands. The river has been portioned off into swims of ten yards in length, each divided by a little red flag, and the warriors are gathered round the committee stand, to "draw" their

number, and then march off to the swim, whose stake bears a corresponding figure.

"Gentlemen of the Committee" are going their beats, examining the bags and baskets of the anglers like custom-house officers, to prevent all smuggling and other imposition. Then comes a lull in the joking and laughter, and, as a merry old "Walton" warns all to hold on their heads, the report of a pistol jars upon the noon-day air, there is a simultaneous throwing and dipping of lines and hooks, and the match has begun.

For a time all is quiet. Every angler is very intent upon the action and behaviour of his float; somebody's bait is not worked up well enough, one is too near the bottom, and another just as near the top. Ground bait is thrown in the whole extent of the swim, the depth is plumbed, or, in nautical terms, sounded, and then all have settled quietly down into the routine of the day's sport. There are "long and strong" pulls at the pocket flasks, just to "wet the job" or to "feel a bit business-like," and all along the brink of the water stands a line of competing anglers.

Now comes the question: "Who will catch the first fish?" an omen of future success. This is soon solved. A float is beginning to bob, and the calm, still water around it begins to ripple, there is a sudden disappearance altogether, a tightening of the line, and the fish is landed. Aye, and what a fish too! A silver-sided dace, with plenty of life and strength, is gasping on the green bank, to him no friendly terra-firma. Still, whatever he may be, however deficient his merits, he must be denominated as the first fish, and his captor considered as a lucky man. All jokes and sallies are answered by the jovial announcement of the successful angler, that he is "going in for quantity, not quality."

And now the gleams from silver scales on the bank are becoming more in number, more than one heart is hoping for a bright future, and many anglers are anticipating the laurels which they hope to gain.

But the sport is not so very brisk, and one by one the less staunch among the anglers are beginning to sit down upon the grass; inventions are being devised to make the rod self-supporting and the visits to the refreshment tent are becoming more in number.

Those who have provided bait for man as well as fish, are beginning to fulfil the demands of appetite. Some one is declaring himself ready for a plate of stewed worm—what a piscatorial turn of mind, or perhaps stomach, he must have.

About two hours have gone by, and many of the more unfortunate have despaired of success and are packing up; others, with whom the sport is slow, are walking along the line, inquiring after the welfare of their companions.

And now a few of the gentler sex have found their way on to the field of action, and proved more formidable than all the attractions of the angling art, and rods are abandoned to stroll up and down the line with these besiegers, who, though not fishers, may be anglers for all that.

Thus time goes on, the afternoon wears away, and it is four o'clock, the time designed to end the competition for the various prizes. The pistol is fired, and for the last time the lines are drawn from the water, and all are busily engaged in packing up their accoutrements, and with their spoil over their shoulders trudge up to the committee tent, where are seated the judges, with their weighing apparatus before them. Jokes are cracked, laughter is universal, and exceptional applause and congratulations are given as each man's catch is made known. One jovial sportsman insists upon having his single sprat weighed—and the merriment of the crowd exceeds all description when the umpire announces in a loud tone: "Mr. ——— one fish, one quarter of an ounce."

All is over, and the anglers begin to wend their way back again to the bridge, where stands the anglers' general resort—The Black Horse.

Was there ever a merrier party "along the road"?

Here is a sportsman full of mirth, wheeling before him a borrowed barrow, upon which are two diminutive sprats, which form his day's spoil, while another is merrily trudging along with a drowned cat over his shoulder, fished from the water it is true—but with the wrong end of the rod.

Such was our angling match at Littleport, and I doubt whether our friends at Doncaster had a more enjoyable day.

SUSSEX RIVERS.

(Continued.)

ONE branch of the Sussex Ouse rises above Slaughan, near St. Leonards Forest. In the park there is a handsome piece of water well stocked with jack, perch, etc., particularly tench, for which Sussex is famous. Some of the many feeders of the Ouse come down from the forest of Worth, through Wakehurst Park,

West Hill, Balcombe (where there is a railway station), Ryland, Standgrove, passing under the railway at Riverwood, and in its course turning several mills, more or less picturesque, with pools occupied with fish. The Ouse then runs near Lindfield (to which it is navigable for barges; about three miles from Hayward's Heath Station), by East Mascalls and mill, and then takes in a tributary composed of three off-shoots of a very winding character, from Broadhurst. Wakehurst Park was the residence of the Culpeppers, of which family the celebrated herbalist was a member. Near the church is the so-called "Rocking Stone," locally termed "Big upon Little," 20 feet high and 63 feet round. From Broadhurst the Ouse passes Horsted Keynes, Trimmings, and Cockcase Mill, watering in its course a wild, richly-wooded and most sequestered part of Sussex. East Mascalls is an old, half-timbered house, the seat of the Newtons, from a branch of which family Sir Isaac Newton was descended. The vicinity abounds with studies of old farm-houses and picturesque cottage architecture. We now follow the Ouse to Washbourn Bridge, after which it laves the boundary of Washbourn Wood, and then, sending forth several thready entanglements of running water, reaches Sheffield Bridge. Here is a splendid park with expansive lakes, fed by a stream from Colin Godmins and Sheffield Mill, the latter with a good pool. Our river, after skirting Sheffield Park, and touching upon Fletching village and its bridges, runs on to Goldborough, where its volume is augmented by an affluent rising above Nutley in Ashdown Forest. Then we pass Newick and its parsonage, Sharp's bridge and lock, finding more and more water from tributaries, amongst which is one through Marshfield, then on to a paper-mill and lock near Isfield Church, where an important feeder comes in. This latter auxiliary is little less than 25 miles in length, and its branches spread in many directions, making it very difficult to follow with desired accuracy, although we had every assistance offered us by the gentry and landowners. Thus the Ouse touches Hastingford Buxted—a village of ancient character in a beautiful district, where iron cannon were first made in England. Ralph Hogge cast iron ordnance here in 1543 at a spot called Hoggetts' Furnace. We now reach Uckfield, where there is a station, amongst some of the best scenery of the county, and again return to Isfield, another station, where much attractive water will be found about the old mill. A little lower down the Ouse passes under the railway, dividing into two streams, until it gets to Barcomb Mills and railway station, absorbing likewise a tributary or two. We do not quit sight of the railway until it reaches the sea, but, dividing itself into many branches near Lower Stoneham and South Malling, skirts the fine town of Lewes and Southover, and thus on to Newhaven and the coast.

Plumpton Place (Earl of Chichester), near Lewes, under Ditching Beacon, formerly the seat of the Mascall family, is known as the place where carp were first brought into this country from the Danube by Leonard Mascall, who lived in the reign of Henry VIII. The mansion is moated all round, and contains heavy carp and tench, and we believe bream and perch. The Ouse is now protected by an association for some miles above Lewes, and it having been placed under the Salmon Laws it has especial legal care extended to its fishery.

The angler will find good hotels not far from the railway stations and unassuming inns at most of the larger villages.

The Cuckmere River is not well supplied with railway facilities, it having only one station that approaches it for many miles, and that is Berwick, near Chilver Bridge. We must, however, record our ramble, where possible, along its banks. From Chilver Bridge downwards to the sea it passes under the railway and Sherman's Bridge by Berwick, Alfriston, Excebe Bridge, Lillington, West Dean, by the Foxhole and Barracks into the ocean at Cuckmere Haven, about three miles from Seaford.

We now, from the absence of more railway facilities, travel upwards from Chilver Bridge. We pass in our ramble Arlington, Sessingham Bridge, Week Street, Michelham Priory, where its waters form a moat, Hamsted, Horse Bridge and Mill and Hellingley and mills, and, further up, Warbleton and Nettlesworth. This is a good trot of several miles, but we must not turn after going thus far, and a short walk further takes us through Nettlesworth, Sapperton and into Heathfield Park, in which Jack Cade was killed by Alexander Iden, Sheriff of Kent, in 1450. Then we reach Theobalds, where a good deal of charming water lies around.

At the village of Hellingham the Cuckmere meets the Waldron branch, which, forming a boundary of that parish and East Hothly, passes by Streame, the site of the great ironworks in the parish of Chiddingfold, and swollen by several minor rills in its course. These rills abound in small trout of an excellent flavour, but would be better disposed of in stocking deeper and less accessible waters, than being eaten by the dozens, like sprats. They are caught principally by roving with the worm, one or more being taken out of each bend of the streamlet, their strength often de-

ceiving the angler into the notion that he has got hold of a pounder when two or three ounces only is the result.

NOTICES OF BOOKS, &C.

THE ROD IN INDIA: BEING HINTS HOW TO OBTAIN SPORT; with Remarks on the Natural History of Fish, their culture, and Value; and Illustrations of Fish and Tackle, by Henry Sullivan Thomas, F.L.S., and F.Z.S.; Second Edition. London: Hamilton, Adams and Co., 32, Paternoster Row, 1881.

THIS is a thoroughly capital book in every respect, and its perusal will afford an agreeable surprise to any who, like ourselves, were in the dark as regards angling sport to be had in India, and who, perhaps, like us, had a sort of general impression that the only sport to be had was fishing with "thundering" heavy tackle for enormous freshwater sharks, called Mahseer, in gigantic, but sluggish and muddy rivers. It was, then, with a feeling of wonder almost that we received this portly volume, of over four hundred royal 8vo pages, with first-rate coloured and other illustrations all devoted to sport with the rod in India! Every pleasant page, and no page is unpleasant, is a revelation. Our supposed clumsy shark, the mahseer, turns out to be a formidable rival to the salmon in the British Indian angler's estimation; the muddy river is transformed into a dashing salmon stream, clear as crystal; and the heavy tackle dwindles into the lightest salmon or trout rod, and the finest salmon trace or drawn-gut line. We wish we had space to do justice to the book which we have read with the greatest pleasure, and, as evidence of its interest, at two sittings. Mr. Thomas has the rare gift of combining anecdote with practical instruction in such a way as to lead the reader on from page to page with unflagging interest; and although he writes for the guidance of anglers in India, or those who may be going there, the angler at home or in America will find his book full of matter valuable to him, let his fishing be where it may. Anglers for heavy pike will find many useful hints in Mr. Thomas's descriptions of his mode of capturing mahseer and the kind of tackle he employs; in fact, the book is full of suggestions which any angler may profit by; suggestions which are the fruit of experiences amongst fish as strong, shy and crafty as any to be found in the United Kingdom or America. The mahseer (*Barbus Tor*) is the chief of the many species of the carp family which exist in India, and it is doubtless this fact which has led English anglers who have casually heard of it to come to the conclusion that it is also carp-like in its nature. Nothing could be further from the truth. Merely to mention that it rises as freely at the fly as the salmon does, and shows even a better fight, will at once put it in its proper place, as one of the finest game fish in the world from an angler's point of view. Old salmon anglers, such as our author, describe the first rush of a mahseer as something grand, far more powerful than that of any salmon of equal size. It is no uncommon thing for one to carry out a hundred yards of line at one rush. Then the places which this fish prefers are the quieter waters close to the rush of the stream, or even the stream itself. It lies behind rocks, in eddies caused by bends in the stream—in fact, in just the places which the salmon prefers. It is extremely shy, and, as the best fishing is got when the water is perfectly bright, to be successful the angler must keep well out of sight, and use the finest tackle possible, keeping in view, of course, the great strength and size of the fish, which runs up to 150 lb. and more, though fish of from 10 lb. to 50 lb. are more common. The only way to take mahseer when the water is discoloured is with a stationary live-bait, the reason being, our author thinks, that they cannot see well in discoloured water. In this country we naturally expect best sport when the rivers are just clearing after a flood.

"These who know something about fishing in England are consequently more likely to be on the wrong tack in India, for they would naturally arrange to fish at the very time when, in India, they are least likely to have sport. I have tested this question pretty thoroughly, and am quite satisfied that it may be laid down as a safe rule that it is useless to fish for mahseer except in clear water; it must, at least, be so clear that you can see the small pebbles at the bottom with ease in 4 feet of water, and it may be as much clearer as ever you like. You need not be the least bit afraid if it is as clear as crystal, indeed, it ordinarily is so through all the best months in the year.

The mahseer feeds on pretty well anything it can get in the shape of food, but prefers a fish diet if it can get it.

"This mealy-mouthed gentleman, who looks as if his soft leathery lips could not hurt anything, has a peculiar way of killing his fish. He has no teeth in his mouth wherewith to hold any slippery little fish he may catch, and prevent its struggling out again before he can swallow it. In lieu of this he is therefore provided with great power of jaw, and he kills and holds his fish by compression, violent compression. . . . That the mahseer can exert great power of compression with its soft mouth, I once had clearly proved to

me. My spoon bait, which was nearly new, and for weight's sake unusually stout, and in thorough repair when I cast it in for a spin, was doubled right in two, and crumpled up like a piece of paper, when I landed my fish. . . . Had I tried to produce the same effect, it would have required a good down-right blow with a hammer and anvil to help me."

It was not until he found this spoon so smashed up, that he could understand how it was he lost so many treble hooks—they had been simply smashed up in the same manner; and Mr. Thomas strongly insists on the necessity of using specially made triangles for mahseer-fishing, stouter than anything ever used by anglers in this country. Indeed, from what he says, we should strongly recommend our friends Messrs. Allcock and Co., of Redditch, to manufacture extra strong treble hooks for this fishing; and if they could adopt an idea suggested by a gentleman who is quoted in this work they would get a good demand for them in India, and that is to make both single and treble hooks for mahseer-fishing in various sizes with barbs not cut out of the wire of the hook, but added; to partly sever the wire, is, as this gentleman points out, greatly to weaken its strength at this point, and it frequently happens both in fly-fishing and spinning for mahseer that heavy fish are lost by the hook breaking at the barb section. If, in addition to this, they could make triangles not soldered together, but so fastened that the hooks would, when pressed laterally, give and lie flat one on top of the other, the mahseer-angler would less frequently have to complain of smashed hook. Steel very soon rusts in India, and waxed silk fastenings soon decay, so that the hooks should be nickel plated and eyed.

The mahseer, as we have said before, feeds on almost anything he can eat, and consequently the baits used are various. He will take the fly, but spinning a small natural bait is the most deadly method in our author's opinion, and he is careful to reiterate the necessity of keeping well out of sight, and fishing fine and far off.

"It is necessary to be doubly particular about having as fine tackle with as few hooks as possible; and flights of numerous hooks, that are considered quite 'according to Cocker' at home, look, in our bright waters, so truly terrible that no Indian fish would be fool enough to come within a yard of them."

After reading such a paragraph as this it will occur to every pike angler that if the spinning bait is the best for mahseer, then the method of mounting it must be a very good one, and if it is successful with this wily fish it ought to prove so with our pike, and we therefore give a description of the plan adopted by Mr. Thomas. In general outline there is nothing new about it; we know anglers who spin for pike in the Stoke Newington reservoirs and elsewhere who use a similar method, but it is different in detail, and the difference between success and failure often depends on a careful attention to detail. The length of bait which Mr. Thomas prefers is four inches, and he makes use of two modes of baiting. He says, p. 47:—

"One is more troublesome than the other, but it is, in my opinion, the more killing, so I give it first.

"Having selected your bait out of the bait can, humanely kill it thoroughly with a flip or two on the back of the head, but temper your physical energies with a little discretion, so as not to knock it about. 'There is wisdom in sucking eggs,' and there is a right and a wrong way of killing a bait even. If you have a loach-like bait to deal with, which is to be recommended, you may flip away at his head for a long time without killing him, and though you may half-stun him, you will be horrified when putting the baiting needle through him to find he is still alive and kicking; whereas, if you give him one good squeeze in one band so as to crush his internal organs, he will die instantly. If he is too slippery for you a little river sand will soon get over that difficulty.

"You must not follow this plan with the dace-like fish, however, for if you do the silvery scales will all come off, and it will at once look dreadfully dishevelled. Moreover, it is not necessary, for the dace-like fish have as thin a cranium as a snipe, and a flip on the head soon does for them, and with them it is you must not be too rough.

"Your bait being dead, then insert the baiting-needle, point foremost, at the anus, and bring it out at the open mouth. Before pulling it through, hook the loop of the gut (with only one single triangle at end) on to the eye of the baiting-needle. Then pull the baiting-needle out at the mouth, drawing the gut after it through the fish till the hook comes home to the anus. In doing this, humour the baiting-needle by giving it a turn, as a doctor does an instrument, so as to tear the vent-hole as little as possible in getting the loop through it. When the hook is home to the vent, embed one of the three thoroughly in the fish, so that the two remaining hooks of the treble shall be lying close against the fish. In this position they are scarcely perceptible, whereas if one hook is carelessly only half embedded, the other two stick out and show unnecessarily. It is always worth while to bait very carefully and neatly, because all your subsequent efforts centre on the nicety of your baiting. Then you must have a sinker (a longish, pear-shaped lead with wire loop at top). Pass the baiting-needle through the loop or ring attached to the sinker, and run the sinker down the gut, and push it, this point foremost, down the fish's throat, so that it is entirely concealed within the mouth of the bait. Then remove your baiting-needle, and hold the line so as to come out of the bait's mouth exactly in the centre; and, so as to keep it in the centre, and make the bait spin true, as well as keep the lead from coming out, sew the bait's mouth up as follows with a common needle and thread. Close the mouth, pass the threaded needle through both lips so as to bring it out at one of the nostrils in the upper lip, insert it at the other nostril, and pass it through both lips again, keeping the line between these two stitches. The two ends of the thread will then be over at the chin of the bait; draw them together just gently enough to avoid tearing the bait, and yet tightly enough to

keep the mouth well closed. Tie a sailor's knot and cut off the ends. Use black thread double, or any strong knitting silk double—white thread shows too much. This may seem a long, troublesome and fidgetty process, but it should not occupy as long in the doing as it does in the describing."

The only objection Mr. Thomas has heard of (but which he does not experience) in adopting this method of baiting, is that the bait may bend too much by dragging down on to the hook, because there is nothing in the line to give it rigidity and keep it straight, but he does not find this happen if care is taken not to embed the hook further away from the head than the vent-hole, and "if it be a fault, it is one that is easily remedied by inserting the baiting needle not at the anus, but a trifle nearer to the head," but it should not be inserted in the stomach, which is liable to give way, but "In the firm flesh, half way up the side, and also take care to pass the baiting needle not simply under the skin, but through a good piece of flesh, so as to give a hold, and also embed one of the hooks thoroughly well into the side till the other two lie quite flat against it. This for objectors, but I prefer the use of the vent-hole, as it tears less, and is in my opinion not at all too far back; indeed, I sometimes insert the one embedded hook a little further aft than the vent, because the vent is differently placed in different fish, and some require a little more bend to make them spin. The opposition of the water makes the bait hang back on the hook, so as to draw the tail and create bend enough to make it spin."

Now we cannot help thinking that if some of our pike-anglers will carefully try this method they will find it pay. Jack are getting highly educated, and Thames and other flights showing an array of hooks to the fish, most certainly scare many, and generally the old 'cute fish.

We notice that Mr. Thomas speaks in the very highest terms of the reel lines sold by the Manchester Spinning Company, and having recently used some of their new silk and other lines, we can thoroughly endorse all he says in their favour. Their taper trout lines are perfection. Want of space forbids us saying more about the first-rate work before us, and we feel we have after all said very little about it; at any rate, we trust our readers will take an early opportunity of studying it for themselves. It contains an immense amount of most useful matter—hints on striking, playing, landing fish, etc., in addition to full descriptions of a great many of the splendid game fish of India, of which the mahseer, although chief, is only one. We hope to refer to it again.

"OUR TRAWL."

List of Ichthyological books published in May and June.

ANGLER'S NOTE BOOK and Naturalist's Record. London: Satchell, 1881. 4to. 6s.

DAY, DR. FRANCIS.—The Fishes of Great Britain and Ireland, being a Natural History of such as are known to inhabit the Seas and Fresh Waters of the British Isles, including Remarks on their Economic Uses and Various Modes of Capture; with an Introduction upon Fishes generally. London: Williams and Norgate, 1881. Part II. 8opp, 21 plates. 8vo. 12s.

PARLIAMENTARY REPORTS.—Fisheries in North Sea. Outrages committed by foreign fishermen, 1s. 6d. Fisheries (Ireland) Report for 1880. 10d.

YHLEN, GERH. VON.—Die Seefischerei an der Westküste Schwedens. Gothenburg: N. P. Pehrsson, 1881. 62pp. and map. 8vo. 4m.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

RIVER REPORTS.

Thames (Goring).

Water in very good order for jack and perch. Have not been doing much this week. Gudgeon have been biting well, took 10 dozen on Sunday with one rod; Wednesday, some very good perch and one jack.—JOHN RUSH.

Thames (Halliford).

The river is now in good order for seasonable fishing. Different gentlemen, fishing with me four days since my last report, had takes as follows:—First day, Mr. Long and a friend, 4 barbel, 2 bream, 1 roach and some dace; second day, Messrs. Innes and Withers, 9 barbel, 2 perch and 2 roach, in all 24 lb.; third day, Messrs. Wright and Wilson, 15 barbel, 9 roach, 2 chub and some fine dace—one rod 24 lb. and the other 16 lb., in all 40 lb.; fourth day, Mr. Geo. Paimer, 3 barbel, 1 perch and 3 roach; all legering.—GEORGE ROSEVELL.

Thames (Twickenham).

Wind north-east and quite summer weather, and water now again in first-class condition for all-round fishing. The river has been in a very bad state until this morning through last Saturday's rain, consequently our takes have been small until to-day, and I am pleased to say we have had some good baskets of fish taken away. To-day the tide will suit well for next week, whole day's fishing.

N.B.—By writing or wiring, a punt can always be ready pitched for any customer.—ALFRED PERRIN.

Thames (Windsor).

Water has cleared off very much, but barbel are still taking kindly to the worm and greaves. James Gray has been making some capital bags of barbel. 25th inst., with a patron, 22 barbel; on 28th inst., with Mr. Way, of Windsor, and a friend, 24 barbel and 1 eel. All these fish were had with worm. The best barbel of the week that I know of was a 6½ lb. fish, taken within ten yards of Windsor Bridge by one of the officers of the Royal Horse Guards fishing with me. It was the perfection of a Thames barbel. Since my last I have had a good many barbel from the same swim at odd times, and all with greaves or scratchings, as our Trent brothers call it. Some thumping jack have been seen feeding in the neighbourhood, and expect every day to hear of one of three that I know will take some weights in the scale coming to grief. Roach are being had, but want fishing for with fine tackle. Gudgeon are still feeding, and run a good size.—B. R. BAMBRIDGE.

Ancholme.

In connection with some friends, I paid a visit to this river on Saturday last, but owing to the drawing off of the water at Ferriby Sluice, and its discoloured state, we were unable to do much. We tried the whole round of natural baits—worms, gentles, paste, &c., but only secured a few small roach. Not a run rewarded us in our trolling for pike. The advent of finer weather has, however, worked a change on other parts of the stream, and some fair dishes, chiefly bream, have been obtained by various Brigg and other local anglers. Good coarse fishing may not be had in the South River, between Thoresby Bridge and Austin Fen. Last week a roach weighing 1 lb. 8 oz. was caught by Master George Hollingworth, of Grimsby, eleven years old, who battled with it as skilfully as a salmon fisher with his quarry. The tug lasted, so my report says, twenty minutes, when Master George landed it safely without the aid of a landing-net, and on a single hair hook. Here the fish are in first-class condition and bite well at any reasonable offer. The average takes are four or five score. Coarse fishing may also be had in Grimsby Haven. There a trout weighing upwards of 3 lb. was recently caught. This had probably dropped down from the higher reaches of the Beck, which runs into the haven.—THOS. FORD (Caistor).

Dove.

River in rattling order for coarse fishing, and not bad for the fly. The whirling blue duns have now begun to make their appearance, and while they are on sport ought to be good. The dishes this week have averaged well, perhaps five or six brace each. Both trout and grayling have risen best in the middle of the day. In the Henmore and Manifold several large trout have been killed with the Derby killer, which, it seems, impossible that the spotted ones can resist. Chub fishers are doing rarely with scratching, plenty of good samples having been secured since our last at Ashburne, Mayfield, Rochester, and Uttoxeter. I hear of some Nottingham piscators having been busy amongst the barbel and bream at the junction of the Trent with the Dove, some pretty large ones having come to hand by means of the lob worm. Roach have been taking creed wheat and malt best, but a well-soured cockspur will prove the most alluring as the weather gets colder.—THE SPLDGER.

Exe (Exeter).

Whether it is that the grouse and partridge shooting are in full swing, I know not, but salmon and trout fishing seem almost forgotten. Very few indeed are trying their luck with these silvery and speckled beauties, and yet they are very plentiful, and ere these lines are perused by your numerous subscribers, the salmon-fishing season of 1881, will, as far as this river is concerned, be closed. The run of salmon and peal on the whole has been extraordinary, and to close the season, some very fine fish have been taken in the Cowley Bridge Waters. Mr. J. A. Kelley landed a beautiful trout 2½ lb. weight, and a couple of small jack which has been quite against the ordinary rule; for although we are having most delightful weather for fishing, such as roach, dace, perch, &c., it has been wretched—the waters, so still and placid, like Mickie McQuaid's scholars, have been improving for the worse for

some time back, however, we may have excellent work for the rods shortly, as we have had some heavy showers, and the water is getting in working order although a little discoloured, and of all kinds of fish there are abundance. Bass and bream fishing in the estuary, slow, but some splendid prawns from Exmouth and Budleigh Salterton, also Sidmouth, have been brought in and fetched from three to four shillings per hundred.—FRANK GOSDEN.

Fareham.

The trout season is well over, and although, owing to the bright clear days in the spring and early summer, it made the fish very shy, still I have accounted for 122 brace, averaging a trifle under ½ lb. each. The most taking flies have been “Wickham's fancy,” “Coch-y-bondhu” and “red Palmer.”

Ilfracombe (N. Devon).

Since my last report there has been some splendid sea-fishing, Friday being a beautiful day all boats put to sea, and returned after fishing their tide with their boats strewed from stem to stern with fish of different kinds, codling, whiting, and pollard, others had bream, conger, and ling. Saturday stormy, wind blowing strong from S.W., with drizzly rain, but despite the weather a few boats put out for an hour or two and caught from 30 to 40 lb. each boat. Monday, weather fine, all boats out and some good catches of fish was brought in. Tuesday, some good sport was had, and some fine fish caught, one fisherman brought in a conger weighing 56 lb.; a quantity of big fish was caught, mostly conger and ling; a gentleman also brought in a fine cod, weighing 18 lb. Wednesday: weather still fine, several fishing parties ventured out, some trying for small fish, others for big; they all returned well satisfied with their luck, their catches varying from 80 to 140 lb. per boat. One fisherman brought in a fine skate weighing about 150 lb., it was a monster, he was obliged to put a hook in it and drag it to his house. There is also some fine sport from the pier and jetty with rod and line. Thursday, weather fine, with good prospects of fishing for the next few days.—E. COMER.

Lea (Ware).

Since last Saturday's heavy rain, the water here has daily improved, and is now in excellent condition for all kinds of fish. Royal weather all the week, keen frost every night, so far, and, should this continue, there undoubtedly will be some grand sport for some time to come, if only my brother anglers will try their luck here. The weeds are gradually decaying in some places. Fine roach and perch were taken last Sunday, near the Cat and Monkey, averaging 1 lb. Likewise roach, ¾ lb. In the Old Arm Chair “at the room” a hon. member has had weighable luck all the week. Gentle seems to be the favourite bait. Jack are fairly on feed, but want getting. I have noticed some rattlers since the change between the toll bridge and the slaughter house. Bait can always be had by applying to—VON LEEFE.

Lea (Rye House).

The water is in good order now for roach and perch fishing. The weather is fine and warm, the wind north-west. There have been some very nice roach taken this week, and some nice perch. Mr. Steadman took some nice roach on Sunday, another gentleman took a nice jack, 8 lb., out of the lower water.—W. COWELL.

Medway (Tonbridge).

The rains of Saturday and Sunday made the water as thick as pea-soup, and but very little angling has taken place, but a few bream have been caught. The river is going down nicely, and about Monday, if there is no more rain, it will be fishable.—YE MEDWAY WATER-RAT.

Norfolk.

The unsettled weather during the past week has had a tendency to slightly discolour the water, but in spite of this some very decent catches have been reported, both from the Bure and the Yare. Some of the East Anglian Piscatorial Society showed some splendid bags of roach taken at Coldham Hall last week, and a couple of them, fishing at Homersfield, on the Waveney, returned with a magnificent take of fine perch, three of them scaling 6½ lb. Messrs. Palmer Bros., and E. H. Holley, Esq., also succeeded in making up a nice basket of mixed fish (roach, dace, perch, and bream), at South Walsham, notwithstanding, they experienced a steady downpour of rain throughout the day. Pike are now well on the feed, and large quantities are being taken both on the Yare and Bure. Over 60 were taken by one fisherman at Coldham within a fortnight, and any of our London friends who have a mind for a day or two's sport should make application to Mr. Browne, Coldham Hall Tavern, where comfortable apartments and an experienced man may be met with. The only bait now used is the ordinary spoon with the FISHING GAZETTE spinner attached. I had the pleasure also of seeing eleven fine fish, which were taken between Ranworth and South Walsham on Thursday last, and reports of other equal as good catches are coming in from the various stations, and this shows that I am somewhat near the mark in my predictions, some time since, that we should have a good pike season. The new fishery and pleasure grounds which will shortly be commenced near the Brundall Railway Station will, no doubt, be an immense success. Citizens and strangers alike will find the benefit of it. There will be for fishing purposes alone fifty good substantial boats with every appliance and comfort, suitable for an angler, about the same quantity of boats will be kept for rowing, sailing, and pleasure parties. A private hotel will be erected for the accommodation of gentlemen from a distance during the fishing and boating season. There will also be a large structure for the purpose of entertaining members of fishing clubs, when holding their contests, and also political and other outings. Fishing tackle, bait, angling suits, in fact every requirement, will be able to be obtained, and at a nominal cost. Tea and coffee and light refreshments will always be kept, and parties will also be supplied with dinners, &c., if required. The plot of land purchased lies between two dykes, and these will afford good harbours for yachts, &c., quite clear of the main river. A meeting of the projectors of the scheme was held on Wednesday evening last at the club house of the East Anglian Piscatorial Society, where plans and sketches of the spot may be seen upon application to the hon. sec., Mr. Alfred Palmer. I will send a full report of the proceedings in my next report.—ANGLER.

Ormesby Broad.

Water in good order and weather very fine, but fishermen seem to come rather slowly now, those that have been have had fair baskets of fish, several baskets from 14 to 25 lb. of roach and bream have been brought in. Wednesday 29th, two gentlemen at Ormesby caught 44 lb. of bream, all large fish. I shall expect to see some good jack fishing next month.—S. RICHMOND.

Severn (Shrewsbury).

The water is now in good order for fishing, and the weather all that can be desired. Slight frosts at night, clothing the pastures with a silver garment, have put a stop to early morning fishing, and nothing can be done till Old Sol

sheds his genial rays on all around, and brings the water to something like fishing temperature. We have had a rise of water from the Vermew, which for a day or two made angling somewhat difficult; but this has now run out, and bottom fishers should embrace the golden opportunity afforded at the best season of the year of filling their baskets. Grand takes of perch, roach and dace have been secured above and below the town, with worms and gentles, and should the weather remain as at present, good baskets will be the rule, not the exception.—W. D.

Solent.

The whiting came in much earlier than usual this season, but they do not run very large, and they are accompanied by an immense quantity of dog-fish. These repulsive brutes suck in the bait very quietly, quite different from the sharp tug-tug of a whiting; and you either lose your bait, or have the annoyance of having to clear the hook from the dog, not a very nice job, as a prick from his sharp fin will poison the blood of some people. I heard of 14 dozen being caught by one boat in a day, and I also heard of 26 dozen whiting being caught in a day. But from 4 to 8 or 10 dozen per boat is about the general run. The upper end of Portsmouth Harbour is swarming with flat fish, about $\frac{1}{2}$ lb. each. They are netted by the Fareham fishermen, and sold at about 1d. per lb.

Swale.

The somewhat improved weather of the past few days has helped the anglers a little during the close of the trout-fishing season. The needle brown has been the best fly where the waters were fine enough to admit of fly-fishing. I caught the last trout which I shall attempt to capture this season on Wednesday last—eight fish, all males. Is not this a rather singular result?—THOMAS FORD.

Trent (Alrewas).

With the exception of some good grayling being taken at Alrewas weighing from 1lb. to 1 $\frac{1}{2}$ lb. each, I have very little news piscatorial to send from this locality. On Saturday we had a heavy rainfall in the Midlands, which brought on a rise, and discoloured the water so much as to render the river unfishable. Doubtless this will do the river a deal of good for the angling fraternity, as it will clear away a lot of the decayed weeds and animalculæ on which the fish were feeding, and as we are entering on to one of the best months of the year for roach fishing, I shall be surprised if I do not have to chronicle some good catches when the rivers get in good fishing order. With the rivers the colour of clay, a few good roach have been taken by Messrs. W. Reynolds and F. Jephcott with worms, the largest fish 1lb. 7oz. Pool-fishing has been about on a par with the rivers. At present no large catches of pike have been brought to my notice. I made my first start this season with Mr. John All-day on Friday. Jointly we only succeeded in taking a dozen fish, and only half of them worth keeping. The bait used was a gudgeon on Gregory's archimedean tackle, and Gregory's clipper. To-night the river is reported as getting in good order. The weather is delightful, and matters piscatorial decidedly of a cheerful character.—JAMES GREGORY.

Trent (Newark).

When I sent my last week's note, the weather was very uncomfortable, and the prospects for sport looked very bad; but on Sunday the weather changed very nicely, and we have enjoyed some splendid weather since then. The rains of last week caused the river to begin to rise on Sunday, and during the last two days an extra foot or two came down, of rather a nasty colour; but to-night it has cleared down, and the river is in fairish order for all-round fishing. Sport, as a general rule, has only been very indifferent this week. I have not heard of any catches being had worth mentioning. The baits mentioned in my last will be about right for this week, only the angler might try creed malt and wheat, with a bit of paste as a change against worms and gentles for roach; chub will still take wasp grubs while this fine weather lasts and the water keeps clear; use a few coarse gentles for ground bait, whilst chubbing with wasp grub; barbel and bream might be tried with worm, but these fish seem to have been clean off the feed this last fortnight—but I say "try again," and perhaps you may have the catch of the season, who knows? Roach, I believe, will take the grain bait, or paste, if the present fine weather continues, if not, try them with cockspur worms and gentles. I should try the bream with a brandling worm, the biggest and handsomest you can find, and just tip the hook with a wriggling lively cockspur, and perhaps the jaded appetites of our friends the bream may be tickled. I can remember a case when the bream refused the maiden lob, and took kindly to brandlings and cockspurs (as I have mentioned) the next day in the same swim. We have had some very slight frosts this last morning or two, and perhaps our friends the jack may wake up, and get into the humour of devouring anything that comes in their way. Jack-fishers, who have not got one of Gregory's "clipper" baits, should get one or two at once, as I consider them the best artificial jack-bait going. A canny Scot, working down here at Newark, and entering in a fishing match, came to a friend of mine for a few gentles, a few days before the match, and says he, "I have got a few nice worms, and a bit of bread paste, and a bit or two of salmon roe paste, and some creed malt, wheat, rice, and pearl barley, a few wasp grubs, a bit of bran mash, a few grains, a bit of nice white suet, and a few pellets of red lead." And, added he, "if I could get a few gentles, I think I should have a 'glorious nibble.'" Now, I should not like to recommend a lot of baits like that; what I have mentioned will be found quite enough.—THE TRENT OTTER.

Wye and Derwent (Derbyshire).

Both rivers have risen several times, since my last report, from the heavy thunder rain, that has fallen in Derbyshire. Both the bottom fishers on the Derwent, and the fly fishers on both rivers, have done fairly the latter end of this week, and baskets from 6 to 11 $\frac{1}{2}$ lb. brace for anglers have been made. Grayling are now rising well on both rivers, and I recommend grayling fly fishers to lose no time in trying their skill, for I am quite sure that, if they only have the proper flies to use, "Sport is certain" to those who know how to go about their work properly. I hear of some large baskets of fish being killed off of the private waters of the Wye during the week, chiefly with the honey dun bumble, furnace, and little blacks. Nine and a half brace were killed last Saturday afternoon on the Derwent with the bumble and furnace flies. Mr. H. Wild, of Matlock Bath, has killed a large grayling of 1 $\frac{1}{2}$ lb., by bottom fishing, with maggot, for bait. This is a very large grayling for the Derwent. There have been a very great deal of coarse fish killed with body worms and maggots on the Derwent between Cromford and Ambergate. There was a gentleman visitor killed nine good-sized trout on the Darley Dale water on Tuesday afternoon. Two of the fish being about a pound apiece. These fish were killed by trolling with the small artificial Derby trout-killer. Angling prospects are looking first-class. Barometer rising, with every appearance of a continuance of fine weather.—GEORGE JAMES EATON.

Starkholmes, Matlock Bath. Sept. 29, 1881.

ANGLERS' BENEVOLENT SOCIETY.

At the usual fortnightly meeting of the society, the following members of the committee being present: Messrs. Murphy, Field, Oram, Stevens, Cundall, Manning, Jennings, Beckett, Welch, Aldridge, Marshall, Noble, Mr. Crumpton (Gresham Angling Society) also took his place on the committee, having been elected in the place of Mr. W. Hull, who retires, according to rule. Mr. R. Murphy voted to the chair. In addition to the general business of the evening, the secretary informed the committee that he had received from R. B. Marston, Esq., proprietor of the FISHING GAZETTE, 250 copies of the GAZETTE, containing the full report of the Anglers' Benevolent Society, from May 1st, 1880, to April 30th, 1881, which he had generously presented to the society. A unanimous vote of thanks was passed to R. B. Marston, Esq., for his very handsome gift to the society, and for the great interest he has always taken in the welfare of the Anglers' Benevolent Society, having generously presented £5 5s. donation on its first starting. It was resolved that the committee form themselves into deputations to visit the various societies at their club-rooms on their meeting nights to explain the objects and benefits of the society, and enrol members. The secretary gave a very satisfactory account of the financial position of the society. The next meeting of the committee will take place on Friday, October 14, at nine o'clock.—R. GHURNEY, secretary.

N.B.—The following donations have been received by the secretary since the last meeting:—C. Busbridge, Hampstead Angling Society, 10s. 6d.; R. George, Hampstead Angling Society, 10s. 6d.; Good Intent Society, £1 1s.; W. Roberts, Good Intent Society, £1 1s.; Flood, sen., Cambridge Friendly Society, 5s.; P. Crumpton, Gresham Angling Society, 5s.; G. Austin, Gresham Angling Society, 2s. 6d.; J. Thompson, Gresham Angling Society, 2s. 6d.; C. Bentley, Gresham Angling Society, 2s. 6d.; Caxtonian Angling Society, £1 1s.

GRANTHAM ANGLING SOCIETY.

The eighth annual fishing competition took place on Monday last. The morning was clear and beautifully fine, much to the satisfaction of the fifty-four anglers, all of whom were anxious to secure the first prize, which gives the successful competitor the laurels of the season, as the prize is contributed by the Lord Lieutenant of the county (Earl Brownlow). The worthy piscators, so full of glorious hopes, embarked at the docks at ten o'clock to go to the scene of action, which is about five miles from Grantham. They found the water rather thick from the day's previous rain, and although the result was considered satisfactory, the anglers had all their work to do to get at the fish. It was a remarkable circumstance that one of the members in fishing hooked a beautifully marked snake of three feet six inches in length. Mr. G. Willoughby took the first money prize of £2; Mr. W. Scothern, the second of £1; Mr. J. Hall, the third of 10s.; Mr. J. Welborn, the fourth of 7s. 6d.; and Mr. F. Williamson, the fifth of 5s. There were a considerable number of articles given by the local tradesmen as prizes, which were won by the following members:—Messrs. T. Weaver, W. Wilkinson, Sutton, E. Rudd, Bowman, W. B. Bell, J. Wilkinson, B. Edwards, H. Filing, J. Robinson, T. Goodman, R. Chantry, J. Gandy, F. Simpson, J. Field, Fletcher, H. Smith, D. Harrison, G. Pearson, W. Healey, A. Short, W. Sudbury, H. Doncaster, N. Roberts, A. McLeod, J. Haddon, R. Penchbeck, Leake, A. Martins, A. Birch, &c., &c. The day was closed with the annual supper at the Blue Bell Inn, which was ably presided over by Mr. J. R. Ogden, the vice chair being taken by Mr. G. Willoughby. During the evening the prizes were distributed. The usual toasts were given; there was some excellent harmony, and altogether the evening was an enjoyable one. There are some interesting local incidents of a fishy character which are worth relating. As Mr. A. Malin and Mr. J. R. Teesdale were boating on the canal the previous Tuesday evening, a jack of about 2 lb. leaped out of the water into the boat, but it was an unlucky adventure on the part of the fish, as it was not allowed to return to its native element. Mr. W. Kinsella in fishing in the Denton Reservoir, near to Grantham, where permission can be obtained, caught a fine pike of 16 lb. On being successfully landed, it was found the bait had been taken by a smaller fish when the latter had been apparently seized by the larger one, which had got it so well pouched and unable to extricate itself that Mr. Kinsella brought them both to grass. On disgorging the smaller fish the monster was found not to have been hooked, but remained hold of the other one until he was safe out of the water.—B.

WALTHAMSTOW ANGLING SOCIETY.

The meeting for the President's (Mr. C. F. Haines) and other prizes given by the members was held at Littleport, Cambridgeshire, on Wednesday last, the 21st ult., and proved a most enjoyable outing. The major portion of the party left by the 5.15 express from Liverpool Street, reaching Littleport at 7.30 (other members having gone previously); a conveyance was in waiting to take the party to the Ship Inn, Brand Creek, on reaching which very comfortable hostelry a capital repast awaited, which was done ample justice to. After the cloth was drawn, a very sociable harmonious evening was spent, the members, on account of the early commencement of the competition on the morrow, all retiring before midnight. Up and astir with the groundbait soon after 5, all assembling in the dining-room at a quarter to 6, when after a little friendly chat, and perhaps a little drop of milk (with something in it), as the clock struck 6 the secretary gave the word to "start." The morning was somewhat threatening, and storms occurred at intervals during the day, which greatly marred the sport, instead of a large catch, which might reasonably have been expected, seeing that so many veteran anglers competed. At five minutes to 4 o'clock the secretary passed the word to "stop." Tackle was then done up and a return to the house made, where a profuse smoking repast was ready, to which the members very readily devoted themselves. A conveyance then took the party back to the station for the 7.8 express, reaching Tottenham at 8.10, where cabs were in waiting to convey them to the club house, in Markhouse Road, arriving there to find a goodly assemblage of gentlemen awaiting to see the result of the meeting, which was as follows:—Mr. W. Berry, 7 lb. 4 $\frac{1}{2}$ oz. roach; Mr. Jas. Latham, 7 lb. 3 $\frac{1}{2}$ oz. roach, one scaling 1 lb. 3 oz.; Mr. W. Tungay, 6 lb. 11 oz. roach; Mr. W. Howell, 4 lb. 12 oz. 10ach and rudd; Mr. J. Howell, jun., 2 lb. 11 oz. roach and gudgeon; Mr. G. Chillingworth, 2 lb. 1 oz. roach. The prizes consisted of £2 2s., given by the President; six silver spoons, by Mr. Geo. Lancaster; a handsome book of roach tackle, completely fitted, by Mr. D. G. Casey; a roach rod, by Mr. Cashford; a jack rod, by Mr. Levett; a winch, by Mr. E. Davis. The meeting was a complete success, and all expressed their satisfaction with the arrangements and the pleasure they had derived from so pleasant an outing. Mr. G. Lancaster took 7 $\frac{1}{2}$ lb. barbel and roach up the Thames on Wednesday.—HENRY HOWSE, hon. sec.

THE "FISHING GAZETTE" FLY AND BAIT CASTING TOURNAMENT.

CAN any of our readers suggest a place very near London where this tournament can be held? We want to hold it within ten or twelve miles of London if possible, so as to ensure a good attendance. What we should like would be some comfortable fishing inn, near water which might be utilised and which also could command a large enclosure so that the gate money could be collected. Anglers are getting back to town now, and so we hope to be able to fix a day soon. We had thought of Godfrey's Fishery, but some friends think it is too far away.

FLY-CASTING TOURNAMENT—AMERICAN ARRANGEMENTS—EELS TRAVELLING OVERLAND—TROUT FISHING—WINTER BOTTOM-FISHING.

SOME weeks ago I ventured the statement that in America the caster in a casting tournament retired from the water in order to allow of correct measurement, etc., when making the cast. Mr. Fred Mather, the able fishing editor of "Forest and Stream," New York, corrects this statement, however, in a cordial private letter just received. He says:—"In our casting tournaments the caster does not go back, unless the pond is small. He stands within 10 feet of the water. I had a platform for him near the water. A line—a 'buoy line' we call it, ran from the caster's feet, and was anchored a hundred feet away. This line had buoys or floats at every five feet, numbered, and the judges are either in a boat near where the line may drop, or on the bank parallel to the line. At our last one the pond was small, about 60 by 80 feet, cut out square, and was arranged so. [Here Mr. Mather gives me a rough drawing of the rectangular pond, with the line stretching right across it, buoyed up by floats at the intervals named. The seat for the judges was parallel, on the bank, to the line, and a referee is placed opposite the extreme end of the line.] The floats stood up by being loaded with lead [the line passes through the under side of the buoy]. The buoy was held in place by a screw through the line, which was wet before it was measured."

Now, in my humble judgment, the arrangement described by Mr. Mather is exactly the sort of thing required for the forthcoming FISHING GAZETTE tournament. I have sent on his letter to our respected Editor, that he may see the drawing I am unable to reproduce here.

To what distance can eels travel overland? I am anxious to hear from one of your readers who may have seen eels travelling on *terra firma*, the distances at which these vermicular fish have been observed from the nearest lake or stream. Whilst I know that the creature can traverse dewy grass with great facility, I do not feel sure that isolated ponds become stocked by such peregrinations where they are far distant from other waters. But how can we account for the stocking which often takes place in remote waters?

A correspondent of "Forest and Stream," New York, tells the following story about migrating eels. "About 3 p.m. on a very warm sunny day an eel was killed in a hay field on perfectly dry ground, about ten rods from a narrow ditch, through a bog meadow, and forty rods from the river. The eel was slowly making its way in a direct line for the river." In this case my readers will see that *anguilla* was about fifty-five yards from the nearest water.

During the past fortnight I have been fishing, with a gentleman friend, some splendid pieces of preserved stream above mills in a county not fifty miles from the modern Babylon, and more glorious sport amongst the trout I never before experienced. I am not going to indicate by the slightest clue where this is, though doubtless many of my personal piscatorial friends on reading these notes will make a good guess; suffice it that the stream ultimately finds its way into the Colne.

It rises from springs amid some of the most verdurous and bush-grown scenery, and it never overruns its bank. No rugged mountain steep nor solemn woods environ its birthplace nor its early course, but fruitful orchards and occasional woodlands of beech, oak and elm, with undergrowth of rich pasture lying on either side of this populous brook—it rarely exceeds a dozen yards in breadth—and the ordinary sedges and wild flowers clothe its immediate banks. The depth varies from a few inches to several feet, and the bowers and coverts beneath, near the rough waters of the frequent falls, and amid the plentiful growths of tapeweed, are numerous and gracious to the eye of the fly-fisher.

As for the trout, they are superb. We took some sixty fish during the first two days, and after returning forty of them, carried away five brace apiece, which went 34 lb. Plump, thick fish were they, and being very late spawners, their condition was perfect. The flesh is almost a ruddy pink, and the cream—or fat beneath the] flakes—is

almost salmon-like. The flies' most killing were the duns. I tried others, but found all inferior to these. The beggars come at you with a rush, clearly showing a certain unsophistication of nature truly refreshing, but when on the hook they fight like lions.

Though these remarks may be trite, and to the constant trout-fisher somewhat unnecessary, I cannot help adding an account of a characteristic accident which added rather to the zest of the day than otherwise. At a certain corner, where originally stood an ancient pollard, long since decayed to touchwood, leaving only its solid roots stretching out into the water, the stream has burrowed out a cavern-like recess, which has hollowed out the bank to a lateral extent of a yard square, I should think. Fishing up-stream, I threw my fly very cunningly, as I thought, so that it might float into the eddy caused by the roots aforesaid. Instead of this, the wind took it, and it fell just on a stiff twig of rush growing on the extreme verge of the bank. Try as I would, I couldn't free it, and being unwilling to waste time and a good gut cast, I determined to spoil my chance of a fish, and free it by approaching the edge of the water. Of course, with angler-like confidence and trust, I approached the edge, not dreaming of the chasm under my feet, when, just as I was within reach of the "cussed" fly, an earthquake opened beneath my feet, and 12 stone of profane humanity went head over heels into nearly six feet of turf and clay and water. Of course, he picked himself out, and after spitting out a mouthful of mud, as the Artful Dodger would say, "I suppose he didn't cuss at all—oh, no, of course not." However, I was soon rigged up afresh in a spare suit belonging to my companion—trousers a foot too short and half a foot too big round the waist, coat and vest to match—and sport went on as before.

It is not a little bit too early to remind the readers of the GAZETTE that soon the autumnal floods will be upon us, and those anglers frequenting the Thames, Colne, and other rivers will have to find their roach, perch, chub, &c., in somewhat different quarters to those occupied during the summer months. Lagoons have perhaps formed where never water naturally stood before, and eddies smile with dark-faced mirth where never eddy before appeared—in short, the river is possibly a couple of feet higher than its summer mean depth, and its characteristics are absolutely changed.

What is to be done? The experienced fisher needs no reply, but the tyro can profit by the very few words in which I am about to answer the question. Roach will be found in quiet, moderately-deep eddies, near the bank, and should be legered for or "floated" *a la* Nottingham style; bait, well-scoured tail of lob, or red worm. Perch will also begin to head, but it requires a frost or two to determine them to pack closely. A similar locality near decayed weeds or submerged branches or roots; bait, minnows, lob and red worms. Dace will be found on the submerged grass, and the tail of a well-scoured lob will secure them. Barbel also seek the sides, and chub will be picked up in the shallowest of water, providing such water be only well shaded by alders or willows. In winter-time I pin my faith chiefly to the earthworms for bait, and I have never known my case to be that of misplaced confidence. Will Mr. Bailey give us something on winter bottom-fishing after he has concluded his homilies on his beloved barbel?

J. HARRINGTON KEENE.

[We agree with Mr. K. that we have had about enough barbel-fishing for this season.—ED.]

NOTES FROM ABERFFRAW BAY.

THE oldest inhabitant cannot remember so stormy a season here as the present one. From the end of March to the end of July the wind blew strongly from the south-west, and when people in England went about in fear of sunstroke, great coats and waterproofs were at a premium in "Mona." However, the last month has been perfectly calm, and sport very good. Mackerel are in abundance in the bay, the best day we have had hooking was 300, as well as 80 gurnards and 4 pollack. Conger, ling, and cod take very well, also bream; these latter are not, however, a very plentiful fish here at any time. We had 20 on Friday—the largest number we have ever caught.

Mr. R. Williams succeeded in gaffing a fine conger in rather a peculiar way the other morning. He was ashore, watching a shoal of brit in a rocky creek, when he spied a one-eyed conger after them. He ran to the boat for the gaff, and lying down on the rocks struck him through the back. His first plunge broke the hold, however, when the fish, instead of going out to sea, ran higher up the creek, and Dick, still keeping the blind side of him, struck him again through the head, and after a fearful tussle on the rocks bore him in triumph to the boat. We then went out to "Node Shenkin" (English, Jenkins's Marks) and brought up, where we had good sport with whiting bream, gurnards, &c., &c.

Presently we spied a very large bream repeatedly coming to the surface and chasing the mussel shells we were throwing overboard. After a bit he remained quietly on the top close to our quarter. One of the party got an oar out and gave the boat a bit of a sheer, when I succeeded in getting him. He was in first-rate condition, and did not appear to have anything the matter with him.

Captain Rogers, who was with us, and who has fished for bream in different parts of the world for the last twenty-five years, said he had never seen one behave in so peculiar a manner before.

We had a specimen of "Bloch's topknot" (*Phrynorhombus unimaculatus*) in the Trammell about a fortnight since, which I intended

sending to Mr. F. Gosden, but, unfortunately, I dropped it from the basket, and did not find it till it was too far gone for preservation.

This fish, as well as Muller's topknot (*Rhombus punctatus*) appears to be plentiful in Porth Gwyfan, where they are found on small patches of sand between rocks. From the description given to me I have no doubt that two examples of Ekstrom's topknot (*Rhombus cardina*) were taken in the same place shortly before my arrival here.

Mr. Mee, who is staying at the Prince Llewelyn, has been having very good sport sea-fishing with Harry Thomas, I hear, too, the trout are taking fly well in Llyn Coron, the March brown killing the best; this fly is always good in the Welsh lakes and rivers in the autumn, body dressed smooth with gold twist and very little hackle—most of the March browns the fly tiers turn out have too much by half.—E. GOSLING.

SPLENDID CARP AND TENCH FROM THE BRIDGEWATER AND TAUNTON CANAL.

"Of all the fish that swim the watery mead, not one in cunning can the carp exceed." These words are most truthfully spoken, at any rate, so far as the Exeter Canal carp are concerned, for daily are to be seen monstrous fellows rolling and jumping in the limpid stream, when the sun is fast sinking in the west; but to hear of one being taken fairly with hook and line is out of the question, and unless we should have the misfortune, such as happened to the Bridgewater and Taunton Canal, by one of the banks giving way, it is not likely we shall be able to report of any of these enormous fellows being taken. Three carp taken from the Bridgewater and Taunton Canal, weighed as follows:—17½ lb., 17½ lb., and 16½ lb., measuring in length, 29½ inches, 28½ inches, 27½ inches in girth, 17½ inches, 17 inches, 16 inches. Mr. J. A. Kelly informed me, who saw the above fish, that there were many others equally large, and that several tench turned the scale over 4 lb. weight each. It is a thousand pities these fine fellows were not preserved, instead of being dressed for table; as it is a well known fact, that you must use good stock and port wine to disguise its native taste and overcome its soft watery inanity.

FRANK GOSDEN, Exeter.

"E PLURIBUS UNUM."

America!

Of all the nations, we can feel thy grief most keenly,
And, from our Royal Lady to the lowliest peasant in our
land,
All grieve with thee.

If ever, in our march together through the time to come,
Discord arise between the leaders of our hosts,
Let us hark back!

Hark back, America!
From every church tower, every belfry in our land,
The echoes of our mourning come.

Remember Garfield then, whose loss with you we mourn.
Let his remembrance daunt the dogs of war on either side,
For, though the ocean sever us, a deeper flood proclaims us—
One!

Sept. 26, 1881.

CONVICTION OF A RIVER LEA POACHER.—At the Stratford Police Court, on Wednesday last, September 21st, Thomas Saunders, of Bethnal Green Road, was summoned by the East London Waterworks Company for having unlawfully been on their works, near Tottenham, at half-past twelve o'clock, midnight. Defendant and another man on the occasion in question were seen to place a net in the reservoir, and the sluices were found to have been tampered with. The other man escaped by jumping over a fence. Where the man was seen to jump over, a large net was found; another net, containing about 20 lb. of roach, was found in the river. Inspector Moore, of the Y Division, Metropolitan Police, stationed at Cheshunt, said that the defendant had been twice convicted at Cheshunt for poaching in the River Lea by night. Defendant was now fined £4 10s., including costs, or one month's imprisonment.

MR. WILLIAM C. HARRIS, who founded the *Afield and Afloat* some three years ago, and was its managing editor, we understand contemplates publishing shortly an American *Fishing Gazette*, after the style of the English *FISHING GAZETTE*. There is no paper in the States exclusively devoted to fishing, and his new enterprise will undoubtedly be a success. Mr. Harris is not only a thorough journalist, but universally recognised as a very high authority upon the subject among American anglers.—*Afield and Afloat*.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaits, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[Advrt.]

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Kedditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[Advrt.]

ANSWERS TO CORRESPONDENTS.

T. YETTON.—We think you would be sure to get permission from some of the millers at Dorking; some of them make a small charge. The fishing is good, and of all kinds.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

THE FENCE MONTHS.

SIR,—I have troubled you lately, I am afraid, too much with my experience of fish and fishing; but I again feel it necessary to offer a slight explanation in relation to my own connection with fish generally, as your editorial note was, to a certain extent, written under a misapprehension. It was natural that such a misapprehension should arise, as in my contributions to your paper I have limited my attention almost wholly to salmonidae, and have kept any experience I might possess of coarse-fish angling in the background, seeing that your columns are so ably and abundantly represented in this branch of the art. I must, however, now point out that I am much more entitled to have a voice in the matter than the London angler, who only fishes for three or four hours once a month, as I learn from the tenour of your footnote. Although, like yourself, Mr. Editor, I think fly-fishing for trout superior and more pleasurable than all other modes of angling, and though I seldom employ the worm as a bait for that fish, still I can decidedly relish fly, minnow, or any bottom bait that is limited to the hook, as agents in the capture of those coarse fish for which they may individually be suitable, when I reside in localities where trout are either absent or rare. This being the case, I will now proceed to show that such is a fact in actual practice. From the direction which this controversy has taken, it happens that I have had to quote from my angling diary in relation to fishing which occurred in the years 1873, 1874, and 1875. These are consecutive years, and are therefore not picked individually from amongst others to strengthen an argument unduly. In June, July, and August, 1873, I fished thirty days wholly for coarse fish, as named in my letter of Sept. 10th, thus I angled every third day. In 1874 I again sallied forth against coarse fish on thirty different days, but this time through a more prolonged period. I began in March, but by far the greater bulk of the fish were taken between June and November, the numbers caught being at times by no means small for an afternoon's fishing, as a creel containing about fifty fish for two or three hours' sport was ample proof. The trout-fishing during the same periods was not so extensive as I could have wished, but as what did occur took place in a hard-fished river, the numbers found in my diary are fair, and represent good fish. 1873, seventeen days' fishing, total 315; average per day about 19. 1874, thirty-five days, 711 trout; average per day about 21. In 1875 the fishing was almost entirely for trout and with the fly; total fish thus caught, 2887; 113 days; average per day 26; about one half of these so-called days being the fishing of a couple of hours on a summer's evening—scarcely a day's work amongst the number. I am now residing on the banks of a river containing a fair abundance of coarse fish, chub, roach, dace, barbel, jack, gudgeon, &c.; bream are, however, rare; trout and grayling are also present. Though I naturally prefer these fish when found in their typical haunts, still, when I find them living, as it were, by sufferance, in waters more perfectly adapted for coarse fish, I as often fish for the latter as a bottom angler as I do for the former by fly-fishing. On these grounds, Mr. Editor, I claim some little interest in the matter of coarse fish, and hardly desire to be summarily dismissed from that department of angling as evidently having no taste for it; for it is contrary to my experience that such fishing cannot be successfully practised without groundbait; whilst it was only this groundbait which I assailed—a subject on which I must make a few further remarks. Now, Mr. Editor, I am quite prepared to concede, that if groundbait is anywhere necessary, it is in such broad, deep, and more or less uniform rivers as the Thames, in which it is not easy to tell at a cursory glance where the best fish resort. In rivers of smaller dimensions, wherein coarse fish are similarly abundant, I know such is not the case; and an angler of ordinary ability may readily detect resorts of fish sufficient to satisfy the wants of anything but an insatiable creel; yes, enough for the instincts of a sportsman. Reverting to the Thames, I cannot concede that fishing in deep waters is such an uncertain lottery that the mere fact of relinquishing the groundbait reduces the angler's pastime to a case of stalking solitary fish. It may on certain occasions do this by comparison; there may be greater alternations in the character of sport day by day; but there is this satisfaction left in the breast of a true sportsman: he knows he has not resorted to unseemly devices in order to catch fish which his own craftsmanship is unable to deceive or allure; for, Mr. Editor, though I do not grant that all the fish of large rivers are gathered in schools, yet I concede that schools of various fish do travel about through different areas of the water; but at the same time many individuals remain dispersed universally, by no means scantily. And now, sir, I must consider this action of the groundbait. Presumably I am asked to believe that the only effect of this bait is the anchoring, as it were, of a wandering school, which prevents the angler from losing an hour or two by peering into the depths for fish that some one else has attracted elsewhere by depositing vast masses of minced, or rather hashed, worms, or perhaps scratchings, in the depths of the river—not for one day only, but for several—and in this way attracting not a school merely, but school after school, as well as the scattered fish from the general expanse of the river, thereby causing the dearth to the rod of the "rover" fisherman of which you may occasionally justly complain. But the gathering together of a number of fish, far greater than is naturally found in the schools of the river, is not the worst fault of the groundbait, for after the prey have been enticed to the spot, or detained when passing by, we observe several actions at work. First, there is a lulling into a false feeling of security by a permission to feed a whole day without feeling a hook; for, granting that it is undoubted that fish can smell the bait, they will, of course, not be long before they avail themselves of the opportunity of adding to olfactory sensations any gustatory experiences of which they may sorely stand in need. At last, however, they arrive upon the spot, but a myriad of isolated segments of *lumbricus terrestris* in one limited part of the river is not a natural sight, and the fish, though with watering mouths, look on and dare not eat. At last the old ones, on observing how some of their youthful relatives have been able to devour a considerable number of segments without any evil result, send their kinsmen to the right about, and cautiously devour what has been supplied. But this is not enough, more fish must be called together, their ravening augmented to an uncontrollable pitch by the fear and presence of others that strive to take the food, and wariness must be

reduced to a minimum. A few more myriads of segments are daily consigned to the water; at the end of the third day, the fish, rendered intoxicated and drowsy with overeating, but yet not satiated, have a living, actual worm, not a fractional unliving segment, put directly before them, floating just sufficiently high to go straight down their throats. This worm, though having attached to it a minute thread of something—perchance, if dyed, a confervoid growth—is more natural than an infinity of severed joints; is an attracting vortex; all other things are neglected; there is one wild, giddy whirl, with then a sudden change, and that previous short dream of calm is for ever ended. Turning to my diaries of angling, I must simply state these have been kept with great care, with totals of fish taken, flies used, numbers taken by each fly, and average killing power deducted. Remarkable facts are also recorded.

Now, sir, I must draw my notes to a close. If I have written anything relating to myself which may appear self-laudatory, I hope it will be pardoned, as under the circumstances it had become needful for me to state on what grounds I had been advancing opinions; on this account I had to refer to facts. In relation to fly-fishing I need not speak; you have on one or two occasions been so good as to testify in a way more flattering than I perhaps deserve; but when discoursing on the subject of coarse fish, I may state my first fishing began with eels, whilst I was but a boy, and my first lesson from an expert, as to dealing with these creatures, was one which entailed a groundbaiting principle. Similarly, my first lesson from an adept in float angling and jack spinning was from a proficient Thames carp fisher, who was a great advocate of the Japanese telescope rods which have lately been spoken of highly in the FISHING GAZETTE. Yet once more, my first lesson on the Thames itself, from an expert in its peculiar systems, was given me by a gentleman residing at Ealing, in a section of the river not far from Maidenhead. There was, however, but one thing I cared to learn as emanating from the Thames, and this was the neat wrist-action cast of the bait. So much for the teachers; and and if the pupil be an unworthy follower, his ill-success at least cannot be attributed to his not being an indefatigable devotee, for he has his subject at heart.—I am, &c.,

ROBERT BALDERSTON.

P.S. In the last paragraph but one of my letter of Sept 24th, I must point out that in the fifth line from the end, the word "finding" should have been written "find," whilst in the following line the words "for his" should likewise have been written "for their," the meaning of the passage being otherwise imperfect and obscure.—R. B.

THE FENCE MONTHS.—A PROTEST.

SIR,—I beg to be allowed to protest against the unfair manner in which Mr. Balderston, in last week's GAZETTE, has thought fit to grossly misquote portions of a letter of mine on the above subject, written as far back as April, 1880, and by an ingenious system of mangling—only giving portions of a sentence or paragraph—to entirely spoil or alter the meaning.

I would ask such readers of the F. G. as doubt the accuracy of my statement to kindly refer back and read the whole letter. I have said my last word in this controversy, at least as far as Mr. Balderston is concerned, but I could not allow that letter of his to pass unnoticed.—I am, &c.,

L. BONVOISIN.

THE LATE ATTEMPTED NETTING ON THE THAMES.

SIR,—S. J. W. has done good service in calling attention to the apparently anomalous proceedings of Captain Etheridge, the inspector of the Upper Thames, in, firstly, the matter of the substantive seizure and detention of the cast net, and secondly, the permitting the Beasleys, of Oxford, to remove the illegal flue nets for future use, instead of capturing them. Now, I say apparently anomalous, because the two cases, upon an explanation, will be seen to be absolutely distinct. Doubtless, S. J. W. is not aware of the precise facts in regard to the cast net. The "Deputation," or warrant of water bailiffship, one of which I have the honour to hold, states that "any officer appointed by the Conservators to carry into execution any bye-laws relating to the fisheries may enter into any fishing boat or other vessel employed, or about to be, or having been employed, in fishing or taking fish, or endeavouring to take fish, in the River Thames, and may therein search for fish unlawfully taken, and any unlawful or prohibited net or apparatus for taking or destroying fish, and may seize any such fish, net, or apparatus found therein, and may also seize on the shore of the River Thames any fish unlawfully taken, or any unlawful or prohibited net or apparatus for taking or destroying fish." As I, therefore, amongst others, am thus authorised, it is not remarkable that I should become intimately acquainted with all particulars in which initial action is taken, and those in the cast-net instance, were as follows:—the Captain saw the net hanging to dry on the barge, he "entered" the barge, found the net wet, as only been just used, measured it in the presence of the owner, and declared it grossly illegal. The man's excuse was that it had not been used in the Thames, but in the Cherwell. The natural rejoinder to this was? Why did he not dry it in the Cherwell, instead of waiting until he had got miles away from that river to do so. The fact is, as all reasonable law-abiding men will allow, illegal nets have no business on the river or near the river under any circumstances whatever. Yet there exist those who would stultify the law as it stands for, with singular sophistry, they urge that these illegal nets may be *en route* for sale, or use on other rivers, &c., not barred by their bye-laws. If this were granted, let such nets intended for commerce or otherwise be packed properly, and directed in parcels or boxes, not flaunted out upon deck to tempt the water bailiffs to do their duty, and then, instead of praise, get censured for their interference by men who differ over their own laws.

So much for the cast-net seizure, with the exception that the Captain could scarcely have told the owner to come for it to the Trinity House, as his duty was to comply with his deputation, viz., "with all practicable speed, after seizing any fish or net or apparatus, to bring the same before a justice of the peace, to be dealt with in pursuance of the bye-laws or otherwise, according to law." This was done, the net declared to be illegal, and ordered to be burnt, which was duly carried out.

While upon this subject, I would ask permission to show upon what ticklish ground the holder of a deputation stands, if he desires to follow out the spirit of the bye-laws irrespective of the letter. Under Clause 9 (b) it says:—"It shall not be lawful for any one to have in his possession while on the Upper Thames, or near thereto, a prohibited net, unless he shows to the satisfaction of the justice to whom he is charged, that he had not the same in his possession with the intent, &c."

It will be seen that I have italicised "near thereto" above, while I have likewise equally emphasized, in Section 66 of the Conservancy Act, 1864, as given early in these remarks, "on the shore." Here, then, we have a wide distinction enough to make any cautious water-bailiff hesitate before, as in the Phil-

lips case, he seizes nets, however illegal, "on the bank," the "shore" being ruled to be only that part of the river left uncovered by the normal flow. I maintain there was no fear or want of courage on the part of my gallant colleague. He has proved his pluck, and that against wealth and numbers, too often, where his duty was properly marked out, to expose him to any such imputation, and in this case he would be the first to admit, and doubtless to regret, that he did not wait until the nets were at work, and then his task would have been clear and defined. Indeed, his very words show that there was no hesitation in his resolution to seize the nets, according to law, as he did all he could to aggravate the gang, who were "afraid of him," as they did not comply with his earnest wishes.

Indeed, even now, as the Captain has got his eye upon these destructive engines, I feel assured he would seize them, if S. J. W. and others would come forward and hold him harmless against the costs of any action, which, if it went against him, his employers, the Conservancy Board, might repudiate. The anglers of Oxford should move in this.

As far as the cast-net affair is concerned, it ought to be borne in mind that, by the admission of its owner, he had, at all events, been scouring the Cherwell of its fish with an illegal engine.

I beg respectfully to draw the attention of the Thames Rights Association to the following Clauses, Nos. 6 and 7, in the River Medway Navigation Laws: "Provided always, that no person or persons whatever shall be sworn to serve on a jury or be examined as a witness, where he or they are in any way directly or indirectly interested or concerned in the matters in question.

"Provided always, and it is hereby declared and enacted that no person or persons whatsoever shall sit or act as a Commissioner or Commissioners for either of the said counties (through which the Medway flows) respectively, or in any case where he or they are in any wise directly or indirectly interested or concerned of or in any matter or matters in question."—I am, &c.,

CREELE.

TROUT TAKING PASTE.

SIR,—The only instance of a trout taking paste on a hook that has come under my notice was in the Kennet at Newbury. This fish was of a good size, but I forget its exact weight.

The Derbyshire trout would, I have no doubt, take it well, for some twelve years since I was staying at Buxton and my wife and I used to amuse ourselves by feeding them in the stream which runs through the gardens. They took bread crumbs and small pieces of biscuit equally well, and after a few days, if we stopped on the bridge for a minute or two, we could see a dozen or so come out from the stones and swim near the surface, anxiously awaiting the shower of crumbs. If any of your readers are at Buxton let them try the experiment. The pool we generally went to was at the upper end of the gardens, in rather a retired spot; but we often fed them from other bridges.—I am, &c.,

E. GOSLING.

Aberffraw, Anglesey, September 26.

FISHING AT STOCKPORT.

SIR,—“Stranger” will find no fishing in Stockport, being entirely a cotton-spinning town; but will find nice trout streams with fair trout between Stockport and Matlock, viz., Disley, New Mills, Buxton, Bakewell, Dove Dale and Matlock—trains almost hourly from Stockport.—I am, &c.,

COTTON.

[We believe there was an angling club at Stockport, but it is probably dead.—ED.]

A GRUMBLE.

SIR,—Some few numbers back in your interesting paper, the FISHING GAZETTE, you remarked it would greatly strengthen a cause if correspondents would allow name and address to be appended to their remarks. I have found one great inconvenience from this; once the address is given, even without name, you are continually being pestered with letters, begging letters, packets of new bait, circulars, and enquiries upon various subjects, such as:—"Can the writer (*nom de plume* so and so) give A, B, C, or Z any information where he can get good roach-fishing, &c.?" No doubt many anglers are thus deterred from ventilating a subject or expressing their opinion, as even absence of name is no safeguard. See enclosed letter and envelope.—I am, &c.,

NOT A PROFESSIONAL ROACHER.

P.S.—Your correspondent, L. B., thinks it *infra-dig.* to reply to *nom de plume*. Has he never written under one?

THE DERBY KILLER.

SIR,—Many thanks for your very kind notice of the Derby in your paper. I was out with my rod, or should have returned you my thanks sooner. I took a very good dish, thirteen brace. I trust you had good sport the remainder of your stay at the Dale. I am sure you will be pleased to hear that I have had several orders owing to the kind notice. I trust we may meet again, and hope for a better killing water.—I am, &c.,

Firs Cottage, Burton Road, Derby.

J. BULLOCK.

[If Mr. Bullock makes this bait with *metal* first, we shall be glad to know, as we have been asked.—ED.]

THE NEW FISHING STATION AT BRUNDALL, NEAR NORWICH.

SIR,—We were not aware that our intentions with regard to Brundall had become so widely known as to obtain the honour of a notice in your important GAZETTE; but we are glad that such is the fact, and beg to thank you. The head of our firm, himself an ardent lover of the rod, felt that much might be done for the comfort of the many like him who reside in this capital of East Anglia. Our firm is accordingly endeavouring to supply the want. We may mention also that the convenience of patrons will be further enhanced by the arrangements we have made with our mutual friend, Mr. Green, of London Street, whereby boats, &c., may be secured in advance. We will give the fishing public full notice of our opening (which we hope will take place early next year) through your advertising columns, and we can only hope that our efforts will be successful.—I am, &c.,

FLOWERS AND CO.

5, Lady's Lane, Norwich, Sept. 27.

HOW TO PRESERVE WASP GRUB.

SIR,—Will some of your numerous readers inform me how to preserve wasp grub for next years fishing.—I am &c.,

ANGLER.

Liverpool.

[We fear they are too delicate to preserve white so long.—ED.]

FISHING IN THE LAKE AT WIMBLEDON.

SIR,—In the train to Kingston on Sunday last a fisherman informed me that at Wimbledon Park there was some water on a private estate where any respectable person would be allowed to fish on payment of 2s., and any information I required I could get from the FISHING GAZETTE.

I shall be glad, sir, if you will kindly inform me, in your next issue, of the whereabouts of this said water, and to whom to make application.—I am, &c.,

THOMAS SLATER.

September 27.

[We do not know the water, but you can have no difficulty in finding it. Some particulars about the poaching this water is subjected to (night lines being used by the keeper) were given in the GAZETTE some year or two back, and the subscribers were complaining of the unfairness of this. We hope they have got the matter altered; as, for our own part, we would not pay twopence as subscription to a water which was poached by the keeper.—ED.]

AWNING FOR PUNTS.

SIR,—I noticed in your GAZETTE of Sept. 24th an enquiry from Mr. B. R. Bumbridge for a covering for punts.

Singularly enough, in conjunction with a friend, I have been perfecting such a covering, and was about to give you a description of my so-called umbrella.

Time will not permit me to do so now, but I hope shortly to send you a description of our covering.—I am, &c.,

A. C. TUCKER.

56, Richmond Road, Barnsbury, 28th Sept., 1881.

GOOD SPORT AT WALTON-ON-THAMES.

SIR,—For your information I beg to say that in two days' fishing here (Saturday, 24th, and Monday, 26th) Mr. Wingrove, with Geo. Rogerson, took 27 bream, the largest being $4\frac{1}{2}$ lb., and three barbel.—I am, &c.,

H. WOOD.

MINNESOTA AS A SPORTING RESORT.

SIR,—I promised to send you a letter on the above subject for your neat little journal; but am sorry that I have not been able to obtain all the information I wanted from the old hunter, as we call him here. He has been here in Martin County for twenty-three years, and has had good experience, fishing and shooting with the Indians, who lived round here up to fifteen years back. Some of your readers may ask: Where is Fairmont and how is one to get there? I think the route myself and friend took was, if not the nearest, certainly the cheapest. It was as follows:—from London by one of the National Line Steamers to New York, costing say, £12, this is supposing one takes the £10 berth; and I would advise no one to pay more, as the difference in berths is very little—meals at saloon are equal in every respect to a £15 berth. From New York to Chicago, by Niagara Falls and Detroit, £5; and from Chicago to La Crosse, here changing to the Southern Minnesota Line on to Fairmont (Martin County) for £4; making a total cost of £19. This does not provide for extras such as baggage, overweight, or meals on the way (by train), so that £25 is nearer the actual cost. Taking this amount, and the distance travelled from London (nearly 4700 miles) the expense is not so excessive after all. At Fairmont there is a good hotel, where one can board and lodge from 4s. to 8s. a day. The whole country, taking a line North and South, abounds in freshwater lakes, all connected with each other by small creeks. Fish abound in quantities from 1 lb. weight up to 25 lb. The Buffalo fish is the largest, usually weighing from 20 lb. to even 30 lb., and is caught with a spoon bait trolling from a boat. Shooting, or as it is called here, hunting, is a good as anywhere in America—the prairie chicken (equal, and very similar to, our partridges, is knocked down in same fashion as ours, with the exception that the sportsmen have a buggy or carriage, and drive awpy over prairie and stubble for miles, getting out at all the likely spots.

In my next letter I hope to send you full particulars and descriptions of the fish in the lakes. I must not forget to mention that the severe winters (such as last) killed hundreds of the finny tribe. It was only yesterday, walking along our lake shore, that I came upon a heap of fish-skeletons, all killed through the intense cold, ice in most places having been five feet thick. If any of your readers should wish for news in detail respecting Fairmont or Martin County I shall be happy to obtain and give all the information in my power.

Trusting your paper is increasing by thousands as heretore,

I remain, dear Mr. Editor,

Yours very truly,

A. MARSTON.

Fairmont, Sept. 10th, 1881.

LAKE-FISHING BOAT WANTED.

SIR,—Can you kindly inform me where I can buy a good lake-fishing boat, with newest improvements? Apologising for troubling you, I am, &c.,

E. GODDARD.

31, Longue rue de l'hôpital, Antwerp, Sept. 21, 1881.

CLUB REPORTS.

ACTON AND EALING ANGLING SOCIETY.

Some more good fishing members have joined this week. Messrs. Dudley and Slater took some good roach on Saturday 24; Mr. A. Eydman, roach, dace and bleak on the 26th; Mr. Adams, roach, dace and bleak on the 27th; Mr. W. Eydman, jack, three fish weighing 12 lb. on the 27th; Mr. F. Cooper, one good perch and roach on the 27th; C. J. Dean, roach, bleak and poise on the 27th. The above fish were taken by these members who are all novices, under great difficulty. As the readers of this report will know the fish were not on at the above dates. All were taken from the Thames. Cooper did not break another fishing stool this time.—BLACK BAG.

ALEXANDRA ANGLING SOCIETY.

There was a fine show of fish on Sunday last. Mr. Mortor had a fine jack from the Lea, weight 6 lb.; Mr. Brockett a fine show of roach; Mr. Atkinson, roach; Mr. W. High, roach and perch; Mr. C. Hewett, roach; Mr. Tiffin, chub from the Lea.—E. DYMOND.

ANCHOR AND HOPE.

On Sunday, 25th, members had some good shows of fish. R. Smith bream, A. Shakel roach, H. Scott bream, T. Bowling roach, D. Davis roach, C. Daniels roach, J. Bowling bream.—A. SHAKEL, sec.

September 27.

THE BERMONDSEY BROTHERS.

The Bermondsey Brothers fished for their 3rd series of prizes on Sunday last at Laleham, Mr. Mitchell, jun. first, Herbert, second; Hulse, third; Frost, Owles, and Ayton next. W. ALLEN, Sec.

September 27.

BOSTONIAN ANGLING SOCIETY.

On the 25th instant, Mr. Jennings weighed-in a handsome show of roach and bream; Mr. Harris a nice lot of roach and dace; Messrs. Wight, Cubitt, and Constable, roach.—W. TAYLOR.

September 27th.

BRIGHTON ANGLERS' ASSOCIATION.

Very small takes to record this week, the Ouse, Adur, and Cuckmere being thick, owing to the late heavy rains. Mr. G. Saunders took from the Adur roo roach, weighing about nine pounds. Mr. McNutt caught one tench weighing about 1 lb. 12 oz. The sixth competition takes place in the river Adur, when five prizes will be competed for. If the water fines down by that date, it is expected there will be a good many members on the banks.—GROUNDBAIT.

Sept. 28.

BURDETT ANGLING SOCIETY.

We had a fine show of roach at this club on Sunday evening last, Messrs. Weeks, Hammond, and Hadkiss having the best specimens, Mr. T. Weeks taking the first prize for the heaviest weight caught at Ware.—T. G. WALKER sec.

Sept. 29.

THE CADOGAN ANGLING SOCIETY.

The following members weighed in fish on Sunday last:—Mr. Seeley, a good show of roach, dace and gudgeon, also two fine chub, the largest going $3\frac{1}{2}$ lb.; Mr. Smale, roach and dace and two chub, the largest $2\frac{1}{2}$ lb., all from Great Marlow; also Mr. Ford, with roach and dace, from Penton Hook. Members are requested to attend on Thursday, October 6th, to arrange prizes and other important business.—W.R.

CANONBURY ANGLING SOCIETY.

Our members were out on the 25th, but takes were small. Mr. Key weighed-in bream; Mr. Barber, bream; Mr. Wellsted, roach; Mr. Bennett, bream; Mr. Leach succeeded in "getting them on," he having 18 lb. 8½ oz. of pretty roach. Our return visit on the Central list took place last Monday, when a most enjoyable evening was spent, sixteen clubs being represented. Mr. Smith requested, and Mr. Ghurney gave, an explanation with regard to members of clubs enrolled on the Central Association not being able to join the Anglers' Benevolent, but that objection is now removed, and all anglers should join. Mr. C. Watling kindly officiated as chairman, and was ably supported by Mr. C. Smith in the vice, and the harmonic ball was kept rolling. The next visit goes to the great Northern Brothers.—T. BENNETT.

CITY OF LONDON ANGLING SOCIETY.

The following members weighed-in on the 25th:—Messrs. J. Chambers, Pratt, Hobbs, and Mark had bream and roach from Amberley, the former winning Mr. Hale's prize, a handsome reading lamp; Mr. Castell, roach and gudgeon, from the Roding; and Messrs. Martin and Strong, bream from the Wey. On Sunday next we fish a pegged down match in the Stort, at Roydon, for six prizes. Our West Central Association visit on the 27th was a success. Mr. Langdon in the chair, faced by Mr. A. West. Pianist, Mr. Parkins. We had plenty of harmony by the following gentlemen:—Messrs. Langdon, Smith, Thorling, Bignell, Butler, Richards, Marshall, Fowler, Barr, C. Watling, Parkins, Rymer, Benning, and Hobbs. Twenty-four clubs being represented, viz., Amicable Brothers, Amicable Waltonians, City of London Convivial, Good Intent, Metropolitan, Odds and Evens, Sir Hugh Myddleton, Star, St. John's, and Trafalgar; also, the following not in No. 1 district:—Anchor and Hope, Barbican, Bridgewater Brothers, Buckland, Cadogan, Duke of Norfolk, Bostonian, Clerkenwell, Piscatorial, Little Independent, North-Western, Original Clerkenwell Piscatorial, Peckham Brothers, and Perseverance. We thank the above clubs, and shall not forget them when their turn comes.—CAS.

CLAPHAM JUNCTION ANGLING CLUB.

On Sunday last Mr. E. Withers and Mr. J. Innes weighed-in some nice barbel from Shepperton, two weighing 8 lb. 5 oz., and 7 others weighing 15 lb. $4\frac{3}{4}$ oz.—total, 23 lb. 9¾ oz. Mr. Turner, roach and jack, 4 lb. 4¼ oz.; Mr. R. Wellman, 2 lb. 12¼ oz. Mr. W. Willoughby's prize, Mr. Maslin, roach and dace; Mr. T. Suttler, roach. The next match will be fished for on October 9 at Weybridge, all members to start from Clapham Junction Station by the 8.55 and return by the 8.20 home.—E. WILSON, sec.

September 28.

DALSTON ANGLING SOCIETY.

The members of the above society met on Sunday the 25th, when a very fine show of roach was placed on the trays by Messrs. Nunn, Bunn, Anderson, Fortescue, Eagles, Venour, Midson, Fuller, W. Richardson, Slade and Long. Total weight of fish shown, 65½ lb.—S. MALLEY.

EAST ANGLIAN PISCATORIAL SOCIETY.

The concluding match of the season of this society took place at Horning Ferry on Monday last. The weather throughout the day was miserable in the extreme, and the sport was most indifferent. The following were the prize winners:—1st, Mr. Howard; 2nd, Mr. G. Cubitt; 3rd, Mr. Saul; 4th, Mr. Kerry; 5th, Mr. Hicks; 6th, Mr. R. Palmer; 7th, Mr. Rice; 8th, Mr. Tillott, jun.; 9th, Mr. Springfield; 10th, Mr. L. Lamb; 11th, Mr. Pepper; 12th, Mr. A. Woodcock; 13th, Mr. Smithdale; 14th, Mr. J. Pearce; 15th, Mr. W. Wright; 16th, Mr. A. Palmer, hon. sec.; 17th, Mr. Roberts. The highest single take was 13 lb. 6 oz., and the entire catch weighed only 6 st. 12 lb. Thirty members competed. The prizes, which were distributed next evening at the clubhouse, St. Stephen's Gates, were as follow:—Oak and silver mug (gilt lined), presented by W. H. Grenfell, Esq., M.P. for Salisbury; Bohemian glass biscuit caddy, eight-day timepiece, breakfast cruet, flask and pair buffalo drinking horns, smoking lounge, pike rod, box of cigars, fishing tackle, landing net, tin of biscuits, sauce and ketchup, two bottles spirits, a five-shilling piece, jar of preserve, &c., &c.—ALFRED PALMER, hon. sec.

EUSTONIANS.

The Eustonians were out on Sunday morning last and fished for a prize given by Mr. Shedman, which was taken by Mr. Hornesack. All had fish. Mr. Clements had some fine dace and jack from the Roding.—R. NEALE, sec.
September 21.

GOOD INTENT.

There was a fine display of fish at the club on Sunday last, the following members weighing-in:—Messrs. Everitt, roach; Gadbury, roach; Shuttle, roach; Haines, bream; C. Bates, roach; W. Wheeler, roach and dace; Dowse, roach; R. Murphy, roach; Guntip, rudd; Donovan, roach; Maybury, roach. The first competition since the end of our financial year takes place at Ponders End, roach fishers pegged down, jack and perch fishers the room, for twelve prizes, ranging from a silver-plated tea and coffee service, given by Mr. J. Courcha, as first prize, and 10s. 6d. the 12th prize. We expect at least 60 to compete. I will send you the result.—R. MURPHY.
Sept. 29th.

THE GRESHAM ANGLING SOCIETY.

The Gresham anglers met as usual on Thursday. The secretary produced a revised copy of the rules, and gave notice of one or two verbal alterations, tending to make it clear that the society itself gave prizes only for specimen fish, in preference to gross weights. The meeting was held for the last time in the old quarters in Throgmorton Street, and it was understood that at the next meeting in their new rooms, at the City of London Tavern, 11, Bishopsgate Street Within, to be held on Thursday next, the society would extend a welcome to all true anglers, and pass a pleasant evening after the old Waltonian fashion. Several of the members volunteered to sing on the occasion, and no doubt there will be a large gathering. Some splendid fish have been weighed-in, especially perch from the Waveney, and two new books were presented to the library. Five new members were elected, and several others proposed. A letter was read from Lord George Hamilton expressing his gratification at the society's progress. By a curious error it was stated last week that Mr. Bennett was fishing with Ward. It arose entirely from a telegraphic error, Mr. Bennett's Christian name being Edward, and the first syllable was omitted. The members separated after passing a very cordial vote of thanks to Mr. Parker, who occupied the chair.

IZAIAK WALTON ANGLING SOCIETY.

On Sunday the 25th ult. Mr. B. Crook had a tray of handsome roach; Mr. G. Wood had roach and dace, Mr. C. Green roach and dace, Mr. J. Barnes, roach. On Wednesday 28th ult. Mr. G. Wood showed roach from the Lea; several other members were out, but met with very indifferent success. The three special prizes given by Messrs. J. Barrett, Major Twohey and J. H. Roach will be fished for on Sunday, October 9th, 1881, at Boxmoor. Messrs. J. Hilliar, sen., G. Bliss and T. Dennison, sen., will give 10s. 6d. each to be fished for on a Wednesday, conditions to be named on next meeting night. Two other prizes have been presented, conditions for these to be named on the same evening. It is specially requested that members will muster as strongly as possible.

[In future send your report to 12, Fetter Lane, or it will be late like this one.—ED.]

KNIGHTS OF KNIGHTBRIDGE ANGLING SOCIETY.

The members of the above club held a roving fishing competition on the Thames, from Cookham Bridge to Bournend Bridge on Sunday last for four valuable prizes, kindly presented by Mr. Thomas Pratt, an active member of the club, and after a very close competition the result was: Mr. Sparrow, first; Mr. Young, second; Mr. Schlothanger, third; Mr. Ditton, fourth. The prizes were presented to the winners at the club head-quarters. Mr. Cox's, Grove Tavern, Grove Place, Brompton Road.

THE LITTLE INDEPENDENT ANGLING SOCIETY.

On Sunday we had a fair show of fish contributed by the following members:—Mr. Grey, roach, dace and chub, one roach 1 lb. 4 oz.; Mr. Raine, roach, Mr. Petrie roach and perch, Mr. Heelas roach and dace, Mr. Moorhouse tench, Mr. Hurwood roach and gudgeon, Mr. Scott roach and gudgeon, Mr. Letch roach and gudgeon, Mr. Hopton roach and eels.—W. BROWN, hon. sec.
Sept. 28.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

Several members of the above society met with good success again on Sunday last. Messrs. Lucy, jun., and G. Drew bream, roach, and dace from the Thames; Mr. Neagus, roach from the Stort; Mr. Obbard had also a nice show of roach and bream, one scaling nearly 3 lb.—THOS. W. LUCY, sec.
Sept. 28th.

PECKHAM BROTHERS ANGLING SOCIETY.

An open match was fished for on the 26th for three prizes, Messrs. Garrard, Stidolph, and Matthews proving the winners. The next match will take place on October 9th for three prizes, Mr. C. Fell giving a handsome time-piece, Mr. Nelson, jun., a valuable lamp, and Mr. Matthews a money prize, all fish to weigh, go where you like.—W. R. M., sen.

PETERBOROUGH ANGLING ASSOCIATION.

The annual competition for prizes amounting to £16 came off on Saturday last at Bennett's Plantation, near Milton Ferry Bridge. The water was all that could be desired as to condition, and excellently managed by the stanch keeper. The competitors assembled at two o'clock, at which time the draw took place. Each competitor took his station, and commenced fishing at the firing of a gun.

At five o'clock the gun was again fired, when they ceased fishing, each man remaining at his post until his fish were weighed. Great praise is due to Mr. W. Preston (Vice-President), Mr. J. Trigger and Mr. W. Grice (Secretary) for the excellent arrangements which they made and carried out, giving general satisfaction to the competitors. Some very fine fish were caught, reaching over 2 lb. in weight, and the whole catch amounted to nearly three stones. A meeting took place on Monday evening at the Saracen's Head, Mr. W. Preston ably presiding on the occasion, and who delivered the prizes to the successful competitors, the first prize of £2 15s. being won by Mr. Bullamore, and the second prize of £2 by Mr. J. Steele. There were altogether thirty-three prizes, and the weight of fish that gained the first prize was 3 lb. 12 oz. A hearty vote of thanks to the chairman closed the meeting.—B.

PHENIX ANGLING SOCIETY.

Last Sunday we had about 50 lb. of fish weighed-in. Mr. R. Panther, six bream, 15 lb.; Mr. Joe Panther, 14 lb. of roach and perch; Mr. G. Bentley, 5 lb. of roach, the rest being caught by Messrs. Reed, Gurner, Maynard, Milton, H. Upton, R. Upton and J. Twist.—W. ELBOWEN, sec.
Sept. 27.

THE PISCATORIAL SOCIETY.

At the weekly meeting at Ashley's Hotel, Covent Garden, on Monday evening last, Mr. George Robinson made a splendid show of perch from the Hampshire Avon—he weighed in 45 lb. 6 oz.—twenty-six of the largest turning the scales at 30 lb. 9 oz. Mr. Thomas Huggett had a nice pike of 7 lb. 3 oz., and three chub weighing 6 lb. 4 oz., all from Sonning, and Mr. Marsden from public waters had a fine specimen roach of 1 lb. 13 oz. The pike competition will take place on Monday the 17th of October, and no fish under 3 lb. can be registered.
Sept. 22.

PRINCETS OF WALES ANGLING SOCIETY.

Owing to the very wet morning of the 25th inst., there were very few of our members at Egham to compete for the prizes that were not won on the 11th inst., but those that went, were successful in getting sufficient fish to entitle them to the prizes. The most noteworthy shows were those of Messrs. C. Severn and A. Meers, each having a very decent show of roach, and taking the first and second prizes in the order named. All communications to be addressed to the secretary, Mr. F. Robson, Prince of Wales, Great Barlow Street, High Street, Marylebone.—MEDIOCRE.

RICHMOND PISCATORIAL SOCIETY.

There was a large and influential meeting of the members in the club room at the Station Hotel, Richmond, on Wednesday evening last. Mr. F. C. Clench in the chair, and Mr. H. Dickenson in the vice-chair. The secretary, Mr. J. H. Gaunt, reported that on the previous day Mr. A. J. Little had weighed-in from the old river at Windsor one jack of 4 lb. 15 oz., another of 5 lb. 8 oz., and one specimen perch of 1½ lb. Mr. W. H. Brougham addressed the meeting on Thames Preservation, and forcibly urged those members who are residents on the banks to assist the river-keepers during the present holidays; at the same time remarking that already such vigilance had been used the London tackle shops were unable to supply dace for their customers. This was confirmed by Mr. G. Little of Fetter Lane, who as a member of this society was present at the meeting.—Mr. H. Dickenson and three others volunteered their services for night watching. The Richmond Piscatorial Society is every week increasing in strength and importance. At this meeting three new members were elected, and five other gentlemen were proposed for ballot on the following Wednesday evening. Mr. F. C. Clench has succeeded in gathering a large family of influential anglers around him, and with so large an attendance each night, the hostelry, which is kept by Mr. John Munro, one of the members, must be greatly benefited.—B.

Sept. 22.

TRAFALGAR ANGLING SOCIETY.

Members of the above society are requested to attend on Wednesday night, October 5th, it being quarterly night. Chair will be taken at nine o'clock precisely.—R. G.

Sept. 28.

UNITED LONDON ANGLERS.

The usual monthly meeting will be held on Monday next, at nine o'clock, when business of importance will be brought before the committee for their consideration. The new instruction cards are now ready, and may be had on application to the secretary.—R. GHURNEY.

WALTONIANS.

Messrs. Grace, Roland, Rushbrook, R. Dodge, J. Dodge, Malcom, Good, jun., Greenfield, Starr, and Brady weighed-in fish. The takes were poor, with the exception of Mr. Grace's, which went 11 lb. 1½ oz. The next best take was Mr. J. Dodge's, with 3 lb. 12½ oz. On the Wednesday previous I weighed-in a tench from Elstree 2 lb. 7½ oz.—A. J. MARRIOTT.
Sept. 25.

WEST CENTRAL ANGLING SOCIETY.

Our members have been working hard, with only average success, but the following members succeeded in making a very fair show on Sunday:—Mr. Mathie, a splendid bag of dace from Richmond; Mr. Stanton, bream from Weybridge, one scaling 3 lb. 7½ oz., another, 2 lb.; Mr. Wright, dace from Ordnance Factory; Mr. Wilcockson, roach and dace from Chertsey; Mr. D. Smith, bream from Amberley.—R. I. BEARD, jun., sec.

ANGLING.
Now ready, third Edition.

THE ANGLER'S INSTRUCTOR.

By WM. BAILEY.

A book on the best modes of Angling in English Rivers, Lakes and Ponds, and on the habits of the fish, besides all the latest practical hints on many things that have not up to now been made public, to be had of W. Bailey, 170, Kirke White Street, Nottingham. By post, 2s. 9d.

LONDON and COUNTY ADVANCE and DISCOUNT COMPANY (Limited).

Cash advances from £10 to £500, without preliminary fees or deduction for interest, for short or long periods, repayable by easy instalments, at moderate rates, upon personal security, life policies, furniture without removal, deeds, shares, bonds, &c. Bills discounted. Forms gratis. Offices, 35, Farringdon-street, E.C. JOHN STONE, Secretary.

TROUT FISHING AND SHOOTING.

FISHING in Lakes, River and Sea, good bathing, boats. Flapper shooting from Aug. 1 on three lakes, 2500 acres of preserved shooting, with partridge and snipe in season. Free to visitors. MAELOG HOTEL, TY-CROES, ANGLESEA, "PROPRIETOR."

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.

The Fishing Gazette.

SATURDAY, OCTOBER 8, 1881.

TROUT AND GRAYLING FISHING IN THE DOVE.

By R. B. MARSTON.

(Continued from p. 178.)

AFTER lunch I decided to walk down the stream from the bridge at Hartington to see Charles Cotton's Fishing-house which is situated on a peninsula—if so small a piece of

ground may be so designated—about twelve or fifteen minutes' walk from the bridge. I mentioned in my last that there is a mill just above the bridge, and this mill spoilt my afternoon's fishing—the miller is a pleasant man, and reminded me of the miller described in that most charming book "The Angler's Souvenir," by P. Fisher, Esq., I did not thank him, however, for shutting off all the water below his mill while his mill head was filling, for the stream was entirely stopped for nearly an hour, in fact, until the water had risen high enough to flow over the weir. The river, after passing under the bridge, flows in a very gentle fashion until the fishing-house is reached, it winds between high banks in a woundrously serpentine course through a rich and almost level valley. There are but few streams of any consequence in this length, even when the full body of water is coming down, and the water is shallow until you get near the fishing-house, when it flows sluggishly, and appears to be very deep; some fine sport could be had in a breeze or on a rainy, dull day. I saw many fine fish as I walked down. I cannot do better than let Cotton describe his little fishing-house in his own words. The accompanying illustration gives a view of it as it appeared in Cotton's time, and it is substantially the same now, as far as the building itself is concerned.

For the information of such of the readers of the GAZETTE as may be unacquainted with Cotton's book, I may mention that the following discourse is taken from his "Instructions how to angle for a trout or grayling in a clear stream," which I hope shortly to re-print in the GAZETTE, as I did Walton's "Complete Angler" some time ago. Cotton's Instructions are so good that any angler may profit by them, and to him belongs the credit of first describing the method of up-stream fishing with a worm in clear water which has been so skilfully elaborated by Stewart. Cotton resided at Beresford Hall, he occupied the position of a country gentleman, and was the friend and devoted admirer of Walton, he built the fishing-house expressly to perpetuate their friendship. His work is a discourse in the same style as Walton's, in connection with which it was first published, as a supplement. Cotton is Piscator, and Viator is a traveller from London who has business in the North, whom Piscator overtakes on his way to Ashbourne. They get into conversation, and when Piscator happens to mention Walton's name, Viator tells him that he also knows the venerable "Father" and turns out to be the very Venator of the "Compleat Angler." This is quite sufficient to kindle a mutual regard on the spot, and Piscator persuades his only too-willing companion to break his journey by staying for a few days' fishing with him at Beresford. I will commence my quotation where the friends have just arrived at Piscator's (Cotton's) house.

"PISCATOR: Will it please you to alight, sir?—And now permit me, after all your pains and dangers, to take you in my arms, and to assure you that you are infinitely welcome.

"VIATOR: I thank you, sir, and am glad with all my heart I am here, for, in downright truth, I am exceedingly weary.

"PISCATOR: You will sleep so much the better. You shall presently have a light supper, and to bed. Come, sir, lay the cloth, and bring what you have presently, and let the gentleman's bed be made ready in the meantime, in my Father Walton's Chamber. And now, sir, here is my service to you; and once more welcome.

"VIATOR: I, marry sir, this glass of good sack has refreshed me. And I'll make as bold with your meat, for the trot has got me a good stomach.

"PISCATOR: Come, sir, fall to, then. You see my little supper is always ready when I come home, and I'll make no stranger of you.

"VIATOR: That your meal is so soon ready is a sign your servants know your certain hours. Sir, I confess I did not expect it so soon, but now 'tis here you shall see I will make myself no stranger.

"PISCATOR: Much good do your heart! and I thank you for that friendly word. And now, sir, my service to you in a cup of Morelands ale; for you are now in the Morelands, but within a spit and a stride of the peak. Fill my friend his glass.

"VIATOR: Believe me, you have good ales in the Morelands, far better than at Ashbourne.

"PISCATOR: That it may soon (easily) be, for Ashbourne has, which is a kind of riddle, always in it the best malt, and the worst ale in England. Come, take away, and bring us some pipes and a bottle of ale, and go to your own suppers. Are you for this diet, sir?

"VIATOR: Yes, sir. I am for one pipe of tobacco; and I perceive yours is very good by the smell.

"PISCATOR: The best I can get in London, I assure you. But, sir, now you have thus far complied with my designs, as to take a troublesome journey into an ill country, only to satisfy me. How long may I enjoy you?

"VIATOR: Why, truly, sir, as long as I conveniently can; and longer I think you would not have me.

"PISCATOR: Not to your inconvenience by any means, sir, but I see you are weary, and therefore I will presently wait on you to your chamber, where take counsel of your pillow, and to-morrow resolve me. Here! take the lights, and pray follow them, sir. Here you are like to lie, and now I have showed you your lodgings, I beseech you command anything you want, and so I wish you good rest.

"VIATOR: Good night, sir.

THE SECOND DAY.

"PISCATOR: Good morning, sir! What, up and dressed so early?

"VIATOR: Yes, sir, I have been dressed this hour, for I rested so well, and have so great a mind either to take, or see a trout taken in your fine river, that I could no longer lie a-bed.

"PISCATOR: I am glad to see you so brisk this morning, and so eager of

sport; though, I must tell you, this day proves so calm, and the sun rises so bright, as promises no great success to the angler. But, however, we'll try, and, one way or other, we shall, sure, do something. What will you have to your breakfast? or what will you drink this morning?

"VIATOR: For breakfast, I never eat any; and for drink I am very indifferent, but if you please to call for a glass of ale I'm for you, and let it be quickly, please, for I long to see the little fishing-house you spoke of, and to be at my lesson."

"PISCATOR: Well, sir, you see the ale is come without calling; for though I know not yours, my people know my diet: which is always one glass so soon as I am dressed and no more till dinner; and so my servants have served you."

"VIATOR: My thanks. And now, if you please, let us look out this fine morning."

"PISCATOR: With all my heart. Boy, take the key of my fishing-house, and carry down these two angle-rods in the hall window, thither, with my fish-pannier, pouch and landing-net, and stay you there till we come. Come, sir, we'll walk after, when, by the way, I expect you should raise all the exceptions against our country you can."

"VIATOR: Nay, sir, do not think me so ill-natured nor so uncivil; I only made a little bold with it last night to divert you, and was only in jest."

"PISCATOR: You were then in as good earnest as I am now with you; for to say the truth, it is not very taking at first sight. But look you, sir, now you are abroad, does not the sun shine as bright here as in Essex, Middlesex, or Kent, or any of your southern counties."

"VIATOR: 'Tis a delicate morning, indeed! And I now think this is a marvellous pretty place."

"PISCATOR: Whether you think so or no, you cannot oblige me more than to say so; and those of my friends who know my humour, are so kind as to comply with it, and usually flatter me that way. But look you, sir, now you are at the brink of the hill, how do you like my river, the vale it winds through like a snake, and the situation of my little fishing house?"

"VIATOR: Trust me, 'tis all very fine; and the house seems at this distance a neat building."

"PISCATOR: Good enough for that purpose. And here is a bowling-green too, close by it; so, though I am myself no very good bowler, I am not totally devoted to my own pleasure, but that I have also some regard to other men's. And now, sir, you are come to the door; pray walk in, and there we will sit and talk, as long as you please."

"VIATOR: Stay, what's here over the door? *Piscatoribus sacrum!** Why then I perceive I have some title here; for I am one of them, though one of the worst; and here below it is the cypher too you spoke of, and 'tis prettily contrived. Has my master, Walton, ever been here to see it; for it seems new built?"

"PISCATOR: Yes, he saw it cut in the stone before it was set up; but never in the posture it now stands: for the house was but building when he was last here, and not raised so high as the arch of the door. And I am afraid he will not see it yet; for he has lately writ me word, he doubts his coming down this summer, which, I do assure you, was the worst news he could possibly have sent me."

"VIATOR: Men must sometimes mind their affairs to make more room for their pleasures, and 'tis odds he is as much displeased with the business that keeps him from you, as you are that he comes not. But I am the most pleased with this little house of anything I ever saw. It stands in a kind of peninsula too, with a delicate clear river about it. I dare hardly go in, lest I should not like it so well within as without; but by your leave I'll try. Why this is better and better, fine lights, finely wainscoted, and all exceeding neat, with a marble table and all in the middle."

"PISCATOR: Enough, sir, enough! I have laid open to you the part where I can worst defend myself; and now you attack me there! Come, boy, set two chairs, and whilst I am taking a pipe of tobacco, which is always my breakfast, we will, if you please, talk of some other subject."

"VIATOR: I beseech you, sir, do: and, if you will lend me your steel, I will light a pipe the while; for that is commonly my breakfast in a morning too."

Cotton's book has always had a special charm for me, chiefly because it was my first guide into the pleasant art of trout and grayling fishing, and many a time at school when I ought to have been studying Butter's spelling or some other youthful instructor, I was deep in the mysteries of "Angling for Trout and Grayling in a Clear Stream." I need hardly say then that it was with feelings of deep reverence and pleasure that I viewed the little fishing-house for the first time. It stands almost at the entrance of Beresford Dale, and is certainly most charmingly situated. I was glad to find it was kept in good repair—by Mr. Beresford Hope, I presume. The door was locked, but I got a peep at the interior through a window, and saw a landing net in the corner, just as Piscator's "Boy" might have left it. For many years, and especially at the beginning of this century, the place was allowed to

go to ruin inside, and some barbarians even removed the fittings; but these have been restored to some extent. I caught a good grayling within twenty yards of the house and decided to fish up stream again to the mill and try the big fellows I had seen in the morning. And it was now that the mill stopped my sport, for as soon as I got to the little rustic bridge I found the water rapidly falling, and as I went on it ceased to run at all. The fish had retired to cover, wherever there was a pool, and I found it was hopeless to try them below the mill. I walked up to the weir again, knowing there would, at any rate, be plenty of water there, and hoping to find the fish moving, but the rise was over or nearly so, and I found another angler fishing the few open places between the trees, so I gave it up and got back to the Charles Cotton Inn in time for some tea; I found that a gentleman who had been fishing below the fishing-house for an hour or two, had got four brace—one fish, a fine grayling of nearly two pounds; he described the water below as being much better and full of streams. I shall hope to fish it some other time. As I do not know the river from the fishing-house until one gets down to the village of Mill Dale, I will not attempt to describe it—I hear it is first-class—but will in my next finish my notes by giving an account of the river from Mill Dale to its junction with the Manifold, of some experiences on the latter river, and also of a day on the Wye, between Fillieford Bridge and Bakewell.

(To be continued.)

FISHING IN SWITZERLAND.

THE rivers of Switzerland vary much in their character. Some are largely composed of melted snow, others are pure water, transparent as those of countries where there are no mountains covered with snow and glaciers.

In all the rivers save those which are too cold for trout to live, this fish, trout, is found. Usually they are not large, but at times fish of great size are taken. There is a fishmonger in Basle who occasionally obtains possession of large trout, and when they are of uncommon size he sends them—or, if only one, it—to Berlin, packed in ice, for the use of the Emperor of Germany, who ascertained that a large trout he once saw came from the fishmonger, and the consequence has been that royal trout find their way to Berlin.

There is a small lake in the beautiful Klönthal $2\frac{1}{4}$ miles long and one-third of a mile wide. This lake is said to have a trout similar to some that are

taken in Norway, and of a kind unknown elsewhere in Switzerland.

The supply of trout is far less than the demand. In the Val de Tignes there is a lake, and the trout taken find their market in part on the other side of the Alps at Courmayeur.

Perch are sometimes found in the rivers near lakes, and so are carp and pike as well as eels, but they usually keep in the neighbourhood of the lakes, especially near and in the Lake of Constance, where they are plentiful.

There is a very good fish taken in the Lake of Geneva, called "fêra."* The same fish is taken in the Lake of Constance, but is known by another (German) name there that I could not learn.†

There is also a fish taken in the Lake of Constance, and sometimes in the rivers near the lake called barbe. It has two tentacles I am told on the upper and lower jaw. This fish is not much esteemed, save by the Jews, who are fond of it.

There is an excellent fish taken in the Lakes of Geneva and Constance, called "ombre."‡ It sometimes attains 2 lb. in weight, but not often. This fish is also found in the Doire, I am told, at Aosta.

There is a fish about the size of a finger found in the lakes

* The French name of *Coregonus fêra*.

† The German equivalent is *Bodenranke* or *Blaufelchen*.

‡ Grayling: though *ombre chevalier* is most likely intended; in that case the English name is Charr.

COTTON'S FISHING-HOUSE ON THE DOVE.

* "There is, under this motto, the cypher (I. W. and C. C.) mentioned in the title-page—and some part of the fishing-house has been described; but the pleasantness of the river, mountains, and meadows about; it cannot, unless Sir Philip Sidney, or Mr. Cotton's father, were again alive to do it."—Note by IZAAK WALTON.

called "whitefish." It also frequents the rivers. It seems to be the young of a larger fish, and is found in great abundance at certain seasons.

There is also a little fish which is found in rivers under stones. The stone is lifted, and then the fish is speared. It is called in the German-speaking countries "grundeli."§ It is a poor fish in quality.

In the spring there is a fish that comes up the Rhine in vast numbers, and it is found also in the Aar and other rivers connected with the Rhine. It is called "nase."|| It is a wretched bony fish, and is only capable of being eaten when the bones are dissolved by baking.

Salmon (price 2½ to 3 francs per lb.) are served at nearly all the tables of the best hotels. The Rhine can supply but a small proportion of these. They are sent from Norway to England packed in ice, and sent to the Basle fishmonger (a man said to be of great intelligence), and by him they are distributed all over Switzerland, some hotels taking one hundred pounds weight daily.

Klönthal ice is used in all parts of Switzerland, and the boxes that bring the fish are said to be returned packed with ice.

There is a gentleman, whose name and residence I could not obtain, who has devoted himself to pisciculture, and he is said to rear about 80,000 trout annually—for Switzerland only.

Most of the fishing is done by rod and line—exclusively by that mode (I believe) in rivers.

In the Hotel De Ville at Zurich there was, and probably is, a large drawing of all the fish found in Switzerland, with their special names. This at least was the case many years since, and may be now.

There is a fish taken in the Lake of Annecy, called "lavaret,"¶ exceedingly good; but whether the fish is the same as the "ombre" (it is like it in taste) I cannot say.

There is a close time, which varies according to the rivers. Right of fishing in some rivers is reserved, and fines are imposed.

7th September, 1881.

I went to Zurich, hoping to find the drawings of the fish, but my visit was in vain. The "Townhall" is still there, but no one of whom I enquired knew the place where what I sought was to be seen. I called on a bookseller, but he could not give me any information, though he desired to do so. He told me that there is no book on the fish of Switzerland that he is aware of.**

8th September, 1881.

Fishermen at the Falls of the Rhine gave the following list of fish which they take by rod and line at the foot of the falls:—hasel, forelle, barbe, alet, naze, asche.†† No others.

At Stuttgart we had a small fish called "goujons"‡‡ in the menu, but I could not learn where it was obtained.

The above information was gathered from many persons. For its accuracy your correspondent does not vouch, but if it lead to further communications from those who are better acquainted with the subject, the object of the writer will be answered.

FISHING IN INDIA.

A YOUNG friend of mine being about to proceed to Cashmere, a north-western province of India, being passionately attached to the rod, requested me to make some inquiries of the angling capabilities of that portion of the globe; the following extract of a letter from H. S., 27th Regiment, dated Serinager, was the result, and which I give verbatim as it may be of interest to others:—

"The City of Cashmere is situate on the river Jelum, but owing to the strict preservation, little or no fishing is to be had in its waters, on account of the late Rajah of Cashmere's soul being supposed by the natives to be metamorphosed into a fish. There are myriads of small fish, which on account of their being fed on rice, &c., by the priests, and their confidence rarely abused, will take almost any bait. I have myself repeatedly when rowing a small boat under the bridges out of sight, towed a line astern, with a common trout fly, and have hooked them quite as fast as I could wish for my pleasure. I believe the fish inhabiting the Jelum River, near the town are far from wholesome, owing to the drains, &c., all running into the stream. They certainly are far from

being esteemed, though eaten with great avidity by the poor natives and even by our servants; they are devoid of all scales, and vary in weight from ½ lb. to 6 lb.

"The mahasur, or as it is called by Europeans; the Indian salmon, is scarcely or ever seen so high up the river on account of the intense cold of the water, but proceeding down the river some sixteen or eighteen miles, there are to be had excellent mahasur fishing at a place called Sopore, in the months of August, September and October, and after the snow has nearly all melted the fish abound, are extremely ravenous and will take almost any bait. Spinning with a minnow, or perhaps what is better, with a silver spoon armed with hooks, generally insures success. The natives make use of a common hook to which they attach a small piece of white cotton or tape, half an inch or so in length, and, strange to say, their mode of making a fly will often take sooner than our best London or Limerick makes.

"The water is too clear for coarse tackle, which is a great drawback, as the mahasur varies in weight up to 60 lb., and as they fight with desperation and give plenty of sport, good and strong tackle is required. They take the live minnow, but often they refuse to look at any bait, however, apparently tempting, upon which occasions many of my brother officers amuse themselves by spearing all within reach. Poonah, some sixty miles from Serinager, is *par excellence*, the best place for fishing, situated in Motie Singo territory. Its river is somewhat narrow, but very deep, and runs at the rate of some five or six miles per hour. Its bed is covered with huge boulder stones, in consequence of which great care and nicety in holding your rod is required; as if once your tackle fouls there is little hope of saving it.

"Another drawback is that by nature the mahasur, after having been hooked and played for some time, turns sulky, and goes direct for one of these boulders under which he will jam himself, and there remain quite long enough to tax one's patience. But he is not idle while there, for he often succeeds, either by design or in his panting state, in chafing your line against some sharp angle and gets away. I missed a very fine fish in this manner, having played him for an hour and thirty-five minutes.

"I enjoyed some two or three days fishing in company with three officers at a place called Noushera; the third march from the plains into Cashmere. But owing to the constant whipping of the waters in this locality—as every one who comes to fish mostly remains for days—the fish are extremely cunning, but at the same time, very voracious when in the humour to feed. Two officers of my regiment caught or killed 200 fish (mahasur) in four days, with the fly and bait. I have taken twenty-eight in a few hours, the largest weighing 8 lb., but one was killed by a man named Armstrong, weighing 30 lb.

"In Noushera the water is very clear, with a fine sandy bottom, and as smooth as a mill-pond. The finest tackle is required. I never succeeded unless I fished with single gut. The water is literally in motion with the fish. They will not take a fly—indeed they are so knowing we have to resort to baits. Bread moistened with water, and an equal quantity of white cotton wool, beaten into toughness between two stones, is an excellent bait, as the fish can only get it off the hook with difficulty, the wool or cotton binding the head so that it cannot well be rubbed off. After fishing some time the fish become very wary; you then have to coax them by throwing in a handful of crumbs of bread at the same time as your hook drops in the water. The chances then are nearly certain that your bait will take one of the hundreds of the finny tribe which have been gathered to that one spot, all eagerly contending for the biggest bit, and such is their greediness, that every morsel is devoured before it reaches half-way to the bottom, and before you can land your fish.

"Parched Indian corn is likewise an excellent bait, but owing to the water, it soon drops off your hook. It is no exaggeration when I say that the fish seem to know it directly as containing the barbed wire, and will rub their noses against the corn until they remove it, when it at once disappears. The only resource is, as with the bread, to feed them with a handful every time you cast in your bait. The Indian corn can be purchased at any small village as the poorer classes live upon it, and it is by no means disagreeable.

"The lake, Cashmere, abounds with small fish, and many an afternoon's sport have I had in killing them. The best bait is the "toute" or mulberry, which grow all over Cashmere. These trees overhang the river, and it is an interesting sight to see the fruit drop off the tree, and immediately seized by one of the hundreds of the finny tribe.

"You have only to bait your hook with a mulberry, and you are certain of a fish. There is no lack of this bait here, as the trees grow wild and in great profusion almost anywhere. These fish seldom exceed four pounds in weight, and are far from palatable; but the boatmen are happy to get them. I have tried myself a piece of crimson chenelle, fashioned like a mulberry,

§ Loach.

|| *Chondrostoma Nasus*; a fish somewhat resembling the loach.

¶ *Coregonus Wartmanni*; one of the twenty-one species and varieties of Swiss *Coregoni*.

** A collection of the literature of Swiss fishes by Swiss authors only, and wholly printed in Switzerland, amounting to eighty works in about 160 volumes, was displayed at the Berlin Fisheries Exhibition.

†† Dace, trout, barbel, chub, nase, grayling; this list can scarcely be complete, seeing that thirty-five different species of fishes are caught in the Rhine between Basle and the Falls.

‡‡ The French for gudgeon.

and fastened to a hook, and which, when floating upon the surface of the water, would deceive the most lynx-eyed native, but, strange to say, I never succeeded in getting a bite, although they would freely take hundreds of mulberries falling from the trees which overhang the water.

"Our fauna in this province is remarkably full, although the wild carnivora are becoming more scarce. Tigers ten feet in length from the head to the tail, lions, panthers, leopards, hyenas, lynxes, wolves, bears, jackals, foxes, otters, martins, stoats, wild hogs, porcupines, bats, vampires (held sacred by the natives), peafowl, parrots, jungle-fowl, pheasants, partridges, quails, waterfowl, herons, cranes, pelicans, eagles, vultures, hawks (the exportation of which produce annually £10,000), magpies, hoopoes, doves, bulbul, the Kashmir nightingale, whose note is truly enchanting—alligators of a small species in all the rivers, porpoises, which swim up the Indus, and a small snake whose bite is deadly, etc., etc. Its rivers abound with *killa*, a kind of carp, which is delicious eating, and several other species of fish."

Permit me to suggest to intelligent Europeans in India, that as facts, like unto the above, have a peculiar interest in England, and cannot be other than of use to those who purpose visiting the presidencies, the pen of our officers might praiseworthy be employed in giving a few lines of a like nature to the FISHING GAZETTE—a suggestion, I trust, not the less pertinent when it is known that the principal rivers of India are upwards of thirteen thousand miles in extent, and their tributaries are reckoned by as many hundreds, and that nearly all their waters are occupied by fish.

CREEL.

BARBEL-FISHING.

If by chance you hook a barbel,
And your rod bends like a bow,
Be careful how the reel you handle,
Or, perhaps, you'll let him go.
Give him line, but not too freely,
Keep your finger on the reel;
That's the way in which to angle
If you wish to fill your creel.

—S. S., Nottingham.

NOW I can remember the time, something like thirty-five years ago, when barbel-fishers employed exceedingly strong tackle. The rod was most suitable for jack-fishing, and the line was very stout, and prepared, and had attached to it a plumb of two ounces in weight, and the hook length was double-twisted wire. With this apparatus a barbel, when hooked, had a poor chance of escaping; and, as giving them line when the fish wanted to run was altogether out of the question, not an inch was allowed to go off the reel. A landing-net was seldom used to fish of from 2 lb. to 3 lb. but as soon as brought to the side, he was at once lifted to the bank. Float fishing for barbel at the time mentioned was never thought of.

Time passed on, however. Some of the anglers began to discover that such heavy, strong tackle was not necessary to kill a barbel, and consequently lighter material was used with greater success, and some of the old school began to see they were making a mistake, and quickly improved their tackle for something lighter and finer. But the greatest surprise to the old barbel-fishers was to observe a young rodster attempting to catch barbel with a large cork float and a travelling bait. At this some of the knowing ones laughed heartily, but they little thought what was going to follow the first attempt at barbel-fishing with a float. The young piscator, who happened to be myself, soon found that, although the line was much finer than had been used for plumbing, still, when it got wet, it stuck in the rings on the rod, and of course the float did not travel freely. A finer line was at once procured, which worked much better; and, finding this answered well, a finer one still was placed on the reel. With a smaller cork float and less weight, the whole thing after a while acted fairly. The first barbel was hooked with this tackle at Wilford "boat." And as the writer of the above verses says, "Keep your finger on the reel"; just so. But there was no one at that time to give the hint. However, the barbel, which was a four-pounder, forced the line off the reel. This, of course, just saved a break, and taught the angler a lesson, which was, that there is no fear of a fish breaking you on the run, and not much chance of his getting off the hook so long as you do not hold on too tight. After this fish was landed, and several more besides, many of the old hands tried the same method, but I believe up to this day only a few succeeded. Now I will go a step further and show the danger of losing a barbel in a baited swim, and the consequence. First, I will mention a circumstance that happened at Shardlow. I had baited a noted swim for a gentleman with a thousand worms, and on the following morning he took six good barbel under the hour. On hooking the seventh fish it went away down stream at a great rate for about forty yards, and then turned off. I

remarked "That's a bad job," and so it was, for he never got a bite after. "The fish," I said, "was no doubt hooked where there were perhaps several more close to at the time, and these would all follow wherever the hooked fish went, and stop when he stopped, and the chances are they will not return any more to-day," which was true. My friend, however, had some doubts about what I had stated, but I told him that some day I might be able to show him this curious freak among the barbel more clearly. It was not long after that time that I paid a visit to the Thames with the same gentleman. We selected the water in the neighbourhood of Monkey Island. I went off with a thousand worms to find a place and then bait it. I was, of course, a perfect stranger to the water, but, after walking down about a quarter of a mile below the island, I found a rapid stream, which had not the least appearance of a barbel swim, excepting that I knew it must be an attraction to the fish, for it must be understood that barbel are not in deep water during the month of June, and that was the time I went to find a barbel swim. I put a rod together, and, after finding the depth, which was about five feet, began to catch barbel at once. I then baited the place and left it. On my return, my friend said, "What have you found?" The answer was made by producing the fish I had caught. He said, "That looks promising. Shall we make a catch?" That I did not know. But on the following morning when we got to the spot, my friend said, "Surely you have not baited such a stupid place as this?" I next placed a worm on his hook, and, of course, gave him the right depth. He said, "What shall I do?" I answered, "Throw it into the water." The bait had no sooner reached the bottom than a barbel took it, and for many swims the same thing occurred, to his great surprise. 100 lb. being the result of the day's catch. We then threw a few hundred worms in, and left the spot. Next day the fish bit equally well, and just before lunch he hooked a barbel about 2 lb. in weight, and the first time it showed itself under the spring of the rod (and I was there with the landing net), I saw at least six other barbel come up with it. I said: "Sir, do you see a lot of barbel all round the one you have hooked?" "Yes," he replied; and until the fish was landed the others would not leave, but went with their companion while he had strength to make a run. I here said: "And now perhaps you remember when you lost that fish on the run at Shardlow, and what I told you at the time." "Quite," he said: "I am now perfectly satisfied that what you remarked was correct." Now, from what I stated, the barbel-fishers must see at a glance that it is a great mistake should a barbel be hooked in the top part of the swim, and then make a run of, say forty yards, down stream, to wind up the line and follow him down to the spot where he stops and kill him there. The fish that have gone down with him will not return to your swim above perhaps any more that day. I always say the right thing to do is to stand your ground, and do not move unless the fish has run you foul at the end of the run. If this should happen, of course there is nothing for it but to follow him, with the chance of saving your tackle, and perhaps bring the fish to bank. In my next I shall have something to say on reels for barbel-fishing, and the proper method of using them.

W. BAILEY.

NOTICES OF BOOKS, &c.

ANNUAL REPORT OF THE BOARD OF REGENTS OF THE SMITHSONIAN INSTITUTION FOR THE YEAR 1879. Washington: Government Printing Office. 1880.

THE close union existing between the Secretary and Director of the Smithsonian Institution and the Chief Commissioner of the U.S. Fish Commission, in the person of Professor Spencer F. Baird, naturally accounts for the intrinsic excellence of the ichthyological information contained in the volume forming the subject of this notice. Some of this information, it is true, is not absolutely novel, it having already appeared in the latest Fish Commission Report. But notwithstanding this, no one is likely to challenge its right to a place in the valuable Annual Reports issued by the Smithsonian Institution. For without the last-named, the Fish Commission could never have attained so rapidly to its present exalted position in the eyes of all civilised nations, or executed a tithe of the work it has fortunately been able to perform.

Hence for this, if for no other reason, it will always be doubly gratifying to Englishmen to be reminded that it was their countryman, James Smithson, who, dying at Genoa in 1829, bequeathed the whole of his property (about £115,000), "to found at Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men;" for it is in these brief but significant words that his last wishes were expressed in his will. Less

gratifying must it be to Americans to reflect upon the behaviour of a number of their own chosen legislators, who, shortly after Smithson's death, suddenly discovered it to be "beneath their dignity to accept presents of this kind from any one;" or thought it "too cheap a way of conferring immortality;" or, who actually went to the length of moving a vote of censure on the government of the day, for "consenting to be the recipient of what was called a munificent donation of half a million from an Englishman to enlightened American republicans." "How did it happen," inquired one of these self-same enlightened American legislators, who was doubtless convinced that in his person enlightenment had long before reached its apotheosis, "how did it happen that this government accepted such a boon from a foreigner—an Englishman too?" Fortunately, however, for the credit of human nature and American republicans in particular, the undignified counsels tendered by these inflated malcontents were not adopted. Instead of Smithson's generous bequest being spurned outright as a gift involving the degradation of its recipient, it was accepted, though not without open signs of a grudging spirit, redolent of condescension and contemptuous indifference. In fact, so strong and enduring was this outburst of ill-humoured antagonism, that sixteen valuable years were wasted before the Institution was finally placed on a legal footing and organised in accordance with the wishes of its founder.

At the present day when a close-knit bond of sympathy, wrought on the basis of a wider knowledge and better understanding of one another, connects the two great English-speaking nations in the world, it seems incredible that the malignant disposition we have referred to above could by any chance have existed in reality. But a perusal of the careful paper in the volume now before us, called "James Smithson and his Bequest" from the pen of Mr. William J. Rhees, Chief Clerk of the Smithsonian, will prove that we have rather underestimated than exaggerated our account of American feeling at that time.

It is but fair to say, however, that since 1846, when the Institution started fairly on its prosperous career, the Regents of the Smithsonian have done much to redeem the valuable time frittered away in utterly indefensible tactics of obstruction and delay. They have carried out Smithson's public-spirited intention by every means within their power, and with such marked success that the Smithsonian now ranks high among similar institutions all the world over, and in some respects, in the gratuitous distribution of its publications in particular, outdoes many that far exceed it in age, reputation, and wealth.

It would be foreign to our purpose to give here a retrospective account of the work accomplished by the Smithsonian and the closely-affiliated Fish Commission, in increasing and diffusing scientific and practical knowledge of fishes and all relating thereunto. We can only sum it up by stating that, both as regards quantity and quality, it has no parallel in any other quarter of the globe. Of the amazing activity and literary fertility exhibited by Professor Baird and his zealous staff it is impossible to speak except in terms of admiration and high praise. All agree in pronouncing their productions to be thorough and exact. In their hands theory and practice are made to march within reasonable distance of each other, and abstruse subjects are mostly dealt with in a manner adapted to minds but little above the common order of intelligence. When, therefore, so much is done, and so much admirable information is provided for our use, it behoves us to be doubly on our guard against the semblance of preferring an ungracious and unfounded complaint. Hence we do no more than drop a passing hint that the convenience of students would be better served if their contributions to ichthyology were distributed over a smaller number of contemporaneous publications, issued for and at the expense of the Smithsonian and the Government. It can surely be no part of their object to multiply the obstacles that already hedge the study of fishes round about. Yet in effect, that is what is being done. If we take the case of a student interested in the ichthyological literature of first importance belonging to the United States alone, he will certainly not find his materials cut and dried and ready to his hand. What with having to wade through the long row of folios known as the Smithsonian "Contributions to Knowledge," the handier octavos which make up the Smithsonian "Miscellaneous Collections," and "Annual Reports"; the "Bulletins" of the National Museum as well as its "Proceedings," and the Reports of the U. S. Fish Commissions and the other Commissions appointed by individual State Legislatures, he must needs be not only extravagant in his use of midnight oil, but, as Izaak Walton and his contemporaries have it, he must besides prevent the rising of the sun. Let us hope, then, that the student of the future may, as regards the fresh contributions to American ichthyology that are being produced in our day, find them snugly side by side in volumes specially devoted to the subject.

One material result of last summer's work has been the discovery of an entirely new food-fish, both genus and species being

previously unknown to science. This is the tile-fish (*Sopholatilus chaemleonticeps*.) We are told it can be taken in any desired quantity on a bank newly discovered near Noman's Land, and that some specimens have been found to weigh as much as ninety pounds. This fish has very much the same general food characteristics as the cod, and it is expected that in time it will become an important article of trade. The pole-flounder (*Glyptocephalus cynoglossus*), a flat-fish, discovered off the coast near Gloucester, the well-known great fishing-station, in June, 1877, is now found to be very extensively distributed along the American shores of the North Atlantic, and is possibly the most abundant species of its family on the coast. "In the smallness of its mouth," writes Professor Baird, "which prevents its being captured by the hook, and the lack of use of the beam trawl as a fisherman's engine, are to be found the explanation of the ignorance of the fisherman in regard to the species."

This report also announces the forthcoming appearance of several annual and other reports authorised by law, or ordered by resolutions of Congress, which cannot fail to be of special value and interest to the public in general. And here it may be of use to point out, for the benefit of such persons as may be desirous of procuring the valuable works on fishes and fishing, issued by the U.S. Government, of the existence of a law on the American statute-books which permits any person to subscribe for the Government publication issued under the authority of the law.

As this law is so very little known, we give it in full, as follows:

"If any person desiring extra copies of any document printed at the Government Printing Office by authority of law shall, previous to its being put to print, notify the Congressional Printer of the number of copies wanted, and shall pay to him in advance the estimated cost thereof, and 10 per centum thereon, the Congressional Printer may, under the direction of the Joint Committee on Public Printing furnish the same."

Of the publications referred to above, we pick out, from among others, for which we have no space to spare; "Synopsis of the Fishes of North America," by Professor D. S. Jordan; "Bibliography of the Ichthyology of the Pacific Coast of North America," by Theodore Gill; "Bulletin of the U. S. Fish Commission," Vol. I.; "Report of the U. S. Fish Commission," Part 7; "Report on the International Fishery at Berlin, 1880, and on the present state of the Fisheries of Europe," by G. Brown Goode, Deputy Commissioner, and in connection with the Tenth Census. "A Report on the Present Condition and Past History of the Fishing Industries of the United States." This last-mentioned report promises to be a most elaborate affair, and we can only hope that its contents will be put to honest uses. But of this we have our doubts. There is an ominous ring in the concluding paragraph of Professor Baird's report which bodes little good to England in the future.

Speaking of the census fishery returns, he says:

"A very important corollary of this work is the information, it will furnish for use in any future arbitration between the United States and the British Provinces in regard to the value of its coast fisheries. It is well known that the cause of the United States, at the meeting in Halifax, in 1877, went almost by default in consequence of the absence of this information. While the Canadians possessed the fullest data on the subject of the fisheries, as the result of many years inquiry, the United States had nothing whatever, but what was gathered with special reference to the emergency. The results gathered in connection with the census of 1880 will, it is hoped, be tabulated and published by the time this is needed for diplomatic use, and it will be of inestimable advantage in strengthening any position that the American Government may take in reference to the nature of the American fisheries."

In fact, Professor Baird seems, as it were, to scent the coming fray;

"If it be not now, yet it will come;
The readiness is all." *Hamlet, Act V., Sc. 2.*

and no doubt the inspired incapables who at present hold the reins of Government in England will be found equally ready to settle all demands in the same disgraceful way as the Fortune Bay Fishery dispute was recently brought to an end.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

RIVER REPORTS.

MID-THAMES.

"That what we have we prize not to the worth
While we enjoy it; but being lack'd and lost,
Why, then we rack the value; then we find
The virtue that possession would not show us."

—SHAKESPEARE.

On looking over a number of angling items received during the past week I find that most of the fish captured have been small in comparison to the "screamers" and "reamers" lost to sight, but to memory dear. This is perhaps well that it should be so, for it enables the angler to revisit the quiet nook in which he has lost a beauty, and live in hope, and not die in despair, of capturing the Triton that heretofore had escaped his wily snare. From Maple Durham I have it that Mr. J. Wilson on Monday caught some grand perch, but, of course, lost "the best fish of the day" whilst attempting to get my lord into the landing net. At Henley, Mr. Johnson, on one occasion during the past week, landed five jack; Mr. Day has also had some perch from Marsh Pool; Mr. Withome one jack 6 lb.; Monsieur Du Claret, with Parrott, a fine basket of roach and perch; Mr. Elcamb, also with Parrott, some excellent chub and perch, had legering. Mr. Barstow, with Rush, at the Hamble den weir pool, seven barbel, best going 7½ lb., and also four trout, going respectively 6 lb., 5½ lb., 3½ lb., and 3 lb., all of which were, of course, in a sportsmanlike manner, returned to their mother element, so anglers for April next make a big mem. of this. At Hurley, Mr. H. Thompson, nice takes of roach and gudgeon; Mr. Lee, 12 lb of roach; Mr. Harrison, a tench of 2½, and some roach; and another gentleman, an eel 3½ lb. Marlow, Cookham, and Maidenhead reports uninteresting. Thursday evening: River in slapping angling trim, the late rains having much improved it.—MARLOW BUZZ.

My last weeks report seems to have suffered from one of the ills that Mrs. Post is heir to, and had a miscarriage, but I trust that the offspring will not be still-born, but Siamese-like, will be alive and kicking in this week's issue of the GAZETTE. The Thames during the past week has been suffering from that *bête noir* of a windy initial, the E., and few piscators have ventured to do or to die—or, in other words, to catch fish or rheumatism. At Surley Hall, Bray, and Maidenhead, some decent takes of chub and roach have been had, but the fish have been very wary, and those to hand of small calibre. Cookham seems to be dormant after its gorge of jack a fortnight since, but Bourne-Endites have swallowed three jack, of 6 lb., 5½ lb., and 3 lb. respectively, besides some bushel of roach, since Sunday. At Hurley, Messrs. Lee and Harrison have again been nuts on the roach, and the advent of Mr. Barker and another piscatorial *confrère* is advised for Saturday, so chub look out, or woe betide ye! At Hambleton the name of the angler who took six trout (best fish 6lb.), two jack and thirteen barbel in one day, should have been Barmwell, and not Barstow, as I erroneously reported as above. I make this correction with the greater pleasure because the gentleman acted as a true sportsman, and carefully returned the trout, instead of acting the cormorant, as some would—in other parlance, the best fish would have been "too badly hooked" to return. Thursday evening—River bright, but the frosty nights are weakening and rotting the weeds. Grand sport will soon accrue amid the jack, perch, and chub if this weather continues. Wind N.W.—MARLOW BUZZ.

Thames (Goring).

Water in good order for jack and perch, roach dead off. Have been taking some good perch and jack, largest jack 6 lb., one perch, 2 lb., and four perch going 5 lb.—JOHN RUSH.

Thames (Halliford).

The river is now very low, and rain is wanted badly. Different gentlemen fishing with me three days; their takes have been but very little, owing to the cold north-east winds. First day: Mr. Innes took five barbel and a few roach; second day: Mr. Cooper, two dozen roach and two barbel; third day: Mr. George Palmer, one barbel, three chub and two roach. All taken legering.—GEORGE ROSEWELL, fisherman.

Thames (Kingston).

The water is low and bright, fit only for perch, gudgeon, or chub; not much good if the wind stops in the North-East. I have seen two nice lots of chub, four in one lot, five in the other, all good fish, 3 lb. 14 oz., the best, I have got a few nice jack up to 7 lb. and some few others taken by private boats. This last few days the roach has not fed well, some of the gudgeon are very fine. Very little has been done from the banks. The water so low and clear. A few stray barble have been caught here and there. I should say perch or chub would be the best chance.—JOHN JOHNSON.

Thames (Richmond).

The river is in splendid order for fishing now, and the fish is feeding much better than they have been for some time, the average take being from three to six dozen roach each day. The roach is a fair size now, but the dace have been off feed for over a week now; in fact their is only four or five caught each day, while roach fishing. There is no need to state the individual takes of each fisherman. We have to thank the Thames Angling Preservation Society for the way they have watched our waters during the holidays to save our fish from the men with nets.—JOHN BUSHNELL.

Thames (Shepperton and Weybridge).

Water very low and clear. Not much prospect for the next few days. F. Purdue, two days, 9 dozen gudgeon and 1 dozen roach; T. Purdue, one day, 6 jack, the largest 6 lb.; H. Purdue, four days, 9 dozen roach and dace; a gentleman, spinning from his lawn, near Weybridge, took a jack 7 lb. 5 oz.; myself, two days, 5 dozen roach and dace and 5 barbel.—W. ROGERSON.

Ancholme.

The running-off of the water continues to be against the fishing, but the fine weather of the past week has been all that can be desired for coarse-fishing. My sons had a day on Friday last on one of the numerous feeders of the main stream. They had a large catch of roach and dace, many of the former coming well up to 1 lb. each. These were all taken with King's Natural Bait. They praised the new article very highly, saying it was no sooner in the water than the fish were at it. I hope to try it myself shortly amongst some large carp. Many of the trout fry from Scawby, placed in a small stream by Capt. Sutton, in addition to others put into small becks by myself, are finding their way into the main river. I am trying to move the authorities to purchase a supply of carp to improve this fishery. Pike do not seem to feed well as yet. I have tried both private and public fisheries of late, and have thus far caught nothing respectable. Is this a general complaint?—THOMAS FORD (Caistor.)

Dinsdale-on-Tees.

The last ten days have been most favourable for anglers. The fish have been passing upwards in large numbers, and the Dinsdale water has been in first rate order. The fish have been rising freely, and day by day Mr. Surtees and his friends have landed many fish. On Monday fourteen fish were laid out on the bank, which fell to the lot of two, Mr. Surtees and Mr. Straubenree. Several of these fish were of large size and in good condition, but one was covered with a large red scab. The pleasant and well-written article on the Tees, in your number of Sept. 17th, has interested us much in this locality.

Dove.

The present may be chronicled as almost a blank week. Little has been done amongst any kind of fish. The trout season is now at an end, and the fish are going up the brooks, where the poaching fraternity have already been busy amongst them. At the time of writing a cold east wind prevails, and grayling and jack, which should now be biting freely, are right off the feed. There has been no catch worth mentioning since I wrote last week. Several baitings have been put in for chub, bream and roach, but they have proved quite inoperative in bringing the fish together.—THE SPLODGER.

Ilfracombe (N. Devon).

The weather during the past week has been very fine. On Friday and Saturday there were a great many big fish caught, viz., cod, conger and ling. Some small boats had good catches of whiting, pout and pollack. Monday—all hands busy getting their boats ready for herring fishing, having heard there were five maize of herrings being caught in a boat at Clovelly, which is about 18 miles from Ilfracombe. Several boats started on Monday evening to try their luck, and others on Tuesday. They all returned again yesterday, having caught but very few herrings, mackerel and whiting. They say the water is too clear; it wants a breeze of wind to stir it up. Herrings are caught in this bay before we get them off here, and boats are able to have a good drift without fear of having their nets cut away with passing vessels fishing off Ilfracombe. They are obliged to keep a good look out as the vessels and steamers pass up and down within a mile or two of the land. There has been some fine fish caught with hook and line from the rocks off the Capstone Parade by the men after they leave work of an evening. They take their lines and bait, and amuse themselves fishing from the rocks for an hour or so. When they get a large fish it well repays them for their time and trouble. Weather fine, with good prospects for the next few days.—E. COMER.

Lea (Ponder's End).

Water, bright. Prospects, not very favourable. Not heard of any sport this week.—EDWARD DURBAN.

Norfolk.

Rodsters are still busy, owing in a great measure to the recent fine weather. Every waterside station has been besieged by all manner of anglers, and many are the good catches which have been had. To enumerate them all would be a tedious job, so numerous are they. Roach and bream fishers have been doing the trick this last week, and searchers for pike have been equally successful. Altogether piscators have had a most enjoyable season; there has been no lack of sport, and fish have been shown in large quantities. I should imagine there has been more roach killed this season than has been known for many years, for hardly a sportsman has gone out without returning with a full creel. Bream do not seem to be so prolific. The best catches have come from Reedham; very few having been taken at either Brundall, Buckenham or Cantley. With respect to the new fishing station shortly to be erected at Brundall, everything is progressing most favourably, and I think I may venture to say, 'ere I address you again, will have been commenced. Brundall—so near to Norwich—is as yet comparatively unknown to most people, for there is no place on the river where such charming scenery may be had, and as to the fishing, where is there another place with such facilities? Many are not aware that the proposed "new station" lies between two "broads," viz., Rockland and Surlingham, and what nurseries for the breeding of fish are these!—disturbed by no large craft and opening, as they do, upon the main river, fish cannot but thrive and multiply. Ample proofs of this have been seen during the past season, as the largest takes have come from this spot.—ANGLER.

Trent (Newark).

The water is in capital condition for all-round fishing; the weather has been very fine up to to-day. This morning there was a cold drizzling rain, to-night it looks very dull; but I think the prospects for sport are pretty favourable if the angler will only operate in a suitable swim. Roach have been taking gentles pretty fairly this week; Messrs. T. Sunman and W. Bulman having very good bags of those fish with the before-mentioned bait in a few hours last Saturday. The former had 42 fish and the latter 36, biggest fish 1½ lb., a very good lot, average weight about 10 oz. Gentles and cockspur worms will be found killing baits just now for roach and dace, and worms for bream. I saw an angler last Saturday kill half-a-dozen nice bream in a few minutes with brandlings. Chub are still taking the wasp grub.—THE TRENT OTTER.

Wye (Ross.)

The water is now in capital order for fly or gentle. Several nice dishes o

grayling have recently been taken. The salmon are very plentiful, but few fish have so far been taken. On Saturday, Mr. Hill, of Ross, rose five fish, but could not succeed in landing one.

Wye and Derwent (Derbyshire).

Trout fishing closed with us on the 2nd inst., according to the Freshwater Fisheries Act, for this year, and taking the season all through we have had a very fair one, as both the fly, bottom, and trollers have all done fairly well on both rivers, and some very fine trout have been killed; also some very heavy baskets have been made both by visitors, natives and professional fishermen. Sport during the past week has been very fair, and baskets of from three to eight brace per angler have been made off both rivers with the artificial fly—the honey dun bumble, furnace dun, and little blacks all killing fish. Last Friday, the 30th inst., I had a day's fly fishing on the Wye, between Tilleford Bridge and Bakewell. I succeeded in killing seven brace of good-sized fish, in fact, I had four grayling that weighed over 4 lb., besides two trout of about 1 lb. each. The fish rose the best from 11 a.m. to 1 p.m., and I killed them in the tails of the streams—every fish was killed with the bumbles and furnace flies. I saw Mr. Francis Francis, of the Fields Fishery, who has been staying in Derbyshire for some time angling, and from what I saw myself, and from what I can learn his catches have been very small indeed, through him not having the proper flies to kill fish with, although large baskets were being daily killed off of both rivers during the time Mr. Francis Francis was fishing so unsuccessfully. Several anglers who have seen him fishing, myself included, think very little of his style of fly-fishing, especially him having such a name as he has. No doubt he is a good trout fisherman, but he has a very great deal to learn before he becomes an A 1 in grayling fly-fishing. I hope these remarks will not put him about, for if he had only done as I wished him to do, that is, wrote and told me when he was coming down into Derbyshire for a little fly-fishing, I would have gladly made him a present of a few flies, and if he could not have killed fish with them I would have gone and shown him myself how to have killed both trout and grayling with the same flies. The bottom fishers on the Derwent have killed some very large grayling and coarse fish during the week with cockspur worms and maggots. There have been a few pike killed on the Derwent, between Cromford and Ambergate, with small dace for bait, trolling, the fish running small.—GEORGE JAMES EATON.

GOING INTO SPAWN.

JUST another week or two and the trout season of 1881 will be numbered with the buried dead. They are closing the chapter on some waters already, and for four or five months to come Master and Mistress Speckle will be honey-mooning. May their cup of happiness run right over. They have afforded enjoyment to thousands during the spring and summer, and surely they now deserve a turn themselves.

I have an idea that trout, like the high and mighty ones of earth, take their pleasures soberly, coolly. It seems to me that they rarely get into a frothy state of excitement. See the sedate style in which yon foot-long four-pounder comes up to the live minnow or gudgeon. He doesn't make a sudden rush like a bull at a gate, but calmly adapts his mind to the situation, swims in quite a dignified way up to his prey, and leisurely seizes it. His kinsman, the salmon, does precisely the same. Who ever saw a salmon take a fish in other than a right royal manner? He fully understands his power in the water, and never hurries himself. There his prey is—he saunters gracefully up to it, sucks, not grabs, it into his mouth, and quietly digests it, as if nothing whatever had happened.

I can't, in fact, help thinking that both trout and salmon are not only a cool but a philosophical race. Who knows that troutdom does not contain its Tupper's of proverbial celebrity—who can tell that there are not sages amongst the salmonidæ? Sir John Lubbock has shown that there is a wide world of wisdom in the common ant-hill, why not among the scaly denizens of the waters? From time immemorial, long before either Walton or Cotton wrote, the trout has been credited with prudence and subtlety. Who is there to tell how or to what extent those qualities may have been developed? This you may take for a certainty—troutdom has not stood still. That he has improved in prudence seems clear from the fact that, with all our cleverness in fly-tying, with all our ability in contriving spinning baits that beat the naturals into fits, yet friend Redback takes more catching now than ever he did in days of old. I am afraid our forefathers fishermen would have but a bad time were they to revisit "the pale glimpses of the moon," and commence the piscatorial attack with the weapons they wielded say a hundred years ago.

How the trout would laugh and turn up their noses! "Call that a fly?" some loquacious youngster would say, winking his left eye at his pals; "more like a flat catcher," and away the whole tribe would go to feed like mad a yard or two further on. All honour to our trout treasures that they have kept the march of progress, that they have so immensely advanced in wit and wisdom, and, with the instincts of maternity now becoming strong within them, may they beget a race as cunning as the very serpent! The more wary your takeable trout is, the better the genuine angler likes him—that is, so long as he is not quite wary enough to prevent the said genuine angler from taking an endect basket-full home.

G. T. GROVES.

FISHING IN NORFOLK.—Messrs. G. Yarde and H. Wilson continue to get fair sport in the neighbourhood of Martham. In addition to the 3½ lb. perch Mr. Yarde has secured, a fine pike of 16 lb., also taken spinning, and both anglers have had many other smaller fish—perch and jack. They find the King's Head Inn at Martham a comfortable place to stay at; board, lodging and attendance, good; charges, moderate.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

FISHING ON THE RIBBLE AND HODDER.

MR. W. RAMSBOTTOM, of 24, South John Street, Liverpool, the well-known pisciculturist, sends us the following account of his last week's sport on the Ribble and the Hodder:—Many of your readers will be pleased to learn that there is now good fishing to be had on the Ribble and Hodder. On Saturday week I went out on the Hodder at 4 p.m., and fished up to 10.30 p.m., and killed fourteen sea trout and eight brown trout. On the Monday I again went to work, and killed seventeen sea trout and sixteen brown trout. On Tuesday, at 11 a.m., I turned out on the Ribble for salmon fishing, but luck appeared to be against me. The first pool I fished I raised one salmon but could not hook it. In the next pool I raised other two salmon, but neither of them got hold, and after trying them over several times with change of flies, I left them to the next fisher, who might be more fortunate. At the next pool I was still more unfortunate. After fishing the pool over with the fly, I thought I would try the spoon bait. I had not thrown more than six times before I had hold of one, and out flew a new-run fish not less than 20 lb., but, sad to relate, the next run of the fish up flew my line, and away it went with three yards of single gut and one yard of twisted. There is no doubt when changing my fly for the spoon I trod on the line with the irons which are on my fishing clogs. After this I began to feel—well, many of my fishing friends will know how, having felt the same.

The next pool I pricked another, but only just felt it, but sufficient to prevent it from coming a second time. I then fished the pools back again, and in the last pool I hooked one, and for about twenty minutes I thought I had got hold of a monster. At the first run it took out 90 yards of line, and kept boring away on the far side of the river. For a long time I began to think I should never get it, but at last it gave way, and I was not much surprised to find I had hooked him by the back fin. When I saw the size of the fish, I brought him to the side, when a brother piscator who was with me attempted to gaff it. I say attempted, for he made a stroke at it, and only succeeded in frightening it, and off he went again. After some time I again brought it to the side, and cautioning my friend not to touch my line, he made a second attempt, struck the gaff into the tail of the fish, but with such force that the hook broke in the fish, and when my friend found that he had nothing but the handle of the gaff in his hand, his cry was 'It's gone!' and with that he rushed to try and get hold of it with his hands. But luckily for himself and me the fish was too quick for him, and in an instant it was fifty yards away. Had he broken my line with his bungling, I should have put down my rod and thrown him in, for I had got in that frame of mind with my bad luck that I should not have counted myself answerable for my actions. A third time I got it to the side, and this time it was safely landed, after a splendid run. It drew the scale at 16 lb. I now felt quite satisfied with my day's sport.

On Wednesday I killed one more, and hooked another and got it to the gaff, when the hook in the fish broke. I made a rush at the fish and struck at it with the butt of my rod, and then with my foot, but only succeeded in breaking the handle of my reel off, which put a stop to any more fishing that day.

I may just say before closing, that this fishing can be had within two hours' ride of Liverpool. You can take the 9 express from Exchange Station to Blackburn, which will run you down in an hour; then drive six miles to the De Tabley Arms Hotel, Rochester, where you are on your fishing ground. There is a salmon pool within 30 yards off the house, where I have killed many a good salmon. The house is well kept and very reasonable, and where you can get a ticket for fishing which costs you nothing. Any gentleman going over from now to the 1st of November may expect to meet with good sport if the weather be favourable.—*Liverpool Courier*.

THE FISH SUPPLY FROM THE THAMES.

IN 1828 a Mr. Goldham was the clerk or yeoman of Billingsgate Market. He stated before a Parliamentary Committee that in 1798 four hundred fishermen, each of whom was the owner of a boat, and employed a boy, obtained a good livelihood by the exercise of their craft between Deptford and London, above and below Bridge, taking roach, plaice, smelts, flounders, salmon, shad, eels, gudgeon, dace, soles, &c. So late as 1810 he had known instances of as many as ten salmon and 3000 smelts being taken at one haul up the river towards Wandsworth; and 50,000 smelts were brought daily to Billingsgate, and not fewer than 3000 Thames salmon in the season. Some of the boats earned £6 a week, and salmon was sold at from 3s. to 4s. a pound. Before the time this evidence was given this considerable Thames fishery has been all but entirely destroyed. Before the same tribunal masters of certain Dutch eel-ships stated that a few years before they could bring their eels alive in wells as far up the river as Galleon's Reach, a little way below Woolwich; but now (1828) they were obliged to stop at Erith, and thus had sustained serious losses from the noxious character of the water, which destroyed the fish. The increase of gas-works and of manufactories of various sorts, as well as of the matters discharged from the sewers, were the causes producing this result.—*City Press*.

THE NATIONAL FISHERIES EXHIBITION, 1881.—At a meeting of the General Committee recently held at Mr. Howard Taylor's office, Norwich, it was resolved that the surplus receipts should be devoted to objects connected with fishing and fishermen, and the following grants were made:—Norfolk and Suffolk Fish Acclimatisation Society (in whose aid the exhibition was inaugurated), £400; International Fisheries Exhibition, 1883, £200; £50 each to the societies for the preservation of the Yare, the Bure, and the Waveney; £20 each to the societies for the preservation of the Thet and the Ant; the Royal National Lifeboat Institution, £25; the Shipwrecked Mariners' Society, £25. The balance, £160, was reserved for the present.

EELS!

Concluded from page 469.

OF course eel culture is not to be pursued as one pursues the culture of trout. It is quite impossible to take the spawn-laden fish—even if it were easily recognized and readily captured—and artificially to express the ova and milt, and so complete the process of fertilization, as in the case of most other fishes. A pig with a greased tail is easier to hold by its caudal appendage, than is a healthy eel, and the reproduction of these fishes must therefore be left to nature, so far as the actual generative act is concerned. Nature can, however, be guided, and rendered subservient to a preconceived plan, and I am not quite sure that, in so far as our Isles are concerned, such governance will not be found the most expedient course in regard to even the *Salmonidæ*. But this admits of argument, though Mr. Buckland strongly favoured the idea in his late years.

The precise method to be adopted in individual cases cannot be determined here. Certain general rules for the guidance of intending eel-culturists can, nevertheless, be recalled with advantage. First and foremost, let the fact that the eel is a remarkably clean feeder be borne in mind. The suggestion that eels will devour human remains, which has been from time to time made and credited, probably originated with the undoubted fact that congers will do so. But there is absolutely no instance on record of such voracity in respect of the well-known fresh-water fish. I do not, of course, positively declare that such a thing has never occurred, because fresh human flesh is probably as palatable as fresh meat of any kind, but its rapid decomposition, together with its enwrapped condition—in a drowned person—renders such a repulsive conclusion extremely unlikely. Of fresh-cut offal of the purer sort, they must, however, be said to be extremely fond, and farinaceous food, such as oatmeal mixed with blood, is an extremely relished food for the eel, of a very fattening character. Mud, laden with sulphurated hydrogen, arising from decayed vegetation, render the fish of a very insipid, and even injurious quality.

A model eel-pond should be either paved with concrete, or puddled very hard with brick-maker's clay, over which a layer of gravel, free from sand, has been strewn, to the depth of say, six or eight inches.

In order to impress the importance of a clean receptacle for eels intended to be fostered for the table, let me mention one very certain fact, which applies also in a lesser degree to all fishes. The eel has the power of absorption very strongly developed, and I have by direct experiment convinced myself that the colour of the flesh and its flavour are as much influenced by colouring matters and pronounced by flavoured essences as is the colour of the silkworm's silk, which is fed on cochineal and mulberry leaves. It is said that the tumeric in the curries so inveterately eaten by Europeans in India, causes in great part the peculiar yellow hue of the skin of an Anglo-Indian, and I know that certain essential oils have the positive power of adding a strong tint to the eel, both to taste and smell.

To the aqua-culturist who is desirous of practically experimenting in the growing of eels, I would offer the advice that he select his stock from the captures of live eel fare so abundantly made on some of our tidal rivers—the Severn, for example, near Worcester. He would thus obtain them very young, and all about of a size, and he might very easily, in limited quarters, watch the gradual progress of their growth and general development, to the probable discovery of some very interesting facts of their natural history.

Of course, it need scarcely be said that no other fish, save minnows or very young fry should be introduced into any stream containing eels, and these ought not to be put in till the fish are of sufficient size to comfortably feed on them. The fresh-water shrimp and the larvæ of many insects, are to be sedulously encouraged, and a meal of fresh-shredded horse-flesh mixed with meal, or of worms turned in whole, ought to form the pabulum of the food necessary for rapid growth.

Personally, I am at present quite unable to practice what I preach, but from experience in the feeding and cleaning of eels in the past, I am sure what I have hinted at can be done. At any rate, I don't see why such a delicious and nourishing fish should not be nurtured and preserved with some of the intelligence we are devoting to the culture of the *Salmonidæ*.

J. HARRINGTON KEENE.

THE PISCATORIAL SOCIETY.

THERE was a grand show of roach in the club-room, Ashley's Hotel, Covent Garden, on Monday evening last. Mr. T. R. Sachs and Mr. James Pattison—two of our best roach-fishers,

weighed in from the Hampshire Avon as their joint take 60 lb. weight of splendid roach, the three largest weighing 4 lb., and 4 lb. of dace. The anglers were warmly applauded by those present, and their healths drank in good style. It has been arranged for the second roach competition to take place on the 7th of November, the first prize being four guineas, the second prize three guineas, and one guinea for the best fish. As the members on this occasion will be permitted to fish in any public water, it is expected, if the weather and water is right, there will be a large exhibition of fish on the return of the competitors. The pike competition takes place on Monday week, and it is limited to the Thames. The Annual Supper, which always follows the pike contest, will come off on the following Monday, October 24th, in the club-room. There can be no doubt the new proprietor will do his best on the occasion, as he has already gained the good opinions of the members, who will be quite ready to appreciate his well-known talents as a caterer, on this, the first opportunity afforded him of giving satisfactory proof. B.

THE "FISHING GAZETTE" TOURNAMENT.

(In Aid of the Funds of the Anglers' Benevolent Society.)

AFTER seeing our note in last week's paper asking if any of our friends could suggest a good place for holding the fly and bait-casting tournament, Mr. Wheldon called on us and suggested that Mr. Warner's Fishery at the Welsh Harp, Hendon, would be as good a place as could be found. Other friends have since suggested the same place, and we think that, on the whole, it offers greater facilities than any other. It is close to town, accessible by rail from all parts. We have written to Mr. Warner, and feel sure he will give us every assistance in his power. If nothing prevents, we propose to fix Saturday, the 22nd of this month, that is next Saturday week, as the day for holding the affair. A notice will be sent to all angling clubs, and as the tournament promises to be a very interesting one, and is solely for the benefit of the Anglers' Benevolent Society, we sincerely hope it will be well supported by anglers. Club secretaries will aid us greatly if they will call special attention to it at their meetings. Messrs. Geen, Hoole, Keen, Ghurney, Bonvoisin, Morgan, &c., have kindly promised every assistance, and so has Mr. J. Spreckley, president of the Thames Angling Preservation Society, that Mr. W. H. Brougham will do so goes without saying—he always comes to the front in affairs of this kind. Many prizes have already been promised, and we doubt not others will be forthcoming. Some professional fishermen will, we expect be present, both from Thames and Trent, and we think that an opportunity of seeing what splendid casts can be made both in the Thames and Trent styles will be eagerly seized by all anglers who can possibly attend. The expenses and time of professional fishermen will be paid, and we shall be glad to have the names of any who will attend. Further particulars will appear next week, and any one wanting information should write to the Editor of this paper, 12, Fetter Lane, London.

Any anglers, angling clubs, or fishing tackle makers, who will be liberal enough to give prizes of any kind, are also invited to write to the Editor as soon as possible. Due acknowledgment of such liberality will be made in the GAZETTE.

UNFORTUNATE ANGLERS.

I HAVE been an angler on the river Thames for nearly thirty years, and officially connected with it for over two-thirds of that period of time. Death has made great inroads amongst many of my friends whom I knew thirty years ago, and whose memory will always live in my recollection. I may mention Messrs. W. H. Whitehead, Henry Farnell, H. D. Dean, John Johnson, G. T. Parson, Robert Hardwicke, R. M. Smyth, W. Withall, T. Sheaton, Stephen Ponder, Frank Buckland, H. L. Rolfe, &c. They have all wetted their last line and gone, it is hoped, to the better home above. These thoughts occurred to me on my way from Chertsey last Saturday, when the idea of an article on "Unfortunate Anglers" entered into my mind, and the reason I can give for this is that one of them to whom I shall presently refer was a true type of the class. There are to my notion two characters of anglers, which may be described as "Fortunate Anglers" and "Unfortunate Anglers," as well as two other classes "Good Anglers" and "Bad Anglers." Now, it is the "Unfortunate Anglers" I want to speak about this week, and I am frequently brought in contact with them, especially amongst a type of "Grumbling Anglers," although the one I am going to allude to was not by any means a grumbler, he felt it was not his fate to be lucky in angling. In this world we have men possessed

of a great variety of temperaments—some are easily discouraged, others are disheartened, and plenty cannot surmount a difficulty. I have heard men exclaim, after two or three unfavourable days on the river: "There is no fish in the Thames now—the water is literally fished out!" and yet there are those who are frequently recording exploits that would prove the reverse. The late Mr. R. M. Smyth was an ardent angler, and one of the most genial of men—a thorough English gentleman—and up to the time of his death a member of the Committee of the Thames Angling Preservation Society. His remark in connection with fish was this, "It will never be my good fortune to have a day's good fishing." He used to try hard for it with his favourite fisherman, Fulker, of Sunbury. He has been with the famous Nottingham George, amongst the barbel swims. I am not going to speak about barbel, as I believe with my friend Mr. Keene, that fish has been literally fished out in the swims of the FISHING GAZETTE this season; but all I want to say is that even with those he could never make a good day. I did think he had a chance once. I invited him to have a day's perch fishing with me at Hampton when those fish were known to be on the feed, and he eagerly accepted the invitation. I made arrangements with William Milbourne, one of the best fishermen on the Thames, to let me know when there was a good chance, and the time did come. It was arranged that we should go to Hampton by a train reaching there at nine o'clock in the morning, but the day before my good friend, from a business engagement, found he would be unable to get to the swim before half-past ten, and begged that I would commence at the time originally fixed upon. I did not care about doing this, but he would have no nay in the matter, and I accordingly went to Hampton, where I found William Milbourne with his punt, waiting for us at the ferry opposite the Bell Hotel, the birthplace of the Thames Angling Preservation Society; and the house being noted for "good malt," I had very little difficulty in persuading Milbourne to have a taste. We were not long in getting to the swim in front of "Platt's ait," and as quickly got amongst the perch, catching them with the paternoster two at a time, and really good fish. We were just in the midst of the capital sport, when Mr. Smyth appeared in sight, coming towards us in a small rowing-boat, and myself ready to greet him on the coming prospects. On getting into the punt I informed him of our success in having in the hour landed four dozen fish. He was delighted, and it was not long before Milbourne rigged out his fishing tackle, whilst I was still getting the perch on my paternoster. It was a most remarkable circumstance, the moment he commenced fishing, the fish discontinued to bite, although we persistently tried for some time. "My old bad luck still continues," he exclaimed with a smile. There was no anger, no grumbling in the expression. The anxious fisherman then determined to change the swim, and in spite of this, and other changes in various places up to the "white pile," the fates were against him. The addition to the four dozen at the end of the day was only eighteen fish, making a total of thirty-three brace. I told him I did not want to take back with me a single fish, and he willingly accepted the entire take, as it would be a surprise to his amiable wife and daughters when he arrived home. When I saw him again, a few days afterwards, he related to me what he did, and I will give it in nearly his own words: "On my arrival home one of the servants came to the door—I gave her the fish, and told her to place them all nicely in a tray, and bring them into the drawing-room when I rang the bell. I then joined my wife and daughter, the former saying, 'Well, Robin, I suppose the same old luck.' 'Yes, my dear,' I replied, and I was then asked to let them see what I had really done. I rang the bell, and when the servant came in with the large tray of fish, the scene is better imagined than described—they were delighted enough, and soon sent some of the fish round to our neighbours, who gladly accepted them." The late Mr. R. M. Smyth was not only a true example of an "Unfortunate Angler," but he bore his bad fortune with exemplary patience, and that is not the case with all of that class. I remember an angler some years ago who was an "Unfortunate Angler," and he gave up fishing altogether—withdrew his support to the protection of the Thames, and I do not think he has fished in it since. Now, there are two important qualifications, as a rule, to make good and successful anglers, and those are patience and perseverance, but as there is "no rule without an exception," it was not so with the late Mr. Smyth—he possessed both patience and perseverance, and therefore he must have been a naturally "Unfortunate Angler." Still, my maxim is, persevere. I would encourage all "Unfortunate Anglers" to perseverance. There is an old saying, "It is a long lane that has never a turning," and I thoroughly believe in it. I also believe, with most men, there is a time in their life "Which, taken at the tide, leads on to fortune." Let these maxims be perseveringly studied by "Unfortunate Anglers," and patiently wait the happy issue.

B.

CLUB AND OTHER JOTTINGS.

By L. B.

THE monthly meeting of the West Central Association was held at the Portman Arms, Great Quebec Street, on Friday evening, September 16th, Messrs. Bonvoisin and Beckett occupying the chair and vice-chair respectively. After the minutes of the previous meeting had been read and confirmed, two new Angling Societies, viz., the Acton and Ealing and the Peckham Perseverance, each numbering already upwards of a score of members, were enrolled on the books of the Association.

Mr. Hoole then read the minutes of the last meeting of the Association Working Committee. By these it appeared that he had been empowered to write to Captain Etheridge, warmly thanking him on behalf of the thousands of anglers—whom the Association represents—for the prompt action taken by him to frustrate the intended netting of the Thames by a person named Phillips, residing near Abingdon, who had hired a well-known gang of Oxford netters to do the job. In consequence of complaints of members of angling societies lending their tickets to their friends, the Committee have authorised the printing and circulating of the following notice:—

"West Central Association of London and Provincial Angling Societies. Important Notice.—It has been reported that certain anglers are in the habit of lending their privilege cards to their friends for the purpose of obtaining the anglers' cheap tickets. Complaint is also made that cheap tickets are obtained for certain stations, the anglers travelling to some other station to which the concession is not granted, and there tendering the difference in fare. The Committee beg to remind their members that gaining these grand concessions has cost a very great deal of time, trouble and expense; and that infractions of our agreement with the different railway companies, if not stopped at once, will lead to the withdrawal of the concessions altogether, therefore the Committee have determined to prosecute any member detected infringing the rules of the Association.

"It must be distinctly understood that under no pretence whatever is a member allowed to lend his card to another person, not even to a fellow member, and further be it understood, the tickets are only available at the stations named upon them, if presented at any other they will be cancelled, and the full ordinary fare charged from the starting point.

"The booking clerks have strict instructions to detain any privilege card presented by two persons, and they are not permitted to issue two tickets to one person unless two privilege cards be presented; if any abuse of the privilege be detected, the case will be reported at once.

"A reward will be paid to any person or persons giving such information as shall lead to the conviction of any member or members infringing these rules. The Committee are determined to put a stop to practices that jeopardise the great boon enjoyed by nearly 10,000 anglers.

"Secretaries are particularly requested to read the rules (printed upon the back of the privilege card) to each member before handing it over.

"All communications to be addressed T. HOOLE, hon sec., Mortlake, S.W."

In several cases reported to them by the London and South-Western Railway Company, where tickets had been lent to friends, or to brother members, the Committee deemed it expedient in the interests of the many, and in strict accordance with the terms printed upon the back of the card, to cancel the tickets, and expel the offenders from the Association. The action taken by the Committee met, it is almost needless to say, with the unanimous approval of the general meeting. An auditor was then elected for the Anglers' Benevolent Society. Mr. Crumplen, Hon. Sec., Gresham Angling Society, was elected to serve on the Committee of the Anglers' Benevolent. Some routine business was then gone through, and a vote of thanks to the chair and vice-chair closed the meeting.

Since the above I regret to add that two other cases of lending privilege tickets have been reported by the South-Western Railway Company—one has been considered by the Committee the offence admitted, and the offender been treated as in previous cases—the other remains to be investigated by the Committee on Friday evening next. The whole thing is getting serious, and it is to be hoped the publicity given to it in the GAZETTE and other papers together, with the notices which have been sent to every club, tackle shop, &c., will open the anglers' eyes to the serious nature of the offence some of them are committing, often from sheer want of thought.

From the Thames, at Chertsey, Haslett, has lately been having good sport, as may be judged from some of the following items: Fishing at the Weir, with Mr. Allen, 27 bream, weighing 75 lb.; with Mr. Godwin, 7 bream, 22 lb.; next day with same gentleman, 5 bream, 18 lb. and one perch; four hours with Mr. Allen, 3 bream, 9 lb.; 2 barbel, 7 lb.; and perch. Since the cold wind has set in, Haslett writes "my report is not very good, but I suppose with this cold north wind blowing, that will be a general cry. Three days fishing, 13 bream, and 1 barbel 3 lb.; best bream, 5 lb.

On Friday the wind veered round to its present wintry quarter; on Saturday, Mr. P. Geen, who lives at Addlestone, near Chertsey, had the double pleasure of entertaining Mr. Thomas Spreckley as guest, and afterwards of piloting him to a good take of barbel, &c., estimated at over 30 lb. While Mr. Spreckley was playing the first good fish, Mr. Geen who was waiting with the landing-net ready, noticed the spare rod all but overboard owing to the violent tugging of another leather-nosed gentleman, of course, he dropped the net and seized the rod, but unfortunately the net fell outside the punt and went swirling down stream. Of course, to unmoor, drop down, and fish for it would

in all probability have meant spoiling the swim for the rest of the day, so all the fish were landed by Mr. Geen, who never fishes himself when he has a friend down (with his hands). Some good bream and jack have, I hear, been taken lower down the river, about Walton. The bank-fishing in the Upper Thames is about as bad this year as possible, owing, of course, to the extreme lowness and brightness of the water. Twelve members of the North Western fished at Pangbourne on the 2nd, for a series of prizes. Several of the competitors never had a bite all day, and the prizes were in nearly all cases taken with one or two fish. Mr. Secretary Hill would surely have secured one of these trophies had he not left his spectacles at home.

The painting kindly promised by Mr. Greville Fennell is finished, and will be handed over to the committee of the Angler's Benevolent shortly.

For giving all possible particulars as to baits and tackle, &c., used to secure the good takes of fish that come under my notice, I have been severely talked to by several gentlemen who honour me with their friendship, and who have hinted that unless I mend my ways in this respect, the usual weekly notes will not be forthcoming. Now, the very fact of a few selfish individuals objecting to their being published has proved to me clearly that these particulars are of some use to the many. So by way of answer and just to show I am past reforming in this respect, I this week send our editor a short article about Elstree reservoir which I have striven to make as practically useful as possible.

The monthly meeting of the United London Anglers' Central Committee took place on Monday evening, 3rd, at the Baldhead Stag, Worship Square, Finsbury, Mr. S. Morgan presiding. After the reading and confirming of the minutes of the previous meeting, Mr. R. Ghurney, the secretary, said that now the excursion season was nearly over, he thought the time had arrived when the Great Eastern Railway Company might be asked to receive a deputation concerning the granting of further privileges on their line. A list of stations being then read, the meeting approved of this course, and Mr. Hoole and Mr. Ghurney are to arrange further, so that the application may come jointly from both associations. Mr. Ghurney made a few remarks on the complaints from the South-Western Railway, and a notice similar to the above (excepting, of course, heading and signature) was distributed by him to the delegates present. Mr. Ghurney then announced the retirement of Mr. Herbert Poole from the post of trustee to the association, owing to the state of his health, which was such as to interfere with his discharging the duties of the office, simple as they were. Mr. Poole has filled the office for many years, and it was with regret the delegates heard of his retirement, the secretary being unanimously empowered to write and forward him a hearty vote of thanks and sympathy. Mr. Manning was then duly elected to replace Mr. Poole as trustee. In the place of Mr. Bick, resigned, Mr. Phillips, of the Great Northern Brothers, was elected to be one of the river Lea bailiffs (subject, of course, to the Conservancy's approval). The distribution of several prizes won at the recent delegates' competition at the Rye House, and a vote of thanks to the chairman terminated the proceedings.

From the Lea the reports are very meagre indeed. From the Fish and Eels, Broxbourne, a few jack, taken by the members of the "United Anglers," who rent the water—or rather, I should say, the land. One or two takes of roach from "Ye Olde Rye House," and at St. Margaret's, anglers nearly as thick as the oft-quoted "leaves in Vallambrosa," or anywhere where there are trees, for the matter of that just now. At Ware, some good creels of dace have been made and—"tell it not in Gath"—a trout of 4 lb. Was it returned? Well, I don't know. My correspondent asks the same question, then adds, significantly, "Perhaps it bled too much." From Broxbourne, a few good fish; but they wanted a lot of coaxing.

Another legal fight on at Waltham. The Government ask for time (? is this a sign of weakness). Hearing adjourned for a fortnight.

From the Stort, plenty of fish (roach), but alas! for the quality.

The Society of Caxtonian Anglers, the Falcon, Gough Square, have their house warming on Friday evening next, of which I hope to say a few words in my notes next week.

Mr. Lancaster showed me, the other evening, the 4 lb. perch taken in Northampton reservoir. It has been capitally set up, and will be exhibited for some time at Mr. Gee's the fishing tackle maker, of St. Andrew Street, Bloomsbury.

Bitter complaints from the present proprietor of that portion of the Colne at Wraysbury lately known as "Heath's water."

The filth from the paper mill is said to be poisoning all the fish. Many years ago, the same complaint was made, and not without reason, as in one day two large cart loads of dead fish were taken away. And after the pellet of white paste on the hook had been immersed a little while, it would, if withdrawn, be found covered with a thin coating of this stuff.

I have the above on the authority of Mr. P. Geen, than whom no man knows the water better.

I suppose things mended after a row had been made. Now they are apparently as bad again. All this goes into the Thames, be it remembered, and above the intakes of the several water companies. What do the Conservators intend doing?

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

ANSWERS TO CORRESPONDENTS.

W. WARD.—Try the Welsh Harp, or Elstree Reservoir, or Dagenham Reach.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

THE TURN OF THE TIDE.

SIR,—While waiting for the turn of the tide, I am always seeking for a reason to account for the fish not biting during the flood and rise of tide. Directly it is flood, not only does a loss of appetite appear among the fish, but also a change of position, for they are seen in hundreds jumping about on the top of the water, while before the flood they were biting well close to the bottom. That they will not bite again till the fall of the tide I am quite satisfied, as I have tried with all kinds of bait at different depths, but always with the same unsatisfactory result. While fishing with one of Mr. Perrin's obliging men at Twickenham last Friday, in answer to my question as to whether he had yet solved the difficulty; he replied as follows:—

"Well, sir, I have been thinking it over ever since you were last here, and I come to the conclusion that the fish at flood time are just like a lot of children let out from school. They have been hard at work for twelve hours, swimming against the stream, picking up their living, and when there is no stream to fight against, they take it out in a holiday, jumping for joy."

Well, I think there may be a good deal in this; but still, the quiet stream during flood does not last more than twenty minutes at most, while it is not until the fall of the tide—quite two hours after—that the fish will again feed.

I am referring, of course to the tidal waters of the Thames; but whether other rivers have the same peculiarities, I am unable to say.

If, Mr. Editor, you can furnish me with the information I seek, I shall indeed be grateful. Should you, however, at the moment, not have the necessary news at your fingers' ends, if you will kindly allow this letter to appear in your paper to solicit an answer from some of your numerous readers, I shall feel quite obliged.—I am, &c.,
A CONSTANT READER.

London, Oct. 1.

[We have noticed on the Yare that the fish do not bite quite so well when the tide is turning. We fancy it is because they are, so to speak, all "at sea" until they feel the stream on them again. At slack water they must be swimming about in every direction, like pond fish, and the uncertainty may create slight fear, which would account for their not biting. Perhaps the bottom of the Thames gets stirred up and sickens them a little—but we give it up, and wait to hear what Mr. Keene has to say.—ED.]

MINNOW TRAP.

SIR,—I have "Burgess'" shilling book on angling, and at page 29, chapter 12, is shown a figure of a bottle cut diagonally from the bottom, which is sunk in a stream as a minnow trap. Can any of your readers say where these bottles may be obtained?—I am, &c.,
J. A. KELLY.
2, St. Anne's Terrace, Exeter.
Oct. 4th, 1881.

A TEN POUND PERCH!

DEAR SIR,—I have pleasure in forwarding a description of what seems to me a curiosity, as an extraordinary sized perch, which I saw in the comfortable smoke-room at Host Gregory's, The Cross Guns, King's Heath, Birmingham (one of your numerous correspondents). It is well preserved, looking like life. Length, 27 inches; girth, 18 inches; weight 10½ lb., caught in Burton Broads about ten years since.

To any of your readers who may happen to be in the neighbourhood of King's Heath, it would be worth a visit to see the monster.—I am, &c.,
Eliza Cottage, Chandos Road, Stratford, E.
P. F. DAVIS.
October 4th, 1881.

[What a whacker!—ED.]

HOW TO PRESERVE AND WHERE TO GET WASP GRUBS.

SIR,—If "Angler" will take the grubs that are covered out of the cake alive, and place them in a bottle containing pure Scotch whiskey, he will find that he can preserve them for a long period if he keeps the bottle air-tight. I saw some a few days ago that were perfectly white and fresh, although they had been five years in a bottle.—I am, &c.,
J. W. M.

[We hope "Pixie" will let Mr. J. Haydon, of Coleman Street, Camberwell, know this. Mr. Haydon supplies wasp grubs we believe.—ED.]

THE BRUNDALL FISHERY STATION ON THE YARE.

SIR,—Having noticed with much pleasure the accounts of the formation of the above in your issues of the last two weeks, I should like to take this opportunity of congratulating the promoters of the scheme upon their undertaking. Well knowing the spot, I am certain that it must repay them for their outlay.

It is a want that has been felt for some time past, and one that ought to meet with the approbation of all.

Many can testify to the inconveniences they now experience at the various houses on the river, where boats &c. are kept, and also to the bad arrangements usually met with.

I trust the idea will go on and prosper, and hope before long to be allowed to become a shareholder.

I therefore wish Messrs. Flowers and Co. may have the support of all, as I am certain they deserve it.—I am &c.,
WALTER HAMMOND.
Victory Angling Club, Norwich.

THE RIVER WEY.

SIR,—Having for some time past an inclination to try the above river, which was further strengthened on reading the letter of your correspondent in last week's issue, I took train from Charing Cross to Shalford, which lies between Guildford and Godalming.

On reaching the village I found the water (owing in some measure to a recent rainfall) the colour of coffee, and clouded here and there with a sort of milky soap.

I noticed, moreover, numerous particles of mysterious brown matter being brought down by the stream, the nature of which I was more intimately acquainted with further on. The prospect was not good, and in ordinary circumstances I should have turned back, but when one has travelled forty miles to fish a water it is hard to go back without wetting a line; so, hoping, as it were, against hope, I got into a boat at the wharf, and pulled up stream towards the Flour Mill's. The bloated body of a dead dog detained in the stream by an overhanging willow did not inspire, nor was I subsequently cheered by passing a deceased kitten on an aquatic expedition.

On arriving at the junction of the mill stream with the navigation cut, I tied up the boat and cast out a leger in the hope of tempting some of the large bream the river was said to contain. Finding a peculiar motion on the line I drew it up, when, to my horror, the gut trace was a perfect necklace of filth; at every joint of the gut was a slimy substance from the size of a pea to that of a walnut, even the maiden lob at the end was soiled with this sewage compound. Having with difficulty cleared the line, for the nasty stuff adhered most tenaciously to it, I threw in again and again, but always with the same result, until, in disgust, I gave it up altogether, and took to float-fishing. But that turned out no better, for my nice white bunch of gentles came up covered with mud, and each shot was the nucleus of a mass of filth. The water now beginning to drop disclosed shoals of black mud and roots of trees covered with slime, which, becoming offensive to the nose, fairly drove me away, and I fled home by an earlier train than I originally intended, a wiser and a sadder man.—I am, &c.,
A THAMES ANGLER.

Sept. 27.
[Advice to anglers who do not know the Wey: keep a-wey!—ED.]

THAMES PRESERVATION SOCIETY.

SIR,—Being an ardent angler, and holding office in two societies, numbering over one hundred members, I trust you will spare a small corner in your valuable paper for these few lines. I have heard on several occasions that Richmond is fished out; my late takes at that beautiful spot proves the contrary. I am afraid, however, unless the members of angling societies raise their voices, it will soon be "netted" out. At my frequent visits of this season it has been proved to me that men (not anglers) with boats and nets are in the habit of getting large quantities of fish at night, and I think this unlawful practice should be put a stop to. How is it to be done? The solitary river-keeper has no power to prevent it; single-handed, he cannot do it. Why is he not provided with assistants, as I believe he used to be? Surely, the practice being an illegal one, there should be better protection for the river than a solitary man, and some means taken to prosecute the poachers.

Trusting some more able pen than mine will take the matter up,—I am, &c.,
J. BOALCH, sec., Walworth Waltonians.
203, Old Kent Road.

CANTLEY FOR ROACH.

SIR,—My object in writing is to let your readers know where really good roach fishing may be obtained, if they happen to be staying either at Yarmouth or Lowestoft. I went out one day this week with J. Burroughs, of Lowestoft, and in three hours we had the pleasure of taking forty-two roach in splendid condition. The average weight was 10 ozs., the heaviest being 12 ozs.

Cantley station is within five minutes of the river, and on the river's bank is an hostelry, where the angler is treated well, I can strongly recommend Burroughs, whose address is 25, Chapel-street, Lowestoft. His charge is moderate. He is very attentive and a genuine lover of the rod.—I am &c.,
J. BATTERBURY.

LIVE BAIT FOR JACK.

SIR,—Owing to the report under the heading of "the Richmond Piscatorial Society" that there is no live bait to be had anywhere, we beg to say that, having had a stock in, we have been able to supply jack fishers with live bait for the past fortnight. Any of the London anglers requiring bait should send to
GAYNOR AND SON,
Fishing Tackle Makers,
10, Royal Terrace, Richmond, Surrey.

A ROD FOUND.

On Sunday night I found a rod, &c., on the platform of Peckham Rye Station, London, Chatham and Dover Railway. I handed it to one of the officials to take to the cloak room.—Yours, &c.,
E. FRENCH.
October 4.

CLUB REPORTS.

AMICABLE BROTHERS ANGLING SOCIETY.

STOLEN

From the club-room of the above society on Tuesday, September 27, a fine specimen of a preserved bleak, in a square case, formerly the property of the late William Batho (whose name is in the case), and was caught in the river Mole. A reward of ros. will be paid on the recovery of the fish, and the conviction of the thief or thieves.—T. WORLEDGE.

ANCHOR AND HOPE ANGLING SOCIETY.

Sept. 28th, quarterly night. Distribution of prizes: R. Smith, a cup presented by Mr. A. Shakel; C. Daniels, a cup, presented by Mr. A. West; A. Glass, two prizes, a lamp, presented by Mr. Hall, and teapot, presented by the worthy host; A. Shakel, two prizes, a silver mustard pot, and dinner service, presented by Mr. W. Streeton; W. Streeton, two prizes, a pair of pictures, presented by Mr. B. C. Booth, and carving knife and fork, presented by Mr. Glass; A. Bowling, two prizes, a shade of fruit, presented by Mr. Timkins, and set of tea trays; Mr. Pierneccini, a cup, presented by Mr. W. Streeton; H. Scott, a walking-stick, presented by Mr. Marks; Mr. Hall, a set of hot-water jugs; B. C. Booth, a lamp, presented by Mr. D. Lestan. On Sunday, October 2nd, several members weighed-in. R. Smith, bream; H. Scott, bream; W. Streeton, roach; A. Shakel, roach and dace.—A. SHAKEL.
Oct. 5, 1881.

ANGLERS PRIDE ANGLING SOCIETY.

The members of the above club went to Boxmoor on Sunday last to fish for three valuable prizes, with the following result:—T. Fiddes first, W. Dawe

second, H. Mallett third; T. Wall, W. Hayes, J. Jones, J. Soah, J. Deeley jun., J. Deeley, sen., H. Hines, and E. Austin also weighed in fish.—T. MAR SHALL, sec.

Oct. 4th.

BRIGHTON ANGLERS ASSOCIATION.

The competition of the 2nd of October came off very satisfactory, all prizes were taken. Mr. Olive first, with roach; Mr. Anscombe, second with roach; Mr. Heathorn, third with roach; Mr. Coop, fourth with roach; and Mr. Cardy, fifth with roach and dace. Mr. Croskey went to the Adur and banked a carp, 4 lb. 13 oz., also breaking away with two more larger fish. The prizes taken on the 18th of September were distributed among the winners, and a good sprinkle of donations came to hand for ensuing competitions. The waters in the Ouse and Adur are getting in a good condition; cold wind from the west.—GROUND BAIT.

CITY OF LONDON ANGLING SOCIETY.

On Sunday, Oct. 2, our members fished a pegged-down match for seven prizes in the Stort, near Roydon station. The takes were small, owing to the water having been drawn down a few days before. Mr. Mortimer, first; Mr. J. Chambers, second; Mr. Perry, third; Mr. Payne, fourth; Mr. Hales, fifth; Mr. Hobbs, sixth; and Mr. Mark, seventh. A quarter of an ounce only between first and second. Messrs. Hatfield, Fowler, Castell, P. Parkin, and Blackwell also had fish.—CAS.

CLUB MATCH.

A match was arranged on Wednesday at the Swan, Old Kent Road, to be fished in the River Lee on the 16th inst., between Mr. George Taylor, of the Friendly Citizens, and Mr. R. Smith of the Anchor and Hope, for the greatest weight of fish taken on that day, with one rod and line, to be pegged down, and change swims every two hours, for a stake of £3.—GEORGE G. TAYLOR.

DALSTON ANGLING SOCIETY.

Several of our members were out on Sunday, October 2, when a very nice show of roach, perch and dace was placed on the trays by Messrs. Bunn, Nunn, Venour, Eagles, Slade and Fortescue.—S. MALBY, sec.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

We had a poor show of fish on Sunday last, Mr. Theobald having the heaviest weight, 5 lb. 5 oz. of roach from the Wey. Mr. Parkin, 3 lb. 15 oz.; Messrs. J. A. and J. K. Fitch also had roach and dace from the Wey. Messrs. Reynolds, Young, Baker, and Stanmer, roach from the Colne. W. Watling and J. Warren roach from the Thames. The next Central Association return visit will be paid to the above society on Tuesday, Oct. 10th.—J. A. FITCH, jun., sec.
Oct. 4.

GRESHAM ANGLING SOCIETY.

The first meeting of this society, in their new rooms at the City of London Tavern, 11, Bishopgate Street Within, on Thursday evening, was highly successful, and their large meeting room was crowded. Mr. C. S. Bentley in the chair. Mr. Brougham, representing the Thames Angling Preservation Society, was present, and after some remarks by the chairman and others, made an effective speech on behalf of that association, his remarks being heartily endorsed by the meeting. This was perhaps the most important meeting ever held by an angling society, both from the number and influence of the gentlemen present. The evening was thoroughly piscatorial, and one in which we can imagine our dear old Isaac would have rejoiced. Messrs. Francis and George Austin Aveling, E. Bennett, Boden, Cartwright, Crumplen, Harding, Jardine, Pellant, and others sang, all of whom were highly appreciated for their artistic rendering of their several songs. Messrs. Winterbottom, Woods, and another gentleman accompanied on the piano, and their masterly performances (notably Mr. Winterbottom, who is known as a successful composer), contributed largely to the evening's success. Mr. Jardine's songs were also enjoyed, and that gentleman's collection of fish, lent with others for the Museum, added considerably to the attractions of the evening. The chairman proposed that, considering the circumstances, a collection should be made on behalf of the Anglers' Benevolent Fund, and the sum of £2 was promptly subscribed, which was further supplemented, on the motion of Mr. Parker, by £3, unanimously voted from the society's funds. Mr. Field having returned many thanks for this, the largest contribution yet made by a society to the Anglers' Benevolent Fund, several songs followed. The proceedings closed with more than hearty thanks to the chairman, and a grand rendering of the National Anthem, the whole audience upstanding.

HAMMERSMITH UNITED.

On Thursday, September 29, a visit took place to the above club, when seventeen societies were represented, and considering the short notice the attendance was more than was anticipated—the large room being crowded. The chair was taken by Mr. Hoole, faced by Mr. Packman, who carried out their duties in a most able manner. Among the vocalists may be mentioned Messrs. Gatward, Packman, Sutton (Clapham Junction), Dixie (Golden Barbel), Chambers, Burgess, Lumby, Robson, Penney, and a member from Hampstead. The show of fish was very meagre, Mr. Hoole being the only member having a fish of any size. On Sunday only two weighed-in, viz., Messrs. Peachey and Hitchcock—takes nothing worth reporting.—VORTEX.

The No. 1 District visit of the London and Provincial Angling Society, was held at their club house on Thursday, 29th ult., Mr. T. Hoole in the chair, faced by Mr. W. Packman. The meeting was a decided success, there being nearly 150 piscatorials present. The following societies were represented: Cambridge, Duke of Cornwall, Duke of Norfolk, Golden Barbel, Hammersmith Club, Hammersmith United, Marylebone, Prince of Wales, Waltonians, Westbourne Park, Clapham Junction, Princess of Wales, Portsmouth, and Acton and Ealing. The following gentlemen contributed largely towards the enjoyment of the evening: Messrs. Reynolds, Robson, Star, Gatward, Penny, Dixie, Reeves, Burgess (twice), Toms, Chambers, Chebelier, Peirce, Bushbridge, Lumby, &c. This society possesses a splendid room, which adds materially to the success of a harmonic meeting, and the host, Mr. W. Green, bought a new piano for the occasion. Altogether the meeting was a treat to everybody. Mr. Hoole read the notice issued by the West Central Association, London and Provincial, in reference to the abuse of the railway privileges, and impressed upon every member to do all in his power to assist the Committee in putting a stop to it.—TENCH.

IZAAK WALTON ANGLING SOCIETY.

Mr. J. Hilliar, sen., had some nice perch on Wednesday 5th inst.; Mr. J. Hilliar, jun., had roach and perch; Mr. G. Bliss showed dace. Three special prizes will be fished for on Sunday 9th inst. at Boxmoor. Three special prizes given by Messrs. J. Hilliar, sen., G. Bliss, and T. Dennison, sen., will be fished for on Wednesday 19th inst., all fish weigh; members to choose their own fishing water. Mr. E. W. Turner will give a prize value 10s. 6d. for the heaviest weight of chub, taken on the first two Sundays in November. Mr. T. Dennison, jun. will give 10s. 6d. for the heaviest weight of any kind (bar chub) taken on the same days.

THE LITTLE INDEPENDENT ANGLING SOCIETY.

The following members weighed in on Sunday evening—Mr. G. Letch, jack; Mr. Mead, roach and gudgeon; Mr. Petrie, roach and gudgeon; Mr. Grey, roach and gudgeon; Mr. Heelas, perch and gudgeon; Messrs. Scott, Humphreys, and Doyle, perch and roach.—W. BROWN, hon. sec.

LIVERPOOL ANGLING ASSOCIATION.

A quarterly meeting was held on Thursday evening, the 29th ult., and a goodly number of members attended. The treasurer's account of receipts and payments, showing a balance of £31 odd to the credit of the association, was read by the hon. secretary, and, on the motion of Mr. Sergenson, was cordially and unanimously adopted. The prize list to date, amounting in value to £15 10s., was also read, and a number of prizes presented to the winners. In this list appear the following names as donors.—T. Pavis, Esq., (president), £1 1s.; T. W. Haigh, Esq., £1 1s.; Messrs. Ellinger and Boulding, fishing jacket, £1 15s., and fishing boots, £1 4s.; Mr. W. Jones (treasurer), aquarium, value £2 2s.; Mr. E. Chandler, fern case, value £2 2s.; Mrs. W. Jones, pair of opera glasses; Mr. F. Schmidt, spirit flask; and Mr. T. J. Avann, cigar holder. The prizes for the next competition in the Vyrnwy, at Llanymynech, on October 13, were also decided upon, and amount in value to £5 5s.; and the date of the annual dinner was fixed for Tuesday, November 8. Three guineas was also unanimously voted to the hon. secretary as some recognition of his efforts for the success of the association, which object the members considered as now assured. Anglers should join without delay, as, when the association has secured suitable water, the entrance fee, now fixed at 5s., will, without doubt, be considerably raised.—RD. WOOLFALL, hon. sec.

Oct. 4.

NORTH-WESTERN ANGLING CLUB.

The members of the above fished for the second time this season at Pangbourne for a series of prizes, Mr. Smith taking first prize, Mr. W. Roxbee second, Mr. Billings third, Mr. Lancaster, jun., fourth, and Mr. Wynn fifth. Mr. Underwood also had four nice jack from Elstree weighing 16lb. in the aggregate.—F. HILL, sec.

October 5.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

There were several good takes of fish on Sunday last, Mr. Neagus with roach from the Stort; Messrs. Long, L. Gorsuch, perch from the Thames; Messrs. Laundry, Lucy, jun., and Richardson, roach and bream from Pulborough; Mr. Obbard had also chub and roach. Mr. T. Longman was the winner of the monthly (Mr. Wright's) prize. Mr. Morris, late of the Pegasus, Green Lanes, is the proprietor of the White Hart, Aylesbury Street.—T. W. LUCY, sec.

THE ORIGINAL ALEXANDRA SOCIETY OF ANGLERS.

We had a fine show of fish on Sunday last. Mr. Blackledge, roach and perch; Mr. Newton, one jack, 4½ lb.; Mr. Fligh, roach; Mr. E. Dymond, dace and roach; Mr. C. Hewett, roach; Mr. E. Brockett, roach.—E. DYMOND.

October 4.

SALFORD FRIENDLY ANGLERS' SOCIETY.

The members of the above society held their annual contest on Saturday, September 17, in the canal at Barton, for twenty-one prizes, kindly contributed by the following gentlemen:—Messrs. Baxter, Blackburn, Whitnall, Robinson, Clare, Hopkinson, Sturmeay, Bassett, Thornton, Greenlees, Watson, Whitehead, Kelsall, Woodhouse, Howarth, and Thomas, sen., with the following result:—1st, Mr. Vipond, eight day clock; 2nd, Mr. Walker, tea service; 3rd,

Mr. Scinor, a ham; 4th, Mr. Wainwright, sen., bed-room service; 5th, Mr. Gribble, timepiece; 6th, Mr. Kelsall, copper kettle; 7th, Mr. Hare, timepiece; 8th, Mr. Lamb, copper kettle; 9th, Mr. Wainwright, jun., copper kettle; 10th, Mr. Lawton, knives and forks; 11th, Mr. Fletcher, copper kettle; 12th, Mr. Driver, silver teapot; 13th, Mr. Platford, box of cigars; 14th, Mr. Court, a book; 15th, Mr. Overton, spoon; 16th, Mr. Ogden, set of jugs; 17th, Mr. Eccersley, angler's outfit; 18th, Mr. Tate, bait can; 19th, Mr. Abrams, set of jugs; 20th, Mr. Aspin, tobacco box; 21st, Mr. Ashworth, purse. On the following Wednesday evening the members met at the club house, the Ring o' Bells, Bury Street, Salford, where the prizes were distributed, and a substantial supper provided by the host, Mr. Mark Baxter.—JOHN ROYLE, sec.

ST. JOHN'S.

Some of our members fished for prizes on Sunday, the 2nd, but as the water was so bright and with a strong east wind the takes were small. Mr. C. Fudge, first, with roach and dace; Mr. Leach, roach; Mr. Rushton, roach; Mr. Winch, roach; Mr. Reynolds, chub; Mr. Mathews, roach; Thorling, roach; all from Cookham. On Monday the 3rd, the half-yearly dinner took place at the Club-house, thirty members sat down to the excellent catering of our worthy host, Mr. H. Gill. After dinner, Mr. Pledge occupied the chair; Mr. Thorling, the Vice-chair, with Mr. Cox at the piano. Some first-rate songs were sung by members and visiting clubs in the course of the evening. Five more prizes were given for this month, that making in all for this month, ten prizes.—F. THORLING.

October 5, 1881.

UNITED BROTHERS

Fished a peg-down match at West Drayton on the 25th ult., for five valuable prizes, each prize being taken. J. Warren, first; J. Eller, second; W. Tyler, third; H. Tyler, fourth; G. Belton, fifth.—W. J. M.

Oct. 3.

WALTONIANS.

On September 28th we had a show of grayling 5 lb. 12½ oz. The largest fish 2 lb. 4 oz., and the second 1 lb. 13¾ oz., were presented to the club by Mr. Brady, the gentleman that took them. They are to be preserved by Cooper, and will be an interesting addition to the capital selection of specimens possessed by the Waltonians. Mr. Burton had a show of nice roach from the canal at Boxmoor, 3 lb. 9½ oz. Messrs. Dodge, sen., and Read also weighed-in fish on Oct. 2nd. Messrs. Good, jun., Roland, Jos. Moore, Crabb, J. Dodge, Bradley, and Malcom also weighed-in. The takes, with the exception of Mr. J. Dodge, 4 lb. 10½ oz., were rather poor. I weighed in a perch from Sharnbrook, 1 lb. 3¼ oz.—A. J. MARRIOTT.

Oct 5th.

WALWORTH WALTONIANS.

On the evening of the 30th, the members of the above society were honoured with a visit from Messrs. Ghurney, Murphy, Beckett, &c., committeemen of the Anglers' Benevolent Society. Mr. S. J. Weatherhead introduced them with a very interesting address on the advisability of all anglers supporting the A.B.S. The mode of working the society was then explained by Messrs. Murphy, Beckett, and Ghurney, and it gave so much satisfaction that I am happy to state all members present gave in their names as subscribers to the society, this being done a vote of thanks was given to the visitors for their kindness in coming forward that evening on behalf of the A.B.S. I have been asked how it is that all angling societies do not support the funds of this society "a farthing a week, or a couple of half pints of mild and bitter and a half-screw less a quarter," and added to each member's club subscription would enable this society to mend many a broken "brother Bob," and not one of us be the worse for our retrenchment. What do you think "Pixie!" Not being able to answer this question, I put it to the angling societies themselves. Fish this end of the town is like big diamonds, very scarce, and worth their weight in gold at the present time.—PIXIE.

WEST CENTRAL ANGLING SOCIETY.

Our host and treasurer, Mr. R. I. Beard, sen., and Mr. G. Randall, had a capital show of roach and dace from Richmond on Thursday, Sept. 29. On Sunday the following members made an average display:—Mr. F. Beard, roach and bream from Pulborough; Mr. W. Wilcockson, roach from Weybridge; Mr. D. Smith, jack from Amberley. The monthly prize for October is for the largest jack; a great contest is expected from all the members.—R. I. BEARD, JUN., sec.

October 3.

POLLACK, BASS, MACKEREL.

HEADER AND SON,

Deep Sea, River and Lake Fishing Tackle Makers to H.M. Government, H.R.H. Prince of Wales, H.R.H. the Duke of Edinburgh, and exploring expeditions,

FISHING in Lakes, River and Sea, good bathing, boats. Flapper shooting from Aug. 1 on three lakes, 2500 acres of preserved shooting, with partridge and snipe in season. Free to visitors. MAELOG HOTEL, TY-CROES, ANGLESEA, "PROPRIETOR."

ROYAL AQUARIUM.

Open 12; close 11.30.

UNPARALLELED PROGRAMME.

STUPENDOUS SHILLINGSWORTH.

ROYAL AQUARIUM. — THIS DAY.—12 hours' amusement.

ROYAL AQUARIUM.—GRAND VARIETY ENTERTAINMENT. Best programme in London. Sterling quality versus quantity. No show in London can equal the unrivalled entertainment.

MISS BECKWITH will make her reappearance THIS DAY, at 5.30 and 9.45, in her grand entertainment, during which she practically demonstrates her marvellous method of saving life from drowning.

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 188, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 21, Lombard-market, Battersea, S.W.
Mrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.
Mr. Alfred Young, "The Golden Perch," 174B, Oxford-street, W.
Mr. T. Barnett, 26, Church Street, Lisson Grove, N.W.
Mr. J. Smith, 7, Tottenham Court Road, London.
Mr. Edwin Stevens, Newsagent, 220, Kentish Town Road.

OR

Mr. B. R. Barabridge, 74 and 75, High Street, Eton, Bucks.
Mr. Cowan, 33, South Frederick-street, Edinburgh.

Mr. S. Dale, 7, St. John Street, Nottingham.
Mr. H. Booth, 88, Prospect Street, Hull.
A. W. Warner, 121, Broad Street, Birmingham.

Newsvendors can obtain the journal through their London Agents.

* * The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s.; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C.

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

The Fishing Gazette.

SATURDAY, OCTOBER 15, 1881.

THE FISHING GAZETTE FLY AND BAIT CASTING TOURNAMENT.

(IN AID OF THE FUNDS OF THE ANGLERS' BENEVOLENT SOCIETY.)

It is now definitely settled that, weather permitting, the tournament will take place next Saturday, October 22, at Mr. Warner's Welsh Harp Fishery, Hendon, on the Midland Rail-

way. It will commence at two o'clock. The charge for admission will be only sixpence. The judges will be J. P. Wheeldon, Esq., of *Bell's Life*, and Alfred Jardine, Esq. Mr. Warner has most kindly offered us every assistance in his power. The following are a few of the gentlemen who have promised to be present:—Messrs. Greville Fennell, Brougham, Sachs, Geen, Hoole, Gurney, Bonvoisin, Keene, Addington, Brunton, Morgan, Alfred, Malcom, Gregory, the "Trent Otter," W. Bailey, jun., Yarde, Wilson, &c.

The final arrangement of the competitions is not yet definitely settled, but the following may be considered a general outline of the programme:—

A prize for the longest cast with a double-handed fly rod.

A prize for the longest cast with a single-handed fly rod.

A prize for the longest cast from the reel in the Nottingham style.

A prize for the longest cast with line coiled at feet in the Thames style.

A prize for the longest cast with the forked stick, as practised by the Welsh Harp, Elstree, and other bank anglers.

A prize for the longest cast with unweighted line, baited with paste or cheese (prize given by Mr. Malcom).

Other competitions will doubtless be arranged.

The judges will consider style of delivery of the flies or bait, and accuracy, as well as distance, and for this purpose the following scale of 100 points will be adopted:—

	Points.
Distance across the wind	20
Distance with the wind	20
Style of delivery of flies and bait	30
Accuracy	30

Competitors will be allowed to use their own rods and reel lines; some allowance will have to be made for length of rod used. We shall probably adopt the American scale per foot.

The entrance-fee for competitors will be fixed according to the value of the prize to be won, but will not exceed half-a-crown. Competitors will stand on a tarpauling, a fixed time being allowed in which to make the casts.

We have much pleasure in stating that Mr. Gregory, of Birmingham writes us he is coming to try his hand at throwing the reel (pike-fishing style), and also the Nottingham long-line roach-fishing style. He will give a prize value 20s., consisting of his artificial baits. Also that our friend, the "Trent Otter," and probably Mr. Slater, of Newark are coming. The "Trent Otter" has promised to give an exhibition of all the different styles of fishing in vogue on the Trent.

Also that Mr. Wm. Bailey, jun., of Nottingham, will be present, and offers a Nottingham rod, reel and line for the longest "cast" with a quill float in the Nottingham style.

Also that Mr. John Foster, of Caythorpe, Notts, water bailiff to the Trent Fishery Board, is coming, and will exhibit his skill. In his letter to us he says, "I have fished with gentlemen from all ends of the earth, and am known to every noted angler and tackle maker in Nottingham and county." He recommends six throws in each style; and we think it is a good idea if there is time for so many, as in three throws an angler can hardly feel at home and do himself justice.

Also that we have just received from T. R. Sachs, Esq., of the Piscatorial Society, a handsome prize, in the shape of a magnum silver-mounted Black Forest spirit bottle. (N.B.—We will fill this fine bottle with the best Glencoe whiskey, in order that the fortunate winner and his friends may drink Mr. Sachs's health.)

The following is, we think, a complete

LIST OF THE PRIZES AND DONORS.

at present offered:—

1. Mr. R. B. Marston (Ed. F. G.), A double-brazed best-finished hickory pike rod, made by Mr. S. Bigg, of 33, Russell Street, Covent Garden; a four-joint best finish greenheart fly-rod, made by Little and Co., of Fetter Lane, and other minor prizes.

2. Messrs. S. Allcock and Co., of Redditch, a fly-rod with winch and line.

3. Mr. Wilcock, of the Manchester Cotton Spinning Company, a selection of his best lines.

4. Mr. Malcom, of Messrs. Woolgar and Co., Ludgate Hill, a "Freak" fishing bag, newest pattern.

5. Mr. G. Yarde, a first-class double-brazed pike rod.

6. Some books from a gentleman whose name we forget for the moment (perhaps he will kindly send us a post-card if he wishes it published.)

7. Mr. J. Gregory, of Vyse Street, Birmingham, artificial baits, &c., to the value of 20s.

8. Mr. William Bailey, Junr., of Nottingham, a Nottingham rod, reel and line.

9. Mr. T. R. Sachs, of 12, Hyde Park Place, a magnum silver-mounted Black Forest spirit bottle (which, as before mentioned, we will fill with the best Scotch whiskey).

10. Messrs. Barron and Wilson, 436, West Strand, a pair of "FISHING GAZETTE" pliers.

11. Messrs. W. Thornhill and Co., 144, New Bond Street, two of their new "Marston" fishing knives.

We are having a large poster printed, and shall send it to the secretaries of the London clubs, to tackle-makers and others, and we shall be much obliged if they will kindly put them up in some conspicuous place where anglers may see them.

For the convenience of anglers who do not know the Welsh Harp, we may state that it is on the Midland Railway, and is only a few minutes' walk from Hendon. We mention this because some trains which stop at Hendon do not stop at the Welsh Harp station. Anglers can book to the Welsh Harp from any of the following stations: Victoria, Clapham, Brixton, Elephant and Castle, Ludgate Hill, Snow Hill, Moorgate Street, Aldersgate Street, Farringdon Road, King's Cross, St. Pancras, Camden Road and Kentish Town. Trains are not frequent, so we advise our readers not to trust to catching one at the last moment, but to consult Bradshaw.

In conclusion, we can only hope that our readers will help us to make this, the first affair of the kind, a great success; and that not only will they come themselves but also bring their mothers and their wives, their "sisters, their cousins, and their aunts;" and, that they may have no excuse, the ladies and children shall come in at half-price.

N.B.—If next Saturday proves to be a *thoroughly soaking wet* one, with no appearance whatever of clearing up at noon, the tournament will be put off to the Saturday following. Anglers, of course, do not mind any wet, but this is a question of getting all the money we can for the Anglers' Benevolent Society.

[There is a whisper in the air of a quiet little dinner at Mr. Warner's after the tournament. Names of those who would like to assist at this should be sent to the editor of this paper, 12, Fetter Lane; or to F. C. Clench, Esq., of the Richmond Piscatorials; or to W. H. Brougham, Esq., Swayfield Villa, Hounslow. Mr. Clench has promised to take the vice-chair, and we hope to see Mr. Brougham in the chair. Tickets will be about 3s. 6d. or 4s. each. Wines, &c., of course, not included. All names must be sent in to the editor before the 18th, in order that Mr. Warner may know how many to provide for.]

SUSSEX RIVERS.

(Continued.)

THE Adur has three if not four sources; one is about two miles from Slinford, another about the same distance from Nut-hurst in Sussex, these join near West Grinstead, and are augmented by a brook which has its rise near West Chiltington. It is remarkable that all the Sussex rivers have their source in that county. The stream we are now upon has its rise near Slaugham. This is but a short walk from the Balcomb Station on the Brighton Railway. We quit the station on our left, and crossing a field come at once into the lane that leads to Slaugham, and a most delightful lane it is! James Thorn revels in one of his rambles over this spot. He says:—"If we wanted to give any one a favourable notion of a thoroughly countryfied English lane, we could not select a better. The proximity of the railway has done nothing to destroy its rural character. It is as unpolished and unimproved as Sir Uvedale Price or Mr. Gilpin could desire; but then, how it abounds with wild flowers which they would not have stooped to look at! We never saw a lane so full of flowers, or of choicer or more lovelier kinds than this lane produces. From it and the neighbouring wood few young botanists but would be able to find a new specimen or two for their herbarium. Then there are a cottage or two and a farm house, just enough to break the continuity of hedgerow pleasantly, and not sufficient to destroy the quiet. There are some fine trees in the hedges too, and peeps between them across the Weald, which stretches away on our left, with a huge barrier of lofty downs beyond. On a clear bright day, with just clouds enough in the sky to chequer with their flitting shade the level stretch of the scenery, and to relieve the uniformity of the distant downs, the angler tourist will hardly wish for a more lovely prospect."

It is curious that the sources of the Adur, Arun, and Ouse, which beautify Sussex, as well as a feeder of the Surrey Mole, rise within a radius of less than four miles in or about St. Leonard's Forest. Slaugham is scarcely worth resting at, but a good-sized pond may be found at the mill which contains tench, carp, perch, and large trout; and having, up to very recently, been seldom fished, ought not to be passed by if leave can be had—no difficult task—to angle therein. From this we make our way to Bolney over the downs. This neighbourhood is very pretty, to

which the old dilapidated church greatly assists to give an air of picturesqueness as it stands on a rising ground with the irregular cluster of village houses under it. The Adur is here a noteworthy stream, and its history is rendered important from the fact that salmon are occasionally found in it, seeking appropriate spawning grounds, and we have taken trout from it up to 2½ lb. which almost exceeds belief when the infant character of the stream is considered. Indeed it is upon record that in one of its pools a trout was caught by the parish clerk of Bolney which weighed 22 lb. This was sent to Brighton as a present to George IV; but it was a bad catch for the humble official, who, in his simplicity, which was encouraged by the yokel population, expected nothing short of knighthood for his loyalty and liberality, and the disappointment actually touched his brain. Do not let us laugh at this unsophisticated clown, as something close to it has occurred but recently when *that* Thames trout of extraordinary size was conveyed to Her Majesty.

The Arun now courses by Twineham and Shermanbury, around which villages there are many delightful spots where trout and dace abound. Shortly after passing Shermanbury we find the affluents we have before noticed joining the main river, which, flowing by West Grinstead, is made navigable for barges of shallow draught up to Mock Bridge. If the rambler is an angler we should advise him to be faithful to the stream, keeping her close to his heart; on the left side, and in the tortuous coquettish career of the water, very many skittish bends and turns will woo him to his rod's dalliance, while a goodly family of fish frisking in his pannier amongst the fresh green iris flags will be his exceeding reward. But should he not be one of us, why, then, let him proceed by the road, or the bridle lane from Shermanbury to Henfield, and there select his inn, which is the White Hart, in our time a most comfortable hostelry. The churchyards are not the place for merriment or to raise a depressed mind, but in that of Henfield, if my readers have aught requiring medicament of that nature, there are "efforts in poetry on the stones" that would get a laugh out of the skeletons that lie beneath if they were permitted to rise above the daisies.

Those who are fond of thatched cottages and timbered houses with their projecting stories, and shudder at the red-tiled, brick flimsy, and wretched erections of modern days, will find the former scattered around in plenty. We are not unmindful of the fact that the dwellers in the less æsthetic habitations have more comfort than formerly, when domiciled in those hovels almost universally built up of mud with clay floors, still to be seen in the New Forest and elsewhere; but being prejudicially imbued with an artistic craze, we do lament, and that seriously, the rapid removal of those picturesque landmarks which are so refreshing to a rambler's eye. Let an old and pleasant writer help to explain the sort of cottage we mean, and which he can do while we jog *en route*. "These glorious cottages, so endeared to the sketcher, are very numerous in the middle parts of Sussex, and there are few places better than the vicinity of Henfield to seek them in. Backed by high lands, or a clump of fine old trees, in order to shelter them from the northern and easterly winds, their situation is almost always eminently picturesque, and they are, strange to say, always adapted to their situation; while their bold projecting gables, &c., allow a fine play of light and shade, and thus heighten the general effect. . . . The old houses and cottages scattered over these southern counties have a considerable similarity of character, and yet there is a distinct individuality, so to speak, in those of each county." Thus the chimney shafts of a Sussex cottage are larger and more massive, but not quite so ornamental as the Kent cottages, though more ornamental than those of Surrey and Hampshire; and they are different from each. With some, it may be said, why do we not stick to the water? But to the intelligent angler the surroundings of the river have as lively an interest as the inhabitants of the stream; and of a verity, it is these small matters and local details that give so much of variety and a proper and healthy tone to the bearer of the rod or the knapsack.

But leaving off talking with the tenants in their neatly-kept gardens in front of these cottages, so well adapted to the genius of the place, we will cross the meadows from Henfield and stroll down to the river. That last old cottage was an angler, he spied the fly attached to our hat-band, and told us that "bit o' stuff would be parlous deadly on the water yon." We took the hint, and after crossing the bridge not far from Bramber, sent a line across a pretty likely shallow ripple, and at the first throw got a fine dace, then another, then a white leathern-mouthed chub, then another dace; and then succeeded a desperate fight with what turned out to be a 3 lb. trout, which was not only excited to fury by the bridle we had put upon him, but by a pike of a respectable size that followed his every movement as he struggled to get free. So determined was the pike to dine off our trout, that when we had brought our enamelled victim within reach of the landing net, the "fell tyrant of the stream" had absolutely got his body

partly over the iron hoop of the net while the trout laid, "guiltless of a kick," at the bottom. As the pike was evidently anxious to pair with the trout, either for the latter to be an inside or an outside passenger, we determined to accommodate him. We therefore rigged up some spinning trout tackle, and putting a small slip of a dace thereon, after two or three throws first to the right and then to the left, and then, country-dance fashion, across, we found ourself well into our recently made acquaintance, who, after showing unmistakable evidences of objections to control, was grassed, and received the *coup de grace* from the iron-tipped toe of our shooting Faggs. Then, with a very pretty creel of fish—in which, by the bye, there were no perch—we walked proudly with our burthen, though Ashurst to Steyning, in which village at our inn we learned that our quondam acquaintance at Henfield was considered the best angler in the county, and a sworn enemy to, and dreaded by, all poachers or takers of fish by illegal means. "Could I get the trout and pike conveyed to him?" "Yes," was the response of my landlord; "my cart passes his door to-morrow." Enough—the host did his volunteered errand faithfully, and amongst my cherished documents is a letter acknowledging the receipt of the fish, and the offer of a shakedown whenever we might visit the Arun at Henfield again. The worthy old soul has since gone to his fathers, and if his dreams still continue to be of fishing, as mine in the flesh are, I wish him all the success that the happy hunting grounds can afford.

Steyning is a good example of an almost neglected, if not, altogether forgotten town; but here the river is not abandoned to nature, as the navigator requires the banks to be trimmed, and an air of cut and artificiality is the consequence. But now, as we follow the river, we would have those who accompany us raise their heads and they will see an elevation to the right, on which is a fragment of the grey old grim keep of Bramber Castle. These remains appear somewhat insignificant at a distance, but they will fully compensate the curious by a nearer approach, and when the site itself is gained, will reward him for his pains. But scramble up a little higher than the level on which the ruins stand, and a view unsurpassed in the county, is present. It reaches in one direction over the flat Weald to an immense distance, and along the downs the eye pierces as far as the Devil's Dyke, and a slight turn of the body carries the vision over the sea to the tremulous verge of the horizon.

CREEL.

(To be continued.)

PRIZES FOR SPECIMEN FISH AND THE GRESHAM ANGLING SOCIETY.

I DO not wish to arrogate to myself any praise which is not due to me, but I am more than gratified to find that my initiation of the movement against gross-weight competitions, which I made some years ago, is making the most satisfactory progress. At the time when first I took up the question, my remarks called forth a determined opposition, but each year when I take my stand upon the point the arguments against become weaker, and the supporters of my views largely on the increase. It was no small pleasure to me the other evening at the Gresham Angling Society, to find there is a unanimous feeling in the club in favour of prizes for specimen fish, and the doing away of gross weight competitions. Depend upon it, the move is one in the right direction, and will ultimately triumph in every club-room. The large increase in the body of anglers will claim its necessity against the wholesale slaughter of fish, for the sake of getting a prize. We must not forget that although anglers have immensely increased in numbers, the resources of fishing have not increased at all; and if we must keep up a head of fish, we must not recklessly destroy the stock—in a word, which has always been my argument against taking unsizeable fish, if we want to get large fish and a good supply of fish worth catching, let us put back the small ones. When I commenced the movement of preventing the slaughter of small fish, some sixteen years ago, the opposition was much greater than the one I have initiated against gross-weight competitions. The opposition to the retention of small fish has literally died out, and so will the present feeling in favour of gross weights. I may not live to see it, but others will. The Stanley Anglers has been the first club to adopt my views, and now the Gresham Angling Society, in its birth in the great city, has decided in favour of prizes for specimen fish. I have no desire to advance any fresh arguments against the practice of gross-weight competitions, but I can see a greater necessity for their discontinuance, and not only are several clubs adopting prizes for specimen fish, but anglers are retaining only their best fish. It is now twelve months since I referred last to this question in the FISHING GAZETTE, and which brought out several replies, not altogether upholding the practice, but suggesting certain expediences in reference to some particular species of fish. I do not mind opposition when it is done in a friendly spirit. In one of the letters last year, the writer not only treated my remarks with

becoming courtesy and gentlemanly observation, but sent me a present of game; and, as far as I can remember, he was not a decided opponent of my views. The Gresham Angling Society not only sets its face against gross weights, but it has increased the standard of sizes of fish for ordinary weighing-in purposes—as, for instance, it will not allow a jack to be weighed-in under 3 lb. There are a number of real good men connected with this society, and I shall do all I can to support them. Their principles are right, and they will prosper—they have inaugurated the early commencement of business, another idea I have frequently suggested where practicable. They begin at seven o'clock, and at nine o'clock those who have a distance to travel can leave, as all practical business by that time is finished. Their new club room is of a spacious character, and the proprietor of the City of London Tavern, Mr. Thompson, is one of the right sort, and will, I have no doubt, make the members very comfortable. In the coffee-room, which leads up to the club-room, "chops and steaks are always ready," and, speaking from experience, before I went up to the meeting last week, I had a splendid mutton-chop, a good piece of bread, a delicious cup of coffee, and a pat of butter for fifteenpence, which I thoroughly enjoyed, and I could not help feeling at the time, when I had the opportunity of referring to it, I would do so, as it is well worth knowing. I have a little deviated from my remarks of the club itself, but on a point the members can and will appreciate, and I hope Mr. Thompson, the popular treasurer of the society, will benefit by what I have said. The Gresham Angling Society possesses in Mr. Thomas Crumplen a most valuable and energetic honorary secretary, and the committee are all thorough business gentlemen of position and experience in the gentle art. Mr. C. S. Bentley, who took the chair last week, is most assiduous in his efforts to promote the interests of the society. I am indebted to him for several friendly visits, and I can only hope that he will not forget to repeat them whenever I can be of service to him, or he is desirous of having a little piscatorial chat. So far, the society is a success, and the enrolment of over 150 members in about six months is unparalleled in the establishment of any angling club. That it will continue to progress, no one can doubt, for every meeting night new members are elected, and others seeking election. The prize-list which has just been issued, though not complete, evidences a good start. Mr. Alfred Jardine comes to the front in private prizes, with a painting of "Barbel, Chub, and Roach," by the late Mr. H. L. Rolfe, and which he offers in memory of his late friend "the scaley painter." There are twenty-one other private prizes, with various conditions attached to them, and all of good value. The society's prizes are as follows:—For salmon, "The Society's Diploma of Honour;" for trout, two guineas for the first prize, and one guinea for the second; for pike, perch, chub, barbel, carp and tench, there are for each kind first prizes of one pound five shillings, and second prizes of ten shillings; for bream, roach or rudd, and dace, first prizes of one pound, and second prizes of ten shillings. I have previously remarked, the prize-list is incomplete, because there is this note attached to those I have named:—"There will probably be several additions to the list of private prizes, of which due notice will be given." There is this condition attached:—"The society's prizes are given exclusively for the LARGEST SPECIMEN FISH." A museum and library has already been commenced, and the Gresham Angling Society, in a general aspect, may truly be said to be safely and firmly afloat. Such an institution in "the great City" was needed—its promoters felt this when they made a start—and a very little time, with the energy which has been devoted to it, has fully proved the necessity.

B.

COLOUR PRINTING OF AUTUMN LEAVES.—A novelty of the new-book season will be the production—in a new volume by Mr. Francis George Heath, to be issued by Messrs. Sampson Low and Co.—of a series of coloured *fac-similes* of autumn leaves. No attempt to render the exquisite tinting of the leaves of our autumn woodlands has ever before been made in this country. Wood engravings of New Forest scenery are also being drawn for Mr. Heath's new book.

A GOOD PIKE.—On Saturday last Mr. John Foiman, dyer, Aylestone, accompanied by his son Joseph, visited Welford for the purpose of a day's piking. Father and son fished the reservoir for some considerable time with but little success. At last the father resolved to have a try in the "arm," whilst the son preferred to stop where he was, feeling convinced that his efforts would be rewarded, for the water was very low, consequently the bait could be thrown out a long way, which is not generally the case. His judgment proved to be correct, for he had not thrown out many times before his float disappeared with a rattle, and after "playing" the fish for a short time it could easily be seen that he had hooked a tartar, for it rolled about in fine style, trying to gain its liberty, but both tackle and angler were too good for him, and after some little difficulty it was brought to bank. Another small fish besides the one above referred to comprised the day's sport, but John and Joseph were well satisfied with their visit to Welford. On returning home both anglers, being members of "The Granby" club, proceeded to the Swan-with-Two-Necks for the purpose of "weighing-in." The fish was pronounced to be a magnificent specimen. It measured one yard and three inches in length, and weighed, when first caught, a little over 18 lb., but on being scaled at the club it weighed 17 lb. 9½ oz., having dried-in something like 6 oz. during the journey with horse and trap from Welford to Leicester.

NOTICES OF BOOKS, &c.

SHOOTING: ITS APPLIANCES, PRACTICE, AND PURPOSE. By James Dalziel Dougall. Second Edition.

THE author of this well-written and most readable work enjoys a high reputation as a scientific gunmaker, and also as, for a long period a contributor, to the sporting Press. Originally of strongly-developed literary tastes, he has wisely brought these to bear on his profession; although, at the same time, we believe we are not in error in stating that he has written much, although anonymously, on a wide diversity of subjects. We state this because—as we freely admit we ourselves did, when we first saw the previous edition of “Shooting,” &c.—many may assume that they are about to read a somewhat dry treatise on guns and their adjuncts. In this regard Mr. Dougall’s mechanical, may very probably have been injurious to his literary, renown. This prejudice, however, if it exists at all, which may or may not be the case, will vanish on a perusal of the book now before us; and, indeed, we are given to understand that it is the fourth edition (although little of the first two remains) of the work as originally published. The introduction of breech-loaders, and other reasons, have caused complete revision and considerable elimination of matter now obsolete, and the introduction of still more new, *au courant* with the advancement of the age.

“Shooting” is a work written for the instruction of sportsmen in all that really appertains to the field sports in which guns are used. It gives us neither too much nor too little information. Mr. Dougall, having been himself an ardent sportsman, and an almost unrivalled game shot, knows evidently where to draw the line between what would be merely irrelevant detail and what is really interesting and instructive. Hence the reader is led on as if he were perusing an interesting tale rather than what it is, in fact, an instructive treatise. The author tells him of the material and form of sporting firearms—of explosives—of how to aim—of dogs, moors, partridge ground and other useful things to know all about. The chapter on dogs shows thorough discrimination as to the choice of setters or pointers for the respective work they have got to do, as well as an appreciation of the remarkable gifts with which these animals are endowed, at once keen and kindly, and evidently the fruits of much experience.

Grouse shooting, the *ne plus ultra* of field sports in connection with the gun, receives a full share of attention. Mr. Dougall’s theory as to overstocking of moors being the cause of what is termed “grouse disease,” is becoming universally known, and he is certainly to be congratulated on the unflinching courage with which he has stuck to his colours, and the victory he is unquestionably achieving. But it is no light matter for a man to fight a battle against at first countless odds, and to run the risk of damaging his professional prospects by the advocacy of what he can have no special interest in beyond a love of truth. When we recollect that grouse moors are annually worth to Scotland at least one million sterling, Mr. Dougall certainly deserves well of his countrymen in general, and of Highland proprietors in particular. This great value also invests the subject with an importance not perceived at the first glance, and the proper management of grouse moors becomes, most certainly for a great part of the North, a matter of national economy. So long as mankind will seek reinvigoration after exhausting professional pursuits, so long will grouse shooting—perhaps the greatest restorative known—continue to be followed, and grouse moors to bring high rents. Nor is the pursuit an idle one, or the results to be called for one moment in question, when calculated in reference to the recuperation of hundreds of our greatest men in every branch of the most intellectual pursuits. Taking, for example, the legal profession, as that drawing the most heavily on the mental resources, it will be found that there are no keener grouse shooters than lawyers, from the youngest barristers to the most dignified judges on the bench, not to speak of the equally honourable, but more numerous, solicitors. We are led to write thus somewhat warmly through appreciation of our author’s treatment of this interesting subject.

The third part of the book, the “purpose” of shooting was written, Mr. Dougall tells us in an appendix, at the special request of those who condemned the then numerous and indiscriminate attacks on the morality of field sports. Although not a voluntary controversialist, therefore, he doubtless writes *con amore*, and shows much vigour and ability as a dialectician. The whole book, then (with the addition of the appendix, which contains most interesting information on the peculiarities of how guns throw small shot, with other matter, as on hammerless guns), will be seen to comprehend, 1st., instruction on the agents used in shooting; secondly, on the practice of shooting—how to do it; and, thirdly, in the purpose in doing so, viz., the restoration of nervous energy. To wish it success is superfluous. It has long passed the probationary period; and, as a proof of this, we may

conclude this notice by stating that it has received that which is generally considered a mark of the highest literary honour—translation into several foreign languages. We also observe by the public advertisements that the volume has been reduced in price, a sure token that the demand is found to be permanent.

ANGLING LITERATURE IN ENGLAND; and Descriptions of Fishing by the Ancients. With a notice of some books on other piscatorial subjects. By Osmund Lambert. London: Sampson Low, Marston, Scarle and Rivington, Crown Buildings, 188, Fleet Street. Price 3s. 6d.

MR. LAMBERT’S little volume is decidedly attractive and interesting, and gives a very clear general view of our most prominent angling literature. It does not pretend to exhaust the subject, the aim of its author appears rather to have been to induce an interest in it. Every angler ought at least to know something about the celebrated books which have been written on the subject, and which have done so much to diffuse a knowledge and love of it, and in Mr. Lambert they will find a most careful and painstaking guide, who has devoted years to his labour of love.

Here is a bit which all grayling anglers will endorse. This beautiful fish, the queen of our freshwater fish, is said to have been introduced into England by the monks, and the esteem in which they held it is fully attested by the description of it which Saint Ambrose, “the glorious bishop of Milan,” as Walton calls him, in his “Hexameron; or the Six Days’ Work of the Creation.”

“Nor shall I leave thee unhonoured in my discourse, O Thymallus (grayling) whose name is given thee by a flower; whether the waters of the Ticino produce thee or those of the pleasant Atesis, a flower thou art. In fine the common saying attests it; for it is pleasantly said of one who gives out an agreeable sweetness; he smells either of fish or flower; [thus the fragrance of the fish is asserted to be the same as that of the flower.] What is more pleasing than thy form?—more delightful than thy sweetness?—more fragrant than thy smell? The fragrance of honey exhales from thy body.”

Having again recently caught some grayling in the Dove and Wye, we can only say they deserve this praise, for they are extremely beautiful fish, and their odour when fresh caught is like that of wild thyme. We devoutly wish that many more streams contained them, and especially that they could be found within an hour or two’s journey from London.

We have frequently expressed a wish to see books on angling figure in the lists of club prizes. The Gresham Club is making a bold stand against competitions for gross weight; if it would take the lead in the direction we have indicated, and give noted works on angling as prizes, its example would soon be followed by other clubs, and this alone would do much to elevate the standard of anglers and angling. Any angler who secured a copy of Walton or Mr. Lambert’s little book, or Francis’s “Book on Angling,” or Mr. Manley’s pleasant “Notes on Fish and Fishing,” or any other of the hundreds of books on the subject, would in the end prize it far more than money, or a bottle of whisky or a sack of coals; if he did not he has no right to call himself an angler. He is, and will remain, a mere pot-hunter.

The book has been brought out in most elegant style by the publishers, and its appearance and contents will entitle it to high esteem from all who love angling literature.

A CHARMING BOOK FOR CHILDREN.

FROM Messrs. George Routledge and Sons, of London and New York, we have received a copy of “Mother Goose, or the Old Nursery Rhymes, illustrated by Kate Greenaway, engraved and printed in colours by Edward Evans. Christmas is fast coming on, and doubtless hundreds of our readers will give themselves the pleasure of pleasing little folk in the nursery by presents of coloured picture books. If, before this sweet little book goes out of print, as it probably will, they will secure it, not only may they be perfectly sure of getting plenty of kisses and thanks, but they will also be themselves delighted with the exquisite pictures. The old nursery rhymes have often been illustrated, but never in a more delightful manner than in Miss Greenaway’s edition. We wish we could reproduce the picture on page 22, which illustrates the rhyme—

Little Tommy Tittlemouse
Lived in a little house,
He caught fishes
In other men’s ditches.

Tommy’s sweetheart is evidently on the watch, looking out for the “other men.”

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

"THE TURN OF THE TIDE"—MINNOW TRAP—PRESERVING WASP GRUBS—PAPER MILL POLLUTION.

By J. HARRINGTON KEENE.

A NICE little job it is at any time, Mr. Editor, to account for fish not biting, and especially difficult is it, when the "turn of the tide" is a factor in the defection! However, I will, as you ask me, give my opinion as to the cause of the undoubted fact stated by "Constant Reader;" premising however, that if anybody can supplant my ideas, I shall only be too glad to see it done.

The matter stands thus. As the tide is running out, fish bite; as it returns, and at the flood, they don't—this puts it roughly, for each statement will bear occasional qualification. Now the first question it is necessary to ask, is this: "What kinds of fish are referred to?" A "Constant Reader" speaks of the Thames, and the answer is dace and bleak, and small roach, for under no circumstances will perch, jack, barbel, large roach, or gudgeon at any time be "seen in hundreds jumping on the top of the water." These fish will feed at high water, and as the tide is running out, as I have repeatedly proved at Richmond and Teddington. Therefore our enquiry is narrowed to this: Why will not dace, etc., feed.

Now the dace and small roach are fishes rejoicing in shallow water—that is, not more than, say, 3 feet in depth. This water from its comparatively small volume, very rapidly acquires the temperature of the ground, which, from its accessibility to the sun, is always several degrees higher in the theometric scale than the bottom of the deeper water, especially during summer and autumn weather. This water also possesses a greater amount of oxygenised air, and the two conditions are absolutely necessary to the comfort and health of these fish. Besides, their natural food is found near the ground, and this food, consisting of countless living organisms, is not produced at great depths. Thus food, air, and warmth, exactly suited to the dace, are supplied during the outgo of the tide near the bottom, *ergo*, the fish feed.

Now the water having passed down to the sea, is met soon by a tidal influx, and though much mingles with the ocean at the point of meeting, very much more doubles back. Let this be borne in mind. It literally does double back—the incoming water folding over on the top because of its superior height when it starts to return, and remaining so until its turn, because of its lower density. Supposing this wave to have reached Richmond Bridge, the accumulated volume alters the conditions of the parts of the river beloved by dace—they are deeper and denser—hence uncomfortable, and the higher stratum, though more oxygenised is productive of little food, and that only of an ephemeral nature. It is also colder, and not until the stream proper by its mechanical and thermal forces has rendered the water homogeneous are the fish disposed to feed as before. This I believe to be the philosophy of the thing, and before condemning it I would ask the reader to carefully think out the matter on the principles I have laid down, bearing in mind, primarily, 1st, the nature of the fish which refuse to feed; 2nd, the nature of their habitat when they do feed, and 3rd, the nature of the tidal change. It is due to my view to say that I have been fairly successful in taking dace with the fly at flood.

Why doesn't J. A. Kelly make his own minnow trap? He can do so very easily from a pickle bottle. Take a diamond and cut off the bottom, and tie over this a piece of fine muslin to which a few tufts of red worsted have been tied. The mouth of the bottle is left open and a string attached. Sink the apparatus in a shallow stream, wherein you can see plenty of minnows, with its mouth down stream; the minnows will readily enter, and of course, you only have to haul up. A few crumbs of bread or cut worms will prove an additional attraction. Of course, if Mr. Kelly prefers buying, he can get a much more neat-looking trap from Mr. Little, 15, Fetter Lane, built on the same principle.

Wasp-grubs may certainly be preserved in spirits, but I have been grievously disappointed with the way roach spit them out even after taking them. Depend on it fish have a very clear perception of what is good, and a Scotch whiskey flavour is not reckoned in the category. The following is a much more attractive method of preparing and keeping them. Take the fullest grown and whitest from the comb, and putting them on a colander pour boiling water gently over them from a kettle. Then drop them into a basin of bran and toss them till quite dry. Now make a syrup of sugar, or treacle will do quite as well—the

"golden syrup" of our childhood—and drop them into it. They will keep almost as long as you like, and come out hard and literally as sweet as candy. I am sorry to have to differ from J. W. M.

The pollution of waters by paper-mill refuse is execrable, and I am truly grieved to hear L. B.'s report of Heath's fishery at Wraysbury. I quite recollect the trouble of poor Old Joe when the last cargo of filth was turned in his beloved water. The worst of it is the Colne tributaries are all equally sufferers from this infernal poison.

For it is of a character which justifies the adjective, more than does that of the dynamite charge. Let any one who has watched the process of paper-making remember the sort of chemicals in use. Now that esparto grass has superseded rags for certain kinds of paper, immense quantities of caustic potash are necessary to disintegrate the pabulum from which even the paper on which the FISHING GAZETTE is printed is manufactured. Then, in order to bleach the pulp before it passes through the rollers, the purest chloride of lime is employed. Both these chemicals are so much waste, for they cost too much to recover by washing and evaporation. They are consequently turned into the stream, and the result is fungoid growths of the gills and fins, when death is not instantaneous, from chloride of lime or "bleach," as it is termed, and sudden death from the potash which is generally rendered of a coffee colour from the dissolved tannin and colouring matter of the grass, straw, wood, rags, &c., used in paper making.

The little river Gade rising at Gaddesden, and passing into the Colne somewhere by Rickmansworth, possesses trout without end for a few miles below its source, and no fish at all to speak of lower down, owing to the seven paper mills with which it suffers. It is almost moribund with its foul incubus, and as a fishing river it may be said to suffer unto death from "paper mills of all the vital parts." Ugh!

SOCIETY OF CAXTONIAN ANGLERS.

FALCON HOTEL, GOUGH SQUARE, LONDON, E.C.

PRESENTATION PRIZES FOR THE SEASON 1881-2.

Donors.	PRIZE LIST. For Specimen Fish.	Value.
Mr. G. Little.	Largest Pike (any water)	A Trolling Rod.
" C. Millbourn.	" " " " " " " " " "	A Winch and Line.
	Heaviest Trout " " " " " "	£1 1 0
	Largest Barbel " " " " " "	£1 1 0
" W. Cate.	" Roach " " " " " "	£1 1 0
	" Chub " " " " " "	£1 1 0
	" Dace " " " " " "	£1 1 0
" T. Matthews.	" Bream " " " " " "	£1 1 0
" A. Brooks.	" Perch " " " " " "	A Tackle book, fitted.
" G. Reeves, sen.	" Tench " " " " " "	£1 1 0
" S. J. Field.	" Carp " " " " " "	£1 1 0
" W. Pyne.	" Gudgeon " " " " " "	£1 1 0
	" Fish taken with the fly (any water)	£1 1 0
" A. Mayman.	" Roach (public water)	£1 1 0

Donors.	Gross Weights for the Season.	Value.
	Heaviest gross weight of	
	Jack (any water)	£1 1 0
Mr. J. Esson.	" Chub " " " " " "	£1 1 0
	" Perch " " " " " "	£1 1 0
	" Roach " " " " " "	£1 1 0
	" Barbel " " " " " "	£1 1 0
" B. O. Colnaghi.	" Gudgeon " " " " " "	£1 1 0

CLUB PRIZE.

A Silver Cup, value £5 5s.

For the Heaviest gross weight of Roach and Dace, caught between Twickenham Ait (East End) and Teddington Lock (punt or bank), on Friday, the 7th October, between 6 a.m. and 6 p.m. One rod and line only to be used. The Fish to be weighed-in at the Club House at or before 10 o'clock p.m.

The value of all the Prizes to be in kind.

COMMITTEE OF MANAGEMENT.

President and Treasurer: Mr. William Cate. Vice-President: Mr. John Esson. Committee: Mr. Carter Millbourn, Mr. John Knighton, Mr. Thomas Matthews, Mr. George Reeves, Mr. Alfred Mayman, Mr. Alfred Brooks, and Mr. George Little. Secretary: Mr. Stephen J. Field. Auditors: Mr. John Knighton and Mr. George Reeves, Junr.

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

RIVER REPORTS.

MID-THAMES.

The river is in prime autumn order for any seasonable fishing, viz., barbel, roach, jack, perch, &c. The frosty nights are supplying the river with any amount of clerical garments—otherwise lawn's leaves—which seem to knock the fish off their ecclesiastical diet of worms. At Henley, some splendid chub have been had, and at Hurley, on Sunday, Messrs. Harrison and Gee, fishing from the Treats hostelry, caught in the final hour of angling some 18 lb. of good roach; and saying good bye to the fish, when the float could hardly be distinguished, was such sweet sorrow that they could have said good-bye until tomorrow.

Thursday evening.—Weather fine; wind S.W. Every chance of good sport for those who will try.—MARLOW BUZZ.

Thames (Goring).

Water in very good order, but the fish not on much; rain is wanted very bad. Gudgeon biting very well; roach not biting much, water too clear for them. Saturday, 2 jack and some good perch; Monday, 5 dozen of gudgeon, and some good perch, largest jack taken here was 8 lb.—JOHN RUSH.

Thames (Halliford).

River very low and bright, water much warmer, and prospects for fishing much better. Since my last report I have been out four times. First two days, Mr. Long, fishing with me, took five dozen roach, one perch and a bream. Third day, Mr. George Palmer, two bream, one barbel, two dozen roach and one jack. Fourth day, Mr. Taylor, three dozen roach and dace, which were nearly all returned to the river.—GEORGE ROSEWELL, fisherman.

Thames (Richmond).

The water is a splendid colour for fishing now, and there is not too much stream to prevent us from fishing where we like; in fact, the river and water is to perfection now, and the fish feeding well, especially the roach. Brain, Howard and myself, have been out each day since my last report, and have been doing well, catching from fourteen to twenty lb. of roach each day, and going a fair size. This day, Thursday, Job Brain caught 16 lb. of roach and dace; myself, fishing with one gentleman, caught five dozen roach that turned the scale 21 lb. The bank anglers have been doing well, one of them getting a roach, 1½ lb. yesterday, with two dozen others. It is raining hard, while I write, but it will take a lot to upset the water now.—JOHN BUSHNELL, fisherman.

October, 1881.

Thames (Teddington).

The water is a good colour for fishing. The wind south-west, but a little cloudy. Mr. King, on Tuesday, caught four dozen of nice roach; another gentleman caught three dozen of good dace and two dozen of flounders; two gentlemen and myself caught eight dozen of roach and dace in two days.—J. BALDWIN, fisherman.

Thames Windsor)

Seeing what a lovely morning it is I stepped into my punt, and first tried the barbel in front of Windsor Bridge. Before I had been there three minutes before I was into a nice fish, in splendid condition, of 4½ lb., so pulled up my weight and came in at once to let your readers know that at the time of writing at least barbel are feeding. I return to the swim whilst this is on the road, and hope to report something good next week to make up. Water in fair order, rather bright; 8 a.m.—B. R. BAMBRIDGE.

Ancholme.

The fishing continues very much as when last reported. Mr. Knowles, of Brigg, has since the opening of the season caught no less than 24 stone 12 lb. of bream alone. His biggest take was 5 stone 3 lb. When we consider that all other fish are left out of the scale this result is the more surprising. Mr. Knowles has not informed me where his best swims lie, with what he fishes, and if he ground baits. On reading B.'s notes on "Unfortunate Anglers" last week, I thought how different is my experience! I have been an angler from a child, and never recollect the time when I went home empty-handed, yet I have never caught a fish in an unsportsmanlike manner, or baited a single swim. Surely I am one of the fortunate anglers; but whilst I am glad at all times to report any matters piscatorial that come to hand, I have little sympathy with bottom-fishing. I am in fact movable angler with the trout for my forte. I enjoy more real pleasure in strolling from swim to swim, and poking up a fish here and there than in banking it for a bushel. But this is personal, so I subside.—THOMAS FORD.

Colne.

Water in first-rate order for fishing. Mr. Allen, two days, a fine show of roach and dace, some of the dace going 14 or 15 oz.; Mr. Hersent, perch and jack; Mr. Hawkins, dace; Mr. Stevens, roach; and several others have taken specimen fish, one dace going 1 lb. Mr. Hawkins landed a fine trout while fly-fishing for dace, weighing about 2½ lb.; the fish was brought to the house and shown and then returned to the water, none the worse for his trip on land. There is every prospect of good fishing in the coming week if the wind will only keep a little quieter.—E. GODFREY.

Dove.

The condition of the river has improved since I last wrote. The recent rains have brought on a pretty fair colour, and there is a nice volume of water.

Trout still continue to rise to the flies offered for grayling, but when caught they should be at once returned to the river. I am afraid some of the rodsters who fish on our stream, the locals in particular, are not over careful of attending to this rule, and I should be glad to see an example made of them. The grayling takes have averaged about six brace each. This species of fish is now in prime, gamey order, and they will take both top and bottom lines freely all through this and the following month. The bottom anglers have succeeded fairly amongst coarse fish, such as chub, roach and perch. The maggot has proved the most killing, the fish having been to a large extent off the worm. I cannot hear of many pike being captured.—THE SPLODGER.

Ilfracombe (N. Devon).

Since my last report there has been very little doing in sea fishing, owing to the weather being so stormy. On Friday several boats put out, and each returned with some fine conger and ling. On Saturday a few boats were out, but owing to the weather they had to return within an hour with very poor catches. On Monday the weather was very stormy, the wind blowing from the N.W., with a heavy sea. On Tuesday it was still blowing, with drizzly rain, and on Wednesday a very squally wind blowing from N.W. to N.N.W., and on Thursday the weather is moderating a little. There has been several boats out some have just come in with some nice catches of whiting, pout, codlin and pollack; one fine conger was caught weighing about 50 lb. There has been some fine shell fish taken from the rocks under Lantern Hill. A lad on Friday took five crabs and one lobster, but the weather is getting too cold for them to stay along the shore. In cold weather they go out in deep water.—E. COTTER.

Lea (Rye House).

The water is dead off at the Rye, and will be down for a day, and no one can fish it. The wind is west and showery. There were some nice roach taken on Monday and Tuesday.—WILLIAM COWELL.

Lea (Ware).

This water during the past week has been very little until last evening, when we had a heavy rain, and again to-night, which has nicely coloured and improved it. Nothing worth mentioning taken since last Sunday, when J. Bell, of the Good Intent, took some fine roach; likewise several of the Highbury Brothers had some nice fish, and the Brothers Well Met were here also doing well.—VON LEEFE.

Medway (Tonbridge).

The anglers are as a rule in arms against the clerk of the weather for sending the rains of last Saturday. With the weather just the thing for pike-fishing, it is most provoking to have the water as thick as pea-soup. It is now raining again, so it is very improbable when there will be any fishing again.—YE MEDWAY WATER-RAT.

Severn and Teme (Worcestershire).

Grayling fishing is now at its best; the fish are in prime condition; the streams are all the fly fisher can desire, low, fine, and of that shade of colour given it by the dark blue clouds; in fact, it may be said that the clouds are of the same dun shade as the willow fly, or the iron blue with pale blue for the borders. These small flies are now the best to take grayling. If they do not come at either of them treat them to a bright red fly, a small palmer, or there is also a small red grub in the willow trees that comes out just before the fall of the leaf. I will give further particulars next week. Some good takes have been shown in Worcester. Mr. E. Davis, over fifteen brace; Mr. Hopkin, a few; Mr. Carey, a fine fish, this being his first try. There are many more, but I cannot give names. Mr. Deakin is out for two days. I expect to have good news from him.—JOHN A. GRIFFIN.

Trent (Newark).

The water is now in capital condition for general angling, low and bright; but the weather has been rather rough, or rather the wind has, most of the week, and has operated against successful angling. On Thursday night it rained rather smartly, but I think there will be nothing much to spoil the present condition of the water, which is now in capital condition for roach, chub or pike fishing. If the wind continues in its present quarter, viz., S.W., I should advise anglers to try the roach with gentles. The places that have been most productive of sport this last week or two are very steady swims, by the side of a row of willows, &c., away from the rush of the main stream, with about 4 feet of water, and a nice sandy bottom, and not above two or three yards from the bank. The water, I think, is almost too clear for roach fishing with cockspur worms, so I advise gentles, and ground bait should be administered very sparingly. Chub-fishers will find those fish at home, and inclined to take a nice white bit of scratchings—only the tackle for the foregoing two fish must be of the finest and lightest description—and chub will be found in all sorts of likely and unlikely places, from the deep, quiet eddy by the side of a swift stream, under overhanging bank, or among the roots of the bushes that overhang the stream, to a brawling shallow, with scarcely 2 feet of water, as chub have been found this week in all those places. Sport during the week has not been of an extraordinary character; one angler's basket containing two dozen roach taken with gentles, another had half a dozen chub taken with scratchings, while a stranger last Sunday had a brace of jack taken with a bleak spun on Gregory's archimedean spinning tackle. I have seen nothing else this week worthy of mention.—THE TRENT OTTER.

Trent (Nottingham).

Anglers this week have been a little puzzled to know the cause why the fish would not feed at the worm, roach, dace, bream and barbel refusing to take that bait. A great number of anglers have visited some of the noted places up the river, and on one day seventeen rods were at work on the Willington length, but not a single fish was caught, and one or two of the old hands naturally asked the question as to the cause, but no satisfactory answer could be found. Now I will try to explain. The funny tribe, it should be known, are very sensitive to sudden changes in the weather; if it be for warmer weather they will sometimes seem to wake up unexpectedly and bite freely; if the contrary is the case, and the temperature has gone down very low, all the four fish mentioned not only change their quarters, but apparently refuse to take anything in the way of bait that is offered them. At such times the anglers get deceived, because they have no knowledge of the places where the fish resort, and many return at night with empty baskets, feeling satisfied that the fish would not bite. In some cases I admit this is true. For instance, the water this week has been low and clear, and the weather cold, which was quite sufficient to prevent most of the bottom fish from biting; but some of the anglers seem to forget that at

this season when worm fishing for the time seems to be over, that chub will then come on well at scratching. This, some of our rodsters know without being told; for, although the failed one day with worms, the next they were successful among the chub, bagging 20 lb. and 30 lb. in a few hours. The pike fishers also have done well with the spinning bait, and under the present state of things the anglers cannot do better than go after pike and chub.—W. BAILEY.

Trent (Alrewas).

No news from this river worthy of notice. The cold-bitter east winds that have prevailed the last fortnight have taken the fish completely off the feed, and I cannot learn of even a respectable catch being made bottom fishing. Grayling, however, have been rising well, and some fair fish have been taken with the fly, one angler taking as many as 17 brace, but the majority were too small to keep, and were returned to their native element. A reverend gentleman in the neighbourhood of Alrewas, took a capital brace on Saturday, the largest fish $\frac{1}{2}$ lb., and also hooked a trout the same weight, which was, of course, returned. Very little has been done to date pike-fishing in the Trent, as far as our locality is concerned. A nice fish, 8 lb., was taken by Mr. Jephcott last week with live bait, and a few smaller ones have been taken by the same method. Last Saturday I had a rattling red-letter day with the President of the Birmingham and Midland Piscatorial Association in a pool a few miles from town; we were only at it for a few hours, and landed 25 fish, 13 of which and were under 3 lb. were returned for another day. All the fish were taken spinning and trolling, the majority with a gudgeon on Gregory's celebrated archimedean pike-tackle. I learn Mr. Cope has been having some capital sport at the Harborne reservoir, and Mr. W. Reynolds has been killing some fine tench, three of which scaled 9 lb., and a perch over 1 lb., which is about the sum total of news piscatorial to hand. The river to-night is reported being in capital order, and the weather, although unsettled, is a little more genial. Most probably the fish will waken up after the rain and take a cock-spur worm, which will, I have no doubt, prove the most killing bait. Your readers will regret to hear that Captain Willoughby-Wood, one of the Trent conservators, in a fit of insanity, has made two attempts to destroy himself. To-day, I am given to understand, he is going on as well as can be expected, considering the nature of his injuries. That he will recover is a feeling, I feel sure, will be echoed by all my piscatorial brethren who had the pleasure of his acquaintance.—JAMES GREGORY.

Wye and Derwent (Derbyshire).

We had a nice little flush of porter-coloured water come down the Derwent on Monday. Then again to-day (Thursday) we have had another rise from the heavy rain that has fell up in the woodlands, which caused the bottom fishers on Monday to do well on most parts of the Derwent, as there were some handsome catches of both grayling and coarse fish, killed with maggots and worms for baits. The weather since Monday has been very rough and boisterous, with showers of rain falling daily, which has caused angling to be anything but an enjoyable occupation, for it has caused the fly-fishers (the gentlemen visitors) to leave these rivers, owing to the unsettled weather we are now having. We have had a very great quantity of anglers down here from all parts of the country fly-fishing during the past fortnight. In fact, both the Wye and the Derwent have been sadly too much over-fished, for you could scarcely go to a stream to fish without either finding an angler on the stream or one just going away from it. The leaves are now very troublesome on both rivers, especially on the Derwent. Sport during the week has been anything but good. The best basket that has been made was made on the Whatstandwell length of the Derwent last Tuesday, which was $8\frac{1}{2}$ brace of good-sized grayling. Every fish was killed with bumble and furnace flies. The bottom fishers on the Derwent will no doubt do well during the next week. The grayling fly-fishers ought to do well the beginning of next week, especially on the high lengths of both rivers. The flies I have so often mentioned are still killers, as I can hear of nothing beating them up to the present.—GEORGE JAMES EATON.

Yare (Brundall).

Good roach and pike fishing continue to be had here, and so long as the weather continues to remain dry and fine, the sport will be pretty brisk. Two members of the E.A.P.S. had a very nice take of pike at this spot on Saturday last, the heaviest one scaling just 10 lb. The weight of the entire catch being 30 lb. some few ounces. Roach were also well on the feed on that day, and I think the catch submitted to me for inspection were about the best class I have seen during the season. The fish were all clean and in splendid condition, and must have afforded good sport. The new fishery station here has virtually been commenced, the company is formed and the shares are eagerly taken up, and next week your numerous readers will have an opportunity of perusing the prospectus which will appear in your advertising columns. I am pleased to hear that Mr. Alfred Palmer has been appointed general manager of the entire concern.—ANGLER.

Yore (Yorkshire).

This river has been low and clear for some time, up to the last few days, when high winds accompanied by rain resulted in a "fresh," which has temporarily stopped grayling fishing; before then some very nice dishes were killed with fly, the fish rising most freely to the dark olive bloa, woodcock and orange, and willow fly; the bumble fly has also killed a fair share of grayling. To-day (Wednesday) the weather has been wet and stormy, and seems likely to continue so.—F. M. WALBRAN.

FISHING AT GODALMING.—A member of the anglers' club meeting at the Windsor Castle Hotel, Hammersmith, got some fine jack this week in the Wey, at Melford, above Godalming.

GEORGE JAMES EATON, of Starkhous Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated TROUT FLIES which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

THE GREAT INTERNATIONAL FISHERIES EXHIBITION OF 1883.

IT is with very great pleasure that we direct the attention of our readers to the splendid announcement in connection with the above great enterprise which will be found in our advertising pages this week. The FISHING GAZETTE, as we think our readers will admit, has always taken a prominent part in advocating fisheries exhibitions, and it was the first paper to announce the proposed 1883 Exhibition, and to suggest that it should be under the auspices of the Fishmongers' Company. Mr. G. Birkbeck, M.P., is to be congratulated on the distinguished and powerful help which he has succeeded in securing. We shall not fail to keep our readers well posted in all that occurs of interest in connection with the Exhibition. We hope our friends in Germany, France, America, &c., will not fail to refer to the announcement which we give this week.

CLUB AND OTHER JOTTINGS.

By L. B.

THE FISHING GAZETTE Casting Tournament, in aid of the funds of the Anglers' Benevolent Society, to be fought out in a spirit of friendly rivalry at Warner's Welch Harp, Hendon (see particulars in other part of present number), has much to commend it to the support of the angling and benevolent public. The beneficial influence of the charity for whose advantage it is got up is undoubted and generally admitted; while the very earnest manner in which the society's secretary and committee of picked men successfully canvass on every possible opportunity for donations and members, augurs well for its future career of usefulness. It is needless here to dwell upon the many cases of dire distress it has relieved, particularly during the long and cruel winter, nor to more than state my conviction that not a few deep, heartfelt prayers from humble brothers have gone up most earnestly asking blessings for those generous givers who have placed it in the power of the executive to afford relief when sickness or loss of employment have overtaken the bread-winner of the family, and that promptly, efficiently, and without that publicity which only too often makes the receipt of assistance so bitter. But quite apart from the deservedness of its ultimate object, the Tournament has no end of good reasons to recommend it to the practical angling public. It is quite a novelty in this country, though much in vogue among brothers of the rod on the other side of the herring-pond.

Interesting must also prove the bringing together—as it is anticipated it will do—of picked Thames anglers and some keen representatives from Trent side, all exponents of the different methods of casting. A went casting, long has the wordy battle waged—prepared lines, unprepared lines, casting from reel, casting with line loosely coiled at feet; and, don't smile, casting without a rod, but merely a forked stick. These last will, if they compete, rather surprise some of the knowing ones. Not only will we, it is hoped, see all these styles—as one against the other—but we will get at the publicly-authenticated longest cast on record—ability to cast 40, 50, 60, 70 yards, and even more, as have from time to time been claimed. Here we shall see whether these long-distance casters have deceived themselves or whether they have rightly estimated the distance of their cast. (I say rightly estimated, because I don't believe one in 500 of these claimants to long casting ever measured their cast. Again, as professionals have been invited, and I believe expressed their readiness to compete (I presume in a class by themselves), we shall have a capital opportunity of judging whether the gap between them and amateurs is as wide as that noticed in several other branches of sport, and as some of the wise men would have us believe it is; for my part, I think not.

I sincerely trust that the club anglers in particular will muster in force on this occasion; they owe it not only to themselves, who will be the principal gainers, but the public-spirited promoter, our editor, Mr. R. B. Marston. I have not received a line from the Thames, Ouse, or Lea this week—the silence is significant of the sort of sport that is being met with. A friend told me he went to several clubs where good shows are the rule, on the evening of the 9th, result not a fin. There is never a total blank among the North-Westerns, and on the 9th Messrs. Underwood, Alois, and Rosebee came to the rescue with some well-conditioned jack from Elstree. They tell me there was a little over a score of sizeable fish killed on this water during the day. Mr. J. H. Stead, the "Cure," also having a few good roach, and a nice little chub from Shiplake. I regret to have to announce that Mr. W. J. Wetenhall, the respected treasurer of the North-Western Anglers is seriously ill. The members of this society do not look upon Mr. W. merely as a host and a tavern keeper, but as a personal friend, and many and frequent are the anxious inquiries as to how he is progressing; for my part I hope I shall be able to write next week favourably.

The last item with which I shall close my meagre budget, is to the effect that, in response to a letter written by Mr. T. Hoole, the secretary of the West Central, and signed by himself and Mr. Ghurney, the authorities of the Great Eastern Railway have appointed tomorrow, the 13th, to receive a joint deputation from the West and Eastern Central Association, who are empowered to ask for some important railway concession on the Colchester, and Cambridge, and Stour Valley lines, which, if obtained, would place within the reach of thousands, some of the best coarse-fish angling in Essex and Cambridge—a consummation devoutly to be wished for.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

THE "FISHING GAZETTE" TOURNAMENT AND THE WELSH HARP.

SIR,—I have had the pleasure of visiting the Welsh Harp upon two or three occasions, and have always remarked the reasonable charges in comparison to similar places, but I have not been there upon any "great" day. We all know how the prices for everything run up directly there is any great demand for them at pleasure resorts.

This tournament will be a grand advertisement for Mr. Warner, more especially among the angling public; and now is his time to go fishing himself, and see if he cannot hook on some good customers, by showing them that they can get accommodation at his house as good and as reasonable as they can get in their own club-rooms.

To stick on the prices on the 22nd would be a very great mistake, and I am sure Mr. Warner, who knows the angling fraternity are not all millionaires, does not require any reminder from me.

I am quite sure every one who attends will be delighted with the place, and will be highly amused with the entertainment provided. It is for a good purpose and should be supported.—I am, &c., H.

[We feel sure anglers will have no cause to grumble at Mr. Warner's charges.—ED.]

FISHING IN THE WEY.

SIR,—Perhaps the value of your journal cannot be better shown than in the connection of errors which may appear in contemporary journals, of a tendency to lead to much vexation and disappointment attendant with expenses, which, both in time and money, can be ill spared by a man anxious to enjoy a holiday with his rod by the side of the water. The sickening description given by your correspondent, in your last issue, of the state of the water he found at a part of the Wey, between Godalming and Guildford, is a case in point; this water having been elsewhere described as under the protection of a society with a minute description of the bends and cuts to be met with in its course, and the different fish to be found therein. What makes that description likely to be annoying is the remarkably small annual fee (3s.) necessary to entitle a member to all the advantages of the fishing, and, therefore, the more attractive to the poor man. But if these advantages be such as set forth by your correspondent, I should think that, poor as he might be, he would rather stay at home than encounter them.

A well known genial writer in the *Field* has always maintained that anglers were not only the most deterrent agents against poaching, but were fully entitled to be ranked as sanitary reformers. A thousand persons may approach a polluted and much-abused stream, and a population may live on its banks contented to let things take their course, from bad to worse, without more than a grumble or ineffectual protest; but let an angler visit the water, and his disgust and anger finds vent in a more active and useful direction, namely, he writes to the *FISHING GAZETTE*—read now by its thousands. Then the complaint becomes too loud for parochial ignoring or legislative apathy; the more immediate sufferers wake up to the extent of what they had been so long and patiently enduring, and the pressure becomes too great for even municipal indolence.

It is somewhat of a coincidence that the same issue of your journal should contain a similar complaint from L. B., which likewise has a paper maker for its delinquent (for the presence of the coffee-colour of the Wey is proof of the washings of esparto grass); but here, I suspect, the Board of Conservancy will take action, as Joe Heath's water, on the Colne, is within a very short distance of the Thames, into which it empties itself opposite Egham, a little below Bell's Weir.

In the far back numbers of the *Field* I find recorded the origin of the Wraybury fishery. From this I glean that Joe Heath formerly held a lease of a portion of a branch of the Colne at Longford, the London side of Colnbrook, and, losing this, Mr. Fennell, who patronised Joe a good deal, both for the rod and the gun, looked out for some other eligible quarters. While thus engaged, the late Mr. Crombie, the solicitor of the South-Western Railway, in conversation respecting the waters crossed or approached in the formation of the Windsor line, happened to mention the difficulty the company encountered in coming to terms with the copyholders and millers of Wraybury concerning the appropriation of certain parts of the land for a station, &c., contiguous to this part of the river. However, this was amicably arranged, and, as far as I can glean from Mr. Fennell's published correspondence on the subject, it was agreed that the water between the two mills (that above the rail and that near the Thames) should be leased by the same tenant for a nominal rent. Here, then, was Mr. Fennell's opportunity to benefit his protégé. He soon convinced the proprietor that it was to his advantage to place the water under proper surveillance, and, this done, Joe was duly installed as keeper, and not long after the fishery became worth notice as one of the very best near London. It, however, had its vicissitudes, and, amongst others, esparto grass was introduced for the making of paper to supply the dearth of rags; the caustic alkali was let freely into the water, with the usual consequence, and the fish turned up in hundreds. Catch-pits were, however, soon formed to intercept the flow of this deleterious liquid, and the fishery gradually revived, but not without extraneous aid. The water above Heath's was rented by Mr. Walker, the well known shot manufacturer, who pretty strictly preserved it, or endeavoured to do so; and at certain times, when the Colne was lively, Joe would open the sluice gates at the mill, and down would come a relay of stock, the members of which perhaps were as glad to quit their old comparatively quiet waters for the gravelly scours as was Joe to welcome them. But Walker's water has been netted out, and this once liberal resource for Joe is no longer available.

Now this, perhaps too long, letter would scarcely be complete if I omitted to state that during the praiseworthy attempts of the mill owner to remedy the injurious flow of both the alkali and the esparto steepings, Mr. Fennell and a well known analytical chemist, were trying experiments with these substances upon fish, with the result, that it required a very strong solution of esparto grass to be inimical, but a small portion of the alkali introduced into the tank visibly proved injurious to fish life. With regard to this esparto coffee-like decoction, we have an analogous example in the peat water which comes down from the grouse and other moors in Highland countries, in which the trout appear as healthy as in a crystal stream. With regard to the alkali, catch-pits were formed, and the deposit carted away, first as waste; but it being discovered that 85 per cent. of alkali was recoverable from it before the residue

became utterly useless, except as manure or compost, what was once thrown away and became a nuisance actually recouped annually the manufacturer for his first outlay in forming the catch-pits and evaporating houses; for a full corroboration of which I would refer to P. L. Simmond's "Waste Products," pp. 280, 388-9. The question, therefore, naturally arises: Do these appliances still exist at Wraybury and elsewhere, and if not, why not? But in justice to the paper-maker we may not include the bloated bodies of dogs and kittens amongst his refuse. This is clearly traceable to the culpable negligence of Godalming.—I am, &c., AQUARIUS.

SIR,—Will you please allow me to state that that which I have said representing the fishing in the Wey is perfectly true? Unfortunately the river hereabout is much polluted, but there are times when the water is fishable, and those coming from a distance must of course take their chance. I am sorry I did not mention the fact of the pollution in my reply to "Mercator," but have (since seeing the letter of "A Thames Angler") written him (Mercator) privately apologising for the omission.

I am also sorry "A Thames Angler" did not find things more pleasant—he surely is one of B.'s unfortunate anglers.—I am, &c., GEO. W. KITSON.

SIR,—I have interviewed the honorary secretary of the Godalming Angling Association upon the subject of "Thames Angler's" letter in your issue of the 8th instant. He states that the gentleman in question appears to have been peculiarly unfortunate, though he was bound to admit from his own knowledge that there was a good deal of truth in those remarks as to the filthy condition of the river. But that, notwithstanding the impurities which are thrown into the river, there are plenty of local anglers who know the water, and who could tell a very different story. The river above the town is quite free from pollution, and there, consequently, the best fishing is obtained. It must also, he suggests, be considered that the Thames angler was exceptionally unfortunate, both in his time and selection of his fishing, for where he appears to have taken up his position the current is peculiarly slow, and consequently all the refuse becomes deposited in this particular part of the river.

I also learned that had the "Thames Angler," sought out, as he should have done, any of the authorities of the society—who are doing their best to render the water, and the sport that may be derivable from it, as good as possible—he would, upon a trifling payment towards such a consummation have been directed to the best parts of the river, if not to some private water over which the society has obtained permission to fish.

A note to me upon the same subject, says "I hardly likely to follow the example of the editor in his foot-note to 'Thames Angler's' letter, but I might say that the Godalmingites know the proper 'way' to fish in the Wey, and that some of our members have a very happy knack of weighing in heavy takes of fish taken in the river so much abused by the *FISHING GAZETTE*. I hope we are not going to have an incursion of the same genus of anglers, of which the Yare and other East Anglian Societies, so justly complain, as watching all waters that are preserved at great cost, and then swooping down upon them to share the results of such expensive co-operation without paying a single farthing towards the expenses. If we were threatened with such a visitation, perhaps the letter of the "Thames Angler" may prove a deterrent antidote."—CREEL.

CAPTURE OF A SEAL IN THE THAMES.

SIR,—Chas. Grant, waterman, 3, Pier Place, Strand-on-the-Green, Chiswick, gives the following account:—On September 27, while in a boat opposite the Brentford Ferry, saw what he supposed to be a seal making towards him. Being prepared with a gun (having previously seen it), he fired, and the shots took effect on the head, as it sank immediately, and was not seen again until Thursday, October 6, when it was landed, and turned out to be a seal 4 feet 2 inches in length.

Any information can be had at the above address. It has been sent to Mr. Cooper's to set up.—I am, &c., H. U. A. S.

[This poor fellow must have escaped from some public or private menagerie.—ED.]

THE LARGE PERCH.

SIR,—The anglers in Norfolk are very much surprised at a paragraph in last week's paper, respecting a large perch said to weigh 10 lb. I am a sixty years' angler, and never saw but three that exceeded 5 lb.; two of these I caught myself in 1832, one was in June, and weighed 5 lb. 3 oz., the other in March of the same year, weighed 5 lb. 4 oz. For many years I have offered a good reward, but only once have seen a 4 lb. fish, which I now have in my dining-room. Last week a fish nearly 3½ lb. was said to be caught on Hickling Broad. I saw it this day, and its actual weight was 3 lb. 2 oz.; yet this specimen has since been got up to 4 lb., but I had the truth from Mr. Lowne, who has preserved it very nicely. He lives at Fuller's Hill in Yarmouth, and has a large number of most beautiful birds in cases. I got two silver medals at Norwich and Yarmouth Exhibition this year, and also another at the last Paris Exhibition, for my fish which were preserved by John Cooper, of Radnor Street, near St. Luke's Hospital.

Perhaps Mr. Harrington Keene and other correspondents can give us some information respecting large perch. I have thought this might be a Zanora, or pike-perch, from abroad.

My dear old friend, the late Mr. Frank Buckland, never saw perch so large as I sent him, and they only weighed 6 lb. 1 oz. the brace. I saw many years since at Mr. Holroyd's, tackle maker, Gracechurch Street, a perch, just over 5 lb., caught in the West India Docks. This was a very handsome fish. I should like very much to hear about this perch; only fancy, a 10 lb. fish.—I am, &c., ESQX LUCIUS.

MINNOW TRAP.

SIR,—In answer to Mr. Kelly's Exeter letter in your *GAZETTE* of the 8th inst.—The Minnow Trap—I beg to say I have the glass minnow traps, which never fail to catch minnows when placed in their haunts. I have let my friends have over two dozen of them since I first came across them; and, from my own experience with them I consider them far before minnow nets, which are apt to frighten them away. Mine are round, clear glass, with good-size mouth, the trap-end being shaped after the style of bottom of a claret bottle, with small mouth for minnows to enter.

I shall be pleased to reply to any applications for them.—I am, &c.,

W. J. MAYO.

13, Corn Market Street, Oxford.
Oct. 10.

THE BOTTLE MINNOW TRAP.

SIR,—I have pleasure in informing your correspondent, Mr. J. A. Kelly, that he can obtain the minnow trap he writes about at Messrs. Alfred and Sons, Moorgate Street, E.C.

I have one, but the minnows are not very ready to enter it, unless the red wool inside is steeped in oil of aniseed. This is more attractive. The price is 6s., or in japanned tin case 7s. Trusting this information will be of use,—I am, &c.,

CYRIL G. C. WRIGHT.

Marton, near Rugby, Warwickshire, Oct. 10.

SIR,—Knock a hole in the bottom of a brandy bottle, the clearer the glass the better; cork up, and with a string tied round the neck, sink in any part of the river where minnows and gudgeons are. The minnows are so inquisitive as to enter the bottle, and, like a flock of sheep, follow one another. Some put bran inside, others nothing. I have observed this system practised by many in the South of France, and once or twice, after two hour's immersion, have seen the bottles crammed with minnows, and also some small gudgeons; it will be seen that the hole, driven in with a nail, forms a trap similar to eel baskets.—I am, &c.,

T. R. SACHS.

WHO WAS "J. S." OF "THE TRUE ART OF ANGLING"?

SIR,—I am reluctant to pass "The True Art of Angling," by J. S., 1696, without an attempt to solve the mystery of its authorship. "This minute book, by an anonymous writer," observes Mr. Westwood in his "Bibliotheca Piscatoria," "forms one of the marked features of most angling-book collections, partly from its merit as a manual, but far more for its rarity, only a few copies of the earlier issues having escaped the wear and tear of time." The book is not a mere compilation, though the writer has no doubt drawn on the experience of his predecessors, but possesses a marked individuality, proving the author a man capable of forming his own opinion, and disposed to express that opinion in direct and unqualified terms. This premised, I may point out that a short treatise on angling appeared in 1684 in a work entitled "Profit and Pleasure United; or the Husbandman's Magazine, by J. S.," who, in a subsequent edition (1704) stands confessed as "J. Smith, Gent."

This "Art of Angling" opens in a similar strain to "The True Art," and contains sentences recording personal experiences in the preparation of the angler's equipment, which are nearly identical in both works. For instance, the J. S. of "Profit and Pleasure" says, "the line must be either of silk or hair, though the latter I prefer before the former; and in twisting or brading you must observe an exact evenness, lest one hair being shorter than the rest the whole stress lye upon it, and, it breaking, render the rest weak." The J. S. of "The True Art," says the same thing in almost the same words. I infer that both treatises came from the same hand; but should any correspondent be able to point out the passage quoted in any antecedent writer, my conjecture falls to the ground.—I am, &c.,

THOS. SATCHELL.

Devonshire Hill, N.W.

RICHMOND PISCATORIAL SOCIETY AND THE REPORTED NETTING.

SIR,—Your correspondent, Mr. Boalch, sec., Walworth Waltonians, "holding office in two societies numbering over one hundred members," is pleased to write you, in reference to the T.A.P.S. and their conduct at Richmond, which causes him great anxiety. It is very kind of him to take so much trouble, and we, who reside at Richmond, feel grateful to him for so ably calling attention to the matter. The T.A.P.S. and the Richmond Piscatorial Society evidently want waking up; they not only pity the solitary river keeper, but they actually require the service of your correspondent. They had been looking for a long time for the evidence—the convincing evidence—of a gentleman "holding office in two societies," who had had it proved to his satisfaction, "that men (not anglers) get quantities of fish at night." I shall avail myself of his services, and I now, in your columns, call upon Mr. Boalch to give me the names of his informants. Who are the men who net at night? Strange that we who live on the river cannot get information, in spite of large rewards. It must be left to a stranger to "raise his voice." But may I tell him, and your readers, that I defy him, or any one else, to bring forward one authentic case of netting during the past three months in the waters between Teddington Lock and Richmond Bridge.

Your correspondent does not know that there are few places where the net can be put down, and in those places there are sunk such engines of destruction as would make the poacher hesitate before trying. I can only say, sir, that, as chairman of the Richmond Piscatorial Society, I have not heard of any case of poaching, and you must remember that our members live on the river banks right up to Kingston, and we should be the first to get the news. It now rests with Mr. Boalch to give us the information, but I am sadly afraid that he has got his news from the Thames-side men, who are naturally antagonistic to the T.A.P.S. They would be poachers, many of them, if they dared, and when they get hold of a stranger they enlist his sympathies, especially if sport is not particularly good. Why, it is a well-known fact, and your columns week by week prove it, that never has there been so many dace and roach taken as during the summer months, and not small ones. Plenty of barbel have been had; and if your correspondent will enquire of Mr. Perrin, at Twickenham, he will tell him that he has not had punts enough. With reference to the "solitary river-keeper," that also is not accurate. He has plenty of assistance, and he can have any number of men to assist him. Has the river-keeper himself complained to Mr. Boalch? When he replies, kindly let him give the name of his informant, and if he does not like to state it publicly, let him send it to his representative at the T.A.P.S., Mr. Geen, who will well look into the matter. The fact is, sir, we want this information badly, and now is our chance to get it, and I am sure that from the prominent position of Mr. Boalch he has not made an idle complaint. With his information, the worthy president, Mr. Thomas Spreckley, will be glad, for I know that it is complaints of this nature that cause him much anxiety and worry. It is not known to the general body of anglers the time and money he spends on their services; he gives it in no grudging spirit, and when, time after time, complaints are made about the netting, and after thorough investigation prove to be groundless, it grieves him, I know, to find men in authority coming forward to reiterate complaints, and send broadcast to the angling world so-called facts which he and his committee know have no foundation. Your correspondent calls upon anglers to "raise their voices." We don't want any more shouting. Let them put their hands in their pockets and help support the T. A. P. S., and not leave it to a few anglers. Men come down to our waters week after week and take away quantities of fish who never have and never will give one penny to a preservation society. If Mr. Boalch will get them to raise

their purses instead of their voices he will do good, and we shall get rid in a measure of the selfish policy of a great many anglers who think that it is the duty of the T. A. P. S. to not only preserve the river, but find them in sport. I thank you, sir, for allowing me so much of your space, and I look forward to the reply of Mr. Boalch with the information I and a great many more desire.—I am, &c.,

FRED. CLENCH.

THAMES PRESERVATION SOCIETY AND THE REPORTED NETTING.

SIR,—There can be no doubt as to your correspondent, Mr. J. Boalch, having been misinformed as to some netting at Richmond. There have been several verbal reports recently in reference to such a state of things, but upon a thorough examination they have not only been found entirely false, but circulated for a malicious and party purpose. As to there being only a solitary river-keeper in the district, it can be proved there are three water-bailiffs residing between Brentford and Twickenham, all working as one man to put down every illegal offence. Mr. Spreckley has himself been several nights on the river side, and spent a considerable time in personally investigating some of these fallacious reports. Mr. Alfred Nuthall and others have been out with the keepers at night, and there has been a number of silent watchers, thereby clearly proving the reports of netting to have no foundation. There is also another proof as to the wanton nature of these reports in the FISHING GAZETTE of Saturday last, from an independent quarter. Mr. John Bushnell, a most respectable and intelligent fisherman at Richmond, says, writing on behalf of his brother professionals:—"We have to thank the Thames Angling Preservation Society for the way they have watched our waters during the holidays to save our fish from the men with the nets." I can readily understand Mr. Boalch's desire to give publicity to what he has heard; but I am afraid he has been misled, as others have been, from the same unreliable source.

W. H. BROUGHAM, Secretary T.A.P.S.

7, Ironmonger Lane, October 11, 1881.

SIR,—I should have thought that your correspondent, J. Boalch, who signs as "sec." to an angling society, would have known that the proper way to stop poaching was to act quietly and inform the right authorities of what was going on; then, if the "solitary" keeper did not attend to his duties, he would very soon be removed from his position. As a matter of fact, the "solitary" keeper can have any amount of assistance he may require. I "know" that at least four active members of the Richmond Society have volunteered to assist him, if necessary, and I also "know" that some of the Thames Angling Preservation Society's Committee have lately been on night duty in the district for the special purpose of stopping netting. I should like your correspondent, now that he has publicly announced the "fact," to inform your readers, if he will kindly spare the necessary time, how it has been proved to him that large quantities of fish are netted out at night; because, if it has been proved to his satisfaction, he ought to know the names of the guilty parties.—I am, &c.,

A THAMES ANGLER.

CONGERS EATING HUMAN FLESH.—A LIBEL ON THE CONGER.

SIR,—In an article on eels in your impression of the 8th I notice the following:—

"The suggestion that eels will devour human remains, which has from time to time been made and credited, probably originated with the undoubted fact that congers will do so."

Will Mr. Keene kindly give his authority for this statement, and also say if the bodies eaten were those of recently drowned persons? From my experience of congers I do not believe they will take any bait but a perfectly fresh one, in fact, they are quite as clean feeders as the freshwater eels.—I am, &c.,

Aberffraw, October 10.

E. GOSLING.

A CORRECTION.

SIR,—In my letter of October 1, I find I have, through inadvertence, not given the correct figures relating to the fish I took in 1875, having failed to add 193 fish—all trout except one—to the list, although I added the number of occasions on which they were caught. The figures should have been as follows:—

Wales,	2887 fish,	caught on	101	portions of days.
England,	193	"	"	12 " "
Total	3080	"	"	113 " "

Giving an average of nearly 28 on each occasion, an amount I could have trebled had full days been at my disposal.—I am, &c.,

ROBERT BALDERSTON.

MR. MALCOLM'S PRIZE FOR OUR TOURNAMENT.

SIR,—Herewith I am pleased to hand you my Improved "Freaker" Fishing Bag (removal back, registered) for a prize in your casting tournament, trusting the affair will be a success. In my letter mentioning conditions I advised cheese paste; I think a bread paste would answer the purpose. My idea was simply to show the limit of light casting, and to prove if the Trent men, throwing from the reel, can cast as straight or as far as the Lea or Thames men bait without weight of any kind.—I am, &c.,

F. MALCOLM.

40, Ludgate Hill, Oct. 11.

Re PERCH 10½ lb.—A CORRECTION.

SIR,—In last week's GAZETTE a correspondent, Mr. P. F. Davis writes respecting a gigantic perch to be seen at the Cross Guns, King's Heath, near Birmingham. I have great pleasure to endorse his statement with regard to weight. His remarks that I am proprietor of the hostelry is, however, incorrect. The house is not kept by "Host Gregory," by Mr. William Reynolds, an old and well-known Trent angler, and who is a particular friend of mine. The fish, or rather the skin, came into Mr. Reynolds' possession in a very dilapidated manner, who placed it in the hands of Mr. John Cooper, London, who renovated it, and set it up artistically in a glass case, where it now is the observed of all observers, and well worth a visit from my piscatorial brethren who chance to be in the locality. In the same room is exhibited a barbel, taken in the Isis at Oxford, by your humble servant, weight 13½ lb. Mr. J. P. Wheeldon, *Bell's Life*, when visiting the Midlands last year, pronounced this fish the best barbel in the country, and remarked, in his usual genial and happy style, "Here have I killed hundreds of barbel in my life, but am fairly

knocked into the proverbial cocked-hat by a Brummagem button in point of beauty and size."

Doubtless many of your correspondents and readers will come to the conclusion it is a "pike perch;" it is, however, nothing of the kind, nor like one in any respect. It has the appearance of existing from the time of the Flood, so ancient does it look.—I am, &c.,

JAMES GREGORY,
Hon. Sec., Birmingham and Midland Piscatorial Association.

A CANOPY FOR PUNT FISHING.

SIR,—In your GAZETTE of October 1, I inserted a letter, informing your readers that I would shortly bring to your notice, and give a description of the covering which I wish to introduce to the fishing fraternity, and I feel sure to the ardent piscator who faces rough weather in all its phases; and I have personally a vivid recollection of a rough day on the water, that the above apparatus, from its simplicity, adaptability, and perfect protection from wind and rain, will add considerably to his comfort, and may be the means of preventing cold, too often the forerunner of many an illness. It is very portable, and consists of a ribbed canopy with curtains attached; the whole folds up in a space of 14 inches in length by 3 inches in diameter, excepting a small steel stem 3 feet long, which can be carried with a rod, the whole weighing 4 lb., and it can be easily attached to any boat in one minute. Its price complete, in waterproof material, is from 15s., and it can be had of the patentee and manufacturer, Mr. Scowen, Alpha House, Stoke Newington. There is ample room for striking freely above and on either side; but it must be seen for its advantages to be fully appreciated.—I am, &c.,

A. C. TUCKER.

WASP GRUBS AND WHISKEY.

SIR,—Preserving wasp grubs in whiskey, great failure; gave Jack a bottle to try, next morning no grubs no whiskey. Jack on the floor fast asleep; on waking him up, asked him where the grubs were, "In the comb in the oven, best way to preserve grub, whiskey bottle, neck too small, fumes too strong, fell down and upset the lot, fumes overpowered me," Shan't try whiskey any more; best way to preserve wasp grubs—place them in a warm oven for about five minutes.—I am, &c.,

PIXIE.

Oct. 12.

CLUB REPORTS.

ACTON AND EALING ANGLING SOCIETY.

Since last report five men have joined. The following members have taken fish. F. Clifton, one roach, 1 lb. 3 oz.; S. Head, 6 lb. 12 oz., chub, roach, and dace; W. Howell, 2 lb. 14 oz., chub, roach, and dace; A. Slatter, 2 lb. 10 oz., roach; F. Cooper, chub; Hon. Sec. Williams working hard.—BLACK BAG.

ANGLERS' PRIDE ANGLING SOCIETY.

Several members of the above society went out on Sunday last, the members weighing fish being:—H. Haines, roach and bream from the Thames, one bream weighing 2 lb. 8½ oz.; J. Deeley, jun., roach; W. Nash, roach.—T. MARSHALL, sec.

October 11.

BOSTONIAN ANGLING SOCIETY.

On Sunday last we had a good show of roach in our trays, averaging half pound each. On the 5th inst. 7½ lb. roach. On Sunday next the Bostonians fish a pegged-down match at King's Langley, for six valuable prizes.—H. TAYLOR.

Oct. 11.

BRIGHTON ANGLERS' ASSOCIATION.

Again the weather has turned the wrong way for anglers in this district. The Ouse and Adur are very thick, and too much water running to be comfortable for the sport. A few of our members went to the Cuckmere on Sunday, and one of them landed a carp weighing 4½ lb., and returned at a late hour to weigh-in, when he discovered the fish still breathed. It was thought advisable through the direction of Mr. John Free, an extent judge of fish, to place it in a tank of water, which was accordingly done, and in the morning the carp was alive, as if nothing occurred; it was out of the water six hours. The members then resolved to present it to the Brighton Aquarium, and was welcomed by Mr. Lawler, the curator of that establishment. Mr. Anscombe went to private waters, and banked two nice jack, the competition dated for Sunday next, is postponed on account of the state of the rivers. All prizes won on the 2nd of October will be awarded next Monday evening, and the next competition announced.—GROUND BAIT.

BERMONDSEY BROTHERS ANGLING CLUB.

Our show of fish on Sunday last, as far as numbers, was small, as but few of our members went out, but the quality was good. Mr. Herbert, a perch from the Thames, 1½ lb.; Mr. Allen, a roach, 2 lb., a carp, 4½ lb.—WM. ALLEN, sec.

October 11.

CAMBRIDGE FRIENDLY ANGLING SOCIETY.

On Wednesday, the 5th inst., Mr. Warsop had a very nice tray of fish, consisting of jack, perch and grayling, weighing together 28 lb., all of which were in splendid condition, and much admired, the grayling being the first that has been shown in the society, the seven fish weighing 10 lb., and the three largest will be sent to Cooper, for preservation. Mr. Warsop is to be congratulated upon his excellent catches this season, as he is an ardent angler.—W. SUTTON, sec.

Oct. 8.

CITY OF LONDON ANGLING SOCIETY.

The following members weighed-in on the 9th:—Mr. Mortimer, some fine roach from the Rye-House water—the heaviest fish 1 lb. 3½ oz.; Mr. Castell, roach from Rickmansworth; and Messrs. J. Chambers and Payne, roach and bream from Amberley.—CAS.

DALSTON ANGLING SOCIETY.

Several of our members were out on Sunday, the 9th, when Messrs. Bunn, Fortescue, Long, Baker, and Eagles had a very good show of roach.—S. MALLEY.

EXCELSIOR ANGLING SOCIETY.

The shows at the above society have not been so plentiful, nor yet up to the usual average, owing no doubt to the cold weather which we have had the principal show being by Messrs. Blackman and Smith. On Sunday week last the former gentleman had a splendid tray of barbel (about eleven fish), scaling 26 lb.; the latter, roach, dace, and perch; your humble servant, bream. Last Sunday, Mr. Smith, roach and dace.—A. THOMAS.

October 12.

FIRST SURREY ANGLING SOCIETY.

The members of this society will fish a peg-down match for several valuable prizes at Weybridge on Sunday, October 30th. Members are earnestly invited to attend.—J. D. MANNING, sec.

GOLDEN BARBEL.

Mr. Blank is seldom a visitor to this society. If the shows have not been so good as they used to be, they have had the advantage of all being up to the society's standard in reference to size and weight. According to the fish book, the fish exhibited during the last few Sundays would have been received in some societies that I know, with great gratification, especially those exhibited on Sunday last from the Thames, the Lea, the Colne, and Father Adam's Eden, the Welsh Harp, by the following gentlemen:—Mr. T. Lee, roach, perch, and dace; Mr. Duck, roach; Mr. Goudge, roach and perch; E. Harrison, roach and chub; T. Lumby, roach; Mr. Chapman, jack and bream; E. Henries, carp; E. Hall, dace; gross weight, 24 lb. A competition will take place on the 23rd, for the following:—First gross weight of all fish, an eight-day clock, given by a friend of Mr. Dixie's; two framed pictures, given by Mr. Allen; ½ lb. of tobacco, for the largest roach, given by Mr. Henries; twelve jack hooks, for the largest jack, given by Mr. T. Bigsby. There are also several other prizes for the gross weight of roach, gross of perch, and gross of dace. Conditions—All fish according to club rules, to weigh any style or fish allowed, bar nets and silver hook. Speaking about hooks puts me in mind of those brass screws and rings that are used for suspending the cases that contain piscatorial trophies and the necessity of having them examined now and then. If this is done it will often save the owner the expense of having new glass, and sometimes save a valuable trophy from being spoiled. On Tuesday evening during my visit to this society, in an interval of silence called by the chairman, a sudden crash was heard, and looking round I observe that the highly-prized trophy, viz., the second bream preserved by this society, and captured by Mr. John Jones, at Penton Hook, some years ago, had fallen from the wall, and come to grief through the screw drawing from the case, and the ring was left hanging on the nail. Prevention in time very often saves pounds, and if it had been done in this case the expense of repairing would not have been incurred.—PIXIE.

October 12.

GOOD INTENT.

The members of this club fished at Ponder's End for twelve prizes last Sunday, but the fish being dead off, only nine prizes were taken; the winners being A. Sims, H. Winter, Guntrip, Holmes, Tibbatts, &c. Our worthy treasurer, Mrs. Roberts, has given the members a handsome set of vases, value £3 3s., and the club have given nine other valuable prizes, for the month of November, the heaviest weight of any fish from the Lea to win. Mr. W. Roberts brought up a splendid show of roach and rudd on Tuesday evening, some of the rudd being very fine specimens; they are sent to Cooper's to be preserved.—R. MURPHY.

Oct. 14.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

We had a fair show of fish from the Wey on Sunday last. Mr. Theobald having 10 lb. 6 oz. roach, one fish 1 lb. 6½ oz.; Mr. J. Fitch, 4 lb. 14 oz.; Messrs. Parkin and J. K. Fitch also had roach and perch from same river; Mr. Armstrong, a brace of jack and three perch from the Thames, 5 lb. 3 oz.; Messrs. W. Watling, Young, and Baker, roach from the Colne.—J. A. FITCH, jun., sec.

Oct. 11.

GRESHAM ANGLING SOCIETY.

This society had a magnificent show of fish at their meeting on Thursday evening, about 80 lb. or more of roach, all of large calibre, being weighed-in by Mr. Hunt within two days. Other members weighed-in roach and jack, the latter between 4 and 5 lb. each. The amendment of the rules was carried with enthusiasm, so that they should clearly read that the society gave prizes only for specimen fish. A number of new members were elected, and the Anglers' Benevolent box shaken up effectually. The tournament was also mentioned, and members invited to be present. The society, in carrying out the objects for which it was founded, has decided to have occasional essays and papers read at its meeting. The first of these, on Monday next, will be by Mr. Crumplen, the hon. sec., on "The Causes of the Apparent Diminution of Fish in the River Thames," with remedial suggestions, the chair being taken by Captain Alfred, at 7 p.m. punctually. Any gentlemen or anglers interested are invited to attend and take part in the discussion, which, it is anticipated, will be of unusual interest. The new rooms of the society are at the City of London Tavern, 11, Bishopsgate Street, Within.

HULL PISCATORIAL SOCIETY.

At a meeting of this society, held at the Seven Stars, Fish Street, Hull, on Wednesday, September 28th, Mr. T. Noble in the chair, a deputation of anglers from the Beverley and East Riding Angling Society was received, relative to forming themselves into a branch of the Hull Piscatorial Society for Beverley, Driffield, and the East Riding of Yorkshire, and after a long discussion between Messrs. H. J. Willett (treasurer), W. Hague (secretary), and Mr. Cheeseman, of the Hull Piscatorial Society. It was unanimously agreed that a branch should be formed, and that the officers of the branch should be those of the Beverley Society, viz., president, Mr. Hutty; treasurer, Mr. Garfield; and secretary, Mr. F. Greenwood; the branch being empowered to elect their own committee, the meeting house to be the Angel Hotel, Beverley. The fourth match of the season was then arranged to take place at Brigham, near Driffield, on the river Hull, on Thursday, the 20th October.—H. J. W.

Hull, Oct. 6.

IZAACK WALTON ANGLING SOCIETY.

Three special prizes were fished for on Sunday last, 9th inst., at Boxmoor, only one of them was taken. The two special prizes (the cup and 10s. 6d.), which were not taken on the 9th inst., will be fished for on the last two Sundays in October, the first two heaviest weights of any kind to win; members to choose their own fishing water. No competitor to leave London before the mornings of the competition. Three special prizes will be fished for on Wednesday, the 19th inst., same conditions as above. Mr. B. Crook had a handsome show of roach and chub on the 9th inst.

KING'S CROSS UNITED ANGLING SOCIETY.

The members of this society have been out in full force for the last few Sundays, but have not up to the present been rewarded according to their deserts. The competition for the prize presented by Mr. Davis, and which took place on the 2nd and 9th inst., was well contested, the winner turning up in Mr. Burnett, who had a nice sample of roach and a pretty little jack from the Thames. Messrs. Woelfell, Davis, Morley, and Bell also out, but could not tempt any of the finny 'uns to change their residences.—G. TREADWELL.

October 11.

LITTLE INDEPENDENT ANGLING SOCIETY.

Very few members went out on Sunday, and the takes were indifferent. The following members weighed-in:—Mr. Watts, roach; Mr. Heelas, roach and gudgeon; Mr. Petrie, roach and gudgeon; Mr. Raine, roach and dace; Mr. H. Moore, roach and dace.—W. BROWN, hon. sec.

Oct. 12.

ORIGINAL ALEXANDRA SOCIETY OF ANGLERS.

We had a nice show of fish on Sunday last. Mr. C. Hewett, roach; Mr. J. Blackledge, roach; Mr. E. Dymond, roach; Mr. E. Brockett, roach.—E. DYMOND.

Oct. 12.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

The members had a variety of fish again on Sunday last. Mr. Laundry, roach and dace from Fulbore; Messrs. W. and L. Gorsuch and Long, perch from the Thames; Mr. Neagus, with 6 lb. of roach from the Stort; Mr. Obbard, dace from the Lea; Mr. J. Drew had also roach. A splendid bream was also shown, weighing 4½ lb.—THOS. WM. LUCY, sec.

October 13.

PECKHAM BROTHERS ANGLING SOCIETY.

A match was fished for on the 9th for three prizes, Mr. Garrad took the first, Mr. Menard the second, and Mr. Stidolph the third. The other members had fish. The visit of angling societies to this club will take place on Tuesday the 25th inst., when members of clubs are invited to attend.—W. M., sec.

October 13.

The members of this Society competed for prizes on Sunday, but none of the members had arrived home, when I left there at 9.30., perhaps Mr. W. Matthews will forward the results of the competition.—PIXIE.

Oct. 9. 1881.

ROYAL PISCATORIALS.

Thursday evening, Oct. 13: Arrived to hand this evening, 20 lb. of roach, largest fish weighing about 1 lb. 12 oz., all of which are placed to the credit of Mr. G. Hockley: Mr. T. Hughes also forwards 50 lb. of jack, the largest turning the scale at 8 lb. 12 oz.; all these fish are in splendid condition.—PIXIE.

SIR HUGH MYDDELTON ANGLING SOCIETY.

A number of our members were out on the 9th inst., trying Maidenhead and Pangbourne for roach and chub with very poor success. The fish appear to be dead off feed at the above-named stations, so we must wait patiently for a flood, when I am sure the anglers will do better in the Upper Thames. Messrs. Billings and Smith had a few chub; Mr. Dunblair had roach; Mr. Rogers, roach. Could you kindly answer the undermentioned:—What is the name of the river that runs nearest Harpenden, Herts?—G. CABORN, sec.

Oct. 10.

SURREY PISCATORIALS.

The result of the competition this day is as follows:—First, Mr. Howard, with 10 lb.; this gentleman also won the first prize in the Walworth Waltonians a short time back. "Another Foxhall;" second, the worthy host, Mr. Bansback, with 9 lb.; third, Mr. Boach, secretary of the W.W., also M.S.P., with 8 lb.; fourth, Mr. Meadway, with 5 lb. from the Colne; fifth, Mr. Duck, 5 lb. from the Colne. Mr. Beckett also exhibited tench, perch, and chub, nice preservable fish. Several other members also had fish, which made the gross weight up to 41 lb. 6 oz.—PIXIE, London.

Oct. 12, 1881.

WALTONIANS.

On October 5th Mr. S. Keats weighed-in a jack 2 lb. 13 oz., taken on fine roach tackle at Elstree; Mr. Read weighed-in roach, 3 lb. 9 oz. Mr. Morris had a fine show on the 9th, of roach and dace, from the Kennet—10 lb. 3 oz. Mr. T. Watkins also had roach and dace from the Kennet, one dace weighing 11¾ oz. (beating one previously weighed-in by Mr. Waltham, from the Thames, by ¼ oz.), total, 3 lb. 7¾ oz. I regret to say there were no other takes worthy of record. Four or five prizes were competed for.—A. J. MARRIOTT.

IMPORTANT NOTICE.

Secretaries of societies enrolled in the West Central Association of London and Provincial Angling Societies are respectfully requested to send delegates to, or attend themselves, the next meeting, to be held on Friday, the 21st inst. Important letters in connection with the railway concessions will be read. Tickets of admission can be obtained of Mr. T. Hoole.

THE FIRST LONDON BRIDGE.

SLIGHT mention was made in a previous number of the FISHING GAZETTE about the original London Bridge, or the first that was ever made over the Thames. This bridge was constructed of wood, and owed its origin indirectly to a rather singular circumstance.

John Overs was a ferryman, and rowed passengers in his boat to and from Southwark and the City. He was a most penurious, grubbing fellow, and though he kept a number of apprentices, he nearly starved them. His money he put to usury, and altogether he grew very rich. Black-puddings in those days sold at a penny a yard! And chiefly on these he half-fed his men or boys, and would allow them no light at night-time. The old man got so stingy at last that in order to save a day's food to himself and the household, he feigned death. He duly "laid out," and covered himself with a white sheet. His apprentices, "upon hearing of the glad tidings," began to skip and dance; they broke open the cupboard, demolished all the bread and cheese, washed down by a flagon of ale. In the midst of their revelry, who should come down into the lower room but old John Over, the sheet partly covering him, and with a lighted candle in each hand. A "jolly young waterman," seizing a broken oar, and thinking the spectre was "the devil in the dead man's likeness," knocked the old fellow's brains out and killed him on the spot!

But the old man had got an only daughter, and she had a secret lover. The latter, in the crisis, hastened with all speed to London on horseback; but, in proof of the old adage about "slips and lips," the animal fell, and broke the rider's neck! Other lovers came "in such rapid succession," that the young lady resolved to become a nun, built a famous church and dedicated it to the Virgin Mary, and otherwise bestowed her wealth for religious purposes. In memory of the pious act, the people added her own name to that given by her to the church, and called it "St. Mary Overs," which title it bears to this day. To the priests of St. Mary Overs the first London Bridge owed its origin, with the money accruing from the wealth left by the old Southwark ferryman's daughter, and they for a long time kept it in repair. Bermondsey Abbey was in existence in those early days, and nobody would bury the old man, for, from his sordid usury and extortion, he was excommunicate. The abbot, however, in pity for the poor daughter, who was driven mad, had the body thrown over an ass, and the animal (the Abbot's own!) wandered away to St. Thomas-a-Watering, shot the carcass off under the public gallows, where it was buried.—LIBER.

THE UNITED LONDON ANGLERS' CENTRAL COMMITTEE.

BALD-FACED STAG, WORSHIP SQUARE, FINSBURY, E.C.

IMPORTANT NOTICE.

It has been reported that certain anglers are suspected of lending their privilege card to their friends for the purpose of obtaining the anglers' cheap ticket.

Complaint is also made that the cheap ticket is obtained for certain stations, the angler travelling to some other station to which the concession is not granted, there tendering the difference in fare between the two stations.

The Committee beg to remind their members that gaining these grand concessions has cost a great deal of time, trouble, and expense; and infractions of our agreement with the different railway companies, if not stopped at once, will lead to the withdrawal of the concession altogether, therefore the committee have determined to prosecute any member infringing the rules of the committee.

It must be distinctly understood that the card is to be used for angling purposes only, and that under no pretence whatever is a member allowed to lend his card to another person, not even to a fellow member, and further the tickets are only available at the stations named on the instruction cards, if presented at any other it will be cancelled and the full ordinary fare charged from tarring point.

The booking clerks have strict instructions to detain any privilege card presented by two persons, and they are not permitted to issue two tickets to one person unless two privilege cards are presented: if any abuse of the privilege is detected, the case will be reported at once.

A REWARD

will be paid to any person or persons giving such information as shall lead to the conviction of any member or members infringing these rules.

The committee are determined to put a stop to practices that jeopardise the great boon enjoyed by nearly 10,000 anglers.

Secretaries are particularly requested to read the rules to each member printed upon the back of each privilege card before handing it over.

All communications to be addressed to:—

MR. R. GHURNEY, Secretary,
United London Anglers' Central Committee,
10, Baches Street, Charles Square, Hoxton, N.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

BOOKS ON AQUARIA.

We clip this list from that capital paper, *Forest and Stream* :—

Books published and kept by H. H. Bailliere, 290, Broadway, New York. (This name is not now in the city directory.)

Life Beneath the Waters; or, the Aquarium in America. By Arthur M. Edwards. New York: H. Bailliere, 290, Broadway, and 219, Regent Street, London, 1858. 8vo., pp. 163. Finely illustrated.

Book of the Aquarium and Water Cabinet: or, Practical Instruction on the Formation, Stocking and Management, in all Seasons, of Collections of Freshwater and Marine Life. By J. Harper. London: 1856. Price \$1.

Ocean and River Gardens: A History of Marine and Freshwater Aquaria, with the Best Methods of their Establishment and Preservation. With Twenty Coloured Plates from life. By H. N. Humphreys. London: 1857. Price \$3.50.

The Aquavivarium, Freshwater and Marine: Being an account of the Principles and Objects Involved in the Domestic Culture of Water Plants and Animals. London: 1857. Price 75 cents.

Hand-Book of Plain Instructions for the Construction and Management of Freshwater Aquaria. By J. Bishop. London: 1858. Price 30 cents.

The Aquarium: An Unveiling of the Wonders of the Deep Sea. By P. H. Gosse. Second edition, enlarged. With Chromographs and Wood Engravings. Price \$5.

Hand-Book to the Marine Aquarium. By P. H. Gosse. Second Edition. Price 75 cents.

The following books are by various publishers :—

The Family Aquarium. By H. D. Butler. New York: Dick and Fitzgerald, 1855. 8vo., pp. 121. Price 50 cents.

The Aquarium; Its Inhabitants, Structure and Management. By J. E. Taylor. London: Hardwicke and Bogue, 192, Piccadilly, W., 1876. 8vo., pp. 316.

Hints for the Formation of a Freshwater Aquarium. (No author's name,) London: Printed for the Society for Promoting Christian Knowledge; sold at the depositories; Great Queen Street, Lincoln's Inn Fields, &c. (No date.) 12mo., pp. 132.

AWARDED

SILVER MEDAL AND 2 SPECIAL DIPLOMAS OF HONOUR

For Improvements and General Excellence in Manufacture,

NATIONAL FISHERIES EXHIBITION,
NORWICH, 1881.

HARDY BROTHERS, ALNWICK

Gun, Fishing Rod and Tackle Manufacturers,

INVENTORS AND PATENTEES OF THE

NEW WINCH FITTING AND SPIRAL LOCKFAST JOINT,

Are now prepared to Supply ANGLERS with RODS (made to any balance), fitted with these improvements. Prices on application.

Pronounced by the Jurors

TO BE THE GREATEST IMPROVEMENTS EVER MADE IN
FISHING-RODS, AND THAT NO ROD SHOULD
BE WITHOUT THEM.

Send Rod and Reel, and have them fitted with these improvements.

N.B.—As the demand for these goods is very great, we will be glad to have ORDERS PLACED in good time.

1st AWARD MELBOURNE EXHIBITION, 1881.

DAY, SON AND HEWITT'S
STOCKBREEDERS'
MEDICINE CHEST.

FOR ALL DISORDERS IN HORSES, CATTLE, CALVES, SHEEP
AND LAMBS.

In this chest are the following matchless and world-renowned remedies, all that a Farmer can require to cure disease amongst his Stock and keep them in fine, healthy, and buoyant condition :—

"CHEMICAL EXTRACT," for Wounds, Swollen Udders, and Ewes Lambing.

"GASEOUS FLUID," for Colic, Scour, and Debility.

"RED DRENCH," for Cleansing Cows and Ewes, &c.

"RED PASTE BALLS," for Conditioning Horses.

"BRONCHOLINE," for Husk, Hoarse, or Cough.

"GASEODYNE," for Heaving or Paining.

"ALCOHOLIC ETHER," for Colds and Chills.

"CARMINATIVE CHALK," for Diarrhoea in Lambs and Calves.

Price of Chest, with "Key to Farriery," £2 10s. 6d., carriage paid. Each article can be had separately.

Patronised by Royalty, and used for over 40 years by the Leading Agriculturists of the British Empire.

CAUTION.—See that the Name of DAY, SON and HEWITT is on all Bottles and Packets.

The Fishing Gazette.

SATURDAY, OCTOBER 22, 1881.

THE RIVER WEY.

(Continued from page 503.)

THERE is nothing very remarkable about Alton—it has a dull uninviting appearance, without any edifice that would arrest attention, nor has it any associations that render this flatness less sparkling, excepting the far-famed Alton ale, which is sparkling

and not flat. In this respect the Romford ale of late years, while it possesses many of the same characteristics recommendatory to the palate, is by most "judges of malt wine," on a par, if it does not surpass, the Hampshire product. The source of the Wey derives its remote waters from the wild heaths on the borders of the county and the south-west side of Surrey. The main source is about one mile south-west of Alton, through which the brook meanders, and it is a very small stream for a long distance after it quits the town. But the angler will find throughout its course thus far, that is to say to Farnham, a tolerable sprinkling of trout of from half-a-pound to 3 lb., and occasionally over that weight. At a mill-tail at the back of Alton, and more particularly in the waste water-hole, and some small reservoirs at the head of the mill, we have a few years ago, made some pretty baskets with the fly and worm, but our largest trout did not exceed 1½ lb. The valley and the stream is narrow all the way to Farnham, and does not freely admit the practice of the fly, while the hop-gardens here and there on both sides effectually prevent its use. We pass the pretty village of Bentley *en route*. Cobbett's account of this valley, which was his birth-place, may be quoted here, although we do not sympathise with his notions of prettiness, picturesqueness, or beauty. In his "Rural Rides" he says: "Arthur Young calls the vale between Farnham and Alton the *finest ten miles* in England. Here is a river with fine meadows on each side of it, and with rising grounds on each outside of the meadows, those grounds having some hop-gardens. But though I was born in this vale. I must confess that the ten miles between Maidstone and Tunbridge (which the Kentish folks call the *Garden of Eden*) is a great deal finer: for here, with a river ten times as big, and a vale three times as broad, not only hop-gardens and beautiful woods, but immense orchards of apples, pears, plums, cherries, and filberts, and these, in many cases, with gooseberries and currants, and raspberries beneath; and all taken together, the vale is really worthy the appellation it bears."

Bentley should not be passed by the angler who possesses aristic proclivities, as it well merits the encomiums of James Thorne, as "one of the very prettiest little places of its kind we know of." It would have made the fortune of a Dutch painter who should have been so lucky as to light upon it. The church is pure Norman, and approached by a long avenue of yew trees. Here, after passing Bourne, is the sand-hill which Cobbett speaks of as playing a rather important part in his "education." After telling his readers that he worked in one of these hop-gardens when from eight to ten years old, he adds: "but the most interesting thing was a *sand-hill*, which goes from a part of the heath down to the rivulet. As a due mixture of pleasure with toil, I, with two brothers, used occasionally to disport ourselves, as the lawyers call it, at this sand-hill. Our diversion was this: we used to go to the top of the hill, which was steeper than the roof of a house; one used to draw his arms out of the sleeves of his smock-frock, and lay himself down with his arms by his side; and then the others, one at head and the other at the feet, sent him rolling like a barrel of wood. By the time he got to the bottom, his hair, eyes, ears, nose and mouth were all full of this loose sand; then the others took their turn, and at every roll there was a monstrous spell of laughter. . . . this was the spot where I received my *education*, and this was the sort of education; and I am perfectly satisfied if I had not received such an education, or something very much like it—that if I had been brought up a milk-sop, with a nursery-maid everlastingly at my heels, I should have been at this day as great a fool, as inefficient a mortal as any of those frivolous idiots that are turned out from Winchester and Westminster Schools, or from one of those dens of dunces called colleges and universities." Such wild opinions as these may serve to show that Cobbett's addling his brains down a sand-hill, did not tend to enlighten his ideas. It is in the memory and experience of the writer of this paper, that Cobbett, under the conviction that he could oust either Peter Moore or Edward Ellis as members for Coventry, entered that ancient borough during an election, declaring himself a candidate for the suffrages of the burgesses, emphasising his claim upon them by the production of the mortal remains of Tom Paine. Unfortunately for the success of this grave political *coup de theatre*, a young medical man, who had not had the benefit of the education of a sand-hill, or the advantage of its dust in his eyes and other of his facial organs, at once declared, upon an examination of the bones that had been brought over from America, it is said, with such pains, that the extremities were composed of one tibia, three femurs, one shin bone, and three arm bones!

But to return to our river. After this its tortuous course renders it somewhat difficult to follow its windings, but as no temptation excepting night or a tributary stream can lure us from our attachment to the water of our casual adoption, we have followed its erratic course to Godalming, and were well rewarded for our time and affection. Wherever a river bends upon itself, you may rely upon deep holes and sandy scours, for the same action of the

water, by impinging upon an opposing bank, which burrows in time a deeper and deeper profundity, throws up the finer triturated and well-washed particles out of the more rapid current on to the opposite "shore," where they sink, and form a clean stratum. It was at Godalming that the gross imposition of the woman delivered of several wild rabbits took place, which had a great and prejudicial effect on the rabbit market. "Od rabbit it!" is said to have no older origin than this, being the natural exclamation of those guests who found this dish unadvisedly at the dinner-table. A wag of that day said that Mary Toft—for that was the name of the woman who practised this strange deception—had been conceived by Warren Hastings—the number and rapidity with which the bunnies were borne, fully justifying the dual nature of the pun.

We are now at Moor Park, and close to the ruins of Waverley Abbey.

In reference to these remains of the Mother of the Cistercians, quaint old Fuller says that "very valiant trencherman, Time, is wont to leave in the dish some fragments for manners' sake, although, in this instance, they are but slender." They stand on a broad green meadow, round which the Wey, overlooked by low, wooded hills, winds on three sides.

Moor Park was the seat of Sir William Temple, when Swift was residing with him. As Sir Walter Scott has rendered memorable the name of Waverley, so has Swift that of Moor Park. Macaulay's graphic words are here too enticing to let slip:

"To Moor Park a high interest belongs. An eccentric, uncouth, disagreeable young Irishman, who had narrowly escaped plucking at Dublin, attended Sir William Temple as amanuensis, for board and twelve pounds a year, dined at the second table, wrote bad verses in praise of his employer, and made love to a very pretty dark-eyed young girl, who waited upon Lady Giffard. Little did Sir William Temple imagine that the coarse exterior of the dependant concealed a genius equally suited to politics and to letters—a genius destined to shake great kingdoms, to stir the laughter and the rage of millions, and to leave to posterity memorials which can perish only with the English language. Little did he think that the flirtations in the servants' hall, which he perhaps scarcely deigned to make the subject of a jest, was the beginning of a long, unprosperous love, which was to be as widely famed as the passion of Petrarch or Abelard. Sir William's secretary was Jonathan Swift. Lady Giffard's waiting maid was poor Stella."

The angler used to have no difficulty in obtaining permission to enter through the Farm and angle in the old monkish moats, and fish stews which are otherwise concealed from observation.

The course of the Wey again assumes a writhing, wounded worm-like action, and is joined at Tilford by the other branch of the river, which, rising near Haslemere, forms a wide detour by Bramshot and Tresham to the junction at Tilford, taking with it the waters of a branch from Selborne, Gilbert White's village. The Tresham ponds were, until comparatively recent times, open to any well behaved angler, but I have heard that of late years they have been rendered more or less exclusive. The perch that we and our companions have taken there, fishing in a very primitive way would now astonish the most successful paternosterer of Thames, Trent or Avon. These red-letter days, however, are of the past, and preservation, if such is exercised, may have had something to do—as it has, strange to say, elsewhere—with lighter bags.

From Tilford the united streams of the Wey proceed in an eastward direction, by Pepperharrow Park to Godalming, then turning abruptly northward, through a very pleasant country, approach Guildford. Between Godalming and Guildford there is now a society, which, it is to be hoped and expected, will have its influence in removing certain annoyances from sewage works, tanners' yards, paper mills, &c., which are not only abhorrent to the angler but objectionable to the residents. After quitting Guildford we get a view of Sutton Place, on which Queen Elizabeth conferred one of her expensive, if not ruinous visits, "killing with kindness."

Shortly after reaching Send and Woking, the Wey is joined by a considerable stream from the south-west the junction taking place near the ruins of Newark Abbey, delightfully situated in a meadow on the left bank. A bit of monkish scandal—"The emanation of malice"—is still related of the monks of Newark. It is said that the "cowlers" liked good living better than fasting, and that the devotional exercises they most delighted in were those they pursued along with the nuns of the convent at Ockham, on the other side of the river. If we may believe the same scandalous tradition, the monks, in order to facilitate their intercourse with the convent, determined to form a tunnel under the Wey, and thus connect the two establishments. Long and zealously did they labour, and at length they had so nearly completed their work that all the brotherhood were summoned to be present at the opening at the farther end, when, just as they were in the centre of the river, the water burst in and they were all drowned. The same story has, however,

served its turn for so many other priories that we may well leave it amongst the mythical. The mansion of Ockham is the residence of Lord Lovelace, whose lady is Lord Byron's daughter Ada.

At Wisley the Mole and Wey run within a short distance of each other, though they part again almost directly, then we get to Byfleet and then Weybridge, where, for the present, we must leave the reader.

TROUT AND GRAYLING FISHING IN THE DOVE.

(Continued.)

IN my last I mentioned that, not having fished the three-and-a-half miles of water between Beresford Hall and the little village of Mill Dale, I would not attempt to describe it, but would confine myself to describing some experiences of the fishing from Mill Dale to the Dove's junction with the Manifold, in the Manifold itself, and in the Wye.

I will now, with my reader's permission, take him with me, and point out the best casts, as well as my memory will serve me, from Ilam Hall, where the Manifold rises to the surface, after its long and mysterious underground course, down that stream to the Dove, and then up the Dove to Mill Dale. Mr. Prince gave me some interesting information about the Manifold and its sister stream, the Hamps, both of which rise in almost the extreme north of Staffordshire, but some miles apart, run overground for some seven or eight miles, then lose themselves in the ground, and re-appear close together in the grounds of Ilam Hall. The Manifold disappears at Wetton, and the Hamps at Waterhouses the distance, as the crow flies, from each place to Ilam being respectively about five miles and three miles—what exact distance they may travel underground is unknown. One of the most curious things in connection with this freak of nature is that though, as I have said, both streams bubble up like immense springs within twenty yards of each other at Ilam, their underground courses are quite distinct; this having been proved by putting chaff, or something of the kind, into the water of one stream where it disappears, and noticing its re-appearance at Ilam in one spring only, for of course if the rivers united underground the chaff would appear at both outlets. Another curious thing is, that both streams, when flooded, send part of their water over-ground, and then the flood-water of the Hamps joins the flood-water of the Manifold about a mile below Wetton, and they then, as the Manifold, go over-ground to Ilam. After a flood, quantities of fish get left by the subsidence of the water in the pools of these flood-beds, and the villagers quickly annex them. I believe there has been some talk of stopping this by preventing the water from going underground at all. Now there would be no difficulty about this if the water merely went down into one or two big holes, but this is by no means the case. In both rivers it merely loses itself in its bed—in fact, it is just as if it went through an immense sieve.

After this geological essay we will have a turn at the trout. I will suppose, friendly reader, that you and I have got into our fishing "togs," and, having permission to fish the Manifold, are just about to start for Ilam Hall. We look in to the smoking-room to wish Mr. Prince a good morning, and to see if any local angler may be "around." We fortunately find Mr. Waterfall, a farmer who lives at Ilam, and his farmer friend, Mr. Rowland, both good anglers, and most obliging and courteous in affording strangers any information they may want about the fishing, the flies that are "on," &c. Cotton, in his discourses with "Viator," complains of the Ashbourne beer, and if Mr. Prince gets his thence, as doubtless he does, we can only say that it has not greatly improved since Cotton's time; it is too thin for our liking. Mr. Prince's whiskey, however, fully atones for his beer, and, after getting our flasks filled, and learning that Mr. Waterfall recommends a small black fly and a grey palmer, we will walk over the fields to the charming little village of Ilam. After passing the Hall we come to an iron gate at the entrance to a path which runs along the left bank of the river towards its dry course. A dam has been thrown across, just below the gate, and under the path here the Hamps and Manifold bubble up into the light. There is a long stretch of dead water above the dam, and Mr. Waterfall informed me that from some cause or other no trout could live in it. But there are many fine fish in the water below the dam. I fished it in Mr. Waterfall's company one evening, and rose seven or eight good fish, just slightly hooking them, and only getting one fish. Mr. W. must have thought me a bungler, and I could not understand it at all until next morning, on scanning my cast, I found the hook of my tail fly had no barb! I then found that several hooks in the same batch of flies were equally barbless. I will not say where I got them, as I am sure it was a most unusual bit of carelessness on the part of a well-known fly-maker, and I was assured it should never occur again.

The best way to fish this bit of water—a hundred yards or so—is to cross at the bridge below, and fish up the opposite bank, as the one on the Hall side is high, and the water too deep to wade. Just above the bridge we come to another dam, and we will get into the water here and fish down. Stones slippery, eh? Yes, and you will find it will need all your care to keep on your legs when you wade the Manifold. I do not know another river in which there is such a treacherous foot-hold. All the stones seem smooth, and are covered with a thin slimy deposit of some kind. If you happen to step on one of the many long slightly shelving slabs of rock under water, you go sliding down it without a chance of stopping, and are lucky if you are pulled up by some big stone before you get in over your waders! In the Dove you can trust yourself on anything, but in the Manifold!

To be Concluded.

[I find the tournament takes up so much of my spare time at present that I must finish my Dove notes on another occasion. By the way, I have asked Mr. John Bullock, the maker of the *Derby Killer* to be present at the tournament, and sincerely hope he will show us his capital style of using his killer.—R. B. M.]

AUTUMN SEA-FISHING OFF CROMER.

BEFORE proceeding to the chief subject of this paper, I should like to say a few words about this, to me, charming seaside resort.

Many of your readers may possibly know Cromer and its vicinity well, but to those who do not, some few particulars may be acceptable. The little town is situated at the extreme N.E. point of the county of Norfolk, and can be reached by rail from town in about four hours from the Liverpool Street Station of the Great Eastern Railway.

To the traveller arriving by rail, the picture unfolded to him, from the little station on the hill three-quarters of a mile from Cromer town, is one of remarkable picturesqueness and exquisite loveliness. Immediately in front, apparently on a level with the sea, lies the town, its prominent feature being the grand old church of St. Peter and St. Paul, and the German Ocean forming a delightful background for miles along the coast. Away sloping up gradually to the right, are the Lighthouse Hills, clothed in heather and furze relieved by patches of brilliant green and golden brown—a favourite walk along the cliff by almost every visitor to Cromer. Here stands the lighthouse, some 200 yards from the cliff inland, its brilliant revolving light serving on dark and stormy nights to warn the watchful mariners of the whereabouts of a dangerous shoal, which runs about two miles out to sea from this point.

To the left of the town lie the Cromer Hall woods, amidst which, hidden from view, stands the hall, itself well worth a visit. The grounds are also charming and will reveal, to those who take pains to look for them, some lovely little peeps of sea and landscape.

To the extreme left lie the woods and heather-covered hills of the Felbrigg estate, localities offering rare opportunities for the fern collector, magnificent sea views and landscapes. I would strongly advise any brother angler visiting Cromer to take advantage of any compulsory days ashore for walks or drives inland, either to Gunton by way of Overstrand, returning by Roughton and Northrepps; or to Felbrigg Park, the Beacon and Lion's Mouth; or by the Holt road to Sherringham Park and grounds, returning by Beeston and Runton. He will have seen but little of the loveliest scenery to be found in Norfolk, who contents himself with the view from the station, the beach, and the town.

Cromer people are proud, and justly so, of their beach. At low water for miles in a southerly direction is a splendid stretch of smooth hard sand as level as a billiard table, and next the sea, skirting the sand at certain points, are to be seen numerous seaweed covered rocks and rock pools rich in living objects both for the naturalist and microscopist. But, it will be said all this has nothing to do with sea-fishing, so I must to business; and, first of all, as to hotel and lodging accommodation.

It will be hardly fair here to particularise; as places are to be found suited to all pockets. The Bath Hotel, Hotel de Paris, Tucker's, and the Red Lion, are among the most convenient hotels. Lodging houses of all grades and prices are to be found. I always go to the "Bath" as being the most convenient for the beach, with excellent accommodation and reasonable charges.

THE FISHERMEN AND THEIR BOATS.

The beachmen or fishermen are mostly kind-hearted honest fellows who are always ready, wind and weather permitting, to take "the gentlemen off." It is well, however, to make arrangements with them beforehand to prevent misunderstanding. They

have no regular scale of charges, but I have never found them hard to deal with, and should say from 5s. to 10s. per head, according to the time at sea, including men, bait, and option of taking the fish caught, would cover the average daily charge.

The boats such as I used are small but very handy safe little craft, fitted with a lug sail, and are very smart sailers. They carry generally two men, but are easily managed by one in fine weather, especially if "the gentlemen" will give them a turn at the oar now and again. There are larger boats, which mean, of course, increased charges. I was quite contented, however, with the smaller ones, and found they were safe and as roomy as was required.

BAIT.

Consist of fresh mussels, sand worms, and live shrimps. The fishermen always keep mussels by them, and will procure the other two baits if requested; the former, however, are found by far the most killing natural bait for every kind of fish taken here.

RODS AND REEL.

An ordinary three-joint trolling rod, with winch fittings and top joint not too stiff, answers the purpose best—a spare one, in case of a "smash," is no ill store.

Reels are so varied that it is best to give no opinion beyond that the writer prefers an easily running check-action reel capable of winding 60 to 100 yards of line comfortably.

LINES, BOTTOMS, HOOKS, &c.

A No. 10 all-silk prepared line I have found to answer best. This size is as fine as it is safe to use, considering the wear and tear to which it is subjected by being constantly hauled through the rings; it carries very little tide when new, and is strong enough with proper care to kill a 20 lb. cod if you chance to get hold of one.

Gut bottoms and gut-mounted hooks will answer well for a short time, but chiefly by contact with the rocks and other causes the gut becomes rough and unserviceable, and I was reluctantly compelled to discard the use of it altogether.

Instead I procured some medium gimp (gold colour), cut it into 12-inch lengths, formed loops at each end, by binding carefully with waxed thread. Half-an-inch above one loop I affix a little bullet, quarter inch in diameter, of either brass or copper; lead will not do, as it speedily "knocks up" or comes off. The remaining lengths may all be served in the same way. These are to carry the sinker, the little bullet preventing it from slipping down to the hook and the loops, the upper one for attaching the line, the lower one for the hook in the ordinary way.

Kirby bent blue hooks No. 000 to No. 3 mounted carefully on gimp snood not less than 10 inches long were found most serviceable.

The weights or sinkers should be egg-shaped with a hole lengthwise quite through sufficiently large to allow the loop passing through. I find a double set of two, three, four, six and eight ounces most suitable weights, with a supply of perforated round bullets weighing about an ounce.

Hand lines or chop-sticks are also used; these the fishermen always carry with them fitted ready for use, but they are nowhere for killing beside the rod and line.

It is well to carry with you one of Hearder's railing lines fitted with sinker, revolving boom, flight of flies, and spinner; No. 104 in Hearder's sea-fishing catalogue, and to prevent failure, duplicate spinners, flies, and sand eels will be found advantageous. This line is useful for trailing behind the boat as you proceed to your fishing ground or after the tide has acquired too much speed. By rowing or sailing about you may frequently take mackerel, whiting, pollack, gurnard, and codling, keeping a good look out, however, for the "tows" or buoys attached to the "crab-pots," which will most surely carry away your gear if you come in contact with them.

A gaff or landing-net will complete the outfit, of course not forgetting the flask with a wee drop of the dew, which the better half always advises, "just to keep out the cold."

FISHING GROUNDS, STATE OF TIDES, &c.

The fishermen know best where the fish are to be found, and most of them are able by certain marks ashore to moor a boat time after time in a "particular spot" within half a boat's length. If you don't get fish very shortly after mooring the best plan is to move, for you are wasting time if there really are fish on the ground.

Those days are best upon which the time of high water on the beach falls early; the fishermen like these best for they have not so far to carry their boats, and the angler will find it more advantageous for fishing—latter floods and fore ebbs being preferred to latter ebbs and fore floods.

The following is a curious fact—whether peculiar to certain parts

of the coast, only I am unable to say—but at Cromer the water falls on the beach some two or three hours before the flood ceases to run, and flows on the beach correspondingly long before the ebb ceases, hence if you leave the beach in a boat at high water you may make sure of three hours latter flood half a mile out. Neap tides do not run so strongly as spring tides, and are therefore preferable for fishing.

We will now suppose that the angler has started from the beach at high water and reached the selected "spot" with time enough to spare before the tide begins to "break" (slacken) to put together his rod and tackle. The fishermen will be preparing the bait by opening the mussels ready for hooking on.

The angler having "rigged" his rod, reel, and line will take one of the gimp ledgers, attach a hook to the bottom loop, select a sinker and pass the top loop through, slipping it down to the little bullet and attach his line.

The fishermen will hook on a mussel, rather difficult for an inexperienced hand, and you are now ready to commence.

Drop the sinker and bait gently over, see that all is clear and lower slowly until the lead touches the bottom. If it is found that the tide carries the sinker away from the bottom so that the angler cannot "tend" the ground he must substitute a heavier one. This being adjusted, the sinker is gently raised and lowered again to the ground. A few inches will suffice, but constantly making sure by feeling the bottom that he is near the ground. If there are any fish near, in a few seconds he will have the pleasure of feeling the peculiar "tug-tug," and striking quickly, but not too violently, may make almost certain of hooking his fish.

If the victim happens to be a good-sized codling of anything over 3 lb., or a flat fish of half that weight, he will very soon advise you, and must be dealt with accordingly, and a fish of 8 or 10 lb. will sorely try the angler's patience and skill, but the satisfaction when the "big one" lies gasping safely at the bottom of the boat will amply repay him.

DIARY OF STATE OF WIND, TIDE, CATCHES, &c.

September 12. Wind N.E., strong, rain, sea very rough, could not get to sea.

September 13. Wind backed to N.W. during day, becoming finer, sea much smoother; went off in the afternoon, tide half ebb, remained out till dusk. Fish caught, 17 plaice and sandlings, 50 codlings, gurnard and pollack, whiting, bait, mussels.

September 14. Wind light, N.W., fine, sea smooth; off at 10.30 a.m., tide latter, flood remained till ebb, too strong. Fish caught, 47 plaice and sandlings, some 3 to 4 lb., 61 codlings, gurnard, &c. Put Hearder's line over, with spinner and flies, hooked 1 mackerel and 1 gurnard, no wind for sailing. Bait, mussels.

September 15. Wind N., light, but freshening after, sea smooth at first; off at 5.30 a.m., railing; did not get a touch; about 7 a.m. caught a "pot tow" carrying away flight and spinner. Wind and sea making, prevented further fishing.

September 16. Wind N.E.E., veering to E.S.E., strong, squally, rain, heavy sea; went along beach to dig sandworms and sand-eels for bait.

September 17. Wind E.S.E., strong, heavy sea, no getting off.

September 18. Wind light and veering to S.W., rain, then finer, lightning at night.

September 19. Wind N.W., moderate, fine, sea "choppy;" off at 10 a.m. tide, flood ashore at 5 p.m. Fish caught, 37 plaice and sandlings, 72 codlings, &c. (small). Bait, mussels and sandworms.

September 20. Wind N.W., moderate to strong; off at 10.30 a.m., tide, flood, railing to fishing ground, hooked one pollack and one codling. Fish caught at moorings, 21 plaice and sandlings, 85 codlings, &c. Bait, mussels.

September 21 to 25. Strong N.W., N., N.E. and E. winds; weather very bad, sea very rough and stormy (steamer ashore at Hasbro'), moderating on 25 to a calm at noon.

September 26. Wind N.W., fresh, fine; off at 8.30 a.m., latter flood, fished all day. Fish caught, 30 plaice and sandlings, 65 codlings, &c. Railing after ebb too strong, hooked 1 mackerel, 2 codlings. Bait, mussels and sandworms.

September 27. Wind light, variable to calm; off at 9 a.m. tide, latter flood, fished till ebb, too strong, came ashore and off again, latter ebb, 3 p.m. Fish caught 72 plaice and sandlings (very large, 30 codlings. Mussels and sandworms for bait.

September 28. Wind S., light, fine; off at 10 a.m. tide, latter flood, fished only short time. Fish caught 42 plaice, &c., 21 codlings, some large. Bait, mussels.

September 29. Wind S.E., light; off at 10.30 a.m. tide, latter flood, fished till ebb, too strong, 47 plaice, &c., 73 codlings, &c., better sized fish. Bait, mussels and sandworms.

September 30. Wind S.S.E., light, very fine; off at 10.30 a.m., tried railing to ground, did not get a touch, not even a "pot-tow;" took up moorings off Overstrand, tide, latter flood, fished all day,

after ebb ran too strong, dropped and fished with it. Fish caught, 72 plaice, &c., 52 codling, &c., best day both for number and size, some very fine codlings, four and five to 8 lb. Bait, mussels only.

October 1. Wind strong from S.E., fine, heavy sea, could not get off.

From the foregoing it will be seen that the total take for the nine days amounts to 901 fish, or an average of five score per day.

There were a great many fish on the grounds off Cromer this year, and may be still; it is not, however, always the case, the fishermen informed me that sometimes they cannot get one. I have some notion, however, that their mode of fishing for them has something to do with it.

[In our opinion, the above article by "A Norwich Angler" is a specimen of what such an article should be—thoroughly practical and useful.—E.D.]

FISHING IN THE TRENT—WILL CONGERS EAT HUMAN FLESH?—CONGERS OF THE CHANNEL ISLANDS—THE 10½ LB. PERCH!

By J. HARRINGTON KEENE.

A LIVELY friend of mine (Mr. Charles Bramley) has been indulging in a little fishing on the Trent, and, notwithstanding several letters of introduction to various members of the angling brotherhood near Nottingham with which I furnished him, he chose to seek sport on his own hook. He sends me a rhyming epistle, describing his adventures, which I print here for the amusement of my readers, and to punish him for disregarding my advice. He entitles it the "Fishing Trip," and begins as follows:—

* * * * *

"We started in the afternoon, both full on pleasure bent; and, seated in a railway train, were making for the Trent. We speculated as we rode, on lots of fish for tea (the fisherman, observe, was I, the other was a *she*). We chose a pleasant shady spot; the day was clear and fine, and with my fishing-tackle trim, I dropped the fish a line. But all my kind attentions, the fish appeared to spurn—they never got their little line, nor answered by return. I angled on, *she* toddled off, forget-me-nots to cull, and when the little maid returned, my handkerchief was full—but not of little fish, oh no! for that she'd have to wait—'t was simply full of edibles, provided as a bait. But presently the rain came down, the fish then took their hook (their own, not mine, I grieve to say), so we had none to cook. Said she, 'Now, dear, do you not think, that fishing is a bore?' I sadly said 'my dearest one, I am no piscator.' We left the spot, and made for home, and thus, it must be told, that she and I, that livelong day, caught nothing, but a cold."

* * * * *

To return to more serious matter. I am glad to find that the conger eel's character has been vindicated as to cleanliness of feeding, and that it will not feed on human remains. I certainly was under the impression that the conger did not disdain such a meal. For the words "human remains," therefore, please read "human bodies," Mr. Gosling, for we have it on good authority that in the wicked old times of epicurean Rome, the murenidæ were fed on refractory slaves by certain torture-loving members of the "bloated aristocracy" of the period.

* * * * *

According to Pliny, Vedius Apollo, a prime favourite of Augustus, devised a number of cruel experiments with the congers of his piscina; casting offending slaves into these stews, that they might be torn up before his eyes and eaten. "Not," as his quaint translator, Dr. Holland says, "Not that there were not wilde beastes ynow upon lande for this feate, but because he took pleasure to beholde a man torn and pluckt in [pieces all at once, which pleasant sight he could not see upon any other beastes upon lande." On one occasion, it is said, a servant broke some decanters (*fregit crystallinum*), the punishment for which was death by fishes. The accident occurred whilst Augustus was banquetting with Vedius Apollo, and the slave, not waiting to hear his doom, rushed into the presence of the august gourmand, and begged hard for a different death. He "did not care to die, but thought it hard for a man, even though a slave, to be made *esca piscinæ*—the live-bait for fish." Augustus, with great severity, not only set the suppliant free, but ordered the ponds to be filled up, and all his entertainer's glass to be smashed before the assembled company. Dr. Badham in "Prose Hæleutics," says that Mopsus, the Lydian, gave queen Gadis and her son up to the scaly community of Lake Ascalon; and Cruca, Agamemnon's mother, was also for her misconduct given over to the sharks and muræna by her own father.

Talking about congers, it is noteworthy that the conger-fishing of the Channel Islands was considered of value even so far back as the time of King John. A duty on this fish and on mackerel was imposed by a tax termed "esperkeria" in 1331, and the words of the rent roll of Guernsey with respect to the smaller fish are as follows: "The fishermen may do what they like with congers that are so small that they may span them round with the fist, and they may receive from the large as well as the small as much as may be sufficient for their diet." This is translated from the original Latin "*Extent*" of Edward III.

Even previously to this, in the time of Edward I. and II., it is said that Otho de Grandison, governor of the islands "forced an impost upon congers salted for transportation, and that at 1d. only per conger above 10lb., so salted and transported, he raised yearly 400 livres Tournois."

There is a fisherman's tradition in the Channel Islands that the lobster and conger occupy the same quarters, though not in amity, for the lobster nibbles off snacks from his fellow, and the eel, presumably, when the crustacean is thereby fat enough, turns round and incontinently gobbles him up. A sort of compensating action this, reminding one of Hamlet's quaint reflection: "A man may fish with a worm that hath eat of a king, and eat of the fish that hath fed of that worm."

"*Esox Lucius*" cannot be blamed for expressing wonder at the enormous perch,* but as Mr. James Gregory vouches for the 10½lb. this stupendous fish cannot be denied. The "monstrum horrendum informe ingenus," is, however, a son of Anak amongst the lesser specimens of *perca fluviatilis*, and I for one should be exceedingly obliged if Mr. G. will send us the measurements of this gigantic fish. The largest perch I ever saw weighed 4½lb., but such a creature was justly considered a "*lusus naturæ*."

However, larger fish are on record. Blakey speaks of one taken from Whittlesea Mere of 6lb., and "Ephemera" (Edward Fitzgibbon) says one was caught in the Serpentine of 9lb. Isaac Walton refers to one of 2 feet in length caught by a friend, and Schäffer says that the head of a perch preserved in a church of Lulea, Lapland, was a foot long. Quære, the length of the entire fish?

FISH NETTING AND FISH PAINTING.

DRIVEN FROM HOME.

THERE can, in my opinion and experience, be little doubt that the protection of the Thames during the present series of holidays has been of a very satisfactory character, notwithstanding the reports that have been so unfairly and so unjustly calculated to the contrary. The early morning of Friday in last week was to my idea a test point as to where the freshwater fish came from, as that is the time, in Billingsgate Market, when the coarse fish are brought in for sale. A friend of mine happened to be there then, and he said he never saw such a sight of roach, dace, perch, carp, and tench. I remarked, "I do not believe they came from the Thames, as, from all I know, I think it would have been impossible." His reply to me was a satisfactory assurance that my conjecture was correct. "No," he observed, "the baskets had the label of Christchurch on them." They came, therefore, from the Hampshire Avon, and it is a great proof the poachers were "driven from home," our metropolitan river being made too hot for them, and this is by no means an exceptional instance of the same kind. Again, the fishing-tackle shops have been prepared for some time to give any value for Thames dace, but they could not possibly get them. I went all round London last week, after hearing a report that Twickenham had been netted right and left, for fish, for bait, but no fish were to be had anywhere. I felt convinced that if the Thames had been netted on Monday night in last week, as was reported, the supply of Thames dace at the tackle shops would be a solid confirmation, and if there was an absence of bait, it would be a direct negative; and so there was another good proof of the cowardly nature of these reports. If I were a professional fisherman, and got my living by attending on anglers, I should consider it my duty in their interests, and my own, to assist the keepers at this particular time, when there is a great demand for all sorts of coarse fish. I should feel that I belonged to the same category as the poachers, if I did nothing to protect the fish for my customers; and, instead, slept quietly at home, when my help would be so valuable. My very position as a fisherman should make me consider myself an ally of the Preservation Society, and, if I circulated a report of the river having been netted, I should feel the doing of it was as much to my

*[Mr. Jardine is firmly convinced that this is nothing but a sea-perch, and we agree with him.—ED.]

blame as any one else. This is unfortunately not the general feeling of Thames fishermen—I only wish it was. I have heard of some of these men actually witnessing the netting of the river, and taking no steps to prevent it. They have even boasted in my presence of being spectators on such an occasion, and said it was no business of theirs to interfere! What, to allow men to steal the fish from their customers, under their own observation. Why, they are as guilty, in my opinion, as those who actually do it, they are silently consenting to an unlawful offence, and are accessories to it. None of us want poaching. We do not want it in the Thames, but it appears, if it is prevented there, the old offenders are "driven from home" to do their naughty work elsewhere. The Hampshire Avon is a splendid river for roach, perch, and other fish. The angling is principally from the banks—the charge for a boat is five shillings per day—and I am told the hotel charges are very moderate. It is a pity if it is poached; that it has been done, is proved by what my friend saw at Billingsgate Market last week.

MINIATURE PAINTINGS OF FISH.

During my frequent visits to 20, Moorgate Street, I have been called upon to inspect some admirable paintings of various species of fish from the pencil of Mr. H. J. Alfred, which are most charmingly executed, and in which the artist exhibits a talent of no ordinary character. The fish are portrayed in a thorough life-like style exquisitely grouped in a great variety of positions. Mr. Alfred, not only succeeds in giving a correct and natural expression to the fish, but the picture is rendered eminently perfect by the charming scenery appropriate to each particular species. The talented artist is exceedingly happy in this respect, and it is seldom that a talent so complete in fish painting is united with one for choice examples of a scenic description. These valuable little treasures of model fish-painting, in an oval form of about eight or ten inches in width, will be regarded as great prizes to those who are fortunate to become possessors, and I have no doubt Mr. Alfred will not object to gratify the desire of those who may feel anxious to become purchasers. I do not think the late Mr. H. L. Rolfe cared to devote his time and talent to these miniatures—he preferred the larger work—whilst one is as great an example of genius as the other; indeed, in my opinion, the smaller ones require greater care, and a more delicate handling of the pencil. They are certainly great masterpieces of fish-painting, many of them being coloured from life specimens, and cannot fail to immortalise Mr. Alfred's name as a first-rate scaley artist, if he continues to devote his peculiar talent to the painting of these special works of art.

B.

THE EDINBURGH INTERNATIONAL FISHERY EXHIBITION.

[The following notice has been sent to the Home Ministers of Foreign Governments. As many of our English readers will doubtless like to exhibit, we give them these particulars. We are glad to hear our Scotch friends are likely to have a good show, and are working amicably with the Committee of the English 1883 Exhibition.]

SIR,—We have the honour to inform you that an international fisheries exhibition will be held in Edinburgh in the month of April next.

The exhibition will be open to exhibitors from all countries, and is intended to include, as far as possible, objects illustrative of or connected with the fisheries of the world. Such, for example, as models, drawings, and photographs of boats used in fishing and of steam engines adapted for fishing boats; models of fishing-boat harbours and of fishermen's houses; nets, lines, and fishing tackle of all kinds, both for sea and inland waters; piscicultural apparatus; live fish in tanks; collection of stuffed fish and aquatic birds; life-saving apparatus, fog signals, and lights for fishing-boats; fresh fish, cured and tinned fish, and preparations for preserving fish; models of fish passes and ladders, and other similar objects.

We shall esteem it a favour if you bring under the notice of those engaged in, or connected with, the fisheries in your country the fact that such an exhibition will be held here in April next, and if you will also kindly inform us whether you are likely to send us many contributions.

An answer to the above may be sent to Archibald Young, Esq., Commissioner of Scotch salmon fisheries, 22, Royal Circus, Edinburgh.

We have the honour to be your obedient servants,

Sir I. R. S. MAITLAND, Bart.

W. SKINNER, City Clerk, Edinburgh.

F. N. MENZIES, Secretary to Highland Society.

ARCHIBALD YOUNG, Advocate, Commissioner of Scotch Salmon Fisheries.

Hon. Secretaries to International Fisheries Exhibition.

RIVER REPORTS.

MID-THAMES.

The river is in the best of condition for any seasonable fishing, but is alive with leaves, which, in the estimation of many adepts in the gentle art, is subversive to any successful angling. At Streatley, Pangbourne, and Henley, some fair hauls of perch and roach have been had, but nothing big enough to warrant special mention. At Hurley, Mr. Stevens, fishing from the "Treats" hostelry some few days since, took some 10 lb. of roach, and thereby secured a two-guinea prize in his club—the St. John. Mr. Harris, also fishing in the Hurley district, got 9 lb. of perch on one occasion. The frosty nights are getting the perch into droves—so now is the time for minnow work.

Thursday.—Water in prime order for roach, perch, chub and jack. Wind in the quarter unfavourable for man and beast.—MARLOW BUZZ.

Thames (Goring).

Water very low and thick here; I think it is an east wind. Nothing much doing; I have taken some very good perch and chub, largest chub 2 lb., largest perch 1 lb. 1 oz.; one jack, 4 lb.; 1 tench, 2 lb.; and a barbel 4 lb.—J. RUSH.

Thames (Richmond).

Water in very good order for fishing, and the fish are feeding very well; but owing to the heavy winds we have been at our wits' end to find a sheltered place to drop a line in; but notwithstanding all the bad weather we have found enough sport and good baskets of fish for our patrons. This week has not only been the red-letter week for gales, but last Sunday was the best day's roach fishing of my life—fishing with Mr. Brinkley, he caught 40 lb. of roach, having 93 fish. Since my last report, all our fishermen have been out most days, and averaging their takes each day as I saw them there will be about 12 lb.—there are eight of us fishermen to go out nearly every day when you can fish at all in season. What a quantity of fish there must be in the tidal waters, and if we only get the netting stopped to Kew Bridge what a preserve it will be.—JOHN BUSHNELL.

Thames (Shepperton and Weybridge).

Water still very low and clear. Not much prospect while the wind continues in the east. F. Purdue, one day, 3 dozen roach and gudgeon, myself two days, first day, Monday, with Mr. King, took 3 jack and 1 perch, 1 jack weighing 10½ lb., and one 8 lb., the other returned to the river; second day, Tuesday, 3 dozen roach and dace, and 2 perch.—ROGERSON.

Thames (Twickenham).

The wind due north. The water has been somewhat troubled, but now I am glad to say I have never seen it in better condition for fishing. To-day (Thursday) we have had the finest show of the season with roach. Mr. G. Treacher and friend, with young George Coxen, took 20 lb. of fine roach; Mr. Howse, of Shacklewell, with Joe Dobbin, had a nice show in a few hours—all good fish; Mr. White, with Spiers, 18 lb., all roach; and Pert Hammerton, with Captain Smith, 6 dozen splendid fish. We may now consider we are fairly amongst the roach. N.B.—In reference to your correspondent on punt awnings, I might say I have tried it, and it does not suit in our open rivers; it will not stand the wind. I provide my customers with large umbrellas; and it is impossible to use them at certain times.—A. PERRIN.

[Arrived too late for insertion last week.]

Thames (Windsor).

Water average height, but rather bright, and very little doing. Since my last a few jack have been had, also roach and perch. I was at Cookham on 11th inst., with Mr. King, of the Royal Oak, Windsor, fishing with that excellent fisherman, Godden. It was our lot, however, to select a bad day, being extremely rough, and with a low, bright water. As a consequence, roach would not feed, and, beyond about five dozen roach between us, could do nothing. When we get rain with a thickish water, with mild weather, those who have never tried Cookham, and are fond of roach-fishing, I would advise a visit there. They will find Godden an excellent fisherman, and his wife can cater for you after a cold day, which would do credit to many riverside houses, and, above all, at a very reasonable price. I have been several times, and speak from experience. In last week's GAZETTE I mentioned I had just tried the barbel, to see if they would feed, and had taken one after a few minutes in the Windsor Bridge swim, going 4½ lb., which, on weighing, went 4 lb. 13 oz. After I had written you, I went back and took eleven fish, eight barbel and three chub; weights of the barbel, were 5 lb. 5 oz., 4 lb. 13 oz., 4 lb. 8 oz., 3 lb. 13 oz., 3 lb. 3 oz., 2 lb. 3 oz., 2 lb. 2 oz., 1 lb. 14 oz., chub, 2 lb. 7 oz., 2 lb. 1 oz., and 15 oz.—total, 33 lb. 15 oz. This rather upsets Mr. Bailey's theory that, on the appearance of cold weather, barbel will not feed. On that same night we had the sharpest frost of this autumn, and last evening, in the same swim, just before dark, a customer of mine took a brace going about 7 lb., making in all 46 fish I have had out of this swim. If weather altered for wet and discoloured water came down, should still try the barbel, though many Thames, also Trent, anglers pooh-pooh the idea when it gets cold. Jack, perch, and chub ought to be had now by fishing fine, and if rain came some good roach ought to be got. Respecting the longevity of barbel, I timed them, and found

that, exposed in the open air outside my shop, they lived just over seven hours. I reckon that six hours would still find a four-pound fish strong enough to swim away.—B. R. BAMBRIDGE.

Ancholme.

The fair weather which has prevailed during the past week, as well as the colour of the water, has been very favourable for anglers, still no great takes have been had. Some juveniles caught a few roach on Monday last with King's natural bait. The fish are, owing to change in temperature, discarding worms, and gentles, and taking more freely to paste, scratchings, &c. The falling leaves are a great nuisance in some places, but the Ancholme is comparatively free from them. In my report of last week your compositor spoke of me "poking up a fish here and there. This is too good. He must have been joking, but as some readers may not see it, allow me to say the word should have been rendered "picking." The trout which I have placed in the various feeders of the Ancholme are now running up the becks, I saw several on Monday last.—THOMAS FORD.

Dove.

This river is now in rattling order for every kind of fishing—top or bottom. After I despatched my last week's report a tremendous storm of wind and rain came on, which caused the stream to rise rapidly, and the gale lashed it into a mimic sea. On Saturday the river was hardly fishable, but on Sunday it was going down, and by Monday was all right again. The good effect of the storm and rapid rise has been, that it has cleared the river of immense masses of weeds, leaves, and other débris, which proved very obstructive to the efforts of anglers. Now these have gone, piscatorial operations will be conducted under far more pleasant conditions. A gentleman, fishing with the mulberry bumble, caught 6½ brace of fine grayling on Monday, near Mayfield. These are good fish for the Dove, but others have this week been taken weighing over two pounds. The best killing flies, besides that mentioned, have been the grey palmer and the small October dun. Chub have been rising at the red caterpillar on the surface, while scratching and pith have lured them best on the bottom. Several nice baskets of barbel have fallen victims to the worm between Rochester and Uttrother. Weather now getting very cold, and the sharp frosty nights ought to bring the pike on the feed.—THE SPLODGER.

Lea (Rye House).

The water is in good order now, the wind south-east, and the mornings frosty. There have been a few nice chub taken—one on Sunday, two on Tuesday, and a few roach.—WM. COWELL.

Medway (Tonbridge).

While the anglers in the other parts of England are howling about the rivers being low and too bright, we have to complain of a river considerably too high and as thick as pea soup. The frosts have, however, fined it down, and by Sunday it will be fishable. Very few disciples of the gentle art have ventured out, and, besides colds, nothing worth recording has been caught. The water, if the rain keeps off, will be in first-rate trim for jack fishing. By Sunday, no doubt, those who do not mind cold toes could beguile a few roach.—YE MEDWAY WATER-RAT.

Norfolk.

Water very thick, owing to the late heavy gale. The salt tides, which have reached as far as Horning Ferry, on the Bure, have caused much destruction amongst fish. Dead fish of every description were to be seen turned up on the sides of the river. One resident in Horning securing as many as 12 large pike on the Sunday morning, all of which had fallen a prey to the saline intruder. There is no report of any good takes to hand, and anglers may settle themselves down again for a few weeks until the water clears. The annual dinner of the East Anglian Piscatorial Society is fixed for Thursday, the 27th inst., when it is expected that the members will muster in full force. Owing to the increase of members during the last year, the club-room will be inadequate to accommodate them, and they have, therefore, decided to hold their banquet at Cooper's Restaurant. The club now numbers 60 members.—ANGLER.

Suir and its Tributaries (Clonmel, Ireland.)

The following is a reply from the Inspectors of Irish Fisheries, in answer to a memorial from the rod-fishers of Clonmel and its precincts, a copy of which appeared in the FISHING GAZETTE some time since.

Office of Irish Fisheries,

Dublin Castle, Oct. 13th, 1881.

SIR,—Referring to your communication, addressed to Major Hayes, forwarding a memorial from the rod fishermen of Clonmel and its vicinity, praying for an alteration in the angling season in the river Suir and its tributaries, I am desired by the Inspectors of Irish Fisheries to request you will be good enough to inform memorialists that at the last close season enquiry, held in 1879, it was proved that in the upper waters of the river Suir, during the latter part of September, three out of the four fish caught were "full fish." This evidence led to the existing close season order being made. The law will not admit of any further enquiry, until application is forwarded to this office, to be dated after the expiration of three years from the date when the last close season order came into force, which was 21st November, 1879, being six weeks after publication. If an application be made for an enquiry, in conformity with foregoing, when the three years has expired, it will receive the careful consideration of the Inspectors.—I am, &c., ALAN HORNSBY.

Trent (Newark).

In my last note from the Trent, I said that I thought the rain we had had would make no difference to the water; but I soon found I was wrong, for by the time the GAZETTE was in the hands of its readers the river was in high flood, bank full, and very thick. Now I begun to turn over in my mind the reasons for this, and I could come to no other conclusion than there must have been a lot more rain in the higher districts of the Trent than we had down here. We had a terrible gale last Friday, and as it blew down the river, it no doubt brought down the water quicker than it otherwise would. I have not heard of any sport being had down here this week, the weather has been so dreadfully rough all the week, and the wind in the very worst of all quarters, viz., east. To-night, the water is getting in capital trim, and in the course of another day or two will be all right. Chub should soon begin to take pith and brains, and that bait and a bit of scratchings should make the chub give an account of themselves. With the wind in its present quarter, I don't think

the roach will feed much, but, if they are inclined to take a bait, gentles and cockspur worms will be the best. Under the present circumstances, chub and pike fishing will be the best game. I had nearly forgotten to mention that a very large roach was caught in the eel nets down here this week—weight, 2 lb.—a splendid roach for the Trent. It has gone to be preserved, and will keep the two 14 oz. dace company in Mr. Slater's snug hostelry.—THE TRENT OTTER.

Trent (Nottingham).

The anglers this week have been favoured with the long-desired fresh of water, which came down on Sunday, bringing plenty of colour with it; and it was thought among most of the Trent rodsters that this change would considerably improve the fishing on all parts of the river, as it would doubtless sweep away the flannel weed, and take the insects with it, which have been so numerous, although the summer months preventing the fish from taking to a great extent the bait we have to offer them; but, unfortunately for the rodsters, the change came for the worse. Frosty nights and an extremely low state of the temperature, together with a cold east wind, sent the finny tribe into almost a torpid state; and the fishermen as well, for only a few of the latter would venture out, and those that did make an attempt found the fish so dead off the feed, that nothing could be done until the sun got out in the middle of the day; and even then, the fish took a deal of persuading, and careful fishing with a nice cockspur worm on the hook. Some nice roach, dace and bream were caught, the most successful spot being at Trent lock where the bottom is mostly sandy and the streams slow; in fact, the proper winter places for the fish named; but, if any of the anglers happened to throw a few chopped worms in at the wrong time, the fish at once ceased biting. To know the proper time to throw any sort of groundbait in is, in my opinion, one of the great secrets in rod fishing. Only give the fish one little lot of stuff at the wrong time, and your day's sport is all over (so far as that swim is concerned) for the day. The fresh of water has now all passed away, and the river, at the time of writing, is in fair condition for both chub and pike fishing. Pith and brains should be employed for chub, and livebait for pike; but should the weather change for warmer, scratching might do for chub, and a spinning bait for pike, which must be used in all the slack parts of the river, for the anglers may depend that neither fish will face the streams any more this winter.—W. BAILEY.

Yore (Yorkshire).

After I had sent my report last week, a tremendous storm of wind and rain caused the Yore to overflow its banks, and for some days even bottom-fishing was out of the question. It has, however, now run down to a fly-water, and should no more rain fall I expect to hear of some good dishes of grayling being killed. I should think that most of the salmon will have now reached the upper waters of the Yore, as the weirs were nearly level with the river during the recent flood.—FRANCIS M. WALBRAN.

Wye and Derwent (Derbyshire).

The latter end of last week we had large floods on both of the above rivers, through the great quantity of both rain and snow that have fallen, the wind being very boisterous for several days, doing great damage all over Derbyshire. The cleach-net party killed a good lot of fish on various parts of the Derwent during the time the river was in flood. The Derwent, below Rowsley, has had a nasty white froth water in it all the week, which seems to have taken the fish completely off the feed at either bottom or top. Above Rowsley, on the Chatsworth length on the Derwent, sport has been very fair, and some nice baskets of grayling have been killed, chiefly with Eaton's honey dun bumble, ash dun, furnace and dyed hackle flies, the bumbles killing the most fish. The bumble fly will now raise nineteen fish out of every twenty you throw out, providing the angler has only got the proper bumble fly to use. The bumble may now be relied upon as a point or stretcher fly. The bumble flies of different kinds have killed more fish in Derbyshire and elsewhere this season than all the others put together. We have very few fly fishers who know how to make a bumble fly properly—I mean to put the proper backing and body of the fly together properly. Sport on the Wye during the past two or three days has been but moderate. There have been some few grayling and a fair quantity of coarse fish killed on the Whatstandwell length with maggots and worms for baits; also some pike killed with the small natural dace, the fish running small. Trout are now most of them up the brooks for spawning purposes. They will be very forward this season. Weather fine—beautiful grayling weather, if the Derwent has only been low enough below Rowsley. It will take at the very least another week before it has run down to its proper height for successful grayling fly-fishing below Rowsley. Above Rowsley it is all right now. So is the Wye.—GEORGE JAMES EATON.

THE LABRADOR AND NEWFOUNDLAND FISHERIES.—Advices from Labrador, dated August 31, speak discouragingly of the fishery operations on the northern part of the coast. In some places the prospects are very gloomy; at Esquimaux Bay the worst apprehensions prevailed, and it was feared that there would be starvation there during the coming winter. The Government had already been appealed to for assistance. The weather had been so unfavourable on the southern and western shores of Newfoundland, that it was thought a large quantity of fish would be spoiled in curing. In Valencia Bay rain and fog prevailed for eighteen days, without sight of the sun, paralysing business and making navigation extremely dangerous. The Bank fisheries continued good. Unusually fine weather was reported in the far north.—*The Colonies*.

A HUSBAND having arrayed himself elaborately with gaiters, game bag and gun, accompanied by his faithful dog, went forth to hunt, but shot nothing. Impossible to return empty-handed to the house, he stopped at the market and bought a hare, which he presented to his wife. The hare was terribly high, not alone in price. "Ah!" said the wife, with a sniff, "so you killed it? You are right. It was high time."

It is said that the French have no respect for the oyster, because it never had a bony part.—*Sea World*.

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

"FISHING GAZETTE" TOURNAMENT.

AS stated last week, the Tournament will come off at Mr. Warner's, Welsh Harp, Hendon, on the Midland Railway, at two o'clock to day (Saturday), October 22. The price of admission is sixpence. Tickets can be taken for the Welsh Harp or Hendon Stations from St. Pancras and from the Metropolitan underground railway stations—King's Cross, Snow Hill, Aldgate, &c. (see last week's paper). We advise anglers to make sure of the train times, and also to note that more trains stop at Hendon than at the Welsh Harp Station, and Hendon is only a few minutes' longer walk. A bus for the Welsh Harp leaves Regent Circus (Oxford Street), at 10.30 a.m.; corner of Praed Street, 10.45 a.m., and Kilburn, 11 a.m. As there is a long programme to get through, competitors are requested to pay the entrance-fees and give in their names and addresses before the times mentioned below.

N.B.—Competitors can use their own rods, reels and lines, but will have to use weights, flies, &c., provided by the management, in order that all may use a similar weight.

THE HANDICAP FOR FLY RODS.

The handicap for fly rods will be five feet per foot of rod—i.e., if one competitor uses a ten-foot rod and another an eleven-foot rod, the eleven-foot rod will have to give five feet to the ten-foot, and so on in proportion.

THE HANDICAP FOR BAIT RODS.

In the bait casting competition the handicap will be seven feet per foot of rod—i.e., an eleven-foot rod will have to allow seven feet in the distance thrown to a ten-foot rod. To make this quite clear, suppose A with a ten-foot rod throws his bait fifty yards, in order to make an equal throw B, with an eleven-foot rod, will have to throw fifty-seven yards.

All the competitions except the fly-casting, float-casting, and cheese bait casting, will take place over the grass, and the competitors will stand on a large tarpaulin, to keep the lines from obstructions.

ORDER OF THE COMPETITIONS, AND PRIZES FOR SAME.

I.

AMATEUR COMPETITION IN CASTING IN THE THAMES STYLE.

(Entrance fee, 2s. 6d. Competitors must give in their names and addresses, and pay the fee, before 2 o'clock, at the tent in the ground.)

First prize (for longest throw).—A four-joint, double-brazed best hickory jack rod, made by Mr. S. Bigg, presented by R. B. Marston, Esq., and two guineas, presented by T. Spreckley, Esq.

Second prize.—A "Marston" Fishing Knife, presented by Messrs. Thornhill and Co., and one guinea, presented by P. Geen, Esq.

Third prize.—A pair of the "FISHING GAZETTE" Pliers, presented by Mr. Wilson, and half-a-guinea, presented by T. Spreckley, Esq.

II.

AMATEUR COMPETITION IN CASTING FROM REEL IN NOTTINGHAM STYLE.

(Entrance fee, 2s. 6d. Competitors must give in their names and addresses, and pay the fee before 2 o'clock, at the tent in the ground.)

First prize (for longest throw).—A magnum silver-mounted Black Forest spirit bottle, presented by T. R. Sachs, Esq. (and filled with whiskey by Ed. F. G.); and two guineas presented by T. Spreckley, Esq.

Second prize.—Mr. Gregory's prize of 20s. worth of his artificial baits, and one guinea, given by T. Spreckley, Esq.

Third prize.—Best four-joint double brazed pike rod, given by G. Yarde, Esq.

III.

PROFESSIONAL COMPETITION IN CASTING IN THE THAMES STYLE.

(No entrance fee. Competitors must give in their names and addresses by 2.30 at the tent in the ground.)

First prize.—Two guineas.

Second prize.—One guinea.

IV.

PROFESSIONAL COMPETITION IN CASTING FROM REEL IN NOTTINGHAM STYLE.

(No entrance fee. Competitors must give in their names and addresses by 2.30 at the tent in the ground.)

First prize.—Two guineas.

Second prize.—One guinea.

V.

COMPETITION IN THROWING THE BAIT WITH FORKED STICK.

(Entrance fee, 2s. Competitors must give in their names and addresses and pay entrance fee at the tent in the ground before 2.30.)

First prize.—Seventy yards of patent American braided silk water-proof line, given by R. B. Marston, Esq., and a pair of "Arctic" braces, given by W. H. Brougham, Esq.

Second prize.—Copy of "Vanity Fair" and a copy of "Ten Thousand a Year," given by A. J. Marriott, Esq., and a framed copy of Rolfe's picture of salmon, trout and perch, given by R. B. Marston, Esq.

VI.

MR. WM. BAILEY JUNR.'S PRIZE FOR THE LONGEST CAST, AND WITH QUILL FLOAT IN NOTTINGHAM STYLE.

(Entrance fee, 2s. Competitors must give in their names and addresses and pay entrance fee at the tent in the ground by 2.30.)
Prize.—A Nottingham rod, reel and line.

VII.

MR. MALCOM'S PRIZE FOR THE LONGEST CAST WITH TRIANGLE BAITED WITH PASTE OR CHEESE.

Entrance Fee, 1s.

Prize.—A "Freake" fishing bag, newest pattern.

VIII.

AMATEUR FLY-CASTING COMPETITION WITH SINGLE-HANDED FLY-ROD.

(Entrance fee, 2s. 6d. Competitors must give in their names and addresses, and pay entrance fee at the tent in the ground by 2.30.)

First prize.—A fly rod winch and line, given by Messrs. S. Allcock and Co.

Second prize.—A best brass check winch and D. T. fly line, given by Mr. S. Bigg, the maker.

Third prize.—A selection of the Manchester Cotton Spinning Company's new lines, given by R. Wilcock, Esq.

VIII.

AMATEUR FLY-CASTING COMPETITION WITH DOUBLE-HANDED FLY ROD.

(Entrance fee, 2s. 6d. Competitors must give in their names and addresses, and pay the entrance fee at the tent in the ground, by 2.30.)

First Prize.—A framed oil-painting, presented by G. Fennell, Esq.

Second prize.—A four-joint double brazed greenheart fly-rod, given by R. B. Marston, Esq., and a "Marston" fishing knife, given by Messrs. Thornhill and Co.

Third prize.—A selection of the Manchester Cotton Spinning Company's new lines, given by R. Wilcock, Esq., and a pair of F. G. pliers, given by R. B. Marston, Esq.

Other competitions may be arranged if there is time, but we fear there will hardly be sufficient time to get through the above properly. Before the affair commences we expect that Mr. John Bullock will show his style of casting his "Derby killer" (for trout, perch, jack, &c.), and method of recovering the line on his hand; also that the "Trent Otter," and Mr. John Foster will give us a display of their skill in various ways.

THE DINNER.

We have great pleasure in stating that the chair will be taken by Thomas Spreckley, Esq., President of the Thames Angling Preservation Society, and the vice-chair by Fred. Clench, Esq., President of the Richmond Piscatorial Society. Mr. Spreckley, with his usual generosity, has promised five guineas towards the prizes. Amongst the gentlemen who have already promised to stay to the dinner, we may mention. Messrs. T. Spreckley, Alfred Jardine, J. P. Wheeldon, P. Geen, T. Hoole, R. Ghurney, W. H. Brougham, R. B. Marston, G. Yarde, H. Wilson, W. B. Addlington, G. H. Field, J. W. Martin, and we hope to see many other well-known anglers.

Tickets for the dinner, price 3s. 6d. each, must be obtained of Mr. Warner before three o'clock, and any anglers who may wish to dine with us will greatly oblige by getting their tickets as early as possible, in order that Mr. Warner may know how many to provide for. In order to prevent mistakes, all extras (wine, grog, cigars, &c.), must be paid for at once by the gentlemen ordering them.

In conclusion, we will only hope for a fine day, and remind our readers that the tournament is to be held in aid of a most deserving society—the Anglers' Benevolent Society—the object of which is to give help to cases of real distress amongst its members and their families. The small payment of one shilling per year confers membership in this society on any club angler, and we confidently hope that a principal result of our FISHING GAZETTE tournament will be a large accession of new members. If the affair is a success, it will be due to the very great assistance we have received on all sides, and especially from our respected friends and judges, Messrs. Wheeldon and Jardine.

The Prize Winners will be announced in next week's GAZETTE.

IRONCLAD FISH *v.* DYNAMITE.—JUSTICE LIVES.—The Sacramento *Bea* reports that a Chinaman had both hands blown off, while trying to capture with a giant powder cartridge. From the reports that come to us from some portions of Indiana and Ohio, the citizens will have to breed some species of iron-clad fish to protect them from that kind of slaughter. It seems a pity that the fish cannot be armed with some weapon that would enable them to fire back at the cowards who undertake their capture by such foul means. We are glad to note the fact that on the 27th of August a conviction was secured in California for this offence, and the guilty party was fined \$50. We regret, for the honour of our race, to say that the convicted scoundrel was not a Chinaman, either.—*American Field*.

SPINNING FOR MACKEREL.

HAVING noticed several enquiries concerning sea-fishing in recent numbers of the FISHING GAZETTE, I have presumed to place a little of my experience in the hands of our esteemed editor, hoping that it may find favour in his sight, and amuse and instruct brother anglers.

Sea-fishing, although generally considered mere butchery of fish, and altogether lacking the more delicate qualities of sport which freshwater angling affords, certainly fills one's basket most effectually, and always yields palatable fish. I felt this most acutely a fortnight ago, as I hastily undid my tackle after a hard day's spinning in the Thames, my sport—two perch, one $\frac{3}{4}$ lb. and the other $1\frac{1}{2}$ lb.—barely covering the bottom of my creel.

Tynemouth is the finest watering-place I have ever visited. Its fine stretch of sand diversified by clusters of rocks, its cosy haven, its huge overhanging cliffs surmounted by the ruined grey priory, its pale lighthouse, and its massive fortifications, form at once a picturesque and a grand landscape. Then its piers! what watering-place can boast of two such piers as those huge breakwaters which embrace the mouth of the Tyne? It is quite a sea-voyage to walk along one of them in the evening. These are its natural attractions; for amusement there is a magnificent aquarium, but the finest charm to a Cockney, withal, is the quietness, the calmness of the place.

One beautiful morning last August I was just starting for a walk along the Tynemouth pier, when I was agreeably surprised by meeting an old friend, and as we leaned against the stonework talking over old times and looking over the salmon playing ground, the smooth surface of the water was suddenly broken in a hundred places by shoals of sprats leaping out of the water and leaving that peculiar ripple which only fishes make.

"By the shade of Walton! there's the mackerel, Jack," cried my friend, "in thousands too; that's the first I've seen of them this year."

"Let's get among them old boy, as quick as possible; but where's the tackle? My spinning-rod is about a mile off. I have a spoon bait——"

"You neither want a rod nor a spoon bait; you want a boat, and Ned Fry is the man. He will let us have a nice light boat, and can supply us with lines and bait, come on, come on man, we are wasting time."

So we ran down to the Haven, where Ned Fry seated us in a fine boat and we were soon pulling with a will round the pier-end. It is rather a long pull, but what oarsman does not enjoy a good row on the sea?

A quarter of an hour's row brought us close to the fish. There were several shoals of them chasing the sprats almost on the surface of the water, many of the heaviest fish leaping right out. We quickly prepared our tackle, the boat lying on some six fathoms of still, clear water. Tackle! No Nottingham style here. Just fancy a thick tanned cord of 50 yards; strong enough for a tow-line with a good pound of lead fastened about 10 yards from the triangle of tin and hooks forming the spinning-bait. The spin is effected by rowing the boat slowly, the lead keeping the bait near mid-water.

My friend rowed first, holding his line between his teeth, and I all excitement and expectation, sat in the stern-sheets spinning over the quarter. He had not taken half-a-dozen strokes when I felt the rush of a heavy fish.

"I've got him," I cried, and let him run, intending to play him.

"Here's another," cried my friend, as he shipped his oars and pulled in his line hand over hand with all his might.

"You'll certainly break if you pull like that," I said, "play him, man, play him!"

"Play him be blowed! Break! Ned Fry's tackle won't break, and the fish's head can't come off," he replied.

"No; but your hooks may come off."

"Pull your fish out and don't argue, you're only wasting time," he said, lifting out a fine mackerel, tearing the hooks from its mouth and throwing it into the bottom of the boat.

After letting my fish run for about a minute or two I brought him to the side of the boat and lifted him gently out. What a beautiful fish a mackerel is when just taken out of the water. I think no fish, not even the speckled trout, is so beautiful.

We rested for a few minutes to fill our pipes, wet the fish, and carefully observe the exact route of the nearest shoal—a most necessary precaution in mackerel fishing.

"Now, George, if we are to secure a good 'take' you must be careful. It is finer sport and indeed much more profitable to run a fish a quarter of an hour than to lose your hooks," I said.

"Bosh, Jack! You must really excuse me, you're not on the Thames. Why there's no comparison between the two styles of fishing. These fish are not afraid of a line, and one has only to follow them," he replied.

"Well, you fish your way. I'll angle. I confess I'll *kill* the fish without *murdering* them, and let the result judge between us. There, let's to work."

In went our baits again, and my friend rode after the fish. I soon had another run, and after a little careful handling, by which I managed to keep my fish from under the boat, I landed another fine one. As I was disgorging the hooks my friend stopped rowing, shipped his oars, and taking his line from between his teeth, had a tremendous rush. He held on, and the fish pulled, and the harder the fish pulled the harder he held on, and commenced to haul in hand over hand, and broke.

"There, I told you so," I exclaimed. "I'll say no more, but leave you to your conscience."

"Well they must have been rotten hooks, or something weak about the trace," he replied, pulling in his line.

We found the triangle gone close to the spinning bait, and if the maker of that triangle could have heard the blessings showered on his head by my friend, he would certainly have felt anything but complimented.

I proposed that he should take my line and put me ashore, so that I could get my own tackle.

"Very well, do as you like," he replied, and I rowed the boat alongside the pier, clambered up some twenty feet of iron ladder let into the stonework, and went in search of my jack-tackle.

In another half-hour I was seated once more in the boat with my friend. He had taken half-a-dozen good fish during my absence, but had lost two out of his three hooks, so I took off the spinning bait and put on a small spoon. Seeing that I had a good supply of perch hooks, he asked me to fasten two of them above the spoon. I did so, placing them about a yard apart, and taking one of the mackerel he cut two oblong pieces of the glistening skin from its breast, and placed it on the hooks. With this bait, while I was putting my tackle together, my friend, now more careful, landed two fish at once, and, during the remainder of the time we were out, this mackerel skin was most deadly, being greedily taken. He afterwards landed a gurnard and cut the skin from its tail. This bait was also very successful. Indeed, I believe mackerel will take any bait that moves and glistens in the water.

While he was landing a fish, I made my first throw, sitting in the stern of the boat just as if I were in a punt on the Thames; my bait, a large phantom minnow, was almost instantly seized, and I had fine sport with a heavy fish, my friend looking on with surprise and admiration. He was so pleased with the spinning throw, that he shipped his oars to let me have it all my own way for a while, and to watch me intently.

There were now several boats out, and knots of people on the pier watching us. I believe, in fact I afterwards heard, that many of the folks there thought me crazed, for they had never seen a rod *at sea*. A friend asked me in the evening if I had been "trying the salmon," with a sarcastic smile.

We had another hour's good sport, and then to show my friend what "playing" could do, I took a small Devon minnow on fine trout tackle, and when he had rowed sufficiently near a shoal, cast over them. At the third throw I had a run, and after five minutes' play the water was so bright we could see the largest mackerel we had struck darting about in the water, and soon after struggling in the bottom of the boat. It was very nearly two feet long.

We determined that this should wind up that day's sport, especially as we observed the clouds banking up to windward. We each took an oar, and had a rather stiff row against a squally breeze and a two-foot "lipper," which gave us a few showers of spray.

When we landed we were surrounded, for the fish were very fine ones, and we had a splendid catch.

I took seven of the finest, and they were as much as I could carry.

We paid 3s. for three hours' excellent sport, and as I have seen far inferior fish sold in town for 6d. each, I consider that, even as a mere commercial speculation, my first mackerel were a glorious success.

WAMBA.

AMERICAN FISH CULTURE.

THERE can be no doubt that our American cousins, in the matter of fish culture, are far ahead of us. It is true that the splendid aquatic resources of the country give them a decided advantage over all other nations, but not a little of this success is due to the thoroughness of the manner and the enthusiastic temper in which each branch of the science of aqua culture is prosecuted.

I have just received from the corresponding secretary (A. F. Mather, U.S. Fish Commission), of the Central Fish Cultural Society, a copy of the proceedings of that association for 1881,

and its contents reveal several new, and, in England, unsuspected discoveries in the natural history of fishes, and, as well, afford many items of great interest to fish culturists. A *precis* of the chief of these will doubtless be acceptable to the readers of the FISHING GAZETTE.

The food of young fishes is but imperfectly known, and the paper of Mr. S. A. Forbes, therefore, comes in appropriately when we find that not only trout but perch are being artificially bred in this country. It would appear that the use of minute insects has been attempted in France as food for young trout, but the practice does not seem to have been followed up. The writer ascertained that common perch, of from a quarter of an inch to an inch and a quarter long, feed, in a natural state, wholly on Entomstraca and the larvæ of Chironomous. The first of these names is applied to the minute crustaceans which are found most abundant in lakes and other stagnant water, but occur likewise to some extent in running streams. The name of water-fleas is sometimes given to a large section of this group. Chironomous is a gnat whose larvæ is familiar to all who have ever noticed the minute animals of stagnant water; it is red and moves through the water with a wriggling motion. I may add to this that other larvæ—of the *tipulæ* for example, also are devoured voraciously by young perch.

The pike seems to commence attacking small fish at a very early age, but it also feeds on Entomstraca, chiefly of the *Amphipoda*, *Daphniæ* and *Lynceidæ*—terms perfectly well known to students of the microscopic organisms of water. Minnows also go in for a similar dietary; one, three-eighths of an inch long, being found to have consumed Entomstraca (25 per cent) and Chironomous larvæ. Chub, ranging from five-eighths of an inch to one inch, was found to have eaten only 7 per cent Entomstraca and the rest filamentous algæ—thus indicating an exception to the general rule. The rest of the paper is taken up with estimations in respect of fish not known in England. I therefore omit further reference.

Some most extraordinary results of carp breeding and raising are recorded by Mr. Mather, who starts by saying that it is a well-known fact that when an animal undergoes a change of climate it seldom remains as it was before the change; a bulldog taken to India loses the courage which distinguished it in the British Islands, and becomes a coward. Other instances are recorded in the pages of natural history, where room will now have to be made to note the fact that carp, after transplanting to America, has grown to three times the size which it did in Germany, in the same space of time. In one case it seems that, from spring-time to October, fish originally three inches long grew so rapidly as to measure 12 and 14 inches; in another, carp three or four inches long in the winter of 1879 were 20 inches in October, 1880, and in Georgia it is certain that, from two or three inches, some carp grew to 25 inches in less than a year.

In order to positively show the extraordinary character of the growth, I quote the paper again. Three German fish-culturists gave Mr. Mather the following rates of growth for Germany for four years. Those of Mr. Herman Haack (of Huningue) will suffice:—One year to 8 inches; two years, $\frac{1}{3}$ to $\frac{2}{3}$ lb.; three years, $1\frac{1}{2}$ to 3 lb.; four years, 2 to 5 lb., according to temperature and food. Rather a difference in these rates and those referred to! A Mr. G. R. Miller, of the Michigan Fish Commission, it is also said, grew carp to 17 inches, and a weight of 3 lb., in less than a year from fish, not over $1\frac{1}{2}$ inch long. Another fish-culturist deposes to having found them grow nine clear inches between June and September of the same year. These results seem to me very striking.

Perhaps the most interesting and curious discovery in the history of fish-culture is that of the breeding of California salmon in fresh water. Mr. N. K. Fairbank, the president of the society, read a paper on the subject which seems to set the matter at rest, and if such results could be attained in England, it is easy to see what a valuable discovery this is. A large lake being at his disposal, fed by a stream, and having no outlet to the ocean which would allow of migration, he introduced, roughly speaking, half a million young salmon in excellent condition—this to October, 1880, the first batch being placed in the lake in the spring of 1876. In July last a salmon was taken weighing $12\frac{3}{4}$ lb., which proved excellent eating, which fact proves the fish will grow well in an enclosed lake. "In September," to quote Mr. Fairbank's own words, "they began to show themselves at the head of the lake near the mouth of a small creek, having its source in a group of springs a mile back, which empties into the lake. Mr. W. Welcher, who has charge of the hatchery and ponds there, discovered eight fine specimens, one day, splashing about in this creek;" they were endeavouring to reach a suitable spot for spawning bed, for, on the capture of a female, the eggs were found quite ripe. Nests were found to have been made, and there, as the writer naively puts it, "Unlike Brigham Young, they find

they can be very good Mormons, and increase and multiply without going to a Salt Lake."

I, of course, have not attempted in this short *resumé* to give all the points of interest with which the report bristles. The items mentioned cannot, however, fail to interest such of the FISHING GAZETTE readers as are interested in the piscicultural doings of the Americans.

J. HARRINGTON KEENE.

CLUB AND OTHER JOTTINGS.

By L. B.

THE joint deputation from the East and West Central Associations which waited upon the authorities of the Great Eastern Railway relative to the granting of further concessions upon that line, received a most courteous reception from Mr. Birt, the General Manager and Mr. Robertson, the Superintendent, who promised the subject should receive every attention, and that the secretaries of the respective associations would be informed of the ultimate decision arrived at by the directors.

In the face of the recent complaints from another company, it is quite pleasant to be able to record Mr. Robertson's opinion that the privilege tickets had worked very well, and that they, at all events, had no complaints whatever to make. "Praise from Sir Hubert Stanley is praise indeed."

The deputation consisted of Messrs. P. Geen, S. Morgan, T. Hoole R. Ghurney, R. Murphy, Field, J. Manning, Aldridge, Beckett, Munroe, Chambers, Noble, Starr, Cundall, Welsh, R. Marshall, &c. After the deputation, Mr. Marshall, still on fish, if not on fishing bent, found his way instinctively, I believe, into "Ye Market of Billingsgate," where he was sorely tempted to become the purchaser of a monster skate, perfectly fresh, and weighing 150 lb. (one hundred and fifty pounds!), for the very modest sum of 2s. (two shillings!) Had it been hake, for which he has a particular weakness, Mr. Marshall says he would not have hesitated a moment.

On Thursday last I spent the afternoon with Mr. G. Fennell. Great comparing of angling notes, and after we had a moderate consumption of "Scotch warm," he handed me at parting the painting kindly presented by him to the Anglers' Benevolent Society. It will no doubt prove all the more attractive to a Waltonian as it represents a fishing subject, a brother of the rod figuring in the foreground, thigh-booted and wielding a long fly-rod with right goodwill. Of course the picture will be suitably framed, and the committee will have to decide how so acceptable a gift can best be utilised and with most solid advantage to the funds.

I am glad to notice that my friend and late brother club member, Mr. Alfred Mayman, of the society of Caxtonian Anglers, managed in the recent dace competition in the tidal water to win the silver cup (value £5 ss.), and to hear him speak of J. Bushnell, of Richmond, whose services I advised him to secure, as "the smartest little fisherman he has ever been out with."

I read and re-read my friend, B's, article "Prizes for Specimen Fish, &c.," in last week's GAZETTE, very carefully. While there is much in which I heartily concur, there is also much which, in my opinion, is fair matter for discussion.

For laying night lines in the River Thames from a friend's lawn at Twickenham, Mr. J. H. Macgregor, of 17, Burlington Road, Bayswater, was at the Brentford sessions, on Saturday last, fined 10s.

Mr. W. J. Wettenhall, the popular treasurer of the North-Western Angling Society, who has been dangerously ill with quinsy, is, I am happy to say, very much better.

To-night (Friday) is the monthly meeting of the West Central Association, and as there is some important business to be brought forward, Mr. Hoole writes that he hopes all delegates will attend.

In a contemporary last week appeared the following:—

"CHERTSEY.—A correspondent informs us that the account given in a contemporary as to 75 lb. of bream being taken by a local professional is utterly devoid of foundation." The report of the take first appeared in my notes in the FISHING GAZETTE, of October 8th, as one of Haslett's, of Chertsey's, recent takes, and directly I saw this very hot paragraph, I wrote to Mr. Geen, who lives close by for independent corroborative particulars, and am just in receipt of a letter in which he says:—"There were 27 bream caught that day by Mr. Allen, St. George's View, Addlestone, fishing with Haslett, they were taken from the well of the punt, and placed upon the lawn in front of the Chertsey Bridge Hotel; after which they were weighed by Mr. Thurston, the proprietor, in the presence of a number of people, the weight being just over 75 lb."

About the middle of the day I was informed by Mr. Taylor, a professional fisherman, that Haslett was taking in the weir with Mr. Allen, a number of fine bream, and that it was anticipated a grand weight would be the result of to-day's fishing."

I refrain from comment, but expect some explanation and apology from your contemporary's correspondent for causing so much trouble, and no doubt some annoyance and pain, to Haslett, when he might so easily have ascertained the facts for himself.

Apropos of Haslett, who has, I am told, written Mr. Marston to say he intends to accept his generous invitation to the tournament, and (this he did not put in his letter), but was overheard to say that, even should he fail to win a prize, he will have the pleasure of seeing a number of his patrons whom he sincerely hopes will on this occasion remember his little weakness for Scotch, and therefore not press him too hard.

Fishing news proper, very meagre again this week. I always try and give a prominent place in my jottings to the capture of good fish, and

accordingly have selected the following among a multitude of small fry. From the Ferry Boat, Tottenham, Mr. Mead, is to be credited with the capture of a roach 1 lb. 12 oz. Mr. Diggins with a tench 3 lb. 1 oz. From the Arun, near Pulborough, a London angler succeeded in capturing in one day among others, three bream, one carp, and one perch, weighing respectively 6 lb. 8½ oz., 4 lb. 10 oz., 4 lb. 6 oz., 4 lb., and 1½ lb. The bream and carp were taken ledgering with gentles on a No. 10 hook; a friend of this fortunate piscator also securing a handsome bream 5 lb. 8 oz.

I am pleased to be able to congratulate Mr. W. Roberts, the treasurer of the Good Intent Anglers, upon securing a good take of roach and rudd (20 lb.) from Waterbeach. Also Mr. William Green, the host and treasurer of the Hammersmith United, upon the capture of a very nice chub.

Mr. Hoole tells me the accounts of the West Central Association have this week been audited, and show a balance to the credit of the association of £106 6s. 6d. The number of privilege cards issued this year up to 12th inst. being 2037.

Concerning the tournament on Saturday, Mr. Hoole only received the admission tickets on Monday last, but lost no time in getting them sent out to the secretaries of all angling societies enrolled with the association. He earnestly requests that secretaries will not send him stamps in payment for tickets sold.

Nothing like facts, dates and figures to prove a case. Have dace two spawning seasons, or, rather, are there dace which spawn in the spring and others which spawn in the autumn, as stated by the chairman at the recent meeting of anglers in the Society of Arts Room?

On Thursday last, October 13, Mr. Walters, while fishing in the River Colne, at Uxbridge, succeeded in taking 33 dace, weighing 11 lb. 15 oz., which, in my opinion, conclusively proved Mr. P. Geen's statement to be correct, as these fish were taken from a shallow, sandy-bottomed eddy in about a foot of water. The fourth of them had just completed the act of spawning, and were, on being opened, found empty; their scales were rough, their flesh flabby, and their vents distended. About one half had evidently been caught while in the act of shedding, as the slightest touch caused the fully developed spawn to come from them. The remainder were extraordinarily full, and on being opened clearly showed that they were on this particularly favourable spot for the purpose of there depositing their spawn.

The chairman, the secretary, indeed the whole of the members of the Club (Hammersmith United) present carefully inspected the fish, and saw them opened, and those who doubted it before are now fully convinced that dace have two spawning seasons.

F. C. Clench, Esq., might have been seen at Allroyd's, Gracechurch Street, on Monday last, critically inspecting their rods. It is said he has a commission to purchase a rod for "the Prince," who is the President of the Richmond Piscatorial Society.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

ANGLING LITERATURE IN ENGLAND—GRESHAM SOCIETY PRIZES.

SIR,—Referring to the review (in your last issue) of "Angling Literature in England," the suggestion is happily made by the reviewer that the Gresham Angling Society should give as prizes the best works that have appeared on piscatorial subjects. This idea has been already considered and approved of by the committee of the above society, but it was thought best not to trammel too much the choice of a prize winner, who is now at liberty to select any suitable article of value, books, of course, included, but the winner is not in any case to have the cash value paid to him.

It may, in passing, be noted that books already appear amongst the private and special prizes in the "Gresham" list.

With regard to Mr. Lambert's beautiful little work, I was so pleased with it that at our last meeting I handed in a copy for our library on condition that another was obtained, as I thought the book would be in great demand amongst our (nearly 200) members. Of course, another copy was promptly forthcoming, and no doubt these two copies will be none too many for us, as it is a work that every educated angler should read; and club members especially will find in this little book much respecting angling literature that is very interesting.—I am, &c.,

GRESHAM MEMBER.

MINNOWS IN THE ROACH SWIM.

SIR,—Whilst roach-fishing in the Thames I am continually annoyed by minnows, who come by the thousands into the swim and follow the bait dows to the depth of from 10 to 12 feet and then seize it. Can any of your readers inform me if there is any way of either enticing or driving them to a distance?—I am, &c.,

H.

[A few dry crumbs of bread thrown on the stream will draw some of them away, but you seem to have hit on a hole where they are "packing" for the winter.—ED.]

MR. GREVILLE FENNELL AND THE "FISHING GAZETTE" TOURNAMENT.

SIR,—Herewith I send you the first number of the old *Fishing Gazette*, of which I spoke over the whisky and water at the Shades, London Bridge.

I have a small oil sketch—"Magna Charta Island"—which I purpose giving towards the tournament, and hope to get Mr. Rayner, the hon. sec. of the Piscatorials, to put it into presentable shape—of course giving him credit for this essential part of the business.

It is a spirited offer of yours to fill Mr. Sach's bottle with whisky (enough to make a tumbler of it!), and I do not even grudge so good a purpose, though it may come off the expectant bulk destined (*a la Shades*) to cheer—Yours, &c.,

JOHN GREVILLE FENNELL.

A DAISY WITH A DORSAL FIN.

SIR,—In the issue of September 3, in Mr. J. Harrington Keene's comments on the American carp, quoted from "Forest and Stream," he says, "Fancy a daisy with a dorsal fin." Now, Mr. Editor, I don't know that it is necessary to make any apology for this quotation, yet to ears unused to American similes I presume this does seem strange. The writer in "Forest and Stream" was evidently indulging in what your English fishermen call "gush," or, as we term it, "hifalutin." A daisy is slang, quite slangy, yet a word that has crept into common use. It denotes that anything handsome, pretty, or gay—in fact, anything above ordinary, is a daisy—a fine horse, a well-bred dog, a handsome woman, or even an extra fine trout; all of them, under the circumstances, are daisies.

If a party of boys in our streets see a young girl passing by them dressed in good style, or if overdressed, you hear the expression instantly, "Phew! ain't she a daisy, tho'?" The expression is so common that children from four years up to mature men all catch it. Even the ladies are not exempt. All of us use it. It is not distinctive, like Boston's "Too utterly utterly," or "Too sweet for anything."

These slang phrases live and flourish for the time being, and spread over the entire Continent, and grow into our conversation until they become Americanisms. Hence this term, "They were pretty to look at; one of them was a daisy." The English daisy is a scarce flower in this big country, except where under cultivation, and certainly does not grow dorsal fins.

I trust Mr. Keene will accept this explanation of this seemingly ambiguous term in the kindest spirit, and not think me critical in bringing up the subject again.—I am, &c.,

W. DAVID TOMLIN.

Chicago, U.S.A., Sept. 28.

[We are sure Mr. Keene will accept this as desired. For our own part we should not object to some new names for trout, being quite tired of the stale "speckled beauty," "spotted beauty," and similar expressions, as also the done-to-death words "finny tribe."—ED.]

REPORTED FISH-NETTING AT RICHMOND.

SIR,—I have very carefully read your correspondent's letter, signed Fred Clench, but why he writes so many words to such little effect I cannot understand. He states that he and his brother members of the club he represents, living on the banks of the river between Richmond and Teddington, would know of everything, particularly netting, taking place.

Now, we know very well, from past experience, that people may live so close to a danger that they are unconscious of such being near.

His members may live between Richmond and Teddington but still not fish the Richmond waters.

If I read his letter correctly, I fancy he must have been in a peculiar humour to write in such a strain and with so much animosity, otherwise he would have read Mr. Boalch's letter in a different spirit.

I can say that I have had upwards of twenty years' experience of Richmond, both boating and fishing, and can testify to the fact that those living close to the river know very little of what is going on in respect to the water, and I therefore consider it an idle boast of your correspondent, F. C., to assert that the members of his club should know of everything taking place either on or in the waters that he mentioned.

Your correspondent, Mr. Boalch, has brought this question of netting before the public, and should, out of courtesy to all anglers, name his authority for making such assertions.

The able letters from your other correspondents need no comment from me.—I am, &c.,

A RICHMOND SCULLER.

[It is all very well for "A Richmond Sculler" to complain of Mr. Clench's somewhat sharp letter, but it is most likely that he would himself write in the same strain under similar circumstances. Until Mr. Boalch gives chapter and verse for his statement, we consider he is not acting fairly either to the T.A.P.S. or to the Richmond anglers. He has thrown a slur on their vigilance which he has not, and, in our opinion, cannot, prove that they deserve.—ED.]

PRUSSIAN CARP.

SIR,—I see in your issue of the 24th September a correspondent, signing himself J. J. Harris, asks for information as to taking the Prussian carp. Perhaps the following hints may be of use:—

I have never heard of them being found in rivers, and have only known them as pond fish.

In habit, they resemble the common carp, and bite about as freely. I used to take them, when a youngster, in a small pond belonging to a friend. Our tackle was, to say the least, primitive, consisting of a piece of crotchet cotton, about a yard of bean stick, a roach hook, and for a float a piece of small stick tied on to the line by a half hitch, and for baits a brandling dug out of the cucumber frame. Plumbing was an unknown mystery in those days. We used to pitch in and wait for the fish. When we first tried there we took several dozens, including gold fish; but after a few days they became very shy. They are very long-lived fish; some I caught were alive ten years afterwards in an aquarium. In conclusion, I should say fish with the finest drawn gut, a medium hook, and a light quill float carrying three shots, either on the bottom or about an inch from it, and if possible on a dull day.—I am, &c.,

A CARP.

P.S.—I believe somewhere in Berkshire there is on the top of a hill a pond full of them where any one may fish. I get my information from an old countryman, professionally a rat catcher. If I can meet him again I will get all the information I can and forward it to Mr. Harris.

FISHING AT OXFORD.

SIR,—Last week whilst angling in the Thames, near Sandford, Mr. Charles Kersey succeeded in taking a large jack weighing 11½ lb., also two others of 3 and 4 lb.

The water for the last few weeks has been very low, but on Friday (I suppose from the high wind) it was some 5 or 6 inches over the side weir at Folly Bridge. The fish are going fairly at worm, but I have heard of no big catches, the general complaint being for the last two months that they went go at all.—I am, &c.,

RED PALMER.

October 16.

THE 10 LB. PERCH.

SIR,—When I read "Esos Lucius's" letter, I really thought I must have, in some unaccountable manner, been the victim of a delusion, and almost felt regret at having troubled yourself and readers with my account of the aged

monster; and felt, moreover, inclined to take at once another trip to King's Heath, for the purpose of reassuring myself, the more especially so, seeing your own (to my idea) ominous remark. "What a whacker!" thinks I. Does he intend this for the perch—the story—or myself? seeing that I am some 27 st. good weight. However, my mind was greatly relieved on coming to Mr. J. Gregory's letter. I regret very much having committed the error of making use of his name for that of Mr. Reynolds. It was purely an error, for which I offer him my apology, endorsing, as he has, my account.

I hope many a rodster will take the opportunity of having a look at the perch, when I doubt not that they will be as much astonished as I was.

The fine barbel Mr. G. names is indeed another whacker, and worth a visit. I feel, also, an apology is due to Mr. Reynolds, for my having so unceremoniously installed his friend Mr. G. as host of the Cross Guns.—I am, &c.,

P. S. DAVIS,

(Formerly colour-serjeant Grenadier Guards).

Eliza Cottages, Chandos Road, Stratford, E.

October 17.

WORMS.

SIR,—Can any of your numerous readers inform me whether worms that are cut in halves with the spade whilst digging ever regain their original forms? and if so, in what way does the tail portion form a new head; and how does it obtain nourishment to enable it to perform this extraordinary feat?—I am, &c.,

Oct. 18.

MARK ANTONY.

[We hope to review Darwin's new book on worms soon, and cull some facts of interest.—ED.]

A GOOD ROD-VARNISH WANTED.

SIR,—I should feel exceedingly obliged if any of the readers of your valuable paper can give me the receipt for producing that hard glassy appearance on new rods? Mine stands sadly in need of doing up, and being a great favourite I should like it to have the best treatment.—I am, &c.,

NOVICE.

WALTON, EDITED BY EPHEMERA.

SIR,—Can any correspondent help me to complete the list of editions of the "Complete Angler," edited by "Ephemera," of which Messrs. Routledge are now the publishers? I have Ingram's of 1832, Nathaniel Cook's of 1854, and Routledge's of 1859 and 1881. There have been several issues during the last twenty years, and I shall be glad to learn whether these are dated or not.—I am, &c.,

THOS. SATCHELL.

CLUB REPORTS.

ACTON AND EALING ANGLING SOCIETY.

Mr. Slatter, roach, 6 lb. 7½ oz., from the Thames; Mr. S. Head, one roach, 1 lb. 3 oz., from the Thames; ten roach, 4 lb., from Thorney Broad; one chub, 1 lb. 15 oz. from Thorney Broad; one perch, 7 oz.; total, 6 lb. 9 oz.; Mr. Slatter, roach, 4 lb. 3 oz., from the Thames. Mr. Dudley weighed in 1 lb. 10 oz. of roach from the Thames. More members have joined. Windsor Joe has not taken that barbel. Mr. Geen I hope will shake hands on Saturday with BLACK BAG.

ANGLERS' BENEVOLENT SOCIETY.

On Friday evening, October 14th, the usual fortnightly meeting took place, being well attended by members of the committee, S. Morgan, vice-president, in the chair. On the application of R. B. Marston, Esq., a money-taker for the Angling Tournament was appointed, and the committee offered to assist in any way they could be useful on the day, in carrying out the arrangements. The following members gave in their names:—Messrs. Morgan, Field, Manning, Aldridge, Murphy, Clarke, and Ghurney. The gentlemen who formed the deputation to wait on the Clubs gave in their report, which was very satisfactory. During the fortnight they had visited the Walworth Waltonians, the Burdett, and the Brothers Well Met Angling Societies, and were received in the most respectful and courteous manner, and in each club were promised the whole of the members present to join the Anglers' Benevolent Society, and to use their influence with their brother members to do the same. Two other societies were selected to be visited during the next fortnight. The secretary stated that since the last meeting he had had the pleasure to acknowledge the receipt of the following subscriptions:—£5 from G. Tracey, Esq.; £5 from the Gresham Angling Society; and £1 1s. from the Great Northern Brothers' Angling Society. The Secretary was instructed to convey a grateful vote of thanks from the Committee to the above for their very handsome donations to the funds.—R. GHURNEY, Secretary.

ANGLER'S PRIDE ANGLING SOCIETY.

The following members weighed-in fish on Sunday last:—J. Deeley, jun., 4 lb. roach; T. Fiddes, 3 lb. roach from the Grand Junction canal; H. Haines, 3½ lb. roach from the Thames; Messrs. Nash, Soah, &c., also weighed fish.—T. MARSHALL, sec.

October 17.

BRIGHTON ANGLERS' ASSOCIATION.

The postponed competition of the 16th was reconsidered by the committee and came off on Sunday last. All prizes taken: Mr. Ollive first, Mr. Ingram second, Mr. Noble third, Mr. G. Saunders fourth, and Mr. A. Cardy fifth. The competition was open to three rivers, but most members went to the Adur. The day was fine, but the water was in a very muddy condition. Mr. Gates, of Steyning, informed me during last week he took some very fine roach from the upper part of the Adur, and Mr. A. Saunders 17 lb. of bream in two days from the Cuckmere. Mr. Tree a good draw of roach from the Adur. Mr. Anscombe and Mr. Ash went to the Ouse, but the fish were not on. The quarterly meeting takes place on Thursday evening when the balance-sheet will be read, and other business of the Association gone through.—GROUND BAIT.

Oct. 20th.

BURDETT ANGLING SOCIETY.

The members of the above club went out on Sunday, October 2nd, for a series of prizes, the following gentlemen being successful: Mr. Hadkiss the first for the best roach, Mr. B. Smith taking second prize with a splendid tray

of dace, Mr. Ratcliffe third, roach, Mr. Hadkiss fourth, roach, and Mr. Taylor fifth with dace and chub. We had also on Sunday, October 9th, a nice show of dace and roach by Mr. B. Smith and Mr. Hodkiss, respectively.—T. G. WALKER.

CITY OF LONDON ANGLING SOCIETY.

The following members weighed-in fish on the 16th:—Mr. Mor timer, roach, from the Rye House; and Messrs. Hobbs, J. Chambers, Castell, and Mark, roach, from the Stort.—CAS.

DALSTON ANGLING SOCIETY.

Several of the members were out on Sunday, and the following gentlemen were very successful:—Mr. Bunn, roach; Mr. Eagles, roach; Mr. Fortescue, roach; Mr. Richardson, roach; and Mr. Kidd got amongst the chub.—S. MALBY, sec.

FIRST SURREY ANGLING SOCIETY.

This society will fish at Weybridge on Sunday, October 30th, for several prizes. It is hoped there will be a good attendance of members to compete for the same. Members will go down by the first train from Vauxhall.—P. D. MANNING.

Oct. 20.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

On Sunday last Mr. Broach¹ showed a pretty lot of perch from the Thames, weighing 5 lb. 10 oz.; Mr. Barker a jack from the Wey, 3 lb. 3 oz.; Messrs. J. K. Fitch, Theobald Parkin, roach from the Wey; Messrs. Butler, J. Smith, Hutchings, Kirk, W. Watling and Baker, roach from the Colne.—J. A. FITCH, jun., sec.

Oct. 18.

GRESHAM ANGLING SOCIETY.

The meeting of this society held on Thursday evening was very largely attended, Captain Alfred in the chair. Mr. Crumplen's paper "On the Diminution of Fish in the River Thames, with Remedial Suggestions" was read, and warmly applauded. Captain Alfred, Mr. Jardine, Dr. Brunton, Mr. Wheeldon, Mr. Bentley, and others joined in the discussion, Mr. Spreckley also being present, and speaking in highly commendatory terms. In the result, Mr. Crumplen's views were in the main confirmed, and a very hearty vote of thanks was carried by acclamation. It was announced that future papers were promised by Mr. Wheeldon and Mr. Bentley, the former on "The Science of Angling," the latter on "Feeling in Fishes." Mr. Bentley's paper will be read on Thursday, Nov. 3, when Dr. Brunton will take the chair. The paper will be illustrated with diagrams and microscopic subjects, and Mr. Bentley, being a Fellow of the Royal Microscopical Society, a very pleasant evening is anticipated. Five new members were ballotted for and elected, and after Mr. Crumplen's paper, the gentlemen present gave a little music and singing, under the auspices of Mr. Winterbottom, the composer, Mr. George Austin ably filling the chair. This is the most successful evening the society has yet had, and it was stated by gentlemen present that it now clearly headed the angling societies of London. The society voted three guineas to the Thames Angling Preservation Society. After the paper and Mr. Spreckley's able speech, Mr. Spreckley and Dr. Brunton also joined the society. Secretaries of clubs are invited to attend any of the society's meetings, or any gentlemen interested in the subjects under discussion from time to time.

HAMMERSMITH UNITED.

On Thursday, October 13th, Mr. Walters had a good show of dace from the Colne, some of them very fine fish, upon opening them several were found to be heavy in spawn. Is this usual at this period of the year, or does it verify Mr. Geen's assertion that there are two spawning times for dace? This is not only the case in the Colne, but I myself caught one in the Fleet at Wrybury three weeks ago, in precisely the same condition. Perhaps some of your readers can enlighten us on this subject. On Sunday, Mr. Hitchcock weighed-in roach, gudgeon and bleak. Mr. Lewis also a good show of the latter sort from the Thames. The seal shot at Kew is being preserved by Messrs. Gardner, of Oxford Street, and not by Mr. Cooper as stated last week; it was shown at the club-house, Builders' Arms, Hammersmith, for a day or two before being sent for preservation. I would like to draw the attention of the members to the valuable prizes now open for competition, as there is nothing like "making hay while the sun shines."—VORTEX.

IZAAK WALTON ANGLING SOCIETY.

Three special prizes were fished for on Wednesday, the 19th inst. Mr. B. Crook first, Mr. W. H. Meham second, Mr. G. Bliss third. Messrs. T. Dennison, senr., and T. Dennison, junr., weighed-in roach; there were several other members out who met with very little success. There are two special prizes to be fished for on the last two Sundays in this month, the first two heaviest weight of any kind to take them; a special prize for the heaviest weight of chub taken on the first two Sundays in November, also a prize for the heaviest weight of any kind (bar chub) taken on the last-named days. Mr. G. P. Rolt will give a box of cigars, Mr. J. Hilliar will give 10s. 6d., and Mr. W. H. Meham 10s. 6d., to be fished for on a Wednesday. Conditions for these prizes will be named on Wednesday next, 26th inst. Mr. G. Manning will give a prize value 10s. 6d., for the heaviest perch taken on a Sunday from this date to the end of the season. Mr. T. Harris will give a prize for the heaviest weight of jack taken during the season.

20th October.

LITTLE INDEPENDENT ANGLING SOCIETY.

We had a nice little show on our table on Sunday evening, contributed by the following members: Mr. C. Watson, roach, 8½ lb., dace, 1½ oz.; Mr. Blenning, roach, 7½ lb.; Mr. Petrie, roach and gudgeon, 3¼ lb., one roach scaling 1 lb. 4½ oz.; Mr. Goods, one pretty little jack, 3 lb.; Mr. Heelas, roach and gudgeon. On Wednesday next, October 26, we have our half-yearly supper at the Russell Arms, Bedford Street. We shall heartily welcome brother anglers and friends to join in the harmony of the evening.—W. BROWN, hon. sec.

Oct. 21.

LIVERPOOL ANGLING ASSOCIATION.

The final excursion of the season to the Vyrnwy at Llanymynech, took place on Thursday the 13th inst., when twenty members competed for the seven prizes offered on the occasion. The day was very unfavourable for fly-fishing, the wind being very boisterous, the water cold, on the rise, and much discoloured, and consequently those who used the fly were "not in it." On the other hand

the bottom-fishers had fairly good sport, and some good chub, perch, roach, dace and gudgeon were taken. At the appointed time and place (Cross Keys) the weighing-in was gone through with the following result:—H. Wood, heaviest basket, 6 lb. 3½ oz.; E. Chandler, second heaviest, 4 lb. 6½ oz.; R. Feilinger, heaviest (and only) grayling, 4¼ oz.; H. Davies, heaviest single fish (excluding the winning basket) 1 chub, 4½ oz.; W. Pearson, next winning basket, 1 chub, 6 oz.; H. Frances (heaviest basket of those who had not taken a prize during the year), 1 lb. 15 oz. The party then sat down to an excellent dinner set before them by Mr. Baugh, the host, and every one fully enjoyed the nicely-cooked good things provided for their anglers' appetites. Before leaving, the company thanked Mr. and Mrs. Baugh for their uniform kindness and attention, and for the reasonable charges made on all occasions, and on wishing them good-bye for this season expressed a hope that they would all be spared to meet again in the coming year; wishes to which Mr. Baugh aptly and courteously responded, and the anglers started for home, where all arrived safe and sound in due time.—R. WOOLFALL, hon. sec.

Oct. 18.

ORIGINAL ALEXANDRA SOCIETY OF ANGLERS.

We had a fine show of fish on Sunday last, and great excitement prevailed at our club-house on the arrival of Mr. C. Hewett with a fine show of roach; Mr. J. Blackledge had roach, Mr. W. High, roach; and I am sorry to say that the majority of members that fished the River Lea came home with blanks.—E. DYMOND, sec. pro tem.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

We had fair shows of fish again on Sunday last, Mr. Neagus with roach from the Stort, Messrs. L. Gorsuch and Long, roach and perch from the Thames, Mr. Obbard, roach from the Lea. A special general meeting will take place, on Monday next, October 24th, to fix the date of prizes that have been presented to be fished for.—THOS. WM. LUCY.

Oct. 20.

PRINCESS OF WALES.

Several of our members were out on the 16th inst., but only two weighed-in. Mr. Lumsden had a fine show of perch from Pangbourne, and Mr. Glaister a nice show of dace from Windsor. Members are reminded that Mr. Allport's prize will be fished for on the 23rd inst., at Uxbridge; boundary from the first lock to the bridge. All to start on the morning of competition. A sweepstakes will also be fished for on the same conditions as the prize.—MEDIOCRE.

ROYAL PISCATORIALS.

On the 15th inst., Mr. T. Hughes weighed-in this society 40 lb. of jack, the heaviest of which weighed 13 lb. All fish were in splendid condition. Mr. G. Hockley has returned to his favourite "shop" on the "Royal River," and has managed to kill about 35 lb. of barbel. Messrs. Dale and Frith were out on the Lea, at Ware, and succeeded in getting some roach and dace.—PIXIE.

Oct. 20.

SURREY PISCATORIALS.

In my report of the competition which took place last week among the members of this society I made a mistake in the weight of Mr. Meadway's fish. It should have been 7 lb., and not 5 lb., as it appeared. On the same occasion Mr. Howard, jun., succeeded in winning Mr. Banskack's prize, valued £3 3s.; Mr. C. Banskack took Mr. Pugh's, £2 2s.; and Mr. Boalch came in for Mr. Wymer's, £1 1s. The next society's competition will take place on November 9, for which occasion Mr. T. Clark will give £3 3s. Mr. Nash is down for £1 10s., and Mr. Tanner for £1 1s. Place and conditions will be arranged at the meeting held at the society's headquarters on the 26th of this month.—PIXIE.

October 19.

UNITED BROTHERS.

Several members of the above society were out on the 16th, but met with very little success owing to the prevailing cold wind, but we were just saved a blank by two members bringing-in fish—F. Watts, roach; and W. Tyler, roach and bream.—W. BETTON.

October 19.

UNITED LONDON ANGLERS.

A joint deputation of the United London Anglers' Central Committee and the West Central Association of London and Provincial Angling Societies waited on the authorities of the Great Eastern Railway, by appointment, at eleven o'clock, on Thursday, October 13. The deputation was introduced by L. Morgan, Chairman of the Central Committee, and was most courteously received by W. Birt, Esq., General Manager, and J. Robertson, Esq., Superintendent. These gentlemen were addressed by Messrs. R. Ghurney, P. Geen, S. Morgan and W. H. Beckett, who explained that the object of their visit was to ask for an addition to the concessions already so generously granted, that the very great increase in the number of anglers required more fishing rivers to carry out their sport, and the Great Eastern Railway had those rivers running in the immediate vicinity of those stations that the deputation now asked them to grant the further concession to, and that their train arrangements were so admirable that in many places an angler might leave London and have six or seven hours' good fishing in some of the best rivers in England and return the same evening. The General Manager stated he should not be able to give any decided answer at that moment, but it should have his greatest attention, and he would report in a few days. The Superintendent informed the deputation that he would communicate with the Secretary as early as possible. The deputation kindly thanked both gentlemen for the kind and considerate attention they had given to the application.—R. GHURNEY.

WALWORTH WALTONIANS.

The undermentioned gentlemen weighed-in fish on Thursday evening last, for the October Competition, viz., prizes given by the Messrs. J. Collins and Green, jun., to the value of £4 4s., for four weekday shows during October; competing members to present themselves at the society's headquarters the evening previous to competing. Mr. F. Grigg, chub and jack from Shepperton, Mr. Weatherhead, roach and dace, and Mr. Russell roach and dace. On the 16th, Mr. Bayley visited Pulborough; he managed to find a few roach. On the 18th Messrs. Boalch, Banskack, and Howard visited Richmond. The former succeeded in getting 13 lb. 2½ oz., Mr. Howard, 8 lb. 2½ oz., and Mr. Banskack 8 lb. of roach, all very decent going fish, some of them weighing over 12 oz. each.—PIXIE.

October 16.

WALTONIANS.

On October 12th Messrs. Burton, Little, Read and Dodge, sen., weighed-in. On the 16th, Mr. Phillips, who is perhaps entitled to be considered our

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.

SATURDAY, OCTOBER 29, 1881.

SEWAGE AND OUR RIVERS.

THE NATIVE GUANO COMPANY AT AYLESBURY.

THE question of the purification of the waters of our rivers and streams is one of vital importance to the interests of fishing and fishermen. The rapidly-increasing growth of the urban and rural population throughout the length and breadth of the land has caused the question of what is to be done with the sewage of

our towns, villages, and cities, to become one of the most pressing and important, which have to be resolved. The fact that most towns and villages are situate on, or near to, some river or stream, has caused them to be looked upon as the natural receptacles of all the filth and sewage, and thus it has come to pass that most rivers are polluted to a degree which render their waters impure, in a sanitary sense unhealthy, and as regards the denizens of those waters, has in very many instances entirely destroyed all fish-life. We know of many rivers where some few years ago salmon and trout could be had in abundance, but where now not a single fish is to be found because of the polluted state of the waters. We who live in London need not look further for an example than to the state to which our own noble river has been reduced by pouring into it the accumulating sewage of the many towns and villages situated on its banks. And though recently some attempt has been made to remedy this crying evil by the formation of a joint board, representing most of the towns and villages in the Lower Thames Valley, up to the present nothing has been done by this board for the purification of the river, except to propound a scheme to take the sewage to Molesey, and to promote an enquiry before the Local Government Inspector at the cost of many many thousands of pounds to the unfortunate ratepayers of the contributory districts. The silvery waters of the Thames as of old we knew them, are now murky waters, laden with sewage and all impurities. We have been led to make these observations from a visit which we paid on Wednesday last to the Native Guano Company's Works at Aylesbury. The occasion was a show of Farm and Garden Produce, grown with Native Guano, which is made at their works from the sewage of Aylesbury. By invitation of the chairman and directors, we left Paddington by special train at a quarter to eleven o'clock, a large company having assembled, numbering several hundred gentlemen, representing many and varied interests. Everything had been done by the officials of the Great Western Railway to render our journey a comfortable one. Punctual to time we started on our journey, *via* Slough. We passed old Father Thames at Maidenhead Bridge, leaving on our right the historic mansion of Cliveden (bye-the-by, has it been purchased by Mr. Labouchere-Levi-Lawson?) with its glorious wooded heights glowing in the sunshine, with the radiance of expiring autumn's varied tints. From Maidenhead we proceeded, *via* Great Marlow and High Wycombe, and, close to Aylesbury were joined by several local visitors. A temporary platform had been erected at the company's works for the passengers to alight. Before reaching this platform we passed Prebendal Farm, the property of Mr. Fowler, by whose side we were sitting, and who informed us that he was one of the largest poultry farmers in England, a large user of the Native Guano, and, as we afterwards learned, the winner of the first prize for the best sack of corn in the show. On alighting from the train, the first sight which met our view was the sewage of the town of Aylesbury, disinfected and purified, flowing in a clear stream into the river Thame. This was the very thing we had come to see, for, as representing the fishing interests, here before us was demonstrated the fact that by the process of the Native Guano Company, sewage can be so treated as to render the effluent water fit to flow into any river, and innocuous to fish life. In the FISHING GAZETTE of the 20th of April this year, our special Commissioner at the National Fisheries Exhibition at Norwich, called attention to this very company, and the process (the A B C) which they employ, and it is not too much to say that, as a means of disposing of the sewage of towns, and yet allowing the effluent therefrom to pass into the various rivers and streams on which those towns are situated, this A B C process of the Native Guano Company must be considered an undoubted success.

Having gone over the works where this process is carried out, we made a very careful inspection of the Farm and Garden Produce which was exhibited at the Show. The display was worthy of the occasion. A finer collection of roots and vegetables we do not remember to have often seen. The cabbages were simply magnificent, and the same may be said of the cauliflowers, turnips and potatoes, while the beet and mangrel roots were very fine. All descriptions of vegetables were represented grown with native guano, and, worthy of record, some splendid grapes were shown grown with the same manure. The exhibition of corn, too, though not so large as the vegetables, was extremely good, and the Show, apart from the special interest which claimed our attendance, from the hope that it may lead to good results in purifying the waters of our rivers, in itself would have well repaid a visit. At two o'clock we sat down to a magnificent luncheon, which the healthy odour of the sewage in no way rendered unacceptable, and which was done full justice to by all. The Hon. W. F. Massey-Mainwaring presided over the banquet, and was supported by several members of the House of Commons and most of the neighbouring gentry. Some excellent speeches were delivered, notably one from a reverend gentleman from Glasgow, and at half-past

four p.m. we again found ourselves in the train bound for London, in the company of several gentlemen who take great interest in sewage matters, amongst whom may be mentioned Captain Bedford Pim, late member for Greenwich; Mr. J. W. Denton, vice-chairman of the Richmond Union, member of the Thames Valley Sewerage Board, and the proposer of the resolution at the meeting of that board on the 8th inst., by which the suggestion of the Local Government Board, that the Thames Valley Sewerage Board should hold a conference with the West Kent Main Sewerage Board was, unfortunately, it seems to us, declined; and Mr. Alderman Gould, of Kingston-on-Thames. We had a very busy time of it on the return journey, as our fellow-travellers hold most decided opinions on the sewage question, in which we do not coincide. But we earnestly trust that all will aid us in unceasingly urging the necessity which exists, of providing means for preventing the pollution of our beautiful rivers and streams, so that at no distant date they may again contain millions of fish, to increase the food supply of the country and to afford healthy and enjoyable recreation to all lovers of the gentle art.

AUTUMNAL GRAYLING FISHING.

BY FRANCIS M. WALBRAN.

I THINK that I am pretty near the mark in saying that every devotee of either rod or gun has some particular branch of his respective sport that he likes the best; at least I know that it is so with regard to myself, for although an enthusiast on any matter connected with angling, yet I know no phase of that sport to which I look forward with greater eagerness, or enjoy the fulfilment of so much, as a real good day's grayling fishing in the fall of the year.

A better comparison was never made between the relative merits of the trout and the grayling than the one made by Mr. Francis in his "Book on Angling" wherein he styles the former the gentleman of the streams and the latter the lady; in fact, as regards the amount of sport they yield respectively, I consider there is very little to choose between them, and the same remark applies to their edible qualities. Of course, a grayling hooked during the summer months makes only a very poor show of resistance, no more does a trout if caught in winter; but a half pound grayling at the end of a fine gut or hair cast in September or October is a different matter altogether, as many of my readers, no doubt, know well from actual experience.

Having resided for the best part of my life on the banks of the river Yore, which is a better stream for grayling than for trout fishing, I have had ample opportunities for observing and studying the habits of this beautiful fish, and it is with a view of making known to my brother anglers the result of those observations that I am engaged in writing the present article. The list of flies that I shall give is collected from many sources, some of the patterns having been given to me by the best grayling fishers on the Yore and Wharfe. To the experienced of my readers, I do not expect to impart much information, as no doubt most of the patterns will be familiar to them, although a few of them, perhaps, may not. I trust, however, that the tyro in this branch of the gentle art may be able to pick up a few hints that will be of service to him, and should this be the case, I shall feel amply satisfied.

Large grayling are not really in good condition or fit to be taken before the end of August, and in my opinion on a good grayling stream no fish over $\frac{1}{2}$ lb. in weight should be allowed to be caught before that time. Fish under that size, or shott grayling, as they are called, are in condition much earlier. I will start, therefore, with September, and consider the flies most suitable for that month.

No. 1.—THE LIGHT OLIVE BLOA.—Wings, inside of dotteril's wing or the smaller quill of a seagull; body, pale white French silk; legs and tail, pale blue hackle. Remarks: This fly is given by Jackson in his practical book on fly-fishing, and sometimes, towards evening, I have found it answer well. He also recommends the same wing with yellow legs and body, but the pattern given above is the one that I generally employ.

No. 2.—DARK OLIVE BLOA.—Wings, inside of water-hen's wing; body, lead-coloured silk; legs, dark olive hackle; tail, three small rabbit's whiskers. Remarks: This is a grand fly, if dressed small; I am indebted to Mr. Jackson for this pattern also, and I rarely fish on cold days in September or October without giving it a trial.

No. 3.—THE WHIRLING BLUE DUN.—Body, squirrel's red brown fur, mixed with yellow mohair, tied with yellow silk thread well waxed; tail, one or two whisks of pale ginger hackle; wings, feather from a starling's wing, not very light; legs, pale ginger hackle. Remarks: This is a fly that is not held in very great estimation on the Yorkshire streams, excepting perhaps the Rye, but in the

Worcester district and also on the Dove it is a very noted fly. The pattern given above is Ronalds, who varies it somewhat from that given by Mr. Francis, "Ephemera," H. Wade, and others. The best imitations of this fly that I have ever seen were some that the late David Foster sent me last autumn and no doubt his sons can still supply the same pattern; for my own part I prefer No. 2, as being a better killer, at all events in Yorkshire.

No. 4.—THE APPLE GREEN DUN.—Wings, either dark starling, or taken from inside of water-hen's wing; body, apple green silk; legs, dark olive or black hackle. Remarks: I obtained the pattern for this fly from Hensburgh, the water-keeper at Bake-well, and have since then killed well with it on the Yore and Wharfe; it is best to be provided with both dark and light shades of wing. I received a letter from a gentleman quite recently stating that he had found it an excellent killer. I had given him one or two as a sample.

No. 5.—THE NEEDLE BROWN.—Body, a fine shred from the yellowish quill of a thrush's wing; legs, a grizzled blue dun cock's hackle; wings (under ones) starling's feather used sparingly, and above that two fine slips of hen blackbird's wing. Remarks: This fly is quite as great a pest to the fly-fisher as the black midge; the pattern given above is Mr. Francis's, and dressed very carefully and finely this makes the best imitation of the natural fly that I have seen. Mr. Francis remarks that Jackson alludes to it under the name of the little brown, I do not think so myself, as No. 57 in Jackson's book, which he styles the little willow fly, would give a better imitation. Mr. Ford, in his excellent manual on fly-fishing, evidently shares my opinion, as, under the heading of "Needle Brown," he gives, among other synonyms, "Willow fly," but the angler must not confound it with the next pattern that I give. Mr. Wade mentions it in "Halcyon" as the "Spanish Needle," but his pattern represents the insect known on the Wharfe as the "Musk Fly," and a rare killer it is.

No. 6.—THE LARGE WILLOW FLY.—Body, moles'-fur, spun sparingly on yellow silk; to be hackled with a grizzled hackle of copperish hue. Remarks: This is a standard grayling fly, in fact, I have fished on days when no other fly would do. It is easy to recognise it as it flutters across the stream in the sunshine of a warm September day, and the sight of them usually heralds good sport, if the angler has a good sample tied on fine gut on hair.

No. 7.—THE HONEYDUN BUMBLE.—Body, orange floss silk ribbed with bronze peacock's harl, hackled with a honeydun hackle. Remarks: Although a purely fancy pattern, I do not know any fly that can compete with this as a killer of grayling. I believe that I am correct in saying that Mr. Eaton of Matlock Bath was the inventor of it; and most decidedly no one can make them like him. I have killed some hundreds of fine grayling with this fly, and consider it as great a *sine qua non* on the cast of a grayling fisher as the traditional red hackle is in trouting; in fact, more so, as the latter is a fly that I seldom use.

No. 8.—THE RED TAG.—A bright red cock's hackle, wound upon a body of green peacock's harl, with a scrap of scarlet floss silk at the tail. Remarks: Another excellent fancy fly. I am indebted to a Worcester gentleman for this pattern and can strongly recommend it on dull autumn days, when there is no particular fly upon the stir. It should be fished at the tails of streams sunk a little below the surface of the water. I have found it taken almost invariably by good fish.

No. 9.—THE BLUE BOTTLE.—Wings, jay's quill feather; body, blue tin foil, ribbed with purple silk; legs, dark olive hackle. Remarks: As this fly gets weak as the cold weather advances, they fall upon the water, and are eagerly taken by both grayling and dace.

No. 10.—THE HOUSE FLY.—Body, light brown silk, ribbed with drab ostrich harl; wings, lark's quill feather; legs, grizzled hackle. Remarks: This is Jackson's pattern. I have tried it on several occasions, but am inclined to give the preference to the blue bottle.

To be Continued.

ANNIVERSARY OF THE PISCATORIAL SOCIETY.

IT has always been customary to celebrate the anniversary of the establishment of this important society by what is termed an annual supper in which tripe is considered the chief dish. This interesting event—for it is like the return of a birthday—took place on Monday evening last in the spacious club room at Ashley's Hotel, Henrietta Street, Covent Garden; and under the presidency of the esteemed father of the club, Mr. F. G. Pearce, who was supported in the vice-chair by Mr. C. P. Wheatstone, and Mr. Thomas Huggett. Amongst those present were: Messrs.

F. H. Pearce, W. H. Brougham, T. R. Sachs, Thomas Gillatt, Dr. Thomas, Dr. Brunton, R. S. Fenning, B. Perelli-Rocco, James Pattisson, J. Hill, E. Foreman, W. B. Adlington, F. H. Lemann, Henry Gray, James Lander, J. A. Nicholay, M. H. Blamey, T. Norman Harrison, J. Ross Faulkner, G. Walker, John E. Walker, T. Simpson, H. H. Brown, H. B. Brown, E. Russell, Ernest Turner, T. G. Batt, C. W. Elsdon, &c. The supper—which consisted of thick ox-tail and Julienne soups, sweetbreads, fried tripe, boiled tripe and onions, roast beef, roast mutton, jellies and sweets—gave very great satisfaction, and was served up under the personal superintendence of Mr. Bass, the experienced manager, whose attention and catering elicited marks of the highest approval. The Chairman first of all gave “The Queen” in a loyal and affectionate speech, and then proposed “The Prince and Princess of Wales and the rest of the Royal Family,” congratulating them on the interest now taken by His Royal Highness on matters piscatorial—first, in relation to the Norwich exhibition, then in connection with the International Exhibition of 1883; and last, though not least, in becoming Patron of the Thames Angling Preservation Society. Both these toasts were warmly responded to. The Chairman gave the toast of the evening, “Success to the Piscatorial Society,” and, in doing so, said according to date last Sunday would have been the forty-fifth anniversary. The last year had been an eventful one, as, in the first place they had without notice to leave their club room; and whilst the society and its museum was under the kind and liberal charge of Mr. F. C. Hatfield, of the Star and Garter, St. Martin’s Lane there was a demand for their fish for the Norwich Exhibition, where they obtained the principal prize. They had, however, got back to their old quarters under very comfortable arrangements. The society had sustained great losses in the deaths of Mr. Frank Buckland, Mr. H. L. Rolfe and Colonel Crauford, but they had in their possession trophies of the two former which would keep them in lasting remembrance. As regards the society, all he need say was that it was satisfactorily progressing and the funds were in a very flourishing condition. Over the loving cup, which was now passed round, the toast was drunk with the greatest enthusiasm. When this was completed Mr. F. H. Lemann said he had a few words to say. The anniversary of their society was always associated with a competition for Jack—named after their late treasurer, Mr. Shenton—and he thought it a fitting opportunity to present the club with a painting of a Jack, which, he was convinced, they would all admire. It was executed by his friend, Captain Alfred, and one of his earliest pictures. In these miniature paintings he considered the artist would rise to great eminence, and become a distinguished scaly painter. The painting was handed round the room amidst expressions of approval, and several present remarked they should like to become possessors of some of Captain Alfred’s magnificent works of art. Mr. Lemann’s liberality in the presentation was suitably acknowledged, and his health most heartily drank at the request of the chairman. Mr. Sachs then rose to give “Success to the Thames Angling Preservation Society,” which was doing so much for the anglers. Referring to the impediments of the steam launches on the river, which drove the fish all about, he believed there was plenty of fish, and not the scarcity that some thought, and he gave that opinion from practical experience. After eulogising in very glowing terms the energetic work of its secretary and friend, Mr. W. H. Brougham, he would couple that gentleman’s name with the toast. Mr. Brougham, who received musical honours, first of all referred to his connection with the Piscatorial Society some fifteen years ago, on the occasion of one of these anniversary suppers, and was glad to find after that and over twenty-two years’ work with the Thames Angling Preservation Society they were so well satisfied with his services. He would not refer to the past, as there was so much of the present to speak about. They would be pleased to learn that the head keeper on Friday night last captured a net of 30 yards in length and 9 feet deep, with two of the old poachers at Brentford. He then noticed the memorial which had been laid before the Thames Conservancy, and strongly urged their assistance by one from the Piscatorials in favour of the abolition of netting between Richmond Bridge and Kew Bridge, as he was satisfied they could not strengthen that portion of the memorial too much. In conclusion, he heartily thanked them for their enthusiastic reception, and assured them that Mr. Spreckley and himself were doing all they possibly could to preserve the river, and they would continue to do so amidst “evil report and good report.” Mr. Huggett, in thanking Mr. Brougham for his thoroughly practical and interesting speech, proposed that the Piscatorial Society should present a memorial in reference to the extension of angling in the tideway, which was seconded and unanimously carried. A conversation then took place on different practical subjects connected with the river, in which Messrs. W. B. Adlington, F. H. Lemann, C. P. Wheatstone, J. E. Walker and others took part, to which replies were made by Mr.

Brougham. Mr. Thomas Gillatt, in proposing “The Press,” thought they would be overtaking Mr. Brougham’s oratorical powers in uniting his name with it, but as no man had done more for the society in the Press than he had, he was sure it would be safe in his hands. Mr. W. H. Brougham said he had now for about fifteen years regarded himself as their Press representative, and during that time had recorded the doings of the society in at least fifteen of the best newspapers. He hoped to continue to enjoy the position he did in that respect for some time longer, as he did the work more for the love of it than for any pecuniary gain. Dr. Br. Brunton, in very complimentary terms, gave “The Health of the Honorary Secretary,” to which Mr. Lander briefly replied. Mr. F. H. Lemann then referred to the idea of Mr. R. B. Marston on the propagation of all kinds of course fish, and those present heartily concurred with him in the view that it should receive their consideration and support. At this part of the hearing, Mr. T. Huggett weighed-in some fish which he had brought up from the Avon. They consisted of one pike weighing 8 lb. 15 oz., several others weighing 40 lb. 2 oz., and 5 lb. 15 oz. of peal. The Chairman then proposed “The Successful Angler” to which Mr. Huggett replied, and gave “The Chairman” which was acknowledged by Mr. F. G. Pearce. The last toast was “Mr. Bass, the Manager,” the Chairman expressing satisfaction at the excellent supper, which was heartily endorsed by an appreciative company.

THE PISCATORIAL SOCIETY.

THE annual pike competition which took place on the 17th inst. is always regarded as the great event of the year, inasmuch as it is commemorative of the establishment of the society, and prizes are designated after the late much respected treasurer, Mr. Thomas Shenton, and called “Shentonian Prizes.” There was a large attendance at the club-room, Ashley’s Hotel, Henrietta Street, Covent Garden, on Monday evening. Mr. Thomas Gillatt, who is a very old member, being selected to preside on the occasion. There must have been at least fifty members and visitors present. The first prize of four guineas and a prize of one guinea for the heaviest fish were won by Mr. Attwell, with two fish weighing 20 lb. 8 oz. The largest fish which weighed 15 lb. 13 oz. was caught with a small dace on a single hook at Great Marlow. The attendant fisherman being Henry Rockell, jun. The second prize of one guinea was won by Mr. C. P. Wheatstone, with three fish weighing 13 lb. 2 oz., the largest 5 lb. 4 oz. caught at Maple Durham, fishing with E. Shepherd. Mr. Lecluse weighed-in a jack of 4 lb. 5 oz. from Great Marlow. Mr. Thomas Huggett, four chub, weighing 7 lb. 15 oz., the largest 3 lb. from Henley. Between fifteen and twenty members also competed, but were unsuccessful either catching nothing or else fish under the limit, which is 3 lb., really making the match a question of the greatest number of specimen fish. The society for many years has offered prizes for specimen fish only. The healths of the successful competitors were drunk with great enthusiasm, and Mr. Attwell as a new member was warmly congratulated on his piscatorial achievements. The members were reminded of the anniversary supper in the club-room on the 24th inst., at which Mr. F. G. Pearce, the father of the society would preside, and great expectations were raised that the present proprietors of Ashley’s Hotel would give substantial evidence of good catering. B.

VISIT OF THE RICHMOND PISCATORIALS TO KINGSTON.

THERE was a competition amongst the members of the Richmond Piscatorial Society on Thursday in last week at Kingston, for three prizes, amounting in the aggregate to five guineas, liberally presented to the club by Mr. John Bond, the piscatorial proprietor of the Sun Hotel and a member of the Richmond Piscatorial Society. Unfortunately the day selected for the event proved to be an unfortunate one—the atmosphere was excessively cold and the reach at Kingston a perfect sea through the prevalence of a boisterous wind—but the members who had given in their names for the contest were all determined to do their best, the prizes being for the heaviest weights. The jack anglers were completely beaten by the elements and never got a run—two of the roach fishers were in better form—but the one who made choice of chub-fishing was rewarded with a nice dish of fish. As the evening approached and darkness set in, the members and competitors began to assemble not only to witness the result but to look forward to another event which was to close the proceedings of the day—the arrangements including a substantial dinner at the Sun Hotel, where they were all satisfied, Mr. Bond would cater for them in a most excellent style. The

weighing-in of the fish commenced at six o'clock, Mr. R. Knapp, in the absence of the secretary, kindly undertaking the duties of "Master of the Scales," and when all appeared done the following was the verdict: Mr. A. Davidson, 5 lb. 3½ oz. of chub; Mr. W. W. Abbott, 2½ lb. of fish, and Mr. T. Field, 1 lb. 10 oz. The members and visitors had now about mustered, as the time fixed for the feed was half-past seven, and "true as the clock" Mr. John Bond with his happy and jovial countenance came into the "weighing-in room" to announce all was ready. There was a general move upstairs—a drawing room was appropriated as a cloak room, with well qualified attendants, and this opened to a spacious dining-room, where tables were most tastefully laid out, and all around looked comfortable and pleasing. Mr. F. C. Clench, the able commander of the Richmond troop, took his seat at the head of the table, and his deputy, Mr. Dickinson, in the vice-chair. Amongst those present were Messrs. P. Geen, W. H. Brougham, H. Nattrass, J. H. Gaunt, R. Rowe, W. Abbott, R. Knapp, John Bond, Wilson, H. E. Gaynor, J. Plant, W. Giles, W. Eydmann, F. A. Crewe, W. Tirrell, T. Field, G. Eydmann, W. H. Spencer, H. Griffiths, A. E. Fricker, J. T. Matthews, A. Fricker, &c. The dinner was served up in an exquisite manner, fish, flesh and fowl being in great abundance, beautifully cooked and the wines and attendance were eminently good. The Chairman gave "The Queen and the rest of the Royal Family," which was followed by the National Anthem, Mr. W. Abbott presiding at the pianoforte and taking the solo parts, the company joining in a grand chorus. Mr. Clench then proposed "The Richmond Piscatorial Society," which, he said, was going on most prosperously, and had now at least 130 members; and taking those around him as examples, he felt certain for weight, size and ability, they could successfully compete against any other angling club. He called upon all present heartily to respond to the toast, and "long may the society continue to flourish!" The next toast proposed by the chairman was, "The Thames Angling Preservation Society," and he was sure all of them heartily appreciated its valuable services on the river, and in an especial manner the duties of its energetic secretary, Mr. W. H. Brougham, who he was proud to see amongst them on that occasion. His occasional visits to their club room on meeting nights were highly valued, and, in giving his name in connection with the toast, he was satisfied they would give him all the honour and respect he so richly deserved. Mr. Brougham said he was only afraid their excellent chairman had overrated his services, but he was glad to find that having been connected with his society for over twenty-two years his duties were still discharged to their satisfaction. The society had some enemies as well as plenty of friends, and the circulation of false reports by the former as to netting would neither discourage Mr. Spreckley or himself in vigorously carrying on the work of river protection. They had both on the previous day superintended the sinking of a punt at Twickenham, and what with the hindrance of stakes, the sinking of some hundreds weight of tin cuttings, together with a vigilant supervision, the netsmen would have a poor chance between Richmond and Teddington of getting at the fish. He heartily thanked them for their truly welcome reception. Mr. Clench then gave the West Central Association which had conferred such great benefits on the anglers. In obtaining the railway concessions in which his good friend Mr. Geen had so prominently assisted, he was certain that gentleman had sacrificed both time and money to bring their plans to a successful issue, and he felt he would not be saying more than Mr. Geen deserved that no man living had done more for the anglers. Mr. Geen acknowledged the toast in his usual able manner, only regretting there was not sufficient time to tell them all he would like to do about the association, but this he would be glad to do some evening at one of their ordinary meetings. The chairman then announced the result of the competition, the first prize was accorded to Mr. W. Abbott, and the second prize to Mr. T. Field.* Mr. Nattrass in very complimentary words invited those present to drink the health of their esteemed chairman who had made the society what it then was. The whole company rose to do honour to the toast; and the enthusiasm which prevailed must not only have been gratifying to Mr. Clench, but he received as a substantial evidence how highly and unmistakably they prized his eminent services. Mr. Clench in a very feeling manner responded to the toast, their overwhelming expressions of satisfaction would stimulate him to go forward with all his might to raise the position of the society to the highest eminence. "The Vice-chairman," "The Prize Givers," "The Prize Winners," and "The Worthy Host" were the other toasts, and in the latter Mr. Clench expressed to Mr. Bond the entire satisfaction of all present at the magnificent entertainment he had so bountifully provided for them. It may not be out of place here to remark that Mr. Bond has taken the largest pike this season out of the Thames—that he

is an old member of the Thames Angling Preservation Society, and that he always gives a hearty welcome to his brother anglers.

THE BELGIAN DEVIL.

"IT was reported recently that the dandy *Eagle*, belonging to Willam Land, of Lowestoft, was drift-net fishing, when an Ostend trawler endeavoured to sever her nets with a 'devil,' but failed, and the master of the *Eagle* managed to secure the instrument. His nets were damaged, but he failed in the darkness to identify the Ostend boat. A telegram has been received from the British Consul at Ostend to the effect that the Ostend trawling vessel, *Isabel*, O, 31, arrived there on Tuesday night, October 11, with loss of gear. This may lead to the identification of the vessel which trawled into the nets of the *Eagle*, and should it be proved, the Belgian Government will punish the master and the crew."—*Norwich Argus*.

We are indebted to Mr. Soman, of the *Norwich Argus*, for the loan of the accompanying view of the "Devil."

This appropriately named infernal machine is of great weight and stands 3 feet in height, the inner sides of the hooks are as sharp as a knife. The mode of using this devil is to tow it in front of the Belgian vessel's trawl right through the English nets, which it cuts, and all the fish go into the foreigner's trawl. Our only wonder is that English sailors are not held in sufficient respect in the North Sea to prevent any Belgian boat daring to use such a villainous affair. But all they do, as far as we can make out, is to appeal to the English Government for protection. Why do not they combine together and catch a Belgian using a devil and play Old Harry with him? Horsemanship the crew, and then tar and feather them and tow them into an English port. Such a lesson would do more good than any punishment the Belgian Government will ever inflict—at the most, perhaps, a fine, to be remitted on the sly. If the English fishermen in the North Sea cannot stop such "devilry" as this themselves, they had better let the Belgians do all the fishing and turn to farming.

MINNOW-TRAPS.

THE following extract upon the subject is from "A Month in the Forests of France," by the Hon. Grantley F. Berkeley.*

The kennel inspection concluded, and entreaties persisted in that, as we were to hunt roe deer on the following morning, in feeding on this, the previous day, might be over early.

"Now, Jules," I cried, "where is your minnow net, and how shall we catch the live bait?"

"You shall have some directly; come along."

We went then into the kitchen; and, on coming there, I exclaimed in raptures, on viewing as handsome a yellow English setter as ever I wish to see.

"Oh, Jules, what a beautiful setter!"

"Oh, no, it is not a setter."

"Not a setter! Why I never saw a more perfect one to look at. There, if you please, you have got the right thing, if he be as good as he looks to be."

"Oh, yes, he is good—but he is not a setter."

"Not a setter! I cried," rubbing my cap upon my head, as if I desired to be bald for life; then casting away all indignation, I repeated, "Not a setter! Now my dear Jules, you are a sensible fellow, and I must think you have good grounds for contradicting me about a dog whose breed I will swear is of English or Irish extraction. If it is not a setter, with that nice flowing silken yellow coat and beautifully feathered stern, what is he then?"

"Oh, no, he is not a setter, he is a pointer."

"A pointer! Why?"

"Oh, he always points his game, he never sets."

Had I not been close to the fire-place I should have fainted, so, instead of falling, I dived into a corner outside the door, where I had left my fishing-rod, and began to take off the cover. Having finished my preparations for fishing thus far, I looked in to see if Jules was after his minnow net, for the morning was getting on, and I was anxious to begin. My readers will then imagine my astonishment, as well as impatience, when I beheld him at the kitchen table, attended by some old ladies in wooden shoes, and

* Mr. Davidson, not being a member, was disqualified.

in the act of tying up two large bottles, as I supposed for leeches. It could not be for pickling or preserving, for he had tied up their necks with a tight piece of rag, into the strained surface of which he was industriously picking holes.

"Come on, Jules, and leave the bottles. I shall never have time to work the minnow-net, catch live bait, and try the holes for perch."

"I'm ready. You take up your rod and the casting-net, and I'll get you live bait; so come along."

"The casting-net!" I exclaimed; "that is too large in the mesh for anything under a quarter of a pound. If you've no other net than that I shall get no live bait."

"Oh, yes. We have plenty of live minnows. Come along, bring the net. He has nothing to do with minnows; I catch your minnows when we get to the river while you put your rod together. Come along."

Thus speaking, and with the air of a man who knew what he was about, Jules preceded me, bearing in either hand a large glass decanter, plain and very transparent, about the size of what we should denominate an English magnum, into which I perceived he had inserted half a handful of crumbs of bread. I gazed at him in astonishment, with dreamy notions of bottle imps and conjurations, but his bearing was so positive that I followed in speechless mystification. At length we reached the river, and the first good looking perch hole, where he halted, with these words:—

"Now, then, you put your rod together, get out your line and hook, and when you have done that I will have a hundred live minnows."

So saying, I saw him lie down by the side of the stream at a shallower place for a moment or two, and then return to get up his casting-net and see that it was fit for use. In five minutes I was ready, and in a sort of hopeless agony asked him:

"Where are my live minnows?"

"All ready," he exclaimed, scarcely taking his eyes from the lead-line with which he was busy. Then, dropping the net, he repaired to the shallow, and, lifting only one of his bottles, brought it to me filled—a jolly full bottle of fine lively minnows of the most approved sort.

These bottles are made on purpose for fishing. That part at the nether end which protrudes inwards to the centre (and which I believe must protrude a little in all cases but is often, for the purpose of short measure, made much larger than necessary) in these fishing bottles was a little more elongated, and at the end of it there was a hole about the size of a finger to admit the minnows to the bait. When in the formation of the bottle became much the same in shape and effect to the entrance of an eel wheel, or thief, or hoop net, and the minnows never thought of attempting to get out again at the right place. A handier contrivance I never saw, for when held upright the water sank almost as low as the entrance hole, and there was enough water still retained to keep the minnows alive in moving from place to place. When stationary, the bottle was again sunk, and set to fish moored to the side of the stream with a piece of string. Holes being pricked in the rag over the top, which, when not covered, is used to let the fish out, the air escaped, and the bottle lay at the bottom fairly on its side.

I am inclined to think the pickle bottle, treated as Mr. Keene directs, would not answer as desired, as the moment the bottle was moved the minnows would rush out of it. At least, this has been my experience with a somewhat similar contrivance. In the trap described above, it will be seen that the minnows cannot escape.

G. F.

SINKING A PUNT AT TWICKENHAM.

THE committee of the Thames Angling Preservation Society has obtained permission from the Board of Thames Conservancy to sink a couple of punts in Cross Deep, at Twickenham, near to the residence of Lady Adelsa Manners. Only one punt has at present been obtained, and the ceremony of sinking it took place on Wednesday afternoon, 19th inst., at five o'clock, under the superintendence of Messrs. Thomas Spreckley and W. H. Brougham, the work of sinking the boat being under the management of Mr. G. J. Rough, the active and energetic keeper of the Thames Conservancy. The punt was successfully placed in good position, not only as a harbour for fish, but as an obstacle to netters. The Twickenham Deep is well protected with immense stakes covered with tenter hooks and some hundreds weight of tin cuttings have been sunk, the latter always giving strong evidence if the nets have been at work. The Thames Angling Preservation Society will be glad to receive contributions of old punts.

Mrs. F. Y. Brocas, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly-making given.—[Advrt.]

CLUB AND OTHER JOTTINGS.

By L. B.

I REFRAIN from giving a detailed account of the FISHING GAZETTE Tournament, which took place last Saturday afternoon, at the Welch Harp, Hendon, in spite of a perfect storm of wind and rain, as also of the dinner, toasts, speeches, songs, &c., which followed it, because, no doubt, such will appear elsewhere in the present number of the FISHING GAZETTE, but there were certain incidents, observations, and deductions I made from what I saw and heard quite apart from the details of the actual proceedings on which I should like to express an opinion. 1st. There can be no doubt that these kinds of competitions are destined to become exceedingly popular. Though, owing to adverse circumstances the attendance on Saturday was exceedingly limited, the interest was unflaggingly sustained—the various competitions and displays of skill being kept up until the shades of evening closed around. Next, it was, if I may be allowed the term, a thoroughly cosmopolitan gathering.

Thames professionals, amateurs, residing by the side of that river, Trentside and other professionals and amateurs—men of ample means and good social position, clerks, humble artisans and mechanics—all well represented, all testifying by their presence, and the eagerness with which they watched each cast, and the interest they felt in this novel exhibition; while several daily, and almost every sporting paper, were represented by well-known correspondents.

Of the river itself I shall say nothing, but I sincerely hope Mr. Marston's remarks about the scientific breeding and rearing of coarse fish will be carefully gone into, and that a scheme will be drawn up giving practical effect to a project which will not only be of the greatest practical utility in replenishing the daily decreasing stock in our river, but possesses a particular fascination of its own.

Mr. Hoole asks me to mention that he will be particularly obliged if secretaries of angling societies and others will kindly let him have the amount for Anglers' Tournament tickets sold as early as possible and not in stamps.

Too much credit cannot be given to the judges. Messrs. Wheeldon and Jardine for the manner in which they discharged their duties, Nor to Mr. P. Geen, who officiated as timer, under circumstances which would have tried a Mark Tapley.

Apropos of Mr. Geen, how was that gentleman employed during the greater part of the interval between the close of the exhibition and the commencement of a substantial and welcome dinner in the Pavilion? I heard something, and on good authority of a gentleman who was wet—very wet—particularly about the lower extremities being piloted by Mr. R. Lealand, of the North-Western Anglers, who knows the Welsh Harp and its surroundings as well as a snail knows its shell, safely to Mr. Sawyer's (the keeper's) cottage, where Mrs. Sawyer's kind heart was moved, the result being an opportunity which he seized of drying his clothes, putting his feet into warm water and being sent into dinner dry and comfortable, and flashing a pair of Mrs. S's best stockings on his lower extremities. Didn't some of the poor wretches, the writer included, huddling round the fire envy P. G.! Just a few.

Mr. J. Lancaster, the fish-preserver, of 2, Jeffries Place, Kentish Town, tells me he last week received for preservation a nice jack, weighing 20 lb., from Sonning.

Before the recent rains, a few decent bags of fish—mostly roach—were being had from Hurley.

Among the numerous small takes I have recently seen, perch figure conspicuously. These bold-biting, game fish ought now to now to begin feeding in earnest.

Last Friday, Mr. Browning, of the Westbourne Park Piscatorials, had a nice jack, 9 lb., from West Drayton (Godfrey's), Mr. W. Hawkins also having some good dace from the same water.

A large net has been captured in the tidal portion of the T.A.P.S. water. I have no particulars, but the bare fact is enough to make one rejoice.

I was button-holed the other evening by a piscator who wanted to know "What of the Thames Rights Defence Association?" because, as he said, you know, don't you know, if they are still alive it's time, you know, they give some signs of life, don't you know. I have a dim recollection of my hazy answer, which included the words—abstracts, Norman French, City charters, funds, moral support of public, &c.—but he wasn't satisfied; didn't offer and wouldn't accept a liquor; and went away mumbling something about writing to Mr. Francis Francis. I don't know if he will. I should like to know.

I don't know whether congers will devour human remains—my impressions are they will—but I know freshwater eels will gobble most things—a favourite bait for them in Belgium, and one with which I have caught hundreds, are the smaller sea-mussels which they prefer "gamey." I have also taken several good tench with the same bait, but cannot remember whether the bait on these occasions was fresh or high, though I believe the former. I am informed by Mr. Hobden that should any controversy arise concerning the spawning of dace I wrote about last week, some of them have been carefully preserved in spirit for the conversion of unbelievers.

The next West Central Association, No. 1. District, visit will be paid to the Marylebone Angling Club, the "Prince Albert," Sherborne Street, Blandford Square, on Tuesday evening, November 1st, when Mr. Secretary Pearce writes he hopes to see a goodly muster of anglers and friends.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—[Advrt.]

RIVER REPORTS.

MID-THAMES.

"I care not, I, to fish in seas—
Fresh rivers best my mind do please."

—WALTON.

Very little of note has been done in Mid-Thames, to my knowledge at any rate, since my last note, and really I should prefer to fish "in seas" rather than in the river lately to get a continuance of sport. The recent rains have much improved the condition of the river for roach and chub, and I hear from many sources of pretty takes of those fish—but the takes seem to have been enhanced by the surprised delight of the anglers. From above Oxford I glean that excellent takes of chub have been had, and that at Pangbourne, Streatley and Wargrave the roach, perch and chub are fairly on. I am not inclined as a rule to advertise stations, but, if an angler would like to have a chance in Mid-Thames just now, I would advise him to locate himself in Wargrave—educate himself to the water, or get a tutor to cram him, and day by day cram himself at Mr. Wyatt's, and the result I am assured from personal experience will be good sport and good grub. (N.B.—This advertisement is not paid for.) At Hurley, Messrs. Lee and Harrison have been doing grand things with the roach and chub; 30 lb. being the weight for one rod on Sunday, and some 6 lb. or 7 lb. for the other, beside a chub of 3½ lb.

FRIDAY EVENING.—River coloured and high, but, to my idea, in tip-top trim for all-round autumn fishing.—MARLOW BUZZ.

Thames (Goring).

Water very high and very thick; no jack or perch fishing for some time to come; three or four days before the water will be right for jack; do well for roach fishing by Sunday. Prospects look better; a few fine days will soon get the water in good order. On Sunday 2 jack were caught, largest 4 lb., and some perch. I have only had one day's fishing since my last report.—JOHN RUSH.

Thames (Halliford).

The river is now in good order for all seasonable fishing. Different gentleman fishing with me the last week, their takes have been as follows:—First day, Mr. Howard fishing with me, caught four and a half dozen roach. Second day, Mr. Tunis, 1 barbel and some nice roach. Third day, Mr. Palmer, 4 nice chub. Fourth day, Mr. Frith and a friend, 3 dozen fine roach, 1 bream, and 2 perch.—GEORGE ROSEWELL.

Thames (Kingston).

The rain has coloured the water for the first time this season. I am in hopes the fish will feed as there has not much been done for some time. Should it keep fine there will be good all-round fishing. I have got a few roach and dace, and a jack now and then, but not above 3 lb. The best day was Sunday. John got seven barbel, all from 3 lb. to 3½ lb. I have seen plenty of fish prime, but will not feed. Should it be fine I should say try for jack and perch. I found them the first time to-day.—JOHN JOHNSON.

Thames (Monkey Island).

Water getting into good condition after the rain for all-round fishing, and I have no doubt there will be some good takes of jack, roach, and perch during the next week. On Sunday last a gentleman fishing with my son (R. Plummer) took three nice jack, the largest weighing nearly 7 lb.; also a nice show of roach, which ran very large, and in splendid condition. Out myself on Sunday afternoon, in two hours got a nice jack 6½ lb., and a dozen roach, averaging ½ lb. to 1 lb. I began to think there were no jack in the Thames until last Sunday. Just before the thick water came down after the heavy rain jack were seen in all directions. I should think between Bray Lock and Monkey Island as many as thirty jack were seen feeding.—ROBERT PLUMMER.

Thames (Richmond).

Since my last report we have had a mixture of the worst weather we could possibly have for fishing; and to-day, for the first time, the fish have fed at all freely. Should we get no more rain by the time this is in print the river will be in fine fishing order. A shift in the wind will be a great improvement. Also, as the fish do not care for the north-east wind any more than we do, the fishing prospects look well for next week; and anglers who want to wet a line once more before "Jack Frost" comes will not have a better opportunity than now, as I fully expect to have to report some good takes next week. Two gentlemen, members of the Walworth Waltonians Angling Society, fishing here to-day, caught between 20 lb. and 25 lb. of roach to-day, and a lady and gentleman, fishing with Howard, 20 lb. of roach; myself, with one gentleman, 11 lb. of roach. I also have to report the taking of a net by Walters, the Thames Angling Preservation Society's keeper, at Brentford, on Friday night last, Oct. 21, between the hours of 12 and 1. It measures 30 yards in length, and is 9 feet in depth. Such an engine as this would not be long in clearing the river, as it has a mesh of only 1 inch, so as to pick up a 3-inch fish; and it is certain it is not the first time it has been used, as it has seen some wear. I have not seen it myself; I am informed that the two men will be tried on Saturday at the Brentford Police-court. It is to be hoped this is the only one there is or has been at work in the Thames.—JOHN BUSHNELL, Fisherman.

Thames (Twickenham).

Wind N.E. Water in good condition, and tides suit next week for whole days' fishing. We have had some good sport this week, averaging about 8 to 10 dozen of good fish to each punt. I am pleased to say our head riverkeeper, Mr. Walters, of T. A. P. S., has made a splendid capture of an illegal net,

measuring 30 yards by 9 ft. 6 in. deep. The case is to be heard before our Brentford magistrates this day, Saturday, 29th.—ALFRED PERRIN.

Thames (Windsor).

Water is now in capital condition for worm fishing, and the roach are taking the tail end of lob worms well, several good baskets having been had. One roach taken before breakfast on Monday last by Mr. Way, of Windsor, with worm, scaled 1 lb. 12½ oz., and is now in the hands of Cooper for preservation, being an extremely handsome fish. This gentleman has had several others of good size. Mr. King, of the Royal Oak, Windsor, out with that excellent fisherman Godden at Cookham, took 10 lb. of roach yesterday. Since my last the barbel have not taken to the dormant state, and, in spite of the cold, will bite. Richard Gray, with G. Hockley, Esq., of 84, Old Kent Road, took a nice basket of 24 fish, going between 35 and 40 lb.—largest about 4 lb. His brother, James Gray, out with a patron, took 23, all of which ran small, there being nothing over 3 lb. He has since, with patrons, been getting fair baskets of perch, roach, and chub, one of the latter going 4 lb., taken with tail of lob worm. Before the discoloured water came, Lumsden, with a patron, had a day's jack fishing down the "old river," and took seven jack, live baiting, largest about 5 lb. While this water lasts good roach, chub, and perch, will be had, especially where previous baiting with cut up lob in good big eddies and likely lay byes is resorted to; but this is out of the question with your London angler, who could not bait a swim as we do some three days before fishing. I have just now returned from putting the last punt into a very fishy looking crib, making the third punt they have had, and to-morrow, please the fishes, I shall try my first turn this season at ledgering for roach, and as I know some thumping chub are in the neighbourhood, may be able to send Cooper another this winter, but he must weigh over 4 lb. 9 oz.—a light weigh compared with some in the neighbourhood of Windsor Bridge.—B. R. BAMBRIDGE.

Ancholme.

Owing to the very cold and unsettled weather but little has again been done on this river. Pike-fishing is still at a discount, whilst during the past week most fish seem to have been off the feed. I have not heard of one respectable catch. It is, however, a period of transition. When the fish get settled down in their winter quarters they may probably take to a more regular style of living. Worm-fishing is falling off, and the different kinds of paste prove more killing when the fish can be caught on the feed, which, for the present, seems only to be for an hour or two in the middle of the day.—THOMAS FORD.

Dove.

We have had changeable weather since my last—fine, varied by heavy wet. Not many rosters have appeared on the river, and their efforts have not been attended with a great amount of success, though some have done fairly. Only one really good dish of grayling has come to my knowledge, this comprising seven brace. The flies that have been killing best are the grey palmer and mulberry duns, the same as last week. The grasshopper has also done fair execution; indeed, the latter and the maggot on the bottom appear to be getting the largest grayling, as I hear of several two-pounders being captured with them. At the time of writing the weather seems to have improved. There is a good volume of water in the river, and also a tidy colour. Chub are now taking bullock's brains most freely of anything, and I should not advise anglers to come to our river without some. They may be obtained from any butcher, and for use either for ground baiting or on the hook should be as white as possible. As I close my letter, I learn that the whistler and golden dun have been killing pretty tidy dishes in the neighbourhood of Rochester and Uttoxeter.—THE SPLODGER.

Ilfracombe.

I see by looking over the FISHING GAZETTE of last week that my report was not in it; the mistake was caused, I presume, by me sending one of your old directed envelopes as I had no more of the others left. Sea fishing—Friday.—the weather began to moderate, and a few boats ventured out in the evening to try their luck. At about nine o'clock they returned, and the best boat had 2500 herrings, others 1000 and so on, also a few hake and conger. Saturday.—Weather squally, only two boats ventured out, one had 300 herrings the other 100. There were three conger caught from the jetty with hand-line, two weighed 25 lb. each, one 15 lb. each. Sunday evening.—The weather being finer, several boats went out, and their catches were the best for the season; one boat bringing in 8000 herrings, another 5000, and others 1000 and less; the total of all the boats 30 maize of herrings—a maize is 620 herrings—which sold readily at ½d. per herring. Monday.—About a dozen boats went out, but owing to the weather being so bad they were afraid to drift very far; however, they had a short drift and caught about 10 maize of herrings. One boat had four nets cut to pieces by a passing vessel, another had one very much damaged, which I repaired. On Tuesday the weather was very bad, blowing strong from N.E. Several boats went out, but owing to the heavy sea they had to put back. Wednesday.—Through the day the weather was favourable, but towards the evening the wind began to freshen. However, a few boats had fair catches, the best 2½ maize, others 1 maize, and some less, with several fine hake and a few mackerel. Thursday morning.—Weather still bad; only one boat out, which got 200 herrings. There are some fine fish caught from the pier with ground-lines, such as cod, conger, ling, skate, &c., and there are some fine pollack taken with rod and line. Around the piers there are lamps fixed, and any one requiring sport with rod and line must keep close to those lamps, as the pollack can be seen playing about in the glimmer of the light. Thursday afternoon.—Weather moderating, with every prospect of good fishing for the next few days.—E. COMER.

Ilfracombe (N. Devon).

There has been very little fish caught during the past week, owing to the unsettled state of the weather. Thursday night it blew a terrific gale from the west, and, as luck would have it to be, all our boats were in the harbour; but at Clovelly, a little fishing port about eighteen miles from here, one of their boats was caught in the gale. They ran her ashore, where she soon became a total wreck. The crew fortunately saved their lives by climbing the rocks—they were very much cut and bruised. Friday, the gale still continued—about ten o'clock there was a little craft seen coming towards the harbour; it proved to be the *Mischief*, a Cardiff pilot boat, belonging to Mr. Morgan, and as it drew nearer the harbour a heavy sea struck her, completely burying her, but she soon righted herself again, and with great difficulty she was brought safe to harbour amid the ringing cheers of the people assembled on the quay. Saturday, wind blowing strong from north-west; it was quite a sight to see the gentlemen down about the rocks, with their guns, sporting with the sea-gulls. One gentleman shot sixteen, and several others six or eight. Monday, weather moderating, a few boats went out to try for herrings, and returning in the

evening, best boat 150, which sold at 2d. each; a few conger were also caught and three skate, the largest weighing about 200lb. Tuesday, one boat only went out, and brought in 220 herrings, which they soon sold at 1½d. each. Wednesday, wind blowing strong from the east—boats unable to put to sea. Thursday, still blowing a gale—fishermen anxiously waiting for a change in the weather; they anticipate a good herring-fishing season, as the prospects of their first trial has turned out very good.—E. COMER.

Lea (Ponders' End).

The water cannot be in better condition for fishing, the weeds clearing away very fast. For the next few days there must be some good takes.—EDMOND DURBAN.

Lea (Ware).

The water has been very queer, through the heavy rains, but is gradually getting right. Everything will be right for Sunday and for weeks to come, if only the frosts continue. Several natives have taken some nice jack. Our worthy friend, Mr. Halford, brought me three good ones, weighing 12½ lb. The native butcher has been getting some roach and dace up the ditch. Mr. Wells, from the Phoenix, and friend Egan took home from here to-day some nice roach and dace.—WM. LEEFE.

Medway (Tonbridge).

The river has been stirred up again by the recent rains till it is of the consistency of pea soup. A friend of mine the other day deploring the sad state of things declared that the water was so thick that one could walk on it. When it will be fishable again is a very difficult question to YE MEDWAY WATER RAT.

Norfolk.

The water is still in a very "measly" condition, thereby checking all sport. Great has been the destruction amongst the fish on both our rivers owing to the prevalence of the salt tide. Singular to say, scarcely anything but large fish succumbed to the invader on the Bure, whilst on the Yare nothing but the smallest specimens were to be seen, and it is the opinion of an authority on these matters, that nearly the whole of the fish bred this year are destroyed. Although this is a matter of much regret, yet it will not seriously affect our supply, as, since the old river has been taken in hand, by the Yare Preservation Society, the quantity of fish contained therein is inexhaustible. Some of the wherrymen were trying on their little game of netting again last week; but, thanks to the vigilance of Hewitt, the respected water bailiff of the Y. P. S. their intentions were nipped in the bud. I should like to see notices placed at all the stations along the river, cautioning wherrymen and others against these depredations, also informing them of the liabilities they are laying themselves open to. I trust the Yare Preservation Society will take the hint and see that this is done at once, so that in the event of these gentlemen being caught, they may not set up the plea of ignorance of the law. I may first add that Hewitt with his usual tact, suspecting what these parties were about, had, in the meantime communicated with the police at Yarmouth, and had they eluded him would, upon their arrival in that port, have been waited on by the authorities there. With respect to the New Fishery station at Brundall, the following extract from the *Norwich Argus* of this week, will endorse all the remarks which have hitherto been made by me respecting it. It says:—"Speaking of angling, we learn that a fishing station is likely to be erected by a company close by Brundall railway station. Certain preliminary matters are now waiting decision, and when determined we hope to be able to lay the whole scheme before the public." It has been taken up most energetically, and knowing the warm interest taken in all that relates to fishing in the city of Norwich, we believe we shall be able presently to record the success of a great angling movement.—ANGLER.

Trent (Newark).

I have nothing of importance to communicate this week. The river has been in a state of high flood all the week, and nothing at all, as far as I can glean, has been done in the way of sport. To-night the water is fast clearing down, and anglers can resume operations in a few days; wind north east, a nasty quarter. Anglers who have a few gentles cannot do better than try them for roach, or a few cockspurs will do as well. In a few days, if the present condition of things should continue, chub and pike fishers ought to try scratchings or pith for chub, and a neat spinning bait for pike; but the weather is so very changeable now that it is difficult to foretell what will be the best plan to adopt.—TRENT OTTER.

Trent (Nottingham).

On Monday the river was overflowing its banks, and at that time it was thought we were going to have a great flood; such, however, was not the case, for the water on Tuesday morning was found to have subsided considerably, and was almost fishable in slow swims; but the anglers thought it was hardly good enough, so waited until the following morning, when it was quickly made known that the water was in capital condition for bottom fishing with worms, and several anglers at once started to some of the noted winter spots, and succeeded in getting the roach fairly on the feed, with a cockspur worm on the hook, and a very small quantity of groundbait was used, and anglers finding the water was in good condition for bream, tried that noted length at Weston; but only caught a few which greatly surprised the roosters, for it is well known that bream abound in this water. Dace are also plentiful in both the Whittington and Burton waters; and, with the exception of 8 lb. to one rod, scarcely anything was done; and it is certainly surprising, when we take into consideration the splendid condition the water was in on both Wednesday and Thursday, that the fish bit so badly. I cannot account for such a failure, as under the favourable circumstances, 12 lb. and 14 lb. of mixed fish were considered very indifferent sport. The water going down so rapidly on Monday night was, perhaps, the principal cause of the fish not being found on feed. The anglers do not know where to find the fish when the water falls so quickly. The river is still in good condition for bottom fishing, but scarcely anything is being done.—W. BAILEY.

Trent and Tame.

No angling news from either of these rivers during the last fortnight, the incessant rains which have fallen have resulted in the inundation of miles of meadowland in the Trent Valley, consequently angling has been completely at a stand. On Thursday night the weather, on the whole, seems inclined to improve, but the river is still reported as being bankfull, thick and unfishable.—JAMES GREGORY.

Wye and Derwent (Derbyshire).

We had large floods on both of the above rivers both the 1st week and the beginning of this, which quite knocked anglers off their feet, and of last some days, with both bottom and top. Both rivers are now running on the head for fishing, especially below Rowsley; in fact, it will be still very high for fly-fishing, before it is in proper condition for successful grayling fly-fishing. Both

on Thursday and Friday some few grayling were killed off both the Wye and the higher waters of the Derwent. The bottom-fishers on various parts of the Derwent have also killed some nice baskets of fish during the last two days—grayling and coarse fish—with both maggots and brandling worms, the maggot proving the best killing bait. The bottom-fishers have found the fish to feed the best in the long sandy bottom swims close to the streams. The weather seems to-day like us having some fine weather, which is much needed by anglers.—GEORGE JAMES EATON.

THE "FISHING GAZETTE" TOURNAMENT.

IN spite of the miserably wet weather, our Tournament came off in a most satisfactory manner last Saturday afternoon; and from the expressions we have heard on all sides from those who were present, we feel quite justified in saying that, had the weather been fine, the event would have been one of the most interesting which has ever taken place in the annals of angling. Our only regret in connection with the affair is that the thousands of anglers who would have been present had the weather been fine, were represented by only a few scores, consequently the immediate pecuniary benefit to the Anglers' Benevolent Society cannot be much, but, on the other hand, that deserving society has obtained such an amount of publicity as cannot fail to materially aid it in the long run. We should be wanting in gratitude if we failed, both in behalf of the officers of the Anglers' Benevolent Society, and, in our own behalf, to most sincerely thank all those gentlemen who have so cordially assisted practically in the affair, and also those gentlemen on the press whose able pens have given it world-wide publicity in the "Daily News," "Bell's Life," "Field," "Land and Water," "Globe," "St. James's Gazette," "Sportsman," "Norwich Argus," "Sporting Life," "Referee," "Forest and Stream," and others too numerous to mention. Especially would we thank Messrs. J. P. Wheeldon, Wm. Senior, and S. Morgan for their reports.

As regards the Tournament itself, the first thing said by every angler we met after who had not been present was, "Well, how did the Tournament come off?" and on our replying, "Very well indeed," the exclamation was, "What! You surely did not carry it out?" The fact was, we could not very well do otherwise, in spite of our previous announcement, that a "thoroughly soaking" day was to stop it. Saturday last was, up to middle-day, one of those uncertain mornings which, at this time of the year, may turn into a fair afternoon, and consequently, when two o'clock came, to our surprise there was a considerable assemblage of anglers in Mr. Warner's large dining-saloon. There were found to be present amateur and professional fishermen, who had, at considerable inconvenience and expense, come from places hundreds of miles away. If they wished it to take place, it would have been manifestly unfair to have postponed the Tournament. The general feeling was that we should defy the weather and do our level best with the long odds against us. Soon after two o'clock the jolly body of anglers met together under such novel circumstances adjourned to the field prepared for the event. We should mention that during the time we were in the saloon, before starting, none of us were idle. Many pleasant introductions came off. Anglers who had known each other only by name now met for the first time; old acquaintanceships were renewed; the money-box of the Anglers' Benevolent went round; tickets for the dinner were disposed of, entrance fees taken, and also something wet, on the principle that *similia similibus curantur*.

To give a list of the names of all who were present would be impossible. Suffice it to mention that the meeting was a very fairly representative one. Amongst those present during the day we noticed Mr. J. P. Wheeldon, and Mr. Alfred Jardine, the judges; Mr. Whitefoot, the Editor of the "Sportsman," Mr. A. Allison, Mr. Ranscombe, Mr. R. B. Marston, Mr. S. Morgan, vice-president Anglers' Benevolent Society; Mr. T. Spreckley, president of Thames Angling Preservation Society and Anglers' Benevolent Society; Mr. Leo Bonvoisin, chairman of the West Central Angling Association; Mr. Tom Hoole, secretary; Mr. Philip Geen, president of the West Central Association; Mr. Lemann, Captain Alfred, Mr. Field, Mr. Simpson, Mr. Fitch, Mr. Clench, Mr. Ghurney, Mr. Aldridge, W. Bailey, junr., of Nottingham, and others. Mr. W. H. Brougham, Mr. William Senior, of the "Daily News," Mr. Adlington, Mr. Ross Faulkner, Captain Mac Donnell, Mr. Carter, Mr. R. D. Frost, from Bristol, specially delegated by the Bristol Golden Carp Angling Association; Mr. Martin (the "Trent Otter"), Mr. John Bullock, of Derby; Mr. John Foster, of Caythorpe-on-Trent; Mr. H. Wilder, senr., Mr. H. Wilder, junr. Mr. Ned Andrews, Mr. Biggin, &c.

For the benefit of those who were not present, we will briefly describe the arrangement of the ground. A small tent was placed for the use of the judges at the top of the ground. A few yards in front of this was a large tarpaulin for the competitors to stand on, and stretching across the field for 80 yards from this point was

a rope with an ordinary parchment address label attached at every two and a half yards, these labels were marked in large figures with the number of yards they indicated. A row of hurdles ten yards long was placed behind the tent, and another row of hurdles was carried from each end of this top row out into the field to a distance of about forty yards—these were so arranged as to widen out, and the other ends were forty yards apart. In this manner plenty of room was allowed for erratic throws on the part of competitors; these hurdles were intended to keep the spectators off the ground set apart for the competitors.

As a signal for commencing, Mr. Lemann fired a pistol, Messrs. Wheeldon and Jardine took their stand near the flag out in the pouring rain—which as the “Daily News” remarks, they seemed rather to enjoy—and as the bait thrown by each competitor fell, they easily marked off the distance by aid of the line. The competitors were allowed three throws each, and five minutes in which to make them. Mr. P. Geen kindly undertook the office of time-keeper, and did it, as he does all he undertakes, in a prompt business-like and pleasant way, and the same applies to Mr. Fred Clench’s exertions in bringing the competitors up to the scratch. The following account of the competition is from the “Sportsman,” and is written by Mr. S. Morgan, who gave us most valuable assistance in carrying out the whole affair.

“A flag was placed as an object mark for the first competition, which was an ‘Amateur one for casting in the Thames style;’ four entered, and this proved very successful and exciting. With a magnificent cast of 45½ yards Mr. Powell proved the winner, Mr. T. Hoole, the secretary of the West Central Association, second with 40½ yards; and Mr. Da Costa, who seemed to cast somewhat nervously, third, with 40 yards. The second was an amateur competition in casting in Nottingham style, for which Messrs. Martin and Little competed. Mr. Little made a magnificent throw of 52½ yards. The Trent Otter was second with 47 yards, and the third prize was not taken. The third contest was one for professional casting in the Thames style, and Messrs. Ned Andrews, Harry Wilder, sen. and jun., had three throws for championship, Maidenhead in this instance only being represented. H. Wilder proved the winner with a finely executed cast of 50 yards, Ned Andrews getting second with 45 yards, and H. Wilder, jun., third, with 42½ yards. The fourth competition was in casting from reels in Nottingham style. There were only two combatants in this heat, namely, Messrs. W. Bailey, jun., of Nottingham, and J. Foster, of Derbyshire, the former winning with 45 yards, and his style reminded us very forcibly of his father when fishing the £100 match with J. Woodward, of London. The fifth competition, which excited great interest in throwing the bait with forked stick. Messrs. R. Lealand and W. Sawyer, the well-known keeper of this prolific water, were the only two to toe the scratch. This proved very interesting, and, as youth will be served, Mr. R. Lealand won with a magnificent throw of 46½ yards. Though defeated, Sawyer was not disgraced, and he took second honours with a well-delivered cast of 44 yards. The fly-fishing competition between Messrs. Marston and Murphy was watched keenly, and after a fine competition Mr. Murphy won, throwing 24 yards, Mr. Marston casting 23 yards. A variety of throwing was indulged in by Messrs. Wheeldon, Jardine, W. Bailey, jun., and others, and had the weather been more favourable there is little doubt but the exhibits of skill would have been prolonged until dusk. One guinea and a-half was given by Messrs. Brinckman and Beggan for professional throwing of a bait with the line coiled in the hand, and Harry Wilder won with some accurately-measured throws. This style of throwing was greatly admired.

“Nearly forty sat down to a capital dinner, and Mr. Warner deserves every credit for his excellent catering, as considering the bad weather there was little expectation of so many sitting down. Mr. T. Spreckley presided, and he was ably assisted by Mr. Clench, the president of the Richmond Piscatorial Society. The usual loyal toasts were given by the chairman and duly honoured. The Vice-chairman proposed ‘The Thames Angling Preservation Society,’ which was responded to by Mr. Spreckley, the president, and in the course of a very terse, but effective, speech, he pointed out the great good the T.A.P.S. were doing, and what they intended to do in the future. The Chairman then gave the health of Mr. Marston, and this toast, we need scarcely say, was received with the greatest enthusiasm. Mr. Marston’s suggestion that a society for the cultivation of coarse fish should be started, was warmly received. Mr. Geen, in a most eloquent speech, proposed ‘Success to the Anglers’ Benevolent Society,’ and it was responded to by Mr. R. Ghurney. Mr. Bonvoisin gave ‘The Chair and Vice-Chair.’ ‘The Press,’ though last, was not least, and it was responded to by Mr. Senior, who has written some charming works upon angling, both in England and Australia.”

Capital speeches were made by the judges, Messrs. Wheeldon and Jardine; also by Messrs. Clench, Ghurney, Bonvoisin, &c.

We hope next week to have a little more to say on the subject of our tournament, both as regards its practical utility as an exhibition of skill, and also with respect to some suggestions made by speakers at the dinner. In the meantime we shall be obliged if those who won prizes and have not yet received them will send us full address and directions where they are to be sent. We propose to keep the prizes which were not competed for last Saturday, and place them at the disposal of the Angler’s Benevolent Society to be competed for at another tournament to be held during the fence months.

GREGORY’S SPINNING BAITS. The Gregory, the “Flexible Cleopatra,” the “Oxford,” and the “Colorado,” pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory’s registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name “Gregory” is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[Adv.]

WELLINGTON ANGLING SOCIETY.

THE annual dinner of this excellent society took place at Wellington Hotel, Nottingham, on Thursday evening, October 20th. Mr. F. Warsop, president, and was ably supported in the vice-chair by Mr. S. Sills, over sixty guests sat down to an excellent dinner, provided by the host, Mr. S. F. Bestow, and the various items of a neatly-printed menu were admirably served up. After ample justice had been done to the good things placed on the tables, the chairman, in proposing the first toast, the “Queen and Royal Family,” said that the sentiment of loyalty was not exclusively the attribute of the Anglo-Saxon race, but—perhaps it was the vanity of race that was father to the thought—he had a strong impression that the sentiment was a plant of deeper root of stronger vitality, and of greater constancy in the hearts of Englishmen, than in most of the races of the earth. Not alone, loyalty to the Throne, but loyalty to love, to friendship, to truth, to justice. Loyalty in the people to their country and their rulers, and loyalty in their rulers to the people whom they govern. With this sentiment of loyalty so strong, he was sure they would give a hearty response to the toast of “Her Majesty the Queen and the whole of the Royal Family.”

Mr. Geo. Cass, in splendid style, gave the National Anthem, the whole of the company joining.

The Chairman then proposed the “Army, Navy, and Reserve Forces,” and said that the British soldier could always, in all times of the past, as in the present, and he would add in the future, he depended on to do honour to the country whom he served. The greatest nations, the most invincible armies have at times met with reverses, and it was no disgrace to our Army, to say that victory had not in every instance gone with them. In the equal terms, victory would lie with the Briton, and with a British Army. What may be said of the Army may be repeated with a stronger emphasis of our Navy. The British sailor may be always counted on to be a hero, whether doing battle with human foes, or with storm and tempest. With respect to the Reserve Forces, as he was a member of that body, he would say no more than this. He believed that the Volunteer movement had added greatly to the prestige of the nation as a military power in the estimation of other countries.

To which Sergeant Davis, of the Robin Hoods, replied in a humorous speech, concluding with the remarks that the Army and Navy and Volunteers would always be found ready when wanted.

Mr. Geo. Cass proposed the honorary president of the Society, Sir Henry Bromley. We have, in this gentleman, a good neighbour, a true friend to the angler, an ardent lover of British sports, always ready and willing to assist when called upon, and a good type of a thorough English gentleman.

Sir Henry Coxon proposed success to the Wellington Angling Association. It gave him very great pleasure in meeting his old friends on this occasion. The Wellington Association had done a great deal of good in promoting fair and legitimate angling, it was in a very satisfactory and flourishing condition, both financially and numerically, having its full complement of members (sixty), and was recognised as the A.I. Club in Nottingham. The display of valuable articles on the table for presentation spoke well for the interest the members and friends took in its welfare. He hoped those who had been unfortunate in not taking prizes this season Dame Fortune would fill both hands full for the next.

The Chairman thanked Mr. Coxon for the kind manner in which he had spoken of their association. They were, as he had said, in a prosperous condition—in what might be termed a good swim; and there were good reasons for hoping for a continuous prosperity. He was sure that the Wellington would do all in its power for the promotion of good and fair angling, and for the prevention of unfair and unsportsmanlike practices, such as the use of dynamite, illegal netting, unreasonable angling and so forth.

The Chairman, in a few appropriate remarks, presented the special prizes, each recipient being loudly cheered. (Prizes for specimen fish only being given). Gross weight not allowed. As to the special prizes, Mr. G. Bates took the first for barbel, Mr. T. Sylvester took the first for roach, Mr. G. Cass took the first for dace, Mr. G. Daykin took the first prize for bream, Mr. Sills took the first prize for perch, Mr. West took the first for chub, and Mr. J. Tomlinson took the first for bleak. Amongst the second prizes Mr. Fish took the first for barbel, Mr. Toone the first for roach, Mr. Charles Jackson the first for dace, Mr. W. Hartshorn the first for bream, Mr. Geary the first for perch, Mr. J. Cooper the first for chub, and the first for bleak Mr. H. Davis. Other special prizes were awarded to Mr. J. Turton, Mr. G. Kirk, Mr. Christopher Dickinson, Mr. T. Cooper, and Mr. T. Burgoyne.

The money prizes were taken by the following members:—Barbel: 1, Mr. G. Bates, 9 lb. 2½ oz.; 2, R. Fish, 8 lb. 8½ oz.; 3, J. Turton, 5 lb. 13½ oz.; 4, 5 lb. 1 oz. 6 shots. Roach: 1, T. Sylvester, 1 lb. 6 oz. 3 shot; 2, R. Toone, 1 lb. 5½ oz.; 3, G. Kirk, 1 lb. 2½ oz.; 4, T. Essex, 1 lb. 1½ oz. Dace: 1, G. Cass, 12 oz. 2 shot; 2, C. Jackson, 10½ oz. 4 shot; 3, C. Dickinson, 9½ oz. 2 shots; 4, T. Bates, 8½ oz. 2 shots. Bream: 1, G. Dakin, 5 lb. 1½ oz.; 2, W. Hartshorn, 4 lb. 7 oz.; 3, T. Cooper, 4 lb. 1 oz.; 4, W. Gaskill, 3 lb. 8½ oz. 7 shots. Perch: 1, S. Sills, 1 lb. 2½ oz.; 2 and 3, T. Burgoyne and W. Geary, same weights (9½ oz. 2 shots); 4, J. Topham, 9 oz. 6 shots. Chub: 1, G. West, 3 lb. 13 oz.; 2, J. Cooper, 3 lbs. 8½ oz.; 3, H. Cooper, 3 lb 6 oz. 5 shots; 4, L. Litchfield, 2 lb. 14½ oz. Bleak: 1, J. Tomlinson, 2 oz. 3 shots; 2, H. Davis, 2 oz. less 4 shots; 3, S. Hopkin, 1½ oz. 4 shots; 4, W. Wilson, 1½ oz. 3 shots.

Mr. S. Sills proposed the president, vice president, hon. secretary, and committee. I am sure you will all join me in expressing our gratification at seeing our esteemed president, Mr. H. Wyer once more amongst us. We hope that he will soon be restored to perfect health, and be able to occupy the post of president for years to come.

We have a president, vice-president, and hon. secretary. These gentlemen devote a great deal of time and energy to this society, they are thorough men of business, and I am sure in confiding our interests in their hands, the prestige of the Wellington Society will not suffer in their keeping. We have a good working committee. Gentlemen, who are not afraid of a little trouble, I may say they are the right men in the right place.

The Chairman, in answer, said I feel somewhat in the position of that Prometheus who has given a name to the beautiful overture we have just heard so well played by Mr. Essex, who, for his temerity in stealing fire from Heaven, was bound to a rock with an eagle continually tearing at his ever renewed vitals. Not so much as to the latter condition, but in the sense that I have scaled this Olympian height, and occupy a position I have no right to, but for the unfortunate circumstance of the illness of our esteemed president. Though, as you know, he is present amongst us, he has asked me to say for him that he does not feel equal to addressing you, but thanks you very much indeed for the very kind wishes expressed for him, but hopes to soon be able to come amongst us, in which hope, I am sure, we all cordially join. For myself as your vice-president, I simply thank you, and I leave our secretary and committee to speak for themselves.

Mr. Cass, hon. secretary, briefly replied, and Mr. Richardson made a few remarks on behalf of the committee.

The donors of special prizes, and visitors proposed by Mr. H. Davis. He cordially thanked the donors for the special prizes, remarking that they were a handsome and valuable lot. He also thanked the visitors, not only for their attendance that night, but for the interest they had taken in the society by attending its ordinary meetings, and greatly contributing to its conviviality, to which Mr. Davis and Mr. Adams responded.

Mr. Cox, of Halyeford Ferry (a noted fishing place on the Trent), expressed his pleasure at being present. He promised a prize for the next season, and free permission for the members of the club to fish in his waters.

In proposing the Press, the Chairman said:—In the Constitutional Government of our country there are three recognised Estates: the Sovereign, the Peers, and the Commons. Something like a century ago, the literature of the country acquired such a vital force, such an actual power, that it began to be called the "Fourth Estate." Whether that nominal rank of fourth is the true estimate of the power, it yields in this country, I will not say, but taking the whole world into consideration, I am quite sure that it has first and foremost place in the power it wielded over the mind and destiny of the human race. It is said that Archimedes, the ancient geometrician and engineer, wanted, but a lever and a fulcrum, and he would move the world. More than four centuries ago, John Guttenberg, set in motion a lever, which obtained a fulcrum in the mind of man. That lever has lifted a world of semi-chaotic thought from the gloam and uncertain twilight of an abyss of ignorance and superstition to a dawn, a sunrise and advancing morning of intelligence and enlightenment. The full noon and glory of "sweetness and light" is probably not yet realised, but we may be thankful that we live in an age of radiant brightness as compared to the ages before the invention of the fount and nucleus of all this glory the Press. I couple with the toast, the name of our friend and visitor, Mr. Coxon, of the *Express*, a thorough sportsman and good angler.

Mr. H. Coxon suitably replied on behalf of the Press.

Mr. G. F. Kirk, in a humorous speech, proposed the health of the host and hostess, which was drank with musical honours.

To which Mr. Boston replied.

The Secretary announced he had already got upwards of twenty promises of special prizes for the coming season.

Messrs. Cass, Warsop, Pillatt, Clarke, Pickerill, Essex, Crabbe, Whitehall, Adams, and Mark Meats, greatly contributed to the evening's amusement by their singing and recitations. A very enjoyable evening was brought to a close by the National Anthem.

SALMON FISHING EXTRAORDINARY.—The high waters consequent upon the storm of last week seem to have had the effect of stocking the rivers Derwent and Greta with a more than usual run of fish at this season. Mr. John Musgrave, Fitchley, near Derby, accompanied by a friend, Mr. Glossop, of the same neighbourhood, has been paying his yearly visit to his native district during the past week. As a skilful and genial angler, Mr. Musgrave's advent on our pools and streams always finds a warm welcome from his brother sportsmen. As will be seen from the subjoined diary, kindly supplied to us, he and his party have so far enjoyed excellent sport:—Monday—J. Musgrave, two, 6 lbs. and 5 lbs.; C. Boustead, one, 3½ lbs.; W. Glossop, one, 3 lbs. Tuesday—J. Musgrave, two, 6½ lbs. and 4½ lbs.; W. Glossop, one, 6½ lbs. Wednesday—J. Musgrave, one, 17½ lbs. Thursday—J. Musgrave, four, 6½ lbs., 6 lbs., 5½ lbs., and 4 lbs.; R. Musgrave, two, 17 lbs. and 6½ lbs. Friday—J. Musgrave, two, 6½ lbs. and 5 lbs.; C. Boustead, two, 6½ lbs. and 5 lbs.; T. Musgrave, three, 7 lbs., 6 lbs., and 4½ lbs.; W. Glossop, two, 5½ lbs. and 5 lbs.; R. Musgrave, one, 14½ lbs. Mr. John Couperthwaite and Mr. W. Couperthwaite have also secured some good baskets.—*West Cumberland Times*.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

ANSWER TO CORRESPONDENT.

C. B.—You will get the "Angler's Diary" at the *Field* office, Wellington Street, Strand, price 1s. 6d.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

THE GREAT CURSE OF OUR CALLING.

BY A THAMES FISHERMAN.

SIR,—From the kindly way in which you always speak of us in your GAZETTE, I think you will read my letter and judge of its contents in a friendly spirit. If, sir, in your opinion I am serving not only myself but all professional fishermen on our Thames by writing this letter, please to publish it; if it will do us harm, burn it.

I have read your GAZETTE ever since you took to its management, and I now look forward to it week by week with increasing pleasure, partly because it is managed by a friend—excuse the liberty, sir—and partly because I can see what other puntmen are doing, and therefrom take a hint or two. Sometimes I read things in your paper which upset me for more than a day. Do not think that a fair statement of our faults will upset me—but it's a little hard when gentlemen state, as Mr. P. Geen did, that fishermen will say one thing before a drink, and another after. Mr. Geen has fished with me many a day—and he does not want telling how to do it—and if he will come to me for one of his old-fashioned days amongst the chub I won't say I am engaged, as I did when he came to me soon after that meeting. I want to say a word to Mr. Brougham, who says, in your last week's paper, speaking of us Thames fishermen, "I have heard of these men actually witnessing the netting of the river, thereby robbing their customers." Why does he not give us their names, instead of throwing a stain upon the character of all? I value my character as highly as he can. Further on, he says, "It is naughty to net the Thames." I say it is monstrous if netting is going on, as Mr. Brougham actually implies. Mr. Spreckley—who all my customers speak highly of—should put a stop to the shameful practice of putting all fish, large and small, into the well, leaving them to be sorted at night. I used to do this, and on more than one occasion my customers have got hold of the net and emptied my well of all fish, including even my gudgeon and minnows; if I have noticed it at the time, and remonstrated, I have been abused. There is only one remedy: take the undersized from the hook, and return them to the river; but in fairness all fishermen should be compelled to do it.

Now, sir, let me draw your attention to the great curse of our calling.

On the first day of last August my son was out with three, I suppose I must say, gentlemen, as possibly my name for them would shock weak nerves. That boy of mine is a good fellow, but he was not good enough to withstand first beer, then whiskey, which was followed by champagne. Had I been home when my lad came in, there would have been something besides words and strong drink—they should have tasted wholesome water one or two of them; but fortunately I was out with a regular customer of mine, who I have only one name for—a True Gentleman—of whom and his fishing I will write presently. When I came home that night I found it a very different place to that which I left in the morning. The wife stood in front of something in a heap upon the floor. "Good God! our boy is not dead," was my exclamation; the mother wrung her hands, and replied that it would be better to see him in his grave than to see him turn drunkard. Yes, that disgraceful heap of flesh is the drunken remains of the youth who went forth in the morning the pride of his parents.

Will some of your readers use their powerful pen to aid my weak one, to bring a blush of shame to the face of those who, if they desire to make beasts of themselves should remain in London with their boon companions. We don't want them or their spirits, which they boast are so much above proof. I am growing in years, and my notions of what to eat and drink, and what to avoid, are principles with me; therefore, when I overhear two chance customers whisper to each other, "let's make the old buffer drunk," I wonder in what respect these men are my superiors. Possibly their fathers could and did give them better (I mean more, not better) education; but who taught them to expect to purchase with three half-crowns the right to deliberately set about making me drunk, which may end in my tumbling overboard, or what to me and my family would be worse—I may go home drunk, quarrel, and beat my wife. Don't misunderstand me, sir, I like my glass of beer in the day, and now and then my wife—bless her heart—makes me a glass of grog, fills my pipe, and we sit down for a little family chat. Sometimes we speak of the goodness of this and that customer, the shortcomings of others, and the downright wickedness of not a few. These latter are fast enough to grumble because their catches of fish are not equal to those of others that fish with me. Let me inform them plainly, they never will have good takes unless they mend their ways and treat me as something superior to a butt for their follies and ridicule. Do such men as these ever think I can sympathise with their failure? Do they imagine that I shall prepare for their success? All I can give them is a day's time for their day's pay, but that's not fishing.

Now for the brighter side of our lives. Most of us have regular customers, indeed, without them we should fail to make both ends meet. One of my customers fishes with me regularly for two days, twice a month. Punctual to the minute last Friday morning, he stepped into the punt and away we started. Now, if I fail to give him sport, he will not grumble. He has faith in me, but fish he will have, for surely the swim I raked out under the boughs, and baited carefully with well-scoured lobes these two mornings past, will yield some return. His success to-day will be a greater pleasure for me than for him; his failure may disappoint him, it will vex me. Why am I so anxious to-day, yet so careless yesterday? Yesterday was a selfish brute, to-day is the True Gentleman of whom I promised to write. Nine years since this customer came to me by recommendation for a day's jack fishing. It was a fine but bitterly cold morning at starting, yet by the time we reached the Hook it was snowing fast, and a wind from the east began to blow, which increased to half a gale, and with it the snow became almost unbearable. I could see by his style and pluck that I had a man with me, and I inwardly determined that the first squeak must come from him. It came at last, and homeward through the blinding sleet and snow we travelled slowly and fishless. When we got to the cottage I asked him to come in; he did so, and the wife soon made us warm and comfortable. When he had started for London we had something to talk about. We wondered who and what he was, that he

could come amongst us under such circumstances and win our hearts—not with gold, but with the magic of a warm and sympathetic heart.

The next time he came, a fortnight afterwards, I was ready for him, but although I tried my hardest and he did his best, not a fish was the result. He said, "I want very much to take a brace back, I will stop to-night and try them again to-morrow."

I have not yet forgotten my feelings at starting the next day. I would readily have pawned the whole of the following week's success to have secured a brace of good fish; but it was not to be. Two runs, but no fish.

I carried his tackle to the station, expecting it would be the last time he would fish with me. On getting into the train he said, "I will be down Thursday week for the Friday and Saturday; we shall get them then." We did, and we have got them many scores of times since. But fish or no fish, I know he will not turn round upon me and say, as a sneak of a fellow did the other day, "You know d— well there's no fish in this swim, and yet you put me here." That educated gentleman fished from the bank the remainder of the day, and not with me.

Now, sir, it is late in October; the river is still low and bright, and it's difficult for the best of us to know what to do to get the chances in favour of a take. Under these circumstances we, the True Gentleman and I, approach the boughs before mentioned; gently does it, or the fish will fly to mid stream. With light eleven-foot cane rod, finest roach twist, drawn gut line, small cork float, not too fully shot, and a number eight round bend white wire hook, upon which I placed two of the smallest and brightest lobs in such a manner as to make them irresistible. Quietly the lure travels to the first bough; it rests against a little twig; surely it will not stop there a second. What's that? Slight shake. Is it the preliminary which invariably precedes the taking away of a chub, or only a small fish trying to do the impossible? Away it goes, and "swish" says the rod, with the true off-side chub strike. No need to give advice here; the point of the rod is well down and out as far as the right arm can reach; the fish makes a desperate fight for his home under that bough; but he has met his master at last, and all he can do is to die gallantly. Quietly—we want his mate—the net is put under him, and a five-pound chub is in the well. No hurry, no bustle in this punt to-day; no unkind words or thoughts; pure enjoyment is my lot as man, and if I may judge from the joyous expression of the face of my employer, he will not surrender his chair in my punt for a seat in Parliament. Two clean lobs are cut into halves and thrown into the water so that the stream will carry them to the spot where our hopes of the next fish are centred. The hook is carefully baited, the float is cast well out into the stream, and as it travels down it is quietly drawn under the bough. Almost before it settles into its former position you may have seen the same slight nervous shake of the float as if it knew full well the rush, and fight that was coming; away it goes some 12 to 18 inches under water, and then the same perfect chub-strike which so few can imitate—a strike that seems to come from the fish with a thud all up the line and down the rod; like a flash of electricity it travels; and it does not end with the rod, or its wielder, but goes right through the nervous system of your humble servant,

A THAMES FISHERMAN.

P.S.—The evenings are long, Mr. Editor; too much tobacco spoils my nerves. Shall I write you of our other grievances, and suggest a remedy for them?

[By all means; and we most heartily endorse this letter, and hope it may lead to good. If amongst the readers of our little paper there are any of these educated blackguards (and we trust there are not any), perhaps they will understand the low price at which they are valued by the men they think they are fooling. If all Thames fishermen were of the same calibre as the writer of the above letter, and many of them are, it would be a good thing for the river. Unfortunately this is not the case, and that it is not is, we think, in a great measure to be attributed to the demoralising influence of cads who, under the pretence of fishing, hire a punt and drink without moderation, and are not content unless they force others to do the same. What wonder is it that with such examples Thames fishermen may be found who are unworthy and unreliable? We are sometimes told that the reports from the rivers sent by the fishermen are a tissue of lies. To this we reply, in some cases this may be true, but that it is impossible for us to verify these reports before printing them, and in the end those who send them are invariably found out and shunned by all respectable anglers; and the lies recoil on the liars. This question of false reporting to the press is one we should like to see taken up by "A Thames Fisherman."—ED.]

THAMES PRESERVATION SOCIETY.

SIR,—In my letter to you in your issue of the 8th inst. I find that the word "proved" is printed, whereas my copy has it "told," so suppose it is my mistake in copying, as it would be difficult to imagine how the word could be otherwise changed in your valuable journal.

The letter of your correspondent Mr. Clench is rather acrimonious; that of Mr. Brougham and of the "Thames Angler" are politely enough worded to show me the error in the use of the word "proved," but I think all your readers will admit that, whilst I mainly bear the brunt of the attack, the object I had in view in writing has been attained, and that is, in giving publicity to the reports so freely spread and so widely believed in at Richmond. My informants I have since seen, and have listened to an endorsement of the reports, receiving their sanction to give their names. Should this be desired, I will furnish them to any official of the Thames Angling Preservation Society that writes for it.

I may now state that, from information received on my last visit, my impression that netting is still carried on in that district is rather confirmed than shaken, in spite of the very able and gratuitous assistance rendered by the members of the Thames Angling Preservation Society and the River Preservation Society, for which services I am quite sure all anglers are very grateful.

I will relate a circumstance which took place a short time ago, much within the time specified by Mr. Clench, viz., three months. Returning from Richmond by a late train, I found I had for company two men who had a hamper filled with fish evidently not long out of the water; from their conversation, I gathered that the fish had been taken near the "drain," and were then being conveyed to the neighbourhood of Petticoat Lane. These men were not at all careful in their remarks, and seemed jubilant at the success they had met with and the anticipated pleasure they would derive from the proceeds of the ready sale, of which they did not seem to entertain any doubt at all; this may not be proof of netting, but looks very suspicious.

The sarcastic remarks of Mr. Clench I shall not trouble to answer, but truly hope that the cry he raises for more funds to carry out the preservation of the river may meet with the success he desires. Personally, I can state that I have

no doubt all anglers using the Thames will join with me in thanking the members of the Thames Angling Preservation Society for taking so much trouble and running so much personal risk to preserve the water and prevent the use of the net. It is the first time I have been acquainted with the fact that these gentlemen leave their comfortable homes for the cheerless vigil of the water, and I can only reiterate that it does them infinite credit and fully entitles them to the warmest gratitude of anglers.—I am, &c. J. BOALCH.

203, Old Kent Road.

P.S.—Will you kindly inform me how far below Richmond Bridge it is legal to net; and, also, would some of your correspondents living close to the river tell me if the rumour is correct that a net has lately been captured near Brentford?

[In the letter referred to, the word is "proved" and not "told," as Mr. Boalch may see if he likes to call at our office.—ED.]

CLUBS' QUARTERS AT YARMOUTH.

SIR,—Will any of your readers kindly oblige me with particulars of any good angling society for gentlemen in the neighbourhood of Yarmouth.—I am, &c., E. BENNETT.

IMPORTANT NOTICE.

SIR,—The Executive Committee for the International Fisheries Exhibition, 1883, are desirous of obtaining a complete list of the angling and preservation societies of England. Alfred Jardine, Esq., one of the committee, has applied to me for the information. My lists have grown imperfect with the rapid increase of these societies, and as I am anxious to assist one who has undertaken such arduous duties on our behalf. I will feel greatly obliged if secretaries of societies—other than those of London and Sheffield, of which my lists are complete—will forward me at once the name of their societies, the name and address of their chairman, and also their own name and address.—I am, &c., PHILIP GEEN.

Hill View, Addlestone, Surrey.

THE REPORTED NETTING AT RICHMOND.

SIR,—I have read your editorial remarks to my letter, and with all respect to you, consider them more appertaining as a leader in your journal, than as comment to your correspondents.

I beg to call your attention to the article signed "John Bushnell," in last week's GAZETTE, page 518, especially the last line; this, I think, you will find is good answer to Mr. Clench's inquiry. It is in exact opposition to what Mr. Brougham mentions in your previous week's issue, see page 509, line 16.—I am, &c., A RICHMOND SCULLER.

FISHING EXTRAORDINARY.

SIR,—As a set-off against the uniform bad luck which has attended fishermen at Chertsey during the past fortnight, we may mention that Mr. C. Thurston, fishing with Poulter, whilst paternostering, hooked and landed a dace less than two inches long. It may be mentioned that the dace referred to was hooked foul, and it is proposed to add it to the specimens of piscatorial skill which now embellish the bar of the Chertsey Bridge Hotel. I bear silent testimony to the skill of the famous "Charley."

The condition of the river is improving rapidly, and there will be sport for all classes of fishermen in the district by the end of the week. The big take of 75 lb. of bream referred to in your last issue is amply confirmed, and the unwarrantable contradiction so recklessly given publicity to by a contemporary, owes its origin to the petty jealousy of a rival fisherman.—I am, &c., DACE.

THE CONGER.

SIR,—I am obliged to Mr. Keene for his reply to my query. He has, however, fallen into a common error with regard to the muræna. The fish Vedius Pollio fed with slaves was the *Muræna Helena*, of Cuvier, Linnaeus, and Bloch, and not the conger—*Muræna Conger* of Linnaeus—which latter does not arrive at any great size in the Mediterranean. If Mr. Keene will turn to plate 237, vol. iv., of Couch's "Fishes of the British Islands," he will see how admirably the teeth of *Muræna Helena* are adapted for rending a living prey. I do not, however, dispute the fact that congers would eat the bodies of those recently drowned, as I have known fresh beef used as bait with some amount of success.

It is a very common thing for conger to be found in lobster-pots when the bait is quite fresh. They also eat lobsters. This summer I took a fine one from the belly of a conger, and an old fisherman told me he once sold a conger for 1s. 6d., and the buyer found a lobster in it which he boiled and sold for 3s. 6d.

An instance of the voracity of the conger came under my notice here a few weeks ago. Mr. J. Rogers hauled up a conger about 7 lb., with another only 2 lb. heavier hanging on to its tail. He lifted them both into the boat, and the second fish did not relax its hold for some little time.—I am, &c., Aberffraw, Oct. 24, 1881. E. GOSLING.

SIR,—Will you kindly allow me to support Mr. Gosling in his opinion that congers will not take any bait but a perfectly fresh one. Mr. Keene is mistaken when he informs us that "according to Pliny, Vedius Apollo devised a number of cruel experiments with the congers of his piscina." The fish there referred to are the muræna, the inveterate enemy of the conger. The muræna is common enough in the Mediterranean, but I should be surprised to hear that Mr. Keene, or any of your readers had ever captured one off our own coast. Might I suggest that more articles on sea-fishing, similar to the excellent contribution in last week's number would be acceptable to many of your readers as well as to us MARINERS.

FISHING AT PONDER'S END.

SIR,—Can you kindly inform if the fishing is free at the Towing Path at Ponder's End, which leads from Wright's mill to Tottenham, and passes the Pike and Anchor? I think it is called the Barge Cut, as I do not consider that it belongs to the Pike and Anchor Fishery.—I am, &c., PISCATOR.

October 20.

[From the Swan and Pike, Enfield Lock, to the horse bridge, by the Pike and Anchor, is let by the East London Waterworks Company to Mr. Puddicombe, of the Pike and Anchor tavern, and is subscription water. From the horse bridge below the Pike and Anchor to Limehouse on the towing path is free.—R. G.]

THE WEIGHT OF PERCH.

SIR,—As several of your correspondents appear covertly to be giving me a side stroke, when ostensibly directing it at Mr. P. S. Davis and Mr. James Gregory, I find it necessary to write a few words on the subject of the perch. That I am the real mark for the innuendoes of your correspondents is perfectly plain; for, in the number of the FISHING GAZETTE previous to that in which the letter of Mr. Davis appeared, I mentioned the amount of ova found in a perch of 10 lb. weight. Now, it is palpable that there is a wish abroad amongst those who dare not essay the attack-direct, to undermine my recent argument by insinuating that I had misstated a fact in relation to the natural history of the perch. This being the case, I must now point out that a perch of 10 lb. weight is small when compared with another fish of the same variety recorded by a high authority. A perch of 14 lb. is a giant by the side of the fish which has caused so much consternation amongst several of your contributors. Hawkins, in his notes to the "Complete Angler," alludes to such a fish 29 inches in length. On referring to my tables of the weights of fishes, I find that a perch of 25 inches weighs about 9 lb. Here the table stops; but on resorting to the FISHING GAZETTE for October 8th, I observe that 10½ lb. is stated as having been the weight of a perch 27 inches in length. Now, this is almost exactly as it should be, but is, in fact, a trifle below the amount we might expect, judging from the scale of smaller weights. Reverting to Hawkins' fish and calculating in the usual way, we discover that this perch, if in good condition, should have weighed 14 lb.—considerably less than a carp of the same length. The fish mentioned by Izaak Walton as being nearly 2 feet long is equivalent to an eight-pounder. "Ephemera" gives the weight up to 9 lb.; Blakey up to 10 lb.; whilst adding that individuals of 6 lb. had sometimes been taken from Whittlesea Mere. Furthermore, after all this evidence, and much more which might be adduced, I see no reason for being incredulous as to the occasional existence of monster perch, 4 feet in length, such as must have been the dimensions of the Lapland fish mentioned by Schäffer.—R. BALDERSTON.

[We fear the sea-perch will carry off the prize for these big weights when the matter is sifted. How many spines are there in the 10½ lb. perch, Mr. Gregory?—ED.]

FISHING AT EYNHAM.

SIR,—I have seen several reports of fish being taken at Eynsham. Can any of your readers give me any information as to the following:—

1. Is the fishing perfectly free?
 2. If not, can day tickets be obtained and their cost?
 3. Can the assistance of a fisherman and punt be hired there, and about the expense?
 4. Is Eynsham on the Thames proper or on the Isis?—I am, &c., Grosvenor Club, Pimlico, S.W.
- PERCH.

THE SEA AND THE NORFOLK RIVERS.

SIR,—I, with other anglers here was sorry, to hear that after the recent gale, and consequent high tide, a large quantity of fish, including scores of pike, had been killed by the salt water.

I was at a loss to understand this, knowing that the fish ought to make their way up to the Broads, and thus escape the effects of the salt. On making inquiries I find they are prevented doing this by the numerous eel nets in the rivers. If my information is correct there are at least a dozen within a few miles of Heigham Bridge, one or more of which were broken last week by the weight of fish against them.

After all that has been and is being done by our Fish Preservation Societies, this wholesale destruction of fish is greatly to be deplored, more especially as pike were plentiful this year, and spinning prospects excellent.

I trust all anglers and preservation societies will consider if something cannot be done to prevent this sad loss of fish and sport, in which they should be encouraged and assisted by all on the rivers interested in the letting of boats, &c., as otherwise the river fishing will be again destroyed, and anglers driven to waters clear of the tides, such as Ormesby, Fritton, &c.

I hope this matter will be taken up by more able and experienced anglers than, yours, &c.,

A ONE-YEAR JACK.

P.S.—Now I am writing, I would ask proprietors of waters to place anglers under still greater obligations by reducing the number of swans, which are now our greatest enemies and do more havoc in clearing off the spawn than any number of nets.

TACKLE FOR SPINNING.

SIR,—In your review of the work on fishing in India, by my old friend and schoolfellow, Mr. Henry Thomas, you refer to the way of spinning with a single triangle as recommended by him. I believe he had the idea from me many years ago. I myself learnt it from one of the Mr. Walkers of Southgate of cricketing celebrity, whilst trailing with him in a boat at the Stoke Newington reservoirs some thirty years ago. I remember on that occasion we lost far more than we caught, and I have disbanded the plan for many years, finding that although you get more runs in that way than any other, you lose something like two out of three. In my opinion there is nothing like flight of hooks with at least three triangles, when one ought to catch at least two out of three instead of missing two out of three, as will probably happen when using one triangle.—I am, &c.,

C. E. HOLFORD.

Springfield, Ware.

"CLUB AND OTHER JOTTINGS."

SIR,—Under this heading I find it stated in your last week's edition that Mr. Walters caught in the Colne, at Uxbridge, 33 dace weighing 11 lb. 15 oz., that one-fourth had just completed the act of spawning, one half had evidently been caught in the act of shedding, and the remainder were extraordinarily full. Surely there must be some mistake in all this, as I cannot believe that any angler would fail to return to the water fish caught in such a condition. No wonder there are complaints of the scarcity of fish, and the depletion of rivers, &c., if this kind of thing is often done. I do hope that some satisfactory explanation can and will be made as; as it now stands, it bears on the face of it a grave reproach.—I am, &c.,

R. WOOLFALL.

RIVER OBSTRUCTION.

SIR,—With your permission I venture to relate my experience as to the rivulet Dover Beck, a tributary of the Trent. First, about 45 years ago the Trent Navigation Company built a bridge over the estuary of the brook, and what I call the floor of the bridge is about three feet above the water of the Trent at summer level. Ever since the bridge was built the bed of the river has been gradually

silting up—so much so that where there were ten holes there are now none, and where the hole was ten feet deep now it is not three. Notwithstanding all the cleaning, &c., the bed is still being raised. In the bridge there are what are called flood doors, and, of course, a threshold at the bottom. Now, about 25 years ago this threshold was washed away. Its thickness was about four inches. I used constantly to be passing the junction of the brook and river, as I do now, and walking down the bank of the Trent day after day, and finding the water very muddy, I traced it to the bridge, and found that since the threshold was gone the extra "draw" of water was tearing up the bed of the river for a perceptible distance. Now, again, there has been a stoppage of water through the flood doors getting broken and becoming jammed in the arch of the bridge, causing the water to back up a long way—it is hard to say how far. I know that a considerable quantity of land suffers by the obstruction which I have mentioned. Now, if this little obstruction to the free passage of the water of the Dover Beck does harm, how much do the Trent Navigation weirs at the back of Averham, Colwich, Beeston, Sawley, and Castle Donnington? The water is very deep and the current very slow. I think that if all the weirs were taken up the water would not be above two or three feet deep where now it is from ten to thirty feet for miles above each of these obstructions, and floods and poisonous matters would get down to the sea in less time; but I say, keep poisons out of rivers.—I am, &c.,

JOHN FOSTER.

CLUB REPORTS.

ANGLERS' PRIDE ANGLING SOCIETY.

The members of this club were well among the roach on Sunday last. T. Fiddes, 6½ lb.; T. Beeley, jun., 3 lb.; Nash, 2½ lb.; J. Beeley, sen., 1 lb.; H. Haines, 7½ lb. roach and bream from the Wey.—T. MARSHALL, sec.

Oct. 25.

BOSTONIAN ANGLING SOCIETY.

Fish were very scarce with us on Sunday last. About 5 lb. of roach only being weighed-in by Messrs. Jennings and Goodge.—H. TAYLOR.

Oct. 26.

BRIGHTON ANGLERS' ASSOCIATION.

On Thursday last this association held their quarterly meeting, when the hon. secretary, Mr. Ancombe, read the balance sheet, and it figured much better than was expected. A large amount of money has been spent for preserving fine specimens of fish, viz., jack, 20 lb., by Mr. Hassell; jack, 11 lb., Mr. W. Saunders; roach, 1 lb. 10 oz., Mr. Ancombe; a roach, 1 lb. 7½ oz., by Mr. Hassell; and a carp, 8 lb. 5½ oz., also by the last named. The club having paid all demands made upon them, the balance sheet shows the association to be worth between £30 and £40, and numbering upwards of ninety members. A new feature has lately been introduced which bids fair to improve the society, that is an harmonic meeting every Saturday evening, local and instrumental by the members, and friends are admitted by tickets, which can be obtained from any member. As regards fishing this week I have but little to report. The rivers in this district are, I am informed, flooded in some parts. Mr. Ash took one bream, 13 lb., which is all. We are anxiously waiting the rivers to clear so that jack may feed.—GROUBAIT.

October 26.

BRISTOL GOLDEN CARP ANGLING ASSOCIATION.

On Saturday last a contest took place at Lunply Stoke, when about 70 members took part in it. The weather being so unfavourable, the catch was very small, 10 oz. taking first prize. The judges were Messrs. Wheeler, Pulinger, and Pain, and the weighing of fish was conducted by Mr. Pain, jun. Everything was carried out very satisfactory, and the members met at the club-house (White Hart Hotel) on Monday to receive their prizes. Had the weather been fine no doubt a larger number would have competed, as the prizes were very tempting, there being 38 prizes, amounting to over £40. A full list of the prize takers will be issued next week. We could not possibly give list of fish and prizes this week—one of the judges being ill. Our annual dinner takes place on Friday next, so we are busy preparing.—LEWIS WRIDE, sec.

CITY OF LONDON ANGLING SOCIETY.

Several of our members were out on the 23rd, but only two were successful. Mr. Mark with roach and dace from Penton Hook, and Mr. Mortimer had roach from the thick waters at the Rye House.—CAS.

CLAPHAM JUNCTION ANGLING SOCIETY.

Several of the members of the above society having been out since my last report, Messrs. Turner and Wellman having weighed-in some very nice oach and dace. The result of the last prize competition was B. Wellman, 1st.; Mr. A. Turner, 2nd.; Mr. E. Wilson, 3rd.; T. Sutters, 4th.; E. Brewer, 5th.; other members weighing-in. Messrs. J. Innes, Maslin, Valentine, Hamlington. W. Maslin on Sunday last captured a fine perch with a worm, weighing 1 lb. 12 oz., being preserved now and will be added to our collection of fish at the club-house. The next competition for prizes will be fished for on Sunday next, at Weybridge, presented by Mr. T. Smith. Members are requested to attend on Friday next for very important business.—E. WILSON.

[Send report to 12, Fetter Lane in future, please.—ED.]

Oct. 25.

DALSTON ANGLING SOCIETY.

The second pegged-down match this season came off in the River Brent on Sunday last, when the following gentlemen were successful:—Mr. Venour, 1st, with 10½ oz.; Mr. Barson, 2nd, 3½ oz.; Mr. Warman, 3rd, with 3½ oz., and Mr. Midson, 4th, with 2½ oz.—S. MALBY, sec.

THE FIRST SURREY ANGLING SOCIETY.

The members of the First Surrey Angling Society fish a peg-down match at Weybridge next Sunday, October 30th, for a handsome silver cup, tackle-case, timepiece, and other prizes. All fish to be weighed-in at the club-room, at 8.30, the same evening.—P. D. MANNING, sec.

Octobre 27.

GOOD INTENT.

We were just saved from a blank day on Sunday last by Mr. Maybury weighing-in one roach of 4 oz. There were a good many members out, but the Lea not being fishable, they all had blanks. We are going to fish for ten valuable prizes during the month of November, from the towing path of the Lea. Boundary from Tottenham to Hertford Lock. Our general visit takes place next

Monday, the 31st inst., when I should be glad to see as many as could possibly pay us a visit on that occasion, both east and west.—R. MURPHY.

October 20.

GRESHAM ANGLING SOCIETY.

✓ This society held its usual weekly meeting on Thursday evening, Mr. Ellis in the chair. Mr. Bryant was appointed librarian, and Captain Alfred curator of the society's museum, both departments having so far grown as to require personal supervision. Since our last notice there has been a goodly show of specimen fish—perch by Mr. A. Rumsey, dace by Mr. Young; Mr. Parker had also taken a jack $5\frac{1}{2}$ lb. Mr. Bentley's paper on "Feeling in Fishes," with illustrations and microscopic preparations, will be given on Thursday next at 7.30 p.m. punctually, when Dr. Brunton will preside. Papers are to follow by Captain Alfred, Mr. Wheeldon, and other well-known anglers, of which notices will soon be issued. With the aid of Mr. Harding, Mr. Winterbottom, and others, whose musical abilities are always freely placed at the service of the society and so much appreciated, it is shortly intended to reproduce some of the grand old songs (set to the original airs) as given by Isaak Walton in "The Complete Angler," in respect of which the necessary researches are now being made. Secretaries of angling societies, and gentlemen interested, are always welcome to these meetings. The society's jack competition takes place on Tuesday, and the fish will (if possible) be shown on Thursday, so that, coupled with Mr. Bentley's paper, the Gresham Anglers anticipate an evening of unusual interest.

HAMMERSMITH UNITED.

Not a great deal to report this week, Mr. Hobden only being "in the hunt." His take was, on Oct. 19th, two chub 4 lb. 3 oz., also some perch and roach. On the following day he succeeded in landing several perch, the heaviest scaling 1 lb. 11 $\frac{1}{2}$ oz. All these were taken at Eynsham, near Oxford. On Sunday Mr. Penney had a show of roach from the Thames.—VORTEX.

LITTLE INDEPENDENT ANGLING SOCIETY.

On Sunday our takes were very small. Amongst the members who went out the following weighed-in: Mr. Scott, one perch, 1 lb. 7 $\frac{1}{2}$ oz., Mr. Hulas, roach and dace; Mr. Petrie, roach—others unimportant. Last night we had our half-yearly supper; we had a full room to sit down to the splendid repast served up by our worthy host and hostess, who justly received musical honours on the occasion. Chairman, Mr. Pipe; Vice, Mr. E. Barr, Pianist, Mr. Li Gordon. After the usual preliminary toasts had gone round, we had a splendid donation towards the conviviality of the evening presented us by one of our invited guests on the occasion, viz., Mr. Revill (of the Upper Welsh Harp), who, in a neatly-turned speech, wished every prosperity to the Society, and success to the anglers in general. We return thanks for the attendance of the Bostonians, the Phoenix, and the St. Pancras Working Men's Club on the occasion, and we may mention that the Bostonians promised a handsome present to be fished for—heaviest weight to end of season. The harmony of the evening was really A 1, and as everybody said so we suppose it is all right. The following gentlemen contributed to the same:—Messrs. H. Ward, Koring, Jackson, H. Dodd, Letch, Bray, A. Barr, Hewson, Titmus, E. Barr, Jennings, Revill, and others. One pleasing item (if not the chief feature of the evening) was the presentation of a handsome watch and chain to our chairman, Mr. Pipe, for his efficiently-rendered services to the society, and he returned thanks in a few able and touching remarks. We especially thank Mr. H. Dodd with the rendering of his comic songs, Mr. Jackson, with his songs, accompaniments, and astonishing variations on his miniature concertina, and Messrs. Li Gordon and Koeng for their admirable execution on the piano, so passing as enjoyable an evening as the members and visitors said they ever indulged in.—W. BROWN, hon. sec.

Oct. 27.

MARYLEBONE ANGLING SOCIETY.

The next return visit, No. 1 District, will take place on Tuesday, November 1, at the Prince Albert, Sherborne Street, Blandford Square, N.W., when we should like to see as many of our brother anglers as could make it convenient to attend.—W. F. PEARCE.

Oct. 25.

ORIGINAL ALEXANDRA SOCIETY OF ANGLERS.

Our show of fish on Sunday last was not so good as before, although a great number of our members were out, and the majority of them got completely washed out. Mr. Morton had a nice jack; Mr. Blackledge had roach. Several of our members had fish, but did not show up. The water rose rapidly on Sunday last, so that the whole of the meadows at Ponder's End were under water; this ought to make good for all-round fishing on Sunday next, if the weather should be fine.—E. DYMOND, sec. pro tem.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

Although the weather was against angling on Sunday last, several members of the above society succeeded in capturing decent takes, including Mr. J. Drew, with bream from Pulboro'. Mr. Lucy, sen., jack from the Lea, and Mr. Neagus, roach from the Stort. Quarterly night, Monday next, October 31st.—THOMAS WILLIAM LUCY.

October 27.

PECKHAM BROTHERS ANGLING SOCIETY.

A match for a prize, given by Mr. Reed, jun., will be fished for on the 30th, all fish to weigh. The visit of angling societies to this club took place on Tuesday last the 25th October, on which occasion the chair was taken by Mr. Reed (the host), and the vice by Mr. C. Gendle. There was a good attendance of visitors, and a capital entertainment, both vocal and instrumental. Two gentlemen presided at the piano (Mr. Dudmarsh and Mr. Weeber), and both were highly appreciated. There was some capital singing afforded, but the most noticeable was rendered by Mr. Parkins, City of London Angling Society, Mr. Haynes, Anglers' Pride Angling Society; Mr. Watts, United Brothers Angling Society; and a duet by Messrs. Bargners and Minard, "The Upper Ten and Lower Five." Messrs. Reed, Duke, Page, Watts, Dealy, Bignell, Belton, C. Gendle, W. Minard, W. R. Matthews, Secretary of the Peckham Angling Society, Mr. Wilson, district officer; Mr. Reed, jun., Mr. Weeber, Mr. Pain, and Mr. Stidolph, contributed towards the evening's entertainment. The health of the visitors was drunk with musical honours, also the Chairman. The angling clubs were fairly represented, and a most enjoyable evening was brought to a close with the usual loyal accompaniment and "Auld Lang Syne."—W. R. M. Sec.

PISCATORIAL SOCIETY.

This old established society held their annual supper on Monday evening. The catering was of the best description, and gave universal satisfaction. The usual toasts were given and honoured with enthusiasm. The meeting was a great success; 40 lb. 2 oz. of pike and 5 lb. 15 oz. of peal from the Avon were shown by Mr. Thomas Huggett.—H. GRAY.

SIR HUGH MYDDELTON ANGLING SOCIETY.

There were several good takes of fish last Sunday from the Thames and Wey, and no doubt we shall have better shows of fish from this river since the down-pour of Saturday night and Sunday morning. Some of our members who have followed up the Thames have had very poor shows of fish. The following members weighed-in:—W. Dunblain, roach, 8 lb. 4 oz.; E. Smith, two chub, 5 lb. 12 $\frac{1}{2}$ oz.; G. Rogers, roach, 4 lb. 6 oz.; G. Caborn, roach, 1 lb. 15 oz.; Wey, Will. Fowler, roach, 1 lb. 14 oz. The silver lever watch presented by our late member, T. Allard, for gross weight of roach, October and November, is now being competed for. It is very likely we shall have some handsome trays of roach up to the end of November.—J. CABORN, sec.

October 24.

SOUTH LONDON.

On Sunday last being so very wet, we thought we should have a blank day, but thanks to Mr. Brown, who faced the rain. He weighed-in 6 lb. roach and some small chub, nearly 3 lb. from Chertsey, on Sunday. Members fish for a meerscham pipe, given by Mr. Mitchell, at Pulborough or Amberley. All fish to weigh, and the greatest weight to win to-day. Mr. Brown also weighed-in 2 $\frac{1}{2}$ lb. roach from Chertsey.—G. H. FIELD.

October 27, 1881.

SURREY PISCATORIALS.

On the 25th Mr. Hamlyn was duly elected as secretary to this society, to whom all further correspondence must be addressed, Mr. Whitby having resigned that office.—PIXIE.

October 27.

UNITED BROTHERS.

Acting upon the advice of the old adage, "None but the brave deserve the fair," some of our members had the hardihood to brave the miserable weather of Sunday morning, and, I am reluctant to say it, their takes amounted to nil, thus compelling us to record a blank. Should the wind take a favourable turn, the members of the above society will fish a pegged down match on the 30th. We shall decide on the water on Saturday night, the 29th.—W. BELTON.

October 26.

WALWORTH WALTONIANS.

For the October competition the following members have weighed-in fish:—On the 21st, Mr. Boalch, with C. Brown of Richmond, 12 lb. 9 $\frac{1}{2}$ oz. roach; the 24th, Mr. Weatherhead, 4 lb. roach; the 26th, Mr. Bansback and Mr. Howard, jun., with E. Brown at Richmond, the former had 7 $\frac{1}{2}$ lb. and the latter 7 $\frac{1}{2}$ lb. roach; Mr. Boalch, with his favourite fisherman, C. Brown, on the same day succeeded in weighing-in 10 lb. of roach from the same place. Mr. Antony, of High Street, Bloomsbury, has returned the three piscatorial trophies of the late Mr. J. Burnham, viz., one roach weighing 3 lb. 1 $\frac{1}{2}$ oz., the only one of that weight that can be seen in London and three roach weighing 4 lb. 15 oz. and three perch 7 lb. 4 oz. that he had to clean and remount, which he has done in his well-known style, and which give great satisfaction to all parties who beheld them. The next competition will take place on November 13, where and how is open for discussion next week. The prizes are a pair of boots (valued at £1 1s.), by Mr. Boalch; and 10s. 6d. by Mr. Delhaye.—PIXIE.

Oct. 27.

WESTBOURNE PARK PISCATORIAL SOCIETY.

Mr. Buttery, of the above club, had a nice show of bream from the Ouse on Tuesday—total, 17 lb.; largest 4 lb. 4 oz. On the Tuesday previous Mr. Pink weighed-in five bream, weighing just 17 lb., from the same water. Mr. Young on Sunday had a fine chub 3 lb. 12 $\frac{1}{2}$ oz. I have received ten tickets for tournament at Welsh Harp, five only of which are sold.—HENRY ADEANE, sec.

ERRATUM.—In the report of the Liverpool Angling Association's contest on the 13th inst., which appeared in last week's GAZETTE, the weight of Mr. Davis' chub should read, 14 $\frac{1}{2}$ oz., not 4 $\frac{1}{2}$ oz.

HAVERLY'S MINSTRELS AT HER MAJESTY'S THEATRE.—A good laugh is said to be excellent medicine, and if any of our readers feel they want stirring up, we can heartily advise them to spend an evening in the company of Mr. Haverly's Genuine Black Minstrels, who are now giving their farewell entertainments at Her Majesty's Theatre. The fun is, of course, of a boisterous kind, but perfectly harmless, and, in addition to the fun, there is much excellent negro minstrelsy. The opening chorus, "Down in Georgia," given by sixty voices, has a really fine effect. Mr. G. Bohee is very effective in his song "Norrine Morrine;" and Mr. William Kersands evoked roars of laughter with his ultra-comical "Mary's Gone Wid a Coon." Mr. Kersands has a mouth and voice which would have done credit to Cerberus. We never before saw such a mouth on a man. Then, the Bohee Brothers are in themselves sufficient to make the fortune of a music hall. We should say these gentlemen are twins, and, as fine specimens of humanity, would do justice to any race. In fact, we were much struck with the splendid physique of many of Mr. Haverly's black troupe, and after seeing them, no longer wonder at the feats of strength and bravery performed by negroes during the American Civil War. The "International Clog Tournament," "The Hamptown Students," the realistic southern sketch on the Levée, and the laughable absurdity, "Sophie Simpson's Supper," are all extremely entertaining; but of all the big show we think the most amusing is Mr. Robert Mack's "Barnyard Frolics." Mr. Mack comes on the stage dressed as a cock, and gives the most absurdly natural imitations of that immortal bird's walk in life, his dignified deportment, comical chuckle, and triumphant crow. This of itself was very good, but when Mr. Mack introduced his real live little bantam the spectators were fairly taken by storm. Our readers have only got to imagine the comical effect of a cleverly got up imitation cock flapping his wings and running away from the vigorous attack of his minute but plucky little rival to almost see the fun of the thing, and when the little fellow rears himself up, flaps his wings, and gives forth his victorious "cock-a-doodle-do" the applause was universal. We can heartily advise our readers who enjoy a good laugh to see Mr. Haverly's show before it leaves, as it very shortly will.

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 188, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.

* * The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s.; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C.

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

The Fishing Gazette.

SATURDAY, NOVEMBER 5, 1881.

NOTES ON THE "FISHING GAZETTE" TOUR-NAMENT,

THE ILLUSTRATIONS.

THROUGH the courtesy of the publishers of the *Illustrated Sporting and Dramatic News*, and *Funny Folks*, we are enabled this week to give two illustrations in connection with the above. They need no explanation but we may mention that

Mr. Temple's capital sketches were made on the spot, and Mr. Shirley's amusing caricature was done from a verbal description of the affair.

THE COMPETITIONS.

It was the general opinion of all present that, but for the terrible weather, the casts would, in all cases have been very much longer—in our opinion, twenty-five per cent. longer in many cases. The rain made the lines cling to the rods, the wind was strong, but came in gusts from all quarters, the cold made it a difficult matter to manipulate the tackle. All the casting was done with the same baits, artificial dace, weighing just an ounce, and with lead on trace weighing about a quarter of an ounce. Of course, the hooks were taken off the baits. It would be a difficult matter to say which style of casting had most admirers—the Thames style, from line coiled at feet, or from hand; or the Nottingham style, from the reel. Mr. Little made the champion cast of the day, viz., 52½ yards from the reel, and beautifully straight. We confess this splendid cast, which would have been extended to at least another dozen yards under more favourable circumstances, gave the Nottingham style a position in our estimation which it had not had before. None of the professionals equalled this throw, even in their own particular styles. There can now be no doubt whatever that casting from the reel is the very best style of all, and an angler who has mastered the art as Mr. Little has can go and take fish where it would be impossible for anyone else to get them. He can stand up to his knees in a hedge and yet kill a fish fifty or sixty yards away. The angler who can only throw with the line coiled at feet must have a smooth footing free from all obstructions. The only style approaching the Nottingham in this particular and often inestimable advantage is the method of gathering the line into a ball in the palm of the hand, as was most beautifully and cleverly done by the professional Thames fishermen, Harry Wilder and Ned Andrews; in fact, as an exhibition of *skill*, this took the lead, we think. But to learn to do this must be far more difficult than to learn to throw from the reel, and the result can never be so good, for these reasons: the same length of cast cannot be attained, the same speed in getting back the line cannot be attained, and the same certainty of avoiding kinks and catching of the line can certainly not be attained.

Mr. Martin, the "Trent Otter," was unfortunate, smashing his favourite rod, and having to use a less suitable one; he feels certain he can throw sixty yards from the reel on a favourable day. Mr. Bailey junior's style of throwing was much admired, and we can well understand that he has the reputation of being one of the best, if not the best, at throwing from the reel in his native county. The forked stick throwing was another surprise to us. We imagined it was done (as indeed it often is) with a short forked stick; but Messrs. Lealand and Sawyer both used a specially made fork, with a jointed handle about five feet long; they coiled the line at their feet, hung the trace over the fork, and then with a swing sent the bait out nearly fifty yards. In many lakes and rivers where it is necessary to get a live bait or ledger out beyond a bed of weeds, this forked stick style would prove extremely useful, though here, again, the Nottingham style would offer greater advantages.

The state of the weather prevented the float throwing in Nottingham style being entered as a competition; but Messrs. Bailey, Martin, and Foster all showed that great distances can be covered even with such light weights as float tackles. Mr. Foster especially made some beautiful throws. Mr. John Bullock, of Derby, whom we were very glad to see present, showed us his style of fishing for trout with his own bait, the Derby killer. He throws it off his left hand, winding up the line in and out over the thumb and fingers. It is a very useful style, and we have seen him prove its practical utility by standing amongst bushes and sticks, and killing trout thirty yards away. The fly-casting competition between Messrs. Murphy and Marston was got up more to keep the ball rolling than with any idea of doing much. It is impossible to throw over grass in the same style as over water—the water gives a "pull" in withdrawing for a fresh cast, which brings out the power of the rod and enables the angler to get the line well back; on grass there is no resistance. Mr. Murphy used a trout rod of about eleven feet six, and Mr. Marston one of ten feet six; both used the same cast, but the wind made havoc of all attempts at artistic throwing.

SUGGESTIONS AT THE DINNER.

We have previously mentioned the names of the gentlemen who spoke at the dinner. We regret very much having to rely upon memory as to what was said. On two points all speakers agreed, and these were that the exhibition we had just witnessed was a thoroughly interesting, and practically useful one, and could not fail to be followed by others of a like nature; the other was that the Anglers' Benevolent Society was an institution which deserves the warmest support from all anglers. Mr. Spreckley, who takes the deepest interest in the society spoke most warmly in its

favour, and we think this alone is sufficient to inspire confidence in the society. He said he was perfectly satisfied that the work was being carried on in an able, conscientious, and purely unselfish spirit by the officers, who give, in the most generous way, their services to its promotion to the utmost extent of their power, and just in proportion as the members increase, so will their power increase. A very considerable amount of real good has already been done. We look upon this society as one of the best features in connection with the constantly increasing London Angling Clubs, and are delighted to learn that anglers are beginning to see it is a plain duty to belong to and help this society. Messrs. Ghurrey, Morgan, Bonvoisin, Geen, Hoole, and the other members of the executive, deserve the hearty thanks of the angling community for the work they are doing.

Mr. Jardine in his speech most cordially introduced to the anglers present a gentleman whose name must have been known to all of them, we refer to Mr. William Senior, better known under his *nom de plume* of "Red Spinner," author of "By Stream and Sea," "Waterside Sketches," and other charming works. Mr. Jardine said it was one of the pleasantest events of the day to him when he found his old friend, Mr. Senior, was present. Mr.

THE CULTIVATION OF COARSE FISH.

Our suggestion in regard to this very important question was so well received at the dinner and has since been so approvingly referred to both by the press and by prominent anglers, that we have no hesitation in reproducing here our remarks on the subject, and sincerely trust the matter will not be allowed to drop. Amongst the agents causing decrease of fish, we fear only the gradual advance of civilisation, in other words, the increase of population, paper-mills, *et hoc genus omne*. As long as any water remains sufficiently pure to support aquatic life, both vegetable and animal, the question of keeping it stocked with a sufficient quantity of fish is, as we have so repeatedly within the last two years said, merely a question of pounds, shillings and pence. The reason that coarse fish have never in this country, or to any extent abroad been artificially cultivated, is simply owing to the fact that until within the last few years there has never been any diminution in the natural supply, and consequently no demand for fresh stock. It seems to be admitted on all sides that at any rate, certain kinds of our English freshwater fish in the neighbourhood of London, Sheffield, and other large towns, could now well bear an increase in their numbers.

HIGH AND DRY ANGLING.

LAWN-TENNIS HAS BEEN SUPERSEDED BY LAWN-ANGLING, AS EXEMPLIFIED AT THE LATE ANGLERS' TOURNAMENT. THIS SCIENTIFIC STYLE OF FISHING REQUIRES NEITHER WATER NOR FISH. THE AIM IS TO SEND AN ARTIFICIAL FLY TWENTY OR THIRTY YARDS INTO A HAT, A TEA-CUP, OR— BUT NO; HOOKING POOR FIDO WAS A MISHAP. THE SPORT DOES NOT INCLUDE DOG-FISHING.

From Funny Folks.

Senior, in responding for the Press, was most warmly received. He said that in all his travels abroad he had never found such a delight in fishing as in the old country, and he had given all sorts of reasons to his family for leaving Australia, but the real one was that he longed to revisit his favourite English streams. His experiences of fishing in Tasmania and New Zealand will be found in his book "Travel and Trout in the Antipodes," published by Messrs. Chatto and Windus, and which we shall presently notice more fully in the GAZETTE. By the way, Mr. Senior made a suggestion with regard to the GAZETTE which we need hardly say we sincerely thank him for, and that was that if all its readers would give it a help when they could by inducing friends to advertise, it would enable us to give them a greatly improved bill of fare each week. We are sincerely grateful to those advertisers who have supported us so well hitherto, and are glad to know they are satisfied with the results; at the same time we have plenty of room for more advertisements, and if any of our friends will help us in this important feature, they will soon reap the benefit of it in the improvements it will enable us to make in the paper.

For some considerable time past we have been thinking out some plan by which an undertaking of the nature of a coarse-fish hatching and breeding establishment could be established for the purpose of providing young fish and ova for re-stocking depopulated waters. If we get sufficient support from the angling community, we see no difficulty whatever in arriving at success. We shall have nothing to do with the salmonidæ, but confine the experiment entirely to the coarse fish. It is too much to expect any private individual to undertake an affair of this kind. Here, then, is what we propose: That a society for the cultivation of perch, pike, roach, chub, carp, barbel, bream, dace, tench, gudgeon, &c., be formed; that an experienced German fish-culturist (used to breeding carp and other coarse fish), be imported to take the practical management of the affair; that all subscribers (and consequently members) of the society be entitled to take out of the stock either fry or ova to the amount of their annual subscription—the prices of the ova and fry to be fixed by general consent of the members. As an earnest of our interest and confidence in the scheme, we will give five guineas as our own subscription, and will undertake to get all the neces-

SKETCHES AT THE F. G. TOURNAMENT.—(From the Illustrated Sporting and Dramatic News.)

sary information for starting the thing in a business-like way. We do not propose that it should—at the outset at any rate—be a commercial undertaking with a view to profit in money, but there will be no objection to selling fry or ova to outsiders at such price as will help to pay working expenses. What we should like would be to see the London and provincial angling clubs take the matter up; a subscription of a guinea or two annually from say a hundred angling clubs, and as many private individuals, would give us ample working capital. Here is an example of how we think the affair would work. Having secured our water (and we have our eyes on some which would answer admirably), we should get first of all say a few dozen perch in spawn, and put them in our carefully arranged ponds; these perch would deposit their millions of eggs and milt on boughs placed under water for the purpose and carefully guarded. We could then either sell the boughs with the spawn on them (easily transported any distance in water), or we could wait till the fry appeared and sell them, or do both, as might be required. Now suppose the Piscatorials, or the Gresham, or the Bristol Golden Carp Angling Society, or any other club has subscribed a guinea, they would then be entitled to some thousands of eggs or some hundreds of fry, and could place them in any water they wished to re-stock. There is nothing impossible in our suggestion—look what marvels have been accomplished with the far more delicate fish, trout, char, grayling, salmon, shad, oyster, &c. The continent of North America is now being stocked in every part with carp carried from Germany, and propagated in the States—we mention the carp because it comes specially under our term “coarse fish.” Pike can be very easily cultivated; and we could name dozens of lakes and streams near London which ought to afford good pike-fishing, and did formerly, but which are now depopulated. As we said before, this is not a matter for private enterprise, and we cannot undertake it singlehanded or expect any one else to; but if any anglers who read these lines will send us their promise to attend a meeting to discuss the question, we will undertake to call such a meeting together.

TOURNAMENTS FOR ANGLERS AND REPORTS OF NETTING.

ANGLING TOURNAMENTS.

THERE can be no doubt the Anglers' Tournament was in some respects a great success. The idea was right and as an inauguration of similar gatherings amongst anglers at occasional periods it will become practically suggestive of coming events. The only drawback was the weather, which no one can rule. Had it been fine there would have been more competitors, a larger attendance of spectators, and the funds of a most excellent society more considerably benefited. The judges did their work nobly, the competitors, amidst great difficulties, did their best, the lookers-on disregarded the pelting rain, and when all was over there was a decided run on the “Scotch” at the Welsh Harp; and, after all is said, no one grumbled. I did not remain for the dinner, as I was then suffering from a severe cold, and I had other engagements on hand which I was particularly anxious to fulfil. I only want now to add one word of praise to Mr. Marston for the introduction of an Anglers' Tournament, which, I am satisfied, is full of practical usefulness. It will encourage the development of a greater amount of skill amongst anglers, and many will become ambitious to exhibit what they can do on future occasions. At the summer dinners, in the country, of angling clubs, these tournaments will, I apprehend, become general; but we *must* have at least one grand annual meeting of a national character as commemorative of Mr. Marston's introduction. The idea of holding it during the close season may be a correct one. The grounds at the Welsh Harp are in every respect suitable for the gathering of anglers, and in addition to the tournament, if held during the angling season, a fishing competition in the magnificent piece of water might take place; and, altogether, it would complete a grand day.

NETTING REPORTS.

I do not see that I am called upon in the pages of a public newspaper to comply with the wishes of “A Thames Fisherman” to give names. He must be satisfied with my assurance that what I state is perfectly correct, and that the remark was made by a fisherman in the presence of Mr. Spreckley and myself. Mr. Boalch, in his reply last week, very properly takes the same view, and offers to give names to the officials of the Thames Angling Preservation Society, which I am sure will satisfy both Mr. Clench and “A Thames Angler.” If “A Thames Fisherman” thinks I ought to placard about the name of every one I hear under similar circumstances, I certainly cannot agree with him; and, upon reflection, I think he will change his opinion. Those who have charge of the river are the proper persons to be made acquainted

with names, and when confirmatory reports of netting are given to individuals, let them go at once to the right quarter, where, if proof can be afforded, steps would be taken and a conviction would follow. All we want is satisfactory evidence of facts—not such reports as we have investigated lately, where the parties reporting them have been obliged to confess at the last there was no truth in them. Let anglers and fishermen unite with the various preservation societies, and at once report to those connected with them when they can fully prove an illegal offence has been committed, but let them be certain it has actually taken place, and not on the hearsay of others. They will then do some good, and materially help to check the evils which have always existed and always will to a greater or less extent. B.

BIG FISH IN SOUTH AFRICA.

[The editor of the *Investors' Guardian* very kindly sends us the following extract from a letter from the Diamond Fields.—ED.]

IT is so long since I saw any reference to Koffyfontein in your paper, that I expect you have almost forgotten that such a place exists. Nevertheless, we are alive and flourishing, that is to say, there are new buildings being put in the township. Boys are scarce, as is the case at all the other mines, but I hear a supply will soon be here. The place is looking very pretty now, all the fruit trees being in blossom, and the willow trees on the river banks all in leaf. Koffyfontein will be a favourite township now that the mine pays—what with the boating, bathing, and fishing. *Apropos* of fishing, Mr. D. G. A. Dowling, the manager of the mine, caught a monster barbel with a frog last Thursday. It weighed 40 lb., and was 5 feet long, the head being a foot broad, and it measured just a yard round the belly. A champagne bottle was put into its mouth and disappeared entirely. The following day he caught another, weighing just 35 lb., besides a smaller one of about 5 or 6 lb. It is not often that an angler has the good fortune to catch two such fish on two consecutive days. On Sunday the same gentleman and Mr. Clifton caught some fine yellow fish. In fact, there are plenty of fish here; and now that the proprietors of the farm have put a stop to the use of dynamite on the river those who are fond of fair fishing will be able to look forward to favourable results attending their devotion to the ‘gentle art.’ Fish of the above size would try the strongest tackle ever made, and there must be still larger fish in the river.”

THE NUMBER OF SPINES ON PERCH.

IT is a curious fact, but that I had during the past week prepared a paper asking the same question as suggested by the editor of the *FISHING GAZETTE* of this week's issue, viz.: “How many spines are there in the 10½ lb. perch,”* but, owing to pressure of business, was unable to complete for Saturday's number. This must be an enormous fellow, but as to the reality of its being a true perch (*Perca fluviatilis*), can be easily diagnosed by observing the number of spines in the first dorsal fin, these fish having two dorsal fins, whilst the “serranus,” (*Perca cabrilla*) or sea perch, has but one, although the “bass” (*Perca labrax*) has two also, but then no one would think a bass would be taken for a true perch. I have taken many hundreds of perch, but have nevertaken any over 3 lb. weight here in Devon, but have heard of fish of 4 lb. being taken. In September, 1872, I had a dusky perch (*Serranus gigas*), in my possession, weighing 23 lb., of which the late Frank Buckland stated in *Land and Water* for that date, the following: “I regret very much that I did not receive the rare and curious fish from Mr. Gosden. It would have made a splendid addition to my museum.” I merely mention this, because it thus shows that such large fish of the perch tribe are occasionally taken, but this is certainly not a fresh-water specimen. This is also like the fresh-water perch, as stated by Mr. Buckland, a most beautiful fish, although not in appearance, as to shape and colouring, like the former. Latterly I have examined a great number of perch, for the purpose of counting the number of fin rays, the result being in most cases, first dorsal 13, sometimes 14, all spinous; the latter number appearing on mature fish, the lesser number on the lesser kinds. Whether they produce this extra spine as they get larger, I am not prepared to say, the second dorsal, 1, sometimes 2, spinous and 14 soft; but as a better proof of my observations it will be as well to quote some better authority, for instance, Dr. Gunther, Cat. i. p. 38. “Two dorsal fins: The first with 13 or 14 spines, and fin with 2 spines, operculum, spiniferous; præoperculum and præorbital, serrated;” and the Rev. W. Houghton, M.A., F.L.S., in his history of “British Fresh-water Fisheries,” states,

[* Mr. Jardine suggested the query to us.—ED.]

"Dorsal fin, 14-15; all spinous, 1-2 spinous + 14-15 soft; pectoral, 14 all soft; ventral, 1 spinous + 5 soft; anal, 2 spinous + 8-9 soft; caudal or tail-fin, 17 rays soft."

I give the whole of these figures, in case some portion of the fish, probably being damaged and deformed in one particular fin, recourse can be made to the others. Mr. Buckland also tells us in his *F. H. British Fishes*, that a monster of 9 lb. is recorded as having been once on a time captured in the Serpentine, Hyde Park. This, however, is an old story, which he did not believe, although some of 5 lb. or 6 lb. have been taken.

Mr. J. L. Keene, in the "Practical Fisherman," states, "That in England the limit is probably 6 lb., but confesses he never saw one over 4 lb.," but Blakey speaks of some 6 lb. taken from Whittlesea Mere, and "Ephemera" also speaks of the above 9 lb. fish, and Izaak Walton speaks of a friend having caught one 2 ft. in length. Perhaps our Whittlesea brother disciples will inform us as to the size of fish still to be had, and I hope the question on the number of spines on the perch will solve the vexed problem as to whether 'tis a true perch or 'tis not.

FRANK GOSDEN, Exeter.

THAMES FISHERY CONVICTIONS.

THE following convictions have been made by the Thames Angling Preservation Society, Mr. Hickson Briggs, the society's solicitor, being the prosecutor.

Mr. Macgregor was convicted by the Brentford Bench on Saturday last, and fined in the sum of 10s. for laying night lines at Teddington. The defendant, who pleaded guilty, said he was ignorant of the bye-laws relating to night lines.

Daniel Lamb was convicted by the Chertsey Bench on Wednesday last, and fined in the sum of £1 for illegally fishing in the river Bourne, which is now under the protection of the Thames Angling Preservation Society. The defendant in this case also pleaded guilty, and being the first under the present management, Mr. Briggs was instructed to ask for a mitigated penalty as it was intended more as an example and caution to others. This portion of the river Bourne running through the grounds of Mrs. Brooks, of the Hamm Farm, Weybridge, is a valuable adjunct to the Thames, as that river runs in above the Weir at Shepperton, and empties itself below the Weir at the Hamm Point. It is a capital lay-by for fish in the close season. A notice board is placed at each end as a caution to anglers, and this conviction must have a salutary influence against illegal fishing.

CLUB AND OTHER JOTTINGS.

BY L. B.

I HAVE just received from Mr. W. H. Brougham, the indefatigable secretary, the Thames Angling Preservation Society's Annual Blue Book. It would take up too much space to notice, however briefly, all the valuable information it contains. How pleased Mr. W. H. B. must have felt as he wrote for the first time on the first page proper, and in a line by itself—"Patron, H.R.H. the Prince of Wales." Passing over a lot of useful matter we find the annual report, page 27, is in every sense satisfactory. Assistance and advice given to younger kindred societies on the upper portions of the river—important convictions obtained by the Society—proving the vigilance of their keepers. The Society is able to congratulate its members and the angling public upon—at least in the tideway—a very successful season.

Again, owing to the entire absence of floods, the spawning season of 1881 was the most successful there has been for many years. A large number of fish, which had gone up the back water at Hampton Court, have been netted out and returned to the parent stream.

I am sorry, however, to be obliged to differ *in toto* with the opinion expressed and the recommendations made in paragraph 6 of the report—"The entire abolition of gross weight competitions among members of angling societies, and the substituting, in their place, of competitions for a limited number of big fish." The recommendation is made in the kindest possible spirit, and I feel convinced in what the suggestors believe to be the best interest of the sport; but it would, nevertheless, if carried out, have an entirely contrary effect. I know there are many gentlemen who hold with the spirit of the paragraph from which I have quoted, and though I must positively decline to enter into a necessarily long paper controversy, I shall be happy to meet any of them and talk the matter over.

Paragraph 7 is a courteous recognition of the services the Central Associations have rendered the cause of angling.

Paragraph 8 deals with the artificial propagation of fish (trout), as carried on by Mr. Jas. Forbes, of Chertsey, and also of the Society's own experiments in the same direction.

The next paragraph explains the Society's satisfactory relations with the Board of Conservators—recommendations made by the committee to the Conservancy concerning important alterations in the lower Thames bye-laws.

In the concluding paragraph the usual appeal for support and

funds is made, an appeal which, in view of the great amount of good work the Society is doing, I hope will be liberally responded to.

Finally, this little book contains such a lot of valuable and interesting information that I cannot do better than advise the readers of the FISHING GAZETTE to invest sixpence in its purchase.

A local and general visit combined was paid to the Good Intent Angling Society, the Crown Inn, Church Street, Shoreditch, on Monday evening last. Mr. Parker occupied the chair, Mr. Richard Murphy facing him in the vice. No need to say the visit to such a society was well attended, sixteen clubs being well represented. The singing was very good. I don't like to particularise, where all who tried did so well, but Mr. Imey da Costa's two songs were received with roars of applause which they well deserved. Messrs. Ghurney and Bonvoisin, who were present—both at the invitation of the chair and vice-chair—made a few remarks, the former dealing principally with the complaints of the abuses of the privilege cards by certain anglers, the latter going over more extended ground, and dealing with the Anglers' Benevolent, legislation for the protection of coarse fish, the close season, the return of undersized fish, and the suggested abolition of gross-weight competitions among the members of angling societies.

On Tuesday evening the West Central Association, No. I. district, visit was paid to the Marylebone Angling Society, the "Prince Albert," Sherborne Street, Blandford Square. The chair was ably filled by Mr. Prosser, the vice by Mr. J. Hickford. The singing, recitations, etc., were *À l'*, and upon the roll being called at 11 o'clock by Mr. T. Osmon, the district presiding officer, twelve clubs were found to be represented. The next visit to this district will be to the Norfolk Angling Society, Norfolk Arms, Burwood Place, Edgware Road, on Wednesday evening next, the 9th inst., when I hope the anglers will muster in force and give host Galloway, who is an ardent piscator and a good attendant at these friendly visits, a bumper.

From Haslett, of Chertsey, a line comes to say things have been very quiet in his district, a few odd fish—barbel, chub, and good perch—being all he speaks of, but adds, in conclusion, "the water is getting all right again, and I am glad to say old Father Thames has taken his physic pretty well, and I think now he is getting better there will be a chance of some good fishing. Now the weir is shut down again I shall bait up for the bream, and hope to have another good take to report shortly.

A friend and self had a good day at Twickenham last Sunday, and though our boatman, George Coxen, tried all he knew, the fish would not hang on. The few we did get, however, were good fish and in capital trim. I never saw such a lot of clubmen punt-fishing as I did last Sunday between Twickenham deeps and the Orleans club.

On Friday evening, December 4th, there will be a meeting of the working committee, at which Mr. P. Geen has promised to be present. Business of importance will be brought forward, and a new society, "The Jovial Anglers," will be proposed for enrolment.

Re the dace taken in the Colne, at Uxbridge, I beg to assure Mr. Woolfall that the report, as printed in my notes in the FISHING GAZETTE, is perfectly correct, and I originally had the particulars on the highest authority, and have since had them substantially confirmed by several members of the H.U.A.C., whom I met at the dinner which followed the recent tournament at the Welch Harp, one of whom, Mr. Hobden, has preserved a number of the dace in spirits, as I stated last week in my notes. Mr. Woolfall must remember that, in this case, the keeping of these fish by Mr. Walters served the cause of science and fish-culture far better than their return to the water would have done, though I agree with him, if what he wishes to convey is that a lesser number of fish would have proved the point quite as satisfactorily.

BLUE BOOK OF THE THAMES ANGLING PRESERVATION SOCIETY.

THIS most useful publication of the T.A.P.S. has been greatly improved this year by the addition of a much larger amount of useful and referential information. It has evidently been compiled with great care, and a large amount of labour has been bestowed upon it. The printing is admirably executed, and the general appearance of the book is very striking. In addition to important extracts from the bye laws—which every angler and fisherman should know besides the sizes and seasons of fish—there is a river distance table, pleasure boat tolls, river preserves, names of fishermen, angling hotels, lock keepers, river keepers, railway fares, time of high water, number of swans and cygnets, number of fishing boats, fishing tackle makers, list of preservation societies to Reading, fish culture, officials of the three central associations, a complete list of angling clubs up to the present time, officials of the Board of Thames Conservators, the names of the inspectors of salmon fisheries, the origin of the society and the rules, annual report, list of subscribers, &c. The "Blue Book," which is published at sixpence to non-subscribers will be sent post free on receipt of that amount by Mr. W. H. Brougham, 7, Ironmonger Lane, Cheapside, London, and no one will regret the investment. The society is now under the patronage of the Prince of Wales, and the "Blue Book" is eminently in character with its present influential position.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Galis, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVR.]

RIVER REPORTS.

MID-THAMES.

"My busines in this State
Made me a looker on."—SHAKESPEARE.

The river is in prime order for any kind of seasonable fishing. Chub are well on; jack are feeding; perch are on the move, and roach are active, so what more can mortal angler wish for? At Marlow, Maidenhead, and Bray, excellent miscellaneous baskets have been made, the best bag in quality having all been had with lobworms. At Hurley, Messrs. Lee and Harrison have not experienced their usual good luck, one day's angling only resulting in a few pounds of roach. At Medmenham, the river seems in fine trim for chub, several men doing big things. From Mapledurham I hear that Mr. Torridge one day took some fifty perch, and on another occasion three jack of presentable proportions. The foliage at the side of the river is now something worth a journey to see. So what with this and the excellent chance of sport, I would advise my gentle readers to pay a trip to Old Father Thames before the excessive possible cold precludes such a visit.—MARLOW BUZZ.

Thames (Goring).

Water in good order for jack, perch and chub; perch biting very well. While out on Thursday I took 10 lb of perch; best day 4 jack and 6 lb. of perch—J. RUSH.

Thames (Halliford).

Owing to the cold north east winds, we have had the fishing very bad. Mr. Innis, fishing with me at Weybridge on Sunday last, caught six roach, one barbel, and two small chub. Mr. Jukes, fishing with me on Tuesday morning, took twelve roach. Mr. Innis, fishing with me at Halliford on Wednesday, caught 2½ dozen roach. Thursday: weather, fine; wind, south-west; prospects for fishing, much better.—GEORGE ROSEWELL, fisherman.

Thames (Richmond).

The river is in splendid order for roach fishing now, and the change in the weather to-day has brought the fish on again. As I reported last week this would be a good week, but it was not to be the case, for on Sunday morning there was a stinging frost, that took the fish dead off the feed; in fact, it almost took my wits away as well, for more than once I did not know whether I was frozen or not. Since my last report all the punts have been out most days. On Friday and Saturday last sport run from 15 to 20 lb. of roach to each punt; Sunday, Monday, Tuesday, and Wednesday, about 10 lb. per punt; and to-day Job Howard, with two gentlemen, 15 lb. roach; Harry Howard, 10 lb. roach; myself, with Mr. Macfarlain, 25 lb. roach, with one barbel, 3 lb.—JOHN BUSHNELL fisherman.

Thames (Twickenham).

Wind north-west and showery. A little rise of water, but nothing to interfere with anglers. We are still having some very fine takes of roach and dace. Mr. Barlow and Mr. Howes, with Ted Brown, took 60 lb. of splendid fish in two days; Pert Hammerton, one day 18 lb. and two days 45 lb.; George Coxen, one day 6 dozen, one day 4 dozen of roach, weighing 18 lb.; Joe Dobbin, with Dr. Clark and Rev. Limpus, 4 dozen of fine roach in three hours after tide. I am sorry to have to inform the friends of James Brand, who has worked on the river from the Two Sawyers for the past twenty years, that he expired on last Tuesday night after a long and painful illness.—ALFRED PERRIN.

Thames (Windsor).

Water here is very much discoloured, though we have had no rain to speak of. I think the great quantity of leaves in the water has something to do with it; also, perhaps, the cause of fish not feeding, as very little has been done—only here and there a few roach and perch and barbel. The latter are still to be had, though they are very shy. I tried them at Windsor Bridge last Friday; there being a very strong water on I had to use lead three times the ordinary weight of fine tackle—the consequence was the first I hooked had the laugh of me, so gave it up till the water dropped off a bit. Lumsden, on 28th ult., had five barbel, averaging 2½ lb., and on the 1st inst., with a patron, had a heavy chub, going 5 lb. good weight; had it been in a proper condition would have gone 6 lb., or over. It was taken whilst legering for barbel. A good flood now would do a lot of good by carrying away the decayed weed and other refuse in the river; as it is now, the fish will not feed as they generally do when we have a rainy October.—B. R. BAMBRIDGE.

Ancholme.

The advent of winter has put a stop to the fishing of those who only visit the water during fine weather. The past week has been noted for a succession of snowstorms and frosty nights. Despite these drawbacks a few brave ones have faced Boreas, and been rewarded with a measure of success. Mr. J. Atkinson, of Brigg, and a friend were fishing above Brandy Wharf on Friday last. The latter gentleman hooked a large pike of 10 or 12 lb., with the spoon bait, but before he had safely got it to the top of the steep bank Master Jack gave one of his artful summersaults, broke the gimp, and vanished with the electro-plate beneath the waves. These are the sort of lessons anglers require. They do

us good in causing us to examine our tackle to see if it is reliable. I have recently had some very heavy fishing, and have found the new Acme lines to meet every reasonable requirement.—THOMAS FORD.

Dove

Since my last, we have had a heavy fall of snow, but it has now entirely disappeared. Grayling have been feeding well, and the dark October cock-winged duns have been accounting for some nice dishes, as also has the caterpillar. On Monday, in the Birdsgrove length, a local rodster was fortunate enough to take no fewer than thirteen fish, most of them goodly size ones. In Dove Dale too, some pretty samples have been killed, both the flies mentioned above having proved best. Mr. David Foster of Ashbourne has also been doing well with the cocked-winged duns, below Mayfield. Amongst his fish were several trout, which had, of course, to be returned to the river. The best time to fish now is from about eleven till three. Either before or after the hours named the fish won't rise as the naturals disappear from the water. Pike fishing about Uttoxeter, and on the lower lengths of the river, excellent.—THE SPODGER.

Exe (Exeter).

During the past few weeks, sport, in the way of fishing, has called for little or no remark. In the first place, the river has been so exceedingly low, and the storms following in such quick succession, caused the river to become so full and turbulent, accompanied with sharp frost and strong easterly winds, being the chief cause. Many anglers have been out, and plenty of fish are seen, but are in no humour for feeding. Spencer Walpole, Esq., Her Majesty's Inspector of Salmon Fisheries, paid us a visit last Thursday, who, with several of the Conservators, made an inspection of St. James's Weir, commonly called Salmon Pool, previous to deciding as to what kind of pools or pass should be placed in lieu of the useless rotten structure now fast falling to decay by actual wear and tear. During the inspection a fine otter attempted to mount the weir through the old pass, but perceiving the company on the bank, turned a backward somersault, and went down with the tide, giving them many adieus on his way thither. A few fine jack have come to bank, and, should the weather at all favour, sport may prove prolific.—FRANK GOSDEN, Exeter.

Ilfracombe (N. Devon).

Sea fishing, Friday afternoon. All boats out. A few came in at seven o'clock with two and two and a half maize of herrings in a boat at ten o'clock; the larger boats came in with very good catches. One had sixteen, another fourteen maize of herrings, which sold readily at 2s. a maize; also a few fine hake and whiting; some caught with hook and line, others in the nets. Saturday—squally, however, a few fine boats drifted and caught altogether about eight or ten maize. Several ling caught with hand lines from the jetty; also some fine cod, weighing about 14 lb. each, in prime condition. Sunday—several boats out, their catches varying from two to four maize in a boat. One boat with her nets drifted on the rocks, in trying to clear the nets from the rocks, they tore five nearly to pieces, belonging to Mr. J. Turner, of the Admiral Rodney. Monday—fishing rather slack; about a maize or maize and half in a boat, with a few hake. One boat had two nets very much damaged by a vessel going over them. Tuesday—a quantity of hake caught, which sold freely at 1s. each; herrings, twenty-four for 1s. Wednesday—blowing strong, with heavy sea. Three boats went out; they returned with about sixty herrings; and a vessel, with 150 maize of herrings on board, from from Clovelly, bound to Swansea, finding it too rough for them to proceed on their voyage, put into our harbour. This morning, Thursday, the weather moderating a little they started for their destination. Many of our boats have made a start again to-day for Clovelly Bay, where we hope they may be successful. Prospects for the present good.—E. COMER.

Lea (Cook's Ferry).

On Sunday last we had a great number of anglers down with us, and their takes were encouraging. A Mr. Morrison and Mr. Collyer, both members of the Edmonton and Tottenham Fishing Club, took some perch in fine condition, and others returned home delighted with their takes. I may here notify that a new landlord will shortly take the above house, and he has informed me that he intends to do everything in his power to make all who visit this fishery comfortable by supplying them with good and cheap accommodation.

Lea (Rye House).

The water is in good order now. The wind east and very cold. There has been no sport all the week.—WM. COWELL.

The water is getting all right now. It has not been fishable since Sunday. The wind is north-east and cold. Mr. Moss took a small jack on Sunday about 4 lb.—WM. COWELL.

Lea (Ware).

The water here is richly coloured and in good condition. The Bloomsbury Brothers visited here last Sunday, and had a peg-down match, the result of the day's taking, after some grand sport, was as follows:—First prize, Mr. Davis; second, Mr. Barr; third, Mr. Gill; fourth, Mr. Young. The Highbury Brothers and the Izaak Walton were also represented. Lucky Mr. Holford took a jack on Nov. 1 in the Barge river, weighing 9½ lb., the largest I have heard that has been taken here this season so far.—VON LEEFE.

Ouse.

Water in fair condition for all-round fishing; but a rapid stream on, owing to the recent heavy rains, which makes it necessary to use fine tackle, heavily weighted. The searching east wind is spoiling the prospects, otherwise there would be every reason to expect good roach and pike fishing for some time to come. Sport during the week has been very fair for the few anglers who have ventured out; the following are the results:—Oct. 27, Dr. Moxon, Cambridge, fishing with Mr. Innes, Trinity College, got 16 lb. very good roach during the afternoon, very showery and cold, only biting at intervals. Oct. 28, Mr. W. C. Carr, Cambridge, 15½ lb. roach, four largest going 4 lb. the lot. Oct. 29, several anglers out, but little doing; very cold and stormy. Oct. 31, sharp frost during the night, but a few roach taken, Mr. R. B. Marston, London, with a nephew, and Mr. George Basingbourne, getting 8½ lb. I did not expect there would have been a fish taken. Nov. 1, Mr. W. B. Rogers, London, 7 lb. good roach.—CHARLES SOUTH.

Thorney Broad.

The water is in first-rate order for fishing—not too bright. There have been some good takes of roach, dace and chub during the past week. Anglers would do well to give the water a trial for roach, etc., now. Sport during the past week:—Mr. Stocker, 1 chub, 4 lb. 9 oz. Mr. Griffin has had several chub, the largest weighing 4 lb. 14 oz., the smallest over 2 lb. Mr. W. Hawkins had a quantity of dace with the fly, all weighing over 9 oz. Mr. Walker, 4 roach, largest 1 lb. 8 oz. Mr. Holding, 8 roach, several of them weighing over 1 lb. 6 oz., and smallest about 9 oz. Mr. Hawkins, 4 roach, over 1 lb. each. Mr. Browning had a fine jack of 9 lb. $\frac{1}{4}$ oz., and several others had fair takes of roach, &c., too late for last week's paper.—E. GODFREY.

Trent.

Little of import has been done this week, at which I am not in the least surprised. On Monday the river was reported in good fishing order, but the wind blew so fearfully cold that the few anglers who ventured out returned with only meagre catches. On Tuesday a heavy fall of snow and sudden thaw upset all calculations, for, in a few hours the water was again so thick that the fish could not see a bait in the slowest swims. The river to-night is reported out of all condition from the snow broth, and angling will be found stale, flat and unprofitable before the beginning of next week.—J. M.

Trent (Newark).

The water is now in fairish condition for all-round angling, but cannot say how long it will keep so, for it has been raining somewhat heavily most of the day, and so in all probability we shall have a high and thick water by Saturday; but I hope for the best; if the water continues in the present trim, chub ought to take scratchings or pith, and roach gentles, but should advise anglers to bring a few worms down to the river with them, if the water should be high and discoloured. Wind, south-east. The splendid weather of last Monday tempted a lot of anglers out, and some of them did pretty well among the roach. Mr. Slater had a very nice bag of those fish; and so had some others, gentles being the favourite bait. Last Saturday, I tried my hand with the jack, and ran seven, but only succeeded in grappling four, Mr. Gregory's "clipper" being the fatal attraction. I have been frequently asked to describe the method of preparing pith for chub fishing. Now this is the way I do it. For a small consideration the butcher's boy draws me out of the bullock a quantity of the pith, which is the spinal cord. It is rather a dirty, disagreeable affair to look at, but, with a pair of scissors, I carefully remove the skin, and then the inside I carefully wash in cold water two or three times, till it is perfectly white and clean. It is then, after all the water is drained from it, ready for use. Some people scald it, or boil it, etc, but I have tried all dodges, and I find it is the best left as it is after washing. A piece about the size of a hazel nut is carefully put on a No. 4 or 5 round bend Carlisle hook; stick the hook through and through, and through again, the pith, till it works up the shank, and the point is covered. Careful practice is necessary in order to put a bit of pith well on the hook, so that it will stop on for a few minutes. It is a clinking bait for chub when the weather is cold and the water is clear. Our respected editor tells me that he has sent my prize that I won at the tournament, "Mr. Gregory's Baits." He says they are a grand lot and no mistake, but they have not yet come to hand. When they do, I shall perhaps have something to say about them in the next issue of the FISHING GAZETTE.—TRENT OTTER.

Wye and Derwent (Derbyshire).

Both rivers have been in first-class order for angling up to-day (Thursday), when we have here a thorough wet day, and both rivers are milky from the limestone roads, and rising. Sport during the week up till Tuesday, and to-day Thursday has been generally good, and some splendid baskets of good size grayling have been killed with careful good fly fishing off of both streams. The killing flies have been furnace, dyed hackle, bumble, black, or little snuck flies. Fish have been found to rise the best during the past week from "eleven to three," and have been killed chiefly in the deep slow runs, and in the tails of the streams. The bottom fishers on the Derwent have done well during the week, killing both grayling, roach, dace, chub, and a few small sized perch, with maggots and brandling worms. The maggot killing the greater quantity of fish.—J. C. EATON, Starkholmes, Matlock Bath.

Yore (Yorkshire).

Snow has fallen in this district since my last report, and the frosts at night have been very keen; this has brought the grayling well on the feed; and I have heard of some very nice dishes being taken with both the little red worm and maggot. The rivers are now in excellent order, and should the weather keep fine and open, no doubt some good sport will also be had with the fly.—FRANCIS M. WALBRAN.

THE FISH SUPPLY.—The supply of fish to Billingsgate Market for the week ending Friday, Oct. 28, was as follows:—Oct. 22, by rail, 221 tons; by water, 48 tons (1 steamer); Oct. 24, by rail, 264 tons; Oct. 25, by rail, 284 tons; Oct. 26, by rail, 316 tons, by water, 32 tons (1 steamer); Oct. 27, by rail, 306 tons, by water, 48 tons (1 steamer); Oct. 28, by rail, 371 tons, by water, 40 tons (1 steamer). Total by rail, 1761 tons; by water, 168 tons. The above figures go to prove that the Corporation could well provide for land-borne fish, as the water-borne supplies are falling off considerably.—*City Press*.

GREGORY'S SPINNING BAITS. The Gregory's the "Flexible Cleopatra," the "Oxford" and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Kedditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

NOTICES OF BOOKS, &c.

SCIENCE LADDERS. By N. D'ANVERS, author of "Heroes of North African Discovery," "Heroes of South African Discovery," "Elementary History of Art," &c. Series I. No. 1. "Forms of Land and Water." Series II. No. 1. "Vegetable Life." Series III. No. 1. "Lowest Forms of Water Animals." London: Sampson Low, Marston, Searle and Rivington. 1881.

IF there is one subject above all others on which the literary historian of the future will surely fasten, it is the immense improvement effected in educational literature during the latter half of the present century. This improvement, it should be observed, extends not only to the high character, thoroughness, and general usefulness of the books themselves, but to the extraordinarily low prices at which they are procurable. And, as an instance in point, we would draw attention to the very newest aids to scientific learning, namely, the batch of little books whose titles are ranged in order at the top of this notice. These "Science Ladders" form an illustrated series of geographical and natural history Readers, intended to teach the great laws of nature in language simple enough to be intelligible to every child who can read. Purely elementary, they aim at awakening the powers of observation and of reasoning—and to this end the excellent scientific illustrations with which they are copiously supplied must very materially assist. The author's aim and intention is fully secured and carried out in every line, and an almost incredible amount of sound learning is encompassed by these delightful little volumes, averaging seventy pages each. At present only three Readers, the first of each of three series, are sent out to secure the well-deserved favour of the public, but these will shortly be followed by companion Readers, designed to carry their respective subjects to another and a higher stage. The titles of these additional volumes, already announced as in active preparation, are as follows: "The Story of Early Exploration," "Flowerless Plants," and "Lowly Mantle and Armour Wearers."

The short limits of this notice preclude any detailed exposition of the author's admirable method, or any attempt to convey an adequate idea of the easy progressive character of each succeeding lesson. Though primarily intended for the use of children, these books are also well worth the attention of others who are properly curious about what goes on round about them day by day, yet lack the wish or time to study larger works. In conclusion, we would express an earnest hope that these Good and Truth compelling little books may be spread broadcast wherever children are and the English language reigns; for no pleasure can compare with that of climbing up to the vantage ground of Truth; and Good, the more communicated the more abundant grows.

COARSE FISH CULTURE.

WE beg our readers to carefully consider the proposal we make in respect to establishing a society for breeding roach, perch, carp, pike, dace, &c., &c. For details see the article on our FISHING GAZETTE Tournament this week.

PORTSMOUTH WALTONIAN ANGLING SOCIETY.

Thursday 20th ult. was the last angling competition of this club for the year. On the occasion the Chichester Angling Society (a club very recently formed in the ancient city), were invited to contest. The day unfortunately was most unfishy and boisterous, blowing at times half a gale from the N.E. Not at all daunted with the weather the members turned up very well, and met the Chichester club about noon at their head-quarters, the Globe Hotel (Southgate Chichester), each rodster was allowed to fish in any part of the canal he thought proper as long as the time would permit. After three hours (the time specified) the takes were anything but satisfactory. Mr. Mortimer, of Portsmouth, winning first prize, and Mr. Smith, of Chichester, the second prize. The Portsmouth Waltonians are to be highly complimented this season on many former occasions for their large takes both in salt as well as in freshwater, and some very valuable prizes have been won. Mr. Westaway scaled last week over 30 lb. weight of whiting and codlings, angling from a boat off Hayling Island in one afternoon.—DAGGERWOOD.

PRINCESS OF WALES.

A few of our members went to Uxbridge on the 23rd ult., to compete for a valuable prize given by Mr. Allport, but the majority of them met with but little luck. Mr. Glaister won the prize with a decent show of roach, only just beating Mr. C. Severn by $\frac{3}{4}$ oz.—MEDIocre.

ANSWERS TO CORRESPONDENTS.

' COST OF FISHING PUNTS.—In answer to query on this point, we wrote to Mr. Warner and he says his punts, which are very good, cost from £10 to £12. He will give name of builder if required.—ED

W.S.L.—The worm you sent arrived in such a dried-up condition as to be unrecognisable for a certainty. We think, however, it is the *lermea* (a common parasite of fishes) which is said to be the only parasite of the Canadian white salmon (*Coregonus albus*), and is described by Dr. Carpenter as possessing "a long suctional proboscis, a short thorax, to which is attached a single pair of legs, which meet at their extremities, where they bear a sucker which helps to give attachment to the parasite, a large abdomen and a pair of pendent egg sacs." You should place some of them in spirits and forward securely in a box.

C. EDWARDS.—We have asked the "Trent Otter" to be good enough to tell you how to prepare pith for chub-fishing, in his River Report this week, but it has frequently been described in the GAZETTE.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

FISHING AT CONNEMARA.

SIR,—As Ireland is a point of attraction just now, it may interest your readers to hear of the hair-breadth escapes which I and a London friend had two months ago when we went fishing in that romantic land.

In the first place we took tourist return tickets for Connemara at Euston (a risky thing, you will say, not knowing if we should come back again) and arrived at the Railway Hotel, Galway, on Sunday night. On Monday morning, after a hearty breakfast at that comfortable hostelry, consigned ourselves to the care of the well known piscatorial celebrity, Nicholas Brown, for a few hours' salmon fishing. I must here allude to the marvellous show of salmon one sees on looking over Galway bridge. Hundreds and hundreds of these splendid fish are to be seen in the rapid shallow water beneath, waiting to ascend the river. What a spectacle if it could only be witnessed from London Bridge! We went to work without delay with "old Nic" (and a good guide, too, for salmon fishing), and between 10 and 12 killed four salmon of 6, 7½, 7½ and 8 lb.

A 2, after sending our fish to London, we had luncheon at the Railway Hotel, and then got on board the steamer *Lady Eglinton*, which took us up the river and across Lough Corrib to Cong. This trip was most enjoyable, the scenery around the magnificent lake being truly grand. At Cong we stopped overnight at the small but comfortable hotel the Carlisle Arms, kept by Mrs. Burke. We drove in the morning by outside car to Leenane (18 miles), approaching which, via Maam, the singularly wild and picturesque scenery of Connemara presents itself. Placing ourselves in charge of Mr. McKeown, the obliging proprietor of the Leenane Hotel, we met with the best accommodation and comfort. The cuisine was excellent, and the waiter and all connected with the hotel most willing and attentive.

We stayed here three days fishing on the river Erriff and a small mountain stream, with moderate success, and enjoying the beautiful scenery and drives. Leenane seemed to be a good station for shooting, as there were one or two gun parties staying with us who, unmindful of Coercion Bills and Arms Acts, were committing sad havoc amongst the grouse and hares; but as our object was essentially fishing, and time on the wing, we thought we would off to pastures new. We had heard that the Ballinahinch Lakes were the place *par excellence*, so we posted another 17 miles or so, and after the most delightful of drives imaginable, found ourselves snugly ensconced in the charmingly-situated hotel at Glendalough. And now I must tell you, reader, who have not yet had the happiness to know the beauties of this spot, and yet love to wield the rod, you can here attain the Ultima Thule of your expectations, that long desired haven of bliss—an anglers' paradise. The hotel, a handsome white castellated building, is situate on the margin of the lake encompassed with wood, and in the midst of sublime scenery. We found in it, as at Leenane, all the comforts and attentions of home, good living and reasonable charges, at the same time that we were at the headquarters of a large and important fishery.

It was not long until we made acquaintance with the head-keeper Steele—a man, I should say, well-fitted for his post—and learnt that we had something like fine lakes and a splendid river to fish upon, all teeming with trout and salmon. Two boatmen were appointed to meet us in the morning, and one day we visited one lake, another day another, thus varying the drives out and home and general programme. These men were not only good boatmen, but good fishermen as well, knowing all about flies and the best casts on the water. I give their names—Pat Kelly and Michael Fahertie, as I can strongly recommend them as intelligent and hardworking men, really anxious to procure sport for their patrons. We had five days' fishing at Glendalough, and good sport with the sea-trout, getting 15 to 22 per day, all with the fly, fish running generally from 1½ to 2½ lb., and very sportive. We also caught a few small charr, and hooked two salmon with the sea-trout flies, but did not succeed in landing either fish (although one was played by my friend for ten minutes), the small hooks giving way.

On returning via Galway we had a day's trolling with artificial baits on the river and a portion of the Lake Corrib. Singularly, although both possess salmon, trout, perch, and pike *galore*, and we used the finest of fancy tackle, we did nothing on the lake whatever, and we only got 5 small jack at the Galway end of the river, the biggest weighing scarcely 2½ lb. There must surely be monsters where these small fry were. As a proof of it, we saw some local spoon-baits of extraordinary size, fully four times as large as those used on the Thames. We should have remained a few days longer and given the big ones a chance, but had to pass the week which was left us with friends in Dublin prior to our return to the modern Babylon.

In conclusion, we enjoyed our short fishing tour in Connemara, and can safely advise those "brother Bobs" who desire a really wonderful change of scene, most delightful drives, and first-class fishing, to pay it a visit next season, and to make Glendalough their headquarters. As regards disturbance and the hairbreadth escapes I commenced with, believe me that such dangers are mere fallacies. We met with nothing but kindness and respect everywhere we went, and, from what we could see, the people only deplored the absence of the stranger, and were but too ready to offer him a welcome. The only thing which could suggest disturbance that we saw, was the treble guard outside Galway jail, who, from their proximity to the water, might as well have been guarding the salmon. Beyond this, we saw and heard nothing, and, as for my friend, who is a thorough Englishman, he vows he will not read his *D. T.*

any more, but be guided by his own observations, and visit old Ireland again when the season re-commences.—I am, &c.,
Athole Aouse, Gipsy Hill, Oct. 29, 1881.

CASTLECONNELL.

FISHING AT EYNHAM.

SIR,—In answer to "Perch's" enquiries, *re* the Fishing at Eynsham:—
1st. It is all free fishing at Eynsham, all on the Thames.

3rd. I know of no punt or fisherman; I should, speaking from experience, advise him to go to Bablock Hythe Ferry, stopping at the inn there. Here he would obtain good plain accommodation (but will be advisable to make arrangements first), and he will get there a good fisherman, viz., C. Webb, Northmoor, who has a good punt, and knows the waters well. He can then fish up to New Bridge, &c., or down to Skinner's Weir and Eynsham, all good fishing; about 10s. to 15s. a day will cover all expenses I should say. Eynsham, by road, is three miles from Bablock Hythe, and Oxford five or six miles. He will have to arrange for baits, &c., beforehand. He ought to obtain plenty of jack in this neighbourhood. If he will ask you (Editor) for my address, and write to me, I will inform him more. His best way is from London to Oxford or Eynsham by rail, and cab it from either place to the inn.—I am, &c.,
M.

SIR,—In reply to the inquiries of "Perch," the following answers will perhaps be equally satisfactory to him as to other gentlemen whom I know are anxious to hear the reply which I now give.

(1) I replying to this I may say it is one of those questions which has helped to call into existence the Thames Rights Defence Association, and as that body are unable to state what portions of the Thames are "perfectly free" I, as a humble member of it, cannot pretend to do otherwise than state what I know from experience of this portion of the river, and that is that the fishing is claimed by the Earl of Abingdon, through whose land the river and towpath flows hereabout; he lets it to Mr. Treadwell, the keeper of Eynsham Weir, who (and his father before him) issues printed tickets at 5s. each for the season.

(2) Day fishing is allowed by Mr. Treadwell, who is very anxious to get London anglers to fish his waters; he charges 1s. per day, but issues no day tickets.

(3) You cannot obtain either punts or fishermen here, the nearest place at which these can be had is Oxford. Indeed, those accessories to some anglers are not required here, as, except in the weir pools, the best fishing is from the banks on either side.

(4) Eynsham is on the Thames proper, and the weirs, locks and banks and towing-paths are under the care of the Thames Conservancy, who have recently been doing considerable work with a view of getting rid of the flood-water at a quicker rate.

In conclusion, I presume that the reports named by "Perch" refer to fish taken by myself, and I can assure him and others that the sport is good, and that any further information will, I believe, readily be given by Mr. Treadwell, Eynsham Weir. Any angler going to this part will do well to put up at the King's Arms, kept by Mrs. King, whose accommodation is very good and charges low.—I am, &c.,
R. W. HOBDEN.

23, Blomfield Road, Shepherd's Bush.

SIR,—In reply to the letter signed "Perch," in the GAZETTE of this week I have much pleasure in replying to his question, as far as I am able.

(1) The fishing at Eynsham is not free.

(2) The man who rents the water will give permission to any respectable person to angle, leaving the question of payment to the good nature of the angler.

(3) I do not think that a punt or fisherman could be obtained at Eynsham, but the Beasleys or Bossoms are at all times ready to take one when ordered from Oxford; fishing from the bank is the better form.

(4) Eynsham is a continuation of the Isis.

I send you, Mr. Editor, my name and address; and if "Perch" thinks well to obtain it from you, and write me when he contemplates a visit, I shall be glad to give him all the assistance and information I am able.—I am, &c.,
Oxford, Oct. 29.
CHUB.

[Many thanks.—ED.]

FISHING AT RICHMOND.

SIR,—Would you kindly allow me a space in your valuable paper in respect to a capital week's fishing (not ever seeing my name in your Richmond correspondent's report), I wish to report myself, commencing October 26. Mr. Bausback and Mr. Howard, 15 lb. of roach. Thursday 27, with the same two gentlemen, 24 lb. of roach. Friday 28, with Mr. Barlow and friend, 39 lb. of roach. Saturday 29, with Mr. Green and friend, of Richmond, 16 lb. of roach. Sunday 30, with Mr. Aldridge, of Petersham, and friend, 20 lb. of roach. Monday 31, with Mr. Bausback, one rod, 24 lb. of roach. Tuesday, November 1, with Mr. Barlow and friend, 20 lb. of roach. Wednesday, November 2, with Mr. Lovelock, of Kentish Town, 12 lb. of roach, in all, I think, 143 lb.—I am, &c.,
E. BROWN.

3, Montpelier Place, Orleans Road, Twickenham.

P.S.—I owe a great deal of my take to Mr. Walters and the Teddington assistant who captured a net at Brentford. I am sorry to say, I hear from good authority, he has notice to quit; if this is the case, I hope someone will take in hand to know the reason why, as I know from facts he is as good a man as the society ever produced.

UNDERSIZED FISH, &c.

SIR,—I frequently see mentioned in sporting papers about the taking of small fish, unweighable fish, and fish not allowed to be taken, but which I see are taken, and take all they can take, especially about the place mentioned in Sunday's *Referee*, Tottenham, &c. On Sunday, the 9th instant, I took a stroll and saw about fifteen persons, from 14 to 40, on the towing path most assiduously catching the innocents, as they are called, three or four inches long, and putting them into large square-shaped biscuit tins with a piece of rope for a handle to the same. I could not say if they were Huntley and Palmer's, Peake and Frean's, or any other men's, as the labels were not on them. One gentleman about thirty years of age, who I thought might be better off than the rest,

judging from his rod and tackle, had a tin constructed for the purpose, a round one in shape like unto a ladies' muff box, with handle to fold down, nicely japanned and perforated, and which made for him an excellent seat, as he chewed his bread and transferred the tiny ones from the river to the interior of his seat. I then strolled up the towing-path as far as the Pike and Anchor, where I found two young men fishing with small red worms, one of whom had a perch of about 6 oz., in a piece of what looked like muslin, accompanied by another, a poor little mite about 3 inches long. I think one was undersized, and I told him so, but he made no reply.

Now, sir, I have told you something of what I have seen lately; let me tell you of what I have never seen but once, and that was at Waltham, during a period of angling excursions extending over 33 years—a visit from a bailiff. I am afraid they are like otters, often read and heard of, but seldom seen at river sides. I do not like to be unkind, perhaps I have been very unfortunate, and never went when they were there. I have been told since that if small fish are taken away alive no one can interfere with them, because they can say they are "for bait." I hope, if this is the case, it will not continue long, for I think such an evasion of the law ought not to exist. Catch all the little fish, and where shall the honest angler find big ones? Not at Tottenham.

I have known several instances where the catchers have sold them to put in glass globes and small aquariums, there to be frightened and starved to death, as I have found many ignorant persons think that all a fish require is water.—I am, &c.,
New Charlton. H. P.

PRUSSIAN CARP.

SIR,—Having read the recent letters on this subject in the FISHING GAZETTE, I venture to contribute my experience as to Prussian carp.

When a boy, I used to catch numbers of these fish in some ponds in Bucks, which were situate on Naphill Common, lying on the top of the hills about two miles from Hughenden, the seat of the late Lord Beaconsfield.

How these fish had originally got there no one knew, the nearest streams being fully three miles off, and no connection between any of the ponds and them, and I never heard of any of these fish being found in them.

One or two of these ponds lay right away from any roads, shut in among juniper bushes and large beech trees, but all contained Prussian carp and in large numbers.

In one instance (a very weedy pond), by dragging out a large mass of weed near the edge, you could always get some fish among it.

We used to fish for them with a small red-worm and light float and line, generally on the bottom. As a rule, they ran about 4 inches long, but I have taken some about 8 or 9 inches. A warm summer evening was the best time for them, and I have spent many a pleasant evening by these solitary ponds, surrounded by magnificent beeches and completely shut in by the juniper bushes.

A large part of the common has now been enclosed, but the prettiest and wooded portion, towards Bradenham still, I believe, remains; and those of your readers who chance to go into those parts will find a walk from Hughenden, across Naphill Common, to Bradenham, and thence by West Wycombe to High Wycombe, will amply repay the trouble.—I am, &c., G. M. M.
October 26.

THE BAIT USED IN THE "F. G." TOURNAMENT, &c.

SIR,—May I suggest that it would be interesting to your readers to know what was the weight of the trace and bait used in the casting competitions at the late tournament, both in those for Thames and Nottingham styles of throwing. May I also take this opportunity of addressing to your able correspondent, Mr. R. Balderston, the request (subject, of course, to your according the space) that he would give us the tabulated results obtained from various flies used by him, which, in one of his interesting communications, he spoke of having drawn up, with any remarks as to districts fished, &c., he may consider necessary? I am sure the above would be of great interest and value to those, like myself, who are tyros in the art of fly-fishing, and trust that he will consider that sufficient excuse for my taking the liberty of making the request.—I am, &c.,
W. T. S.

[The bait was an artificial dace weighing one ounce, and a lead weighing about half an ounce or less.—ED.]

GOOD PIKE FISHERY WANTED.

SIR,—Can you kindly inform me in your next issue of the GAZETTE where really good pike fishing is to be obtained either public or private, within easy reach of London.—I am, &c.,
H. ATHERTON ADAMS.

[Will some reader kindly answer this? We should say Elstree Reservoir is as good a place as any near London.—ED.]

MR. WALTER'S TAKE OF DACE IN SPAWN.

SIR,—In reply to Mr. Wo olfall, I can assure him he may rest quite easy, that nothing has been done in the matter of these dace not being returned to the water by Mr. Walters, who is one of our most successful dace fishermen, and a thorough sportsman. Mr. W. finding these dace to be in the condition named, considered it an excellent opportunity, in a scientific point of view, to be able to establish ocular demonstration of the fact that some dace do spawn in the autumn, and the number of fish he captured were not more than sufficient for the purposes of those gentlemen for whom they were intended. I may say that I have some of the fish now "preserved in spirits," as I see L. B. has remarked, "for the conversion of unbelievers." I am sure if Mr. Woolfall is anything of a naturalist he will be full satisfied with this explanation.—I am, &c.,
R. W. HOBDEN.

THE SEA AND THE NORFOLK RIVERS.

SIR,—I have every reason to believe that the remarks of your correspondent, "A One-year Jack," with respect to the above serious question, have some amount of truth in them, but at the same time I am proud to be able to inform him that such acts as the selling of eel nets do not apply to the River Yare. From the New Mills at Norwich to Hardley Cross, Reedham, such an object referred to by your correspondent cannot be found, nor has such a thing been allowed in the river for years.

The last time one was seen was three years, since when an old poacher was discovered putting it down between Cantley and Buckenham, but on being discovered by the water bailiff, took to flight and forfeited his net.

At the same time, he is perfectly correct about the great number used on the Bure, and I may tell him that his informant in no way exaggerated when he

put the quantity down at twelve, knowing, as I know, that there are at least twice that number. That these nets interfere with the escape of the fish up the Breads when pursued by their mortal enemy, "the salt tides," there is not the shadow of doubt, for whilst all the large fish were slaughtered in the Bure (where these nets abound) nothing but the very small fry succumbed in the River Yare.

This fact alone speaks volumes; hence the question must arise if this kind of thing is illegal on one river, why should it be winked at on another? Asking an old hand, if he thought that anything other than eels were taken in these nets, his reply was: "That the best fish in the rivers were caught in them." I think if the members of the Bure Preservation Society will refer to their bye laws, they will find that these nets to a certain extent are illegal, and the sooner done away with the better.

Thanking your correspondent for bringing the matter before the public.—I am, &c.,
ALFRED PALMER,
Norwich, October 31, 1881. Hon.-Sec., E.A.P.S.

THE STEAM-LAUNCH NUISANCE.

SIR,—Many thanks for the insertion of my letter a week or two ago on "Turn of the Tide." My acknowledgments are also due to Mr. Keene for kindly replying to my questions. I have anxiously waited to see if more of your readers would give me any information on the subject, but I find them very shy in stating their opinions on such a difficult matter.

Now, sir, I wish to put a very serious matter before you and your readers, and this is the gradual diminution of sport in the Thames. I think you will agree with me that my statement is correct, notwithstanding the noble efforts of the Thames Angling Preservation Society to prevent it. Fifteen years ago (I certainly can speak from experience) the takes of fish, both in size and quantity, were greatly superior to what they are now, more especially so in the upper waters. Surely one would expect that this ought not to be the case when we think how greatly the fence months and the prosecution of poachers induce to a larger supply. Well, sir, I think I can account for the falling off, and my object in writing to you, through the medium of your valuable and very interesting paper, is to bring the real grievance of my brother anglers before the public, in order that the enemy of the lovers of the gentle art may be brought to book.

What is the reason that anglers are not allowed to fish during the fence months? A silly question, you will doubtless say, but pray bear with me to the end of my letter and my meaning will be plain. The answer is that nearly every fish caught during that time is in spawn, and in taking one you are really destroying many.

Every true fisherman hails with enthusiasm the fenced months, but it is not against anglers alone that these months ought to be enforced. They ought to be enforced against those murderous steam-launches which on every journey wash away and thus destroy the spawning beds.

Many of your readers doubtless derive great pleasure from steam-launches, and in making my complaint, I hope I am not in any way hurting their feelings; at any rate it is far from my wish to do so. All I ask is that not only anglers but also steam-launches may come under the rules of the fence months, and I request this boon for the non-tidal waters of the Thames only, although I honestly confess I should like my hopes to hold good as low down as Kew Bridge, but I fear this to be impossible.

Hoping you, sir, and your readers will do your best to bring my growl before the proper authorities, I am, &c.,
"THE CONSTANT READER,"
London, Oct. 31.

LETTERS BY A THAMES FISHERMAN.

SIR,—Permit me to thank you for your kindness in respect to my last week's letter, and also for your kind invitation to write you again. I will accept that invitation, and send you a letter next Wednesday, and every second Wednesday during this winter, and possibly during the fence months. I hope your readers may not tire of me. I promise them and you, sir, that my heart and the truth shall be in what I write.—I am, &c.,
A THAMES FISHERMAN.

IMPORTANT TO ANGLERS.

RIVER LEA BOUNDARY (Navigable portion), and one mile above the Town Mill at Hertford to Limehouse, under the Fishery Bye Laws of the River Lea Conservancy Board.

From one mile above Hertford Town Mill to Ware Park Mill (free) from Ware Park Mill to Engine House (subscription)—Engine House to Gate above Black Pool (free)—from Black Pool to Fielde's Weir Lock, better known as Ratty's Lock (subscription), permission will be given on application to the Rye House—from Fielde's Weir Lock to Dobbs' Weir Lock (Smith's free)—from Dobbs' Weir Lock to Aqueduct Lock, the first lock below King's Weir (subscription)—from Aqueduct Lock to Horse Bridge, Swan and Pike below Enfield Lock (free)—from Swan and Pike to Horse Bridge at Pike and Anchor (subscription)—from Pike and Anchor to Limehouse (free).

N.B.—It is to be understood that the above refers to towing path only.

PRIVATE BACK WATERS.

BYE-LAWS OF THE LOWER THAMES.

THE following memorial has been presented to the Board of Thame Conservancy supplemented by a deputation, and a reply has been received, expressive of a desire of the Conservators to thoroughly revise the old Bye-Laws, and a Committee has been appointed for that purpose. We have great pleasure in giving it our hearty support.

GENTLEMEN,—The Committee of the Thames Angling Preservation Society are desirous of calling the attention of the Board of Thames Conservancy to the desirability of making some important and necessary alterations in the present Bye-Laws of the Lower Thames; and in making the following suggestions would assure the Conservators they have not only occupied the serious consideration of the Committee for some time, but have been unanimously and enthusiastically approved of by upwards of one hundred and thirty angling clubs of London and the suburbs.

First, in reference to the sizes of fish, mentioned in the submitted tabulated scale, several having been reduced in size, one or two increased, and fish introduced which are not now mentioned in the Bye-Laws, but are caught in large quantities in all portions of the waters below the City Stone at Staines.

	Proposed Size.	Present Standard.
Trout	14 inches	1 lb.
Jack	18 "	12 inches.
Barbel	13 "	12 "
Chub	10 "	9 "
Bream	9 "	"
Carp	8 "	"
Tench	8 "	"
Perch	7 "	8 "
Roach	7 "	8 "
Dace	6 "	6 "
Rudd	6 "	"
Gudgeon	4 "	5 "

It has been considered necessary to alter the mode of measurement to the extreme length of the fish, instead of from "the eye to the end of the tail" and in the alteration of sizes as above it will be found, where an increase is made, it is not so large—for instance, in the jack there is a space of about three inches from the nose to the eye, in reality making the increase only three inches instead of six, and then the general opinion is that that is too small a size for a jack to be taken.

Secondly, as regards the season for jack, it is highly desirable to extend the close period to the 31st of July, as the fish previous to that time are not fully recovered from spawning, but lean, and consequently unfit for food, and being hungry are caught in large numbers. This extension of the Close Season is considered of so much importance by the angling clubs of London that they have already adopted rules which exclude jack from being weighed-in before the 1st of August, and in some societies before the 1st of September.

Thirdly, in reference to the enlargement of the bait net. It has long been a matter of complaint amongst those following the trade or business of fishermen that the present size of 13 feet in circumference is much too small to enable them to get bait for their customers, and the Committee are of the same opinion; but in making the increase to 20 feet, it is important to limit its use to those fishermen only. And in making this concession to such fishermen, it is strongly recommended that the net which is sought to be increased from 13 feet to 20 feet in circumference should be given by a license, at a nominal sum, with power to the Conservators to revoke the same when any fishermen holding a license has been adjudged guilty of committing any wilful breach of the Bye-Laws. The Committee have enclosed a memorial from the fishermen on this question.

Fourthly, as regards the abolition of netting between Richmond Bridge and Kew Bridge. Owing to the increased purity of the water in the tidal portion of the river, the fish do not as formerly remain at the head of the tide, but are caught by the anglers much lower down; and it has become necessary in the interests of thousands of anglers to prevent the fish being netted between the two bridges of Richmond and Kew; and as the bulk of the fish have taken up a position much lower down the river, it is important to the anglers that the abolition of netting should be extended to Kew Bridge, and in doing this, it is not depriving the netsmen of any previous advantages, inasmuch as there is a much greater body of fish below Kew Bridge than formerly, and no necessity for to go higher up, unless it is the netsmen to wilfully take the fish away from the anglers. Only a short time since eight of the netsmen's boats came up between Richmond Bridge and Isleworth, and it is believed their visit was only made to annoy the anglers and not as a necessity to get fish. As a further proof of the better condition of the water, anglers are now to be found in considerable numbers at Mortlake, Putney, Wandsworth, and even lower down; and in additional evidence of this fact the netsmen are compelled to work much below Wandsworth to catch flounders and other fish. There appears, therefore, every reason that the Conservators should abolish the netting between Richmond Bridge and Kew Bridge.

Fifthly, the great check that would be given to poaching if the magistrates had the power to imprison, without the option of a fine, as the payment of any amount of fines is no punishment.

Sixthly, to correct the recent Bye-Laws as regards the trout season for the Lower Thames: as in making the alteration, a Bye-Law of the Upper Thames was repealed instead of one of the Lower portion.

The Committee feel they cannot too strongly impress upon the Conservators the necessity of carrying out these suggestions, and they

would be glad if the Board would fix upon a day to receive a deputation from the Society to enable them to give any further information.

THOMAS SPRECKLEY, Chairman.
W. H. BROUGHAM, Secretary.

7, Ironmonger Lane, London.

THAMES BYE-LAWS.

THE following memorial has been forwarded to the Thames Conservators from the Reading Preservation Society. We hope the other associations on the Upper Thames will follow the lead:—

TO THE BOARD OF THAMES CONSERVANCY.

GENTLEMEN,—I am instructed by the committee of the Reading and District Angling Association respectfully to request your honourable Board to consider, and, if you think it well, to carry out the following suggested amendments in the Upper Thames (Fishery) Bye-laws. The matter has engaged our attention for some time, and we feel that the present is a fitting opportunity for bringing it under your notice, as we understand you are now considering the desirability of altering the bye-laws affecting the lower river. We would like to see the following alterations made in the bye-laws of the Upper Thames:

(1) SIZE OF FISH—

	Proposed standard. (Extreme length).	Present standard. (Eye to end of tail).
Trout	16 in.	1 lb.
Pike	18 in.	12 in.
Tench	12 in.	8 in.
Barbel	13 in.	12 in.
Perch	9 in.	6 in.

(2) FENCE SEASONS.—The close season for trout to be extended to the 30th April, and for pike to the 31st July.

(3) BAIT NET.—That a 20-feet cast-net be allowed to fishermen for taking bait only, by licence (as recommended by the Thames Angling Preservation Society).

(4) NIGHT LINES.—The total prohibition of night lines and "bank runners" on the Upper Thames.

(5) PENALTIES.—The power to magistrates to imprison offenders without the option of a fine.

It will be seen by your honourable Board that in many points we ask for the same alterations to be made in the Upper Thames bye-laws as you have been memorialised by the Thames Angling Preservation Society to make in those of the lower river. We earnestly hope that in re-adjusting the sizes of fish, you will take into consideration the importance of a high standard for trout, tench and perch. We also think it of the greatest moment that the close season for trout should be extended as suggested, as during April Thames trout are really kelts—unfit for food, incapable of giving good sport, and, being ravenous, they fall an easy prey. This alteration, if passed into law, will powerfully aid the efforts being made to increase the stock of trout in the river.

By this post I send a copy of the above suggestions to the committees of the Marlow, Maidenhead and Windsor Preservation Societies.

I have the honour to be, gentlemen,

Your obedient servant,

ARTHUR C. BUTLER,

Hon. Sec. Reading Angling Association.

Great Western Hotel, Reading,

Oct. 22, 1881.

"What do you think of Nubian Ink?" "I have heard of Nubian blacking, but Nubian Ink, no, never heard of it." Just so, it is a new thing, and you are not likely to have heard of it. You never do hear anything until it is as old as the story of Queen Anne. Well, I'll just tell you what it is. It is the best combined writing and copying ink in the world. Black, non-corrosive, permanent, gives distinct copies at any time, and is made in soluble pellets, which can be immediately dissolved as required, and thus transformed into this beautiful liquid ink. You can carry it about in your pocket in its solid state, pack it up in your best dress shirt, or sleep with it under your pillow, it won't soil anything till the water is applied. Try it, my friend, and you will never use any other.

The Alhambra Theatre, it is announced, will shortly close, to make some extensive alterations to the stage, required by the Lord Chamberlain, and also to redecorate and refurnish the theatre. The "Bronze Horse," which has been played over one hundred nights, will then have to be withdrawn, and on the re-opening will be produced a new version of the "Black Crook," founded on "La Biche au Bois," a grand spectacular fairy opera, now creating a great sensation at the Porte St. Martin, in Paris. The "Black Crook" is to be mounted on a scale of great splendour, and one of its most interesting features will be the introduction of no less than three new grand ballets, in which Mdlles. Pertoldi, De Gillert, and Palladino will appear. Amongst the artistes engaged for this new opera (the music of which is by Mr. Frederick Clay and Mons. G. Jacobi, and the libretto by Mr. H. Paulton) are Misses Constance Loseby, Lizzie Coote, Emelie Petrelli, Rose Berend, Julia Seaman, and Messrs. Harry Paulton, Henry Walsham, René Longrois, Louis Kelleher, J. H. Jarvis, and W. Hargreaves. We understand that the Alhambra is to be redecorated in the most recherche style of art, and playgoers will doubtless look forward to the re-opening with considerable interest. It is rumoured that during the alterations the "Bronze Horse" and grand Ballet will be transported to Her Majesty's Theatre.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

CLUB REPORTS.

ACTON AND EALING ANGLING SOCIETY.

Since I last wrote more members have joined. The following gentlemen have taken roach:—Messrs. F. Cooper, 5 lb. 7 oz.; W. Howell, 5 lb. 11½ oz.; W. Howell, 4 lb. 14 oz.; W. Head, 6 lb. 11 oz. Roach and dace—Messrs. W. Slatter, 3 lb. 1 oz.; W. Dudley, 2 lb. 1½ oz.; W. Slatter, 5 lb. 12 oz.; A. Eydman, 4 lb. 5 oz.; F. Adams, 3 lb. 9½ oz. All these fish were taken from the Thames with Jack Spong, one of the best professional fishermen I know of, from the Queen's Head, Twickenham. To-day (Thursday) I have no doubt he will pilot some of our members to a good swim. Mr. Brooks, host and treasurer, has bought a piano, which will be performed on soon.—C. J. DEAN, sec.

Oct. 27.

ALEXANDRA SOCIETY OF ANGLERS.

Several members out on Sunday, but the shows were small. Mr. Wills being the only member to weigh. The next district visit of the Eastern will take place at the Crown and Anchor, Cheshire Street, corner of Mape Street, Bethnal Green, on Tuesday, November 8th, when we shall be happy to meet any anglers that will favour us with their company.—C. MAITLAND, sec.

ANCHOR AND HOPE ANGLING SOCIETY.

On Sunday, November 6th, a peg-down match will take place at Kingston.—A. SHAKEL, sec.

Nov. 1.

ANGLERS' BENEVOLENT SOCIETY.

Since the last report I beg to acknowledge the receipt of the following subscriptions, with thanks:—J. H. Edwards (United Essex Angling Society), £1 1s.; J. P. Wheeldon (*Bell's Life*), 10s. 6d.; J. Cooper, (naturalist, Radnor Street, St. Luke's), 10s. 6d.; Mr. Elves (Burdett), 10s. 6d.; Mr. E. Smily (United Essex), 2s. 6d. Secretaries of societies will greatly oblige by returning the unsold tickets for the bait casting tournament at the Welch Harp.—R. GHURNEY, sec.

Nov. 2nd.

ANGLERS' PRIDE ANGLING SOCIETY.

The members of this club went out on Sunday last. The "takes" were very small indeed, in fact the worst day's sport the members have experienced this season. H. Haines, J. Deeley, jun., T. Fiddes and H. Scutt weighed-in roach. The members fish for a series of prizes on Sunday, November 6th.—T. MARSHALL, sec.

Oct. 31.

A NEW ANGLING SOCIETY.

Last week I visited the Jovial Anglers' Society, held at the Jolly Anglers, White Cross Row, Richmond, Surrey. I am pleased to say I found a good muster for a young club, and amongst them some of the oldest Thames anglers. It is strictly a working man's club, and their rules are made to suit the members' pockets, both as regards matches and subscriptions. The secretary, Mr. H. W. Platt, appears to be a most genial fellow, and just suited to the post. The landlord also takes great interest in the object of the club, which is to get every angler and professional fisherman to become members, for, as it was very wisely pointed out to the meeting, if the professionals are members they will take care that all the fish they catch will be weighed-in for the prizes offered, and for their own credit, instead of, as is sometimes the case, letting their customers have the whole lot. By giving the many anglers of Richmond a chance of becoming members they are doing good work for the river, because there will be no inducement to retain small fry. Any member bringing into the club-room a fish under the T.A.P.S. size will be fined. They will also be induced to give information of any illegal practices that may come under their notice. This is just the sort of club that we want, and I trust there will be a lot more spring up. These men, who live so close, have many opportunities of learning what is going on, and their belonging to angling clubs brings them in direct communication with the proper authorities from whom they can obtain rewards for information given. Already they have eighteen members, three of whom are professionals. The society will enrol upon the West Central Association of London and Provincial Anglers' Association on Friday, the 4th inst. The meeting house is close to the riverside. Anglers visiting Richmond will always receive a welcome from the worthy host, who will supply them with refreshments at most moderate prices, and give them any further information in respect to the Jovials. I think the chairman, Mr. Green, must have named the society, he is such a jovial fellow.—H.

BOSTONIAN ANGLING SOCIETY.

On Sunday last our members managed to secure a few fish, the following being weighed-in:—Mr. Bell, 5½ lb. roach and dace, from the tidal waters; Mr. Goodge, roach; and Mr. Jennings, chub, from Cookham. On the 31st ult., Mr. Taylor, 6½ lb. dace, from the Thames.—H. TAYLOR.

Nov. 2.

BRIGHTON ANGLERS' ASSOCIATION.

At the ordinary weekly meeting, on Monday, the minutes of the last meeting having been confirmed, the chairman, Mr. Gambling, took the opportunity of informing the members that a gentleman had lately been initiated into the association, who, no doubt, would prove a very useful member, viz., A. Lawler, Esq., curator to the Brighton Aquarium, and he felt proud as chairman to find such names as the above on the roll. Mr. Lawler briefly replied, and spoke in high terms of the association, and informed the members present that he would do everything in his power to further the interest of the society. He thanked them for the carp lately presented, and was happy to say the fish was doing well. He also said he would cause a tank in the Aquarium to be wholly and solely kept for the use of the Brighton Anglers' Association. Mr. John Tree, with his usual good nature, offered his large tank at the rear of his shop, Queen's Road, and close to headquarters, that the members, bringing live fish from the various districts, can at once place them in till Mr. Lawler can conveniently send one of his assistants to take them direct under the care of the last-named gentleman. A vote of thanks was then passed. Several members went out on Sunday, but the takes were very small.—GROUND BAIT.

BRISTOL GOLDEN CARP ANGLING SOCIETY.

The annual dinner of the above association took place at the White Hart Hotel, on Friday last, when about forty members sat down to a splendid repast, served up by our worthy host, Mr. W. G. Leigh. Mr. F. C. Morris occupied the chair, and Mr. J. Hadden the vice-chain. Mr. F. Marsh presiding at the piano. The usual loyal toasts were given also some capital songs by Messrs.

Warr, Cornish, Wheeler, Inch, Parsons and others. The health of the chairman, vice-chairman, and secretary were drunk with musical honours, and were very ably responded to by Mr. F. C. Morris, Mr. J. Hadden, and Mr. S. Wride, secretary, who informed the meeting that at the present time the B.G.C.A.A. stood in Bristol second to none, both in finance and numbers. He was also pleased to say that they had a very hard-working committee—a committee who studied the interests of the association, and who always felt it a great pleasure in getting prizes to be fished for. Amongst the visitors were—Mr. Hunter, Mr. T. Thatcher, Mr. W. H. Stephens, and Mr. Skeates. The health of Mr. Leigh, Mrs. Leigh, and all the little Leighs having been drunk, the members sang the National Anthem, and dispersed at a reasonable hour, after spending a most enjoyable evening.—LEWIS WRIDE, sec.

BURDETT ANGLERS SOCIETY.

We had a very fair show of fish at this club on Sunday last, Mr. Hopkins showing roach, Mr. B. Smith chub and dace, while Mr. J. Hadkiss caused much surprise by again taking a prize for the heaviest weight, by forwarding to the club a splendid tray of rudd.—T. G. WALKER.

Nov. 3.

CITY OF LONDON ANGLING SOCIETY.

We had a very poor show of fish on the 30th, Mr. Mortimer weighing-in 2 lb. of roach from the Rye House, which was the best take; Mr. Castell next, with chub, roach, and dace, from the Stort; Messrs. Mark and J. Chambers, roach and gudgeon, from the Thames.—CAS.

CLAPHAM JUNCTION ANGLING SOCIETY.

The members of the above society fished at Weybridge on Sunday last, but being such a miserable day, very little fish was weighed-in. Mr. Brewer first, with the small amount of 9 oz.; Mr. Willman second, T. Smith third. The next set of three prizes for the last Sunday in this month, presented by Mr. E. Withers and Mr. E. Wilson, is for perch, when it is hoped members will show up in good force.—E. WILSON.

GRESHAM ANGLING SOCIETY.

The usual weekly meeting of this society took place on Thursday evening, at 11, Bishopsgate Street Within, and their large room was crowded—over one hundred members being present, Dr. Brunton presiding. The meeting had much interest from the fact that Mr. Bentley's paper on "Feeling in Fishes," was to be read, and also on account of the pike competition which took place on Tuesday last. The wind and weather on that day were so adverse that hardly any members had sport, although many were out, and doing their best to secure good fish. Dr. Tucker and Mr. Crumplen (hon. sec.) intended fishing with Bartholomew at Goring, but, unfortunately, missed their train, and repaired to Henley; but their ill luck still followed them, and no sizeable fish was landed—a result, as it appears, common to many others on the same occasion. The society's trays were, however, well filled, Mr. Hunt sending up from the Waveney, a superb collection of jack, weighing from 3½ lb. to 8½ lb. each, besides a number of perch, from ¾ lb. to 1½ lb. each. Mr. Barrett weighed-in one jack, 3 lb. 12 oz., and Mr. White, one dace, 1 lb. 1 oz.—as fine a specimen as could well be seen. Mr. Bentley's paper was of a highly scientific character, and abundantly illustrated by a large array of diagrams and microscopic objects, supplied by Mr. Steward, of Corahill. Mr. Bentley commenced by referring to the sense of pain in the human being, and from thence (after showing the difference between the nervous system of man, compared with the reptilia and fishes), demonstrated in a manner that seemed to meet with the general approval of the society, that fishes having cold blood, small brains, and a peculiar nervous system, did not feel pain to any appreciable extent, and in this view he was supported by remarks from Mr. Crumplen and others. Mr. Jardine and Dr. Lloyd also spoke, and Dr. Brunton delivered a very able address, endorsing to a great extent Mr. Bentley's paper, of which he spoke in terms of high commendation. A very hearty vote of thanks to Mr. Bentley and Dr. Brunton brought this very successful meeting to a close. Mr. Crumplen announcing that papers were in hand by Captain Alfred, Mr. Wheeldon, Mr. Jardine, Mr. Austin, and others; expressing at the same time the hope, which was enthusiastically ratified, that the society, eschewing cards and other similar pastimes, would continue in the path marked out for it as the leading angling society of London, whose sole object would be the advancement of piscatorial art, extending at the same time a friendly welcome to all societies having the same object in view. The meeting closed with "Auld Lang Syne" and the national anthem; some good singing having been given by the members after the formal business was disposed of. Several new members were elected and others proposed.

HUGH MYDDLETON ANGLING SOCIETY.

The trays of the society were well filled on Sunday night with fish, but not of the right sort. Roach were the particular fish required; they were dead off feed and no wonder, a sharp white frost over-night and a strong north-easter blowing all day on Sunday. Your humble servant sat down with the idea of taking a few roach, using single hair-line gentles for bait. I am pleased to say I had not long to wait before I had a knock and struck. I said to myself, if this is a roach he's a beauty. After playing him about three minutes, I got him to the top of the water, and saw he was a chub of 2½ lb. I started again, and soon had another, a fac-simile of the first; they kept on feeding till I had 10 chub, weighing 16 lb. 12 oz.; 3 roach and 1 dace, weighing 1 lb. 6½ oz. Well done, old man, not bad considering the weather. Mr. Jas. Billings came next with a handsome tray of chub, weighing 13 lb.; E. Smith, chub, 4, 3½ lb.; G. Rogers, roach, 1, 7½ oz.; W. Dunblains had roach. All from Thames and Wey.

Will some kind angler answer the undermentioned what is the name of the river that runs by Harpenden, Heits?—G. CABORN, sec.

Oct 31.

IZAAK WALTON ANGLING SOCIETY.

The two special prizes given for the first and second heaviest weights taken on the last two Sundays in October were won by Mr. E. W. Turner, 1st; Mr. B. Crook, 2nd. There are two special prizes for the first two Sundays in November, one for the heaviest weight of chub, and one for the heaviest weight of any kind, bar chub. Mr. G. P. Rolt will give a box of cigars to be fished for on Wednesday, Nov. 16, 1881, and Mr. W. H. Mechem will give a prize, value 10s. 6d., to be fished for on the same day, members to choose their own fishing water. All fish weigh. No competitor to leave London before the morning of the competition. A member of the above society (Mr. G. Manning) on alighting at Euston Station from the Watford train on Sunday evening last, took a gentleman's rods in mistake for his own. The owner can have them exchanged for his own by applying to the secretary of the above society, the Old King John's Head, Mansfield Street, Kingsland Road, E.

JUNIOR PISCATORIAL SOCIETY.

Since my last report, the weighing-in has been :—Mr. Henry Hewitt, fishing at Hampton, 4 barbel, 7 lb. 2 oz.; roach, 1 lb. 15 oz.; dace, 1 lb. 13 oz. Mr. Woodman, at Newbury, 1 jack, 6 lb. 4 oz.; roach, 5 lb. 12 oz. Mr. Fred Palmer, at Newbury, 14 roach weighing 11 lb. 8 oz.—ALFRED H. BISLEY, hon. sec.

NORFOLK ANGLING SOCIETY.

The members of the above society went out last Sunday, October 30, to fish a sweepstake at Shiplake. The weather being fine they had a glorious day, and, considering the average takes lately, had a very excellent show—Mr. Pitchey coming to the front with a handsome show of roach; Mr. Pauncefort being close on his heels with a very pretty show; Mr. Galloway showing a very handsome perch, of which he seemed justly proud—and well he deserved it; Mr. J. Bendall showing a very fine dace. All the other members had average takes, with which they seemed well satisfied. The supper in connection with the outing will take place on Thursday, Nov. 10, on which occasion, no doubt, there will be a good stock of groundbait laid in from the sumptuous larder of the worthy host, which, on these occasions, opens its doors very temptingly and plentifully. The next return visit will take place at the above house on Wednesday, Nov. 9, when the presence of as many friends as can make it convenient to attend will be esteemed a favour.—THOS. BUCKINGHAM, sec.

Nov. 2.

NORTH-WESTERN ANGLING CLUB.

A few members of the North-Western Angling Club have at last had a take worth reporting. On Sunday last Messrs. Stead, Bonvoisin, and Isaac had roach and dace from the Thames. Mr. Harris, a new member only made on Thursday last, had a nice show of dace (7 lb.) from Twickenham; may he have many more. Messrs. Hillier and Hill, fishing a private water on Tuesday had a nice brace of jack weighing 13 lb. and 10 lb. respectively, one falling to each rod, both being now in the hands of Mr. J. Lancaster, 2, Jeffrey Place, Kentish Town, to put up in his usual good form.—F. HILL, sec.

103, Kentish Town Road, October 3.

ORIGINAL ALEXANDRA SOCIETY.

We had very near the whole of our members out on Sunday. Fish were shown from the Lea, Stort, Colne, Thames, &c. I will give you the most successful of the lot. Mr. Newton came up smiling with a nice jack; Mr. W. Hight, roach; Mr. Brockett, roach; Mr. C. Hewett, roach, chub, and dace; Mr. Ackinson, roach; Mr. Morton, jack; Mr. Stanton, roach; Mr. Dymond, roach and chub; Mr. Tylor, roach and jack on Wednesday.—E. DYMOND, sec. pro tem.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

The above society was saved from a blank on Sunday last by Mr. Neagus weighing-in roach from the Stort. On Sunday next the members fish for a series of prizes from the Jolly Bargemen, Waltham, to Enfield Lock or *vice versa*. Tow-path only.—THOS. WM. LUCY, sec.

Nov. 3.

PECKHAM BROTHERS ANGLING SOCIETY.

The match fished for on the 30th October, for a prize given by Mr. Reed, jun., was won by Mr. W. Matthews, with roach from the river Lea. The second club match, for three prizes, will take place on the 13th November, between the Rye House and St. Margarets. The celebration of the second anniversary of the opening of this club will take place at the Club Room, Prince Albert, Rosemary Road, Peckham, on Tuesday evening next, the 9th inst., at 8.30 p.m., when brethren of all societies are cordially invited, and every measure will be taken to ensure an enjoyable evening.—W. R. M., sec.

Nov. 3.

PECKHAM PERSEVERANCE BROTHERS.

The members of the above club will have their next peg-down match on Sunday, November 6, at Kingston.—J. WINSLADE, sec.

Oct. 31.

PHENIX ANGLING SOCIETY.

The members of the above society had a very fair show of fish on Sunday, 40 lb. of jack, roach, perch and chub, and one bream, 4 lb. 3 oz., being weighed-in for the different prizes, by Messrs. Bentley, Maynard, Crisp, Packer, Milton and Elbourn. Four prizes will be angled for next Sunday at St. Margarets'.—W. ELBOURN, sec.

P.S.—I am sorry to say that one of our members, Mr. Edward Cragg, passed away on Sunday last after a few days' illness, and he will be buried on Friday next at Finchley; and as he was very much respected, I have no doubt there will be a good many follow him to the grave.—W. E.

Nov. 1.

PISCATORIAL SOCIETY.

The annual club competition took place on Monday last, and there was a large attendance of members in the evening to witness the return of the competitors. Mr. Hazeland took the chair. During the evening, and whilst those present were waiting for the competitors, M. W. B. Adlington revived the old custom, formerly carried out some years ago in this society, by reading a very interesting paper on chub fishing in the Thames, which was thoroughly appreciated, and a hearty vote of thanks was accorded to him. This spontaneous act of Mr. Adlington has aroused the old spirit and energy of the club of having occasional papers on different subjects, and already both Mr. T. R. Sachs and Dr. Brunton have promised to read papers, the former in about three weeks. The result of the competition was as follows:—Mr. Robert Barker, took the first prize of three guineas with 13 lb. 10 oz. of chub from Sonning; Mr. Thomas Huggett the second prize of two guineas with 9 lb. 15 oz. from Sonning; and Mr. H. B. Brown the supplemental prize of one guinea for the largest fish, a chub of 4 lb. 1 oz. from Abingdon. There were also weighed-in—Mr. Lemann, 4 lb. 11 oz. from Maidenhead; Mr. Foreman, 4 lb. 6 oz. from Bray; Mr. C. P. Wheatstone, 2 lb. 6 oz., from Mapledurham; Mr. Simpson, 4 lb. 14 oz., and Mr. Fenning, 7 lb. 6 oz. from Culham; and Mr. Andrews, 1 lb. 1 oz. from Pangbourne. Dr. Brunton weighed-in nine brace of grayling from the Itchen, taken with the fly, the largest fish, 1 lb. 8 oz. Votes of thanks to the successful anglers and the chairman terminated a very pleasant evening. On Monday next is the extra roach competition, the first prize being four guineas, the second two guineas, and the third one guinea, for fish taken out of any public water, but no fish to be weighed-in under 6 oz. The last competition for roach was limited to the Thames—this one being open will doubtless result in a grand show of fish.—B.

UNITED BROTHERS.

The competition that I gave notice of last week, came off at West Drayton on Sunday, but through some cause or other not one fish was taken. All the members that were entitled to compete did not go. Other members went to the Thames, but only one managed to come up in time to weigh—J. Payne, with some nice roach.—WILLIAM BELTON.

Nov. 2.

UNITED LONDON ANGLERS.

On Monday next, November 7th, a special general meeting will be held, as business of great importance will be laid before the meeting, including the report of the deputation to the Great Eastern Railway, a memorial to the Thames Conservancy for signature, and other important matters. Chair to be taken at nine o'clock, by Mr. S. Morgan.

WALTONIANS.

But little to report this last fortnight. Oct. 23, Mr. T. Watkins had about 10 lb. of roach and dace. Oct. 30, Mr. Brady had dace, 3 lb. 1 oz.; roach, 12 oz. Nothing else worthy of mention.—A. J. MARRIOTT.

Oct. 31.

WALWORTH WALTONIANS.

The evening of the 31st brought to a close a competition which has caused more excitement and more funny inhabitants of Father Thames, between Shepperton and Richmond, to leave their native water for the sweet village of Walworth than any other competition that has taken place in this society for some years. On this evening the following members weighed-in the following weights of fish from Richmond. Mr. Bansback, 25 lb. 7 oz., which made his gross weight from Richmond for four days, with E. Brown, 51 lb. 14 oz. of roach and dace. Next came Mr. Boalch, the energetic secretary of this society, with 11 lb. 5 oz., which brought his gross weight up to 46 lb. 6½ oz. of roach and dace; then followed Mr. F. Grigg, who courted Shepperton for three days, and got 29 lb. of chub; all very nice fish, but on this day he took on to Mr. Bushnell at Richmond, and managed to get 8 lb. 8 oz. of nice roach, the largest going over 1 lb. 4 oz., which brought his gross weight to 37 lb. 4½ oz. Mr. Weatherhead followed with over 8 lb., bringing his weight to 34 lb. 5½ oz. Messrs. Howard, Russell and Collins contributed to the competition, 39 lb. 8½ oz., which made the gross weight for the fourth weekday show competition during October over 207 lb. by these members only. In addition to those prizes mentioned in my last for the competition that is to take place on the 13th. Mr. Feuillade will give a silver watch for honorary members to compete for. P.S.—I have omitted to mention that Mr. Boalch fished with C. Brown at Richmond on this occasion.—PIXIE.

Nov. 3, 1881.

SPRING ON THE RIVER—A FRAGMENT.

'Tis April on the river! What a scene
Of varied beauty dreamily serene.
A many-jewelled landscape calmly lies
Beneath the slumbrous and blue-bosomed skies!
On either side wide meadows starred with flowers
Surround the budding groves within whose bowers
The woodlark and the nightingale repose
Secure from earthly fret and wanton foes.
The birches gleam all silvern through a spray
Of faint green leaflets bursting to the day;
Afar the tall firs rear their sable brows,
The myrtle on the air its fragrance throws,
The waterside is fringed with waving rush,
The thrush is calling from the hawthorn bush,
The lucid stream flows on with murm'rous sound
And softly blends its voice with all around,
In a deep harmony that wakes the soul
To aspirations far beyond control—
That bring a gracious freshening to brains
And hearts all fevered with the weary pains
Of care and toil. For here in sweet content
All earthly cark with Nature's self is blent.
Like to a flash of brightest azure light
Behold the swift and strong kingfisher's flight;
Like to a dream of heavenly beams behold
The water laughing back the rays of gold
—All this the fisher feels, and loves away
To speed his craft upon an April day.

Deep in yon dark recess where the huge bole
Of some large willow hides the shady hole
The Thames trout hidden from all prying eyes,
Poised, watchful and majestically lies.
The fall of fly, or bleak's quick argent gleam,
He notes afar in the down passing stream.
His dark form like a bar of mottled shade
Scarce parts the growths that form his covert's glade
His gills expanding and contracting slow
The rich deep carmine of their fronds do show.
Each fin is moveless, and in calm repose
He takes his rest, unheeding friends or foes.

He doth not sleep, but what his dreams may be
—His day dreams—none can say. Alert is he.
If wandering tread above his lair resound,
Forthwith he speedeth with a panther-bound
—Out in the stream he roams, nor doth return
Till the incipient fear is past and gone.
Cautious and subtle, never unawares,
He scorns the clumsy fisher's utmost snares.
With mighty strength and crafty wile possess'd,
His sleep is as the fox, the tiger's is his rest,

CREON.

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 137, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Cumberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 183, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 21, Lombard-market, Battersea, S.W.

SATURDAY, NOVEMBER 12, 1881.

RAMBLES WITH THE FLY-ROD ON THE TWEED AND OTHER STREAMS.

I.

A FEW years ago, fate and good fortune located me for a short time on the banks of the Tweed. With such a pretty little town as Peebles for headquarters, and such rivers as the foregoing and its tributaries close at hand, it at once became evident that

the rod could not long be a useless ornament for the shelf. Autumn was well advanced, and the season swiftly waning, but as, in the years that were gone, the streams of England and of Wales had yielded no mean tribute to the mandate of the wand I had so incessantly waved above their waters, I was loth, even at an unpropitious period, to leave untested the world-wide fame of the rivers of the north. Three weeks of fishing ultimately terminated by rough and wintry weather,

"Awa frae the labour and pother,
That had fettered one's freedom sae lang."

no doubt imparted freshness and vigour to one's frame for a time; but above this, left deep memories that last for a life.

On trying the waters of the Tweed close to the town on the third day of piscatory enterprise, I found, after fishing "the Auld" and the streams below, my reel had only become richer than at the outset by nine fish. This condition of affairs being hardly tolerable in such waters, I resolved to transfer my efforts to another arena of operations two miles further up stream to the Manor, close to its confluence with the Tweed. This course I adopted, more especially as I had not as yet had any communications with the fish of the former, and a nice freshet was coming down. Just before reaching the Manor the road descends very suddenly from a fir-clad ridge, or spur, of the hills, that is thus cut short by the Tweed itself. The road after this descent crosses the Manor, and then turns off and keeps to the valley of the tributary river. Just above the bridge is a small deep pool, to which a vast number of fish resort. The place, however, requires a peculiar mode of fishing in order to test its merits fully. At my first trial it yielded me fifteen. Satisfied for the time being, I returned home, having 24 fish in all, including those caught in the Tweed. I employed two casts; one took 19 fish, as follows, of which one dropped off before the fly was ascertained: Marlow buzz, 2; March brown, 2; black palmer (tail fly), 14; off, 1.

Two days after this I tried the same place again and the streams of the Tweed just below the point of confluence. The water had run down palpably—I however obtained 26 trout, employing three different casts of flies, the second of which was fatal to 22 of the captives: Marlow buzz, 2; orange fly, 1; hawthorn fly, 1; black palmer, 11; blue dun, 7.

On these occasions I did not fish very long, but on the following day I extended my efforts to a point about two miles up the manor. One cast only was employed, with which I brought to shore 79 fish, 64 retained were trout, the rest were returned. A dozen were caught in Tweed below, the remainder in Manor. On one occasion two nice fish came to land at once; on another, three small individuals. The record of flies is appended as follows:—Marlow buzz, 9; orange fly, 11; hawthorn fly, 8; black palmer, 20; blue dun, 23; fell off, 8.

A good many fish fell off the hook at once, on being transferred to earth, as the process of landing in the case of small fish, was summary and rapid; a sudden click for the stroke, and a gradually quickening twitch, a substitute for the actions of playing and landing. Whilst walking along I came across a fine bull trout that some depredating otter had left, after having extracted the tit-bits from the hump of its shoulders.

A week later, so late as the 10th of November, I again found myself on the banks of the Manor. The lower sections I passed over rapidly, beguiling a trout close to the bridge. On reaching the sections of the river beyond those which I had previously fished, I discovered the stream frequently consisted of long shallow streamy reaches with few pools and hardly any good lodgment for fish. I therefore walked quickly along, casting in here and there in any holds that seemed likely to contain fish; the river, however, was high, and much too full for any great feats with the fly, whilst the weather was extremely cold and windy. I went some miles without a fish, but on getting somewhere near Macbeth's Tower, suddenly got hold of two fish, both of which came to shore. At this time a gentleman and his keeper, who were shooting, passed me, but the operations of these individuals seemed no more propitious than my own. Before reaching the junction of the Glenrath Burn I had one more fish; so far eleven in all. By this time, however, the rain was descending in torrents and I was miles from home. The region, I could tell at a glance, was better than heretofore, but all other conditions were infinitely worse. Eleven fish and a drenching, for such a distance, was more than I could stand; so, despite the freezing rain and cutting blast, I determined to take home, at least, a passable dish of fish; and now diverging from Manor, I essayed to deal with the sublime Glenrath. Here is a lovely burn brawling and gliding through a lonely valley; rugged mountains rise sheer and straight, with beetling brows on either hand and in front, whilst the tortuous stream winds in zigzag course under banks of turf, or now and again breaks over a bed of pebbles from dubs that are full of fish. What could the fly-fisher wish for more! A rapid, winding,

mountain stream is above all others the home of trout; not such as we find in the middle of the Manor below, straight as the flight of an arrow, guiltless of pools or holds of fish or banked in with straight dykes thrown up by native farmers. Ahint to the wandering fly-fisher may here be not untimely. Fishing as I have for many years in mountainous countries, with no other guide than an Ordnance map, I have found it a good general rule to avoid those streams that are represented on the map as having an unwinding course, for such streams are usually devoid of pools, are banked and cut to shape or covered in by underwood. Returning to Glenrath, the fly-catcher finds the scenery alone sufficient recompense for much after-weariness, whilst any fish encreased are a reward beyond the exigencies of the case. In my case I continued fishing with rod and hands streaming with rain, the latter numbed with cold. However, I added 23 trout to the basket in the lower part of this beautiful water, which was bank-full, in many places overflowing. I then returned as rapidly as I had ascended the stream, dipping my flies in here and there, catching two more fish at a ford far down the valley, when suddenly operations were cut short by the junction of a brook with the main stream white with road washings.

The river had for some time been rising, and now became a swollen flood. As bad luck would have it, when fly-fishing was precluded, the weather cleared up, the clouds were lifted from the huge back of Bollar Law, beyond the head of the valley, whose summit the sun revealed clothed with a bright cloak of snow. I had taken by this time, 4 p.m., 36 fish, 35 of which were trout, and had been deluded by the lure in the following manner:—Orange fly, 6; hawthorn fly, 5; black palmer, 12; blue dun, 9; fell off, 4.

Seventeen miles walk at this time of the year and in such weather, for fish—which, however, were certainly in capital condition—was sufficient to render a rest for a period needful even to

THE RAVEN.

PERCH AND PERCH-FISHING.

BY J. HARRINGTON KEENE.

PART I.—THE PERCH'S PERSONAL HISTORY.

THE perch at this season of the year demands, and deservedly receives, considerable attention.

Together with the pike and a few coarse fish, and an occasional grayling, it forms the chief source of sport during the winter months. Indeed, it is a debatable question whether perch-fishing is not entirely superior from all points of view.

The common trout is pre-eminently a summer fish, so also is the Thames trout, or, as it would be termed in France, "un poisson d'Avril." Roach, dace, barbel, etc., are likewise pursued with greatest pleasure when the summer sun glints the water, and the soft breezes fan the cheek of the expectant fisherman. Perch, on the contrary, are in best condition, and, on account of their shoaling, more easily found, when the icy finger of winter has been placed on lake and stream.

In the waters of England but one species of perch is known, namely, *Perca fluviatilis*. It would seem desirable to introduce the pike-perch, or *Lucioperca*, as, according to those who have taken it, its nature is specially fitted for some of our deeper rivers and lakes. Indeed, Mr. Francis Francis has particularly recommended it in his "Fish Culture" for acclimatisation. However, this is not as yet *au fait accompli*. Though, when the late suggestions of Mr. Marston bear fruition, it is to be hoped this fish will meet with due notice at the hands of coarse fish culturists.

The size to which perch attain in our waters is a point involved in obscurity. In the face of the statements made by credited writers as to the size occasionally attained by this fish, and the positively attested assertion lately uttered in these columns of the existence of a 10 lb. perch, I shall refrain from fixing the limit. Blakey speaks of a 6 lb., and "Ephemera" notes a 9 lb. fish. Izaak Walton and Schäffer also refer to monster specimens. It is probable, however, that the average size throughout the United Kingdom does not exceed $\frac{3}{4}$ lb. This, at any rate, is my experience. The sea-perch is, of course, a distinct fish.

The characteristics of the perch are, in some particulars, curious and interesting; but the style in which they have sometimes been described is even more so. Thus an old writer describes the fish as follows:—

"The perch is a fish that is hooked-backt, sometimes like a hog, and armed with stiff bristles, and its sides with dry, thick scales."

A much better description of its character, is however, that given by "Ephemera," who says:—

"The perch is a handsome, noble-looking fish; a bold, dashing biter, and a courageous fellow when hooked, never yielding so long as he has any strength remaining, but fighting bravely to the

last." To this I may add with all emphasis, "and so say all of us." Ichthyologically, it may be useful also to recall its precise character, especially as there seems some doubt abroad as to whether the 10 lb. fish before referred to is actually a fresh or salt water fish. Yarrell thus gives them: two back fins, distinct, separated; rays of the first are spinous, of the second, flexible; length of head as compared to body, as 2 to 7; teeth, small, uniform in size, curved backward, situated in both jaws, lower and palate fore-gill covers notched below, serrated on posterior edge of gill; cores bony, ending in a flattened point. In the specimen with which I verified this description the rays of the spined fin were fourteen. Its colours are as follows: The upper part of greenish brown, fading into a yellow white below; it is marked with dark, transverse bands; first back fin brown and scantily spotted with large dark spots; second back fin and pectoral fins pale brown; ventral, anal, and tail fins bright vermilion, or, as Pope has it,

"The bright-eyed perch, with fins of Tyrian dye."

So much for the ichthyological description of the fish. Sir John Richardson speaks of distorted perch found at Fahlun, in Sweden. They have malformed tails, and are very hunchback. Similar sports of nature are found in some lakes in Merionethshire, but whether either of these examples form a distinct subspecies I do not know, but rather imagine not.

The spawning time of the perch is usually about the beginning of May, although thermal influences occasionally accelerate or retard it. The spawn is deposited in riband-like layers in and out the weeds near the shore in shallow water, and the produce of one fairly large fish is enormous. As many as nine hundred and ninety-two thousand ova are said to have been estimated by Picot, of Geneva, though as to the exactitude of this tremendous number I am in considerable doubt. Of the great fecundity of this fish, there is no sort of doubt, however, as any angler taking perch during succeeding months can satisfy himself by dissection. Were it not for the ravages in the Thames of swans, and the decimation caused by floods, the metropolitan river would absolutely swarm. It may be here remarked that there would be but little difficulty in the successful artificial impregnation of the ova, and the rearing of the fry of perch, it having been largely accomplished in America.

The natural food of the perch indicates it to be essentially carnivorous. All the crustacea of the water, including, specially, freshwater shrimps, the young of the ordinary mussel (*Cygnus nodens*), worms, larvæ of the various flies, leeches, the fry of all fish, minnows, and sticklebacks, etc., etc., form its sustenance. When a perch is thoroughly on the feed, I have known it to take one-fifth its own weight in minnows without apparent discomfort. The haunts of perch in a river are probably more various than those of any other fish, especially when the river in question be large. In such case a large fish is well nigh ubiquitous. The neighbourhoods of submerged piles, old camp-sheathing, blocks of concrete, sunken trees, roots of pollards, underneath the shade of overhanging osiers, etc., form their chief habitat in running water. In still water the case is somewhat different. During summer time the perch, especially the larger ones, love to bask in the contiguity of shady weeds, such as the water-lily; and as autumn advances they frequently congregate in large schools, or shoals, round some patch of decaying vegetation. So, also, it must be said, they proceed in a similar manner during winter in rivers, and frequently a herd of five or six dozen may be found in a space hardly more spacious than a large pocket-handkerchief.

I alluded above to the curious items of angling literature in connection with this fish. One of these is odd, and suggests the idea that perch are self-concipient. Dr. Badham, in his "Fish Tattle," and subsequently a more recent, though equally learned, writer gives currency to this error. It probably arose from the observed fact that the females commonly proceed unattended by the males to the spawning ground. After winding, in a frog-like manner, their spawn about the weeds, they retire, to be immediately followed by the male fish. I have reason to believe that the unimpregnated ova will remain some considerable time capable of fertilisation before the visit of the male. It is easy to see, therefore, how the suggestion of self-concipient may have originated. Another fallacy is that which ascribes to the perch distinct and active antagonism to its fellow-marauder—the pike. Though Ausonius speaks of it as "prince of the prickly cohort," and Drayton, in the "Polyolbion," refers to it as "The perch with pricking fins against the pike prepared," and although Walton, backed up by Mr. Pennell, says, "To afright the pike and save himself the perch will set up his fins much like a turkey-cock will sometimes set up his tail," I am not inclined to consider the perch a quarrelsome fellow. The additionally horrent appearance is often presented by the fish when no cause of a provocative nature is apparent.

SKETCH OF THE F. G. TOURNAMENT, TO SHOW ARRANGEMENT OF THE GROUND.

(Made by Mr. W. LAWRENCE.)

Mr. Jardine. Mr. Martin. Mr. Foster. Mr. Geen. Measuring Line.
Mr. Wheldon. Mr. Clench. Ned Andrews.

In conclusion of this section of the article, the ascribed wholesomeness of the perch—the freshwater sole—may be mentioned. Gesner tells us that it may be eaten with impunity by delicate persons, such as women in child-bed, wounded soldiers, and so forth. Moreover, it is affirmed that there are two round bones in the perch's head which are a remedy for "stone." Where these two round bones are, however, I never could discover.

(To be continued.)

PROPAGATION OF COARSE FISH.

ALTHOUGH the idea of propagating the ova, or of otherwise increasing the supply, of coarse fish has been frequently suggested, the credit of initiating a movement for carrying it out appears destined to belong Mr. R. B. Marston, and he will then become the true pioneer of the work. Whether the science of fish-culture should be extended to roach and dace, is a matter for consideration. As regards the Thames, my idea is we have plenty of those kinds of fish in it. I have always thought the work of coarse fish propagation should be limited to carp, chub, bream, and perch—still, I am open to conviction. In a river like the Thames, unless we can get trailing done away with and the size of jack considerably increased, the culture of that voracious fish would to a great extent be valueless, as hundreds are killed every year by that unsportsmanlike practice. I think it is more with the perch we should aim to propagate—there is no fish that gives better sport to the angler, and no fish which to all appearance has more rapidly declined in the Thames. It is also a fish which most people will recognise as food and more willingly accept than any other of the white fish species. The Thames is eminently suited for perch, and some very fine ones are even now occasionally taken out of it. I have frequently seen them over two pounds each, and one some few years ago was caught at Sunbury that weighed four pounds. As regards their diminution in the Thames the cause is by many attributed to the inlets of the great reservoirs of the various waterworks on the river banks, where they get in as small fry. There is something confirmatory in this from the fact that being one day permitted to fish in one of the reservoirs they could be taken two or three at a time, according to the number of hooks on the paternoster, and all of them not more than 5 inches in length, as though they had gone there in broods; but it may be argued that these youngsters were bred in the lake as it was reported there had been plenty of perch taken out of the reservoir from two pounds to three pounds each. I know amongst the fishermen the prevailing opinion is they leave the river through the grating when in an infantine condition. There used to be no portions of the Thames better stocked with perch than those where the reservoirs are situated, and now they are the worst. The propagation of perch cannot fail to be valuable to the anglers; and

as the Committee of the Thames Angling Preservation Society are turning their attention to these reservoirs, and are hoping to receive the necessary aid of the directors of the various water companies, together with the help and assistance of their engineers, the increase of those fish in the Thames will not only be perfectly safe but highly desirable. Then, as to the carp, we all know they can exist in the Thames; they may not be frequently taken, but these wary customers have occasionally given great sport to the anglers at Teddington and Kingston, and I should hail with no small amount of satisfaction the propagation of carp in Mr. Marston's movement, which already appears to be favourably entertained and largely supported by anglers and angling societies. There would be no difficulty in the matter—plenty of inspawn fish could be procured—and success would be certain. The chub are also a very desirable fish to increase. They give sport in various modes of angling, and no fish is attracted by a greater variety of baits. They also give fine sport to the fly-fishers, but there has been this great misfortune in the Thames—so many of their old haunts have been removed by the destruction of withies and boughs, which are, according to the habits of the fish, their natural homes. The Thames has produced some remarkably fine specimens of chub. I have seen them up to 8 lb. each, and notably one taken at Richmond some few years ago, which, when preserved, was exhibited in the hospitality in the Church Passage, but which has now changed hands. It was caught by the then proprietor, who invited me to see the fish, and to receive a guinea for the Thames Angling Preservation Society. There was one remarkable circumstance attending my visit, and it was this. The proprietor's wife went upstairs to get the money, and, in doing so, detected a burglar in her bedroom, taking her jewellery. I received the subscription, and, as the magistrates were then sitting, went into court afterwards and saw the prisoner committed for trial. The reach at Kingston is a very favourable resort for chub, as there is a long line of boughs where they can exist in any number. The increase of the population in this desirable colony would be well received by the natives. I do not mean by the fish that are now there, but by my Kingston friends, who are remarkably good in chub-fishing. In the lower Thames there are plenty of bream, but it would be a good fish to propagate for those portions of the Thames where they are not to be found at present, and for other rivers where the supply is short. When once these fish are introduced in a river they soon become abundant, as has been the case in some parts of the "City Waters," where they did not at one time exist. Take, for instance, at Chertsey, where, I believe, they were first introduced by a Mr. Heseltine, at that time a great Thames angler, some thirty years ago. He, I believe, brought them up from Walton, after his day's fishing; or, it may be, the result of several days' angling lower down. As a proof of the plentiful supply of bream now at Chertsey, it is not many years ago when

James Haslett in one day pioneered his customers to the capture of 147 lb., and this year, although the report was unnecessarily contradicted, he caught 75 lb. There will, therefore, be no difficulty as to bream. Although I have not included jack in my selection, I fully believe for some places their propagation would be desirable, and many owners of private waters where they have been almost fished out would be glad to replenish their stock. The demand for these fish in those places would, I apprehend, be great. Therefore, whilst only mentioning those which I think best for the lower Thames, I am satisfied Mr. Marston will be making his scheme generally complete by including all the species of coarse fish. If a meeting is called for the purpose of carrying out his suggestion, I shall make a point to attend, unless some important official duties keep me in another direction. In the largely-increasing number of anglers, we want our stocks of fish keeping up; and, as a necessary supplement to this, we shall require what I think is coming—a general law of the sizes of fish in their minimum measurements. The clubs and owners of water will have the option of making their own standard above those sizes, as, for instance, in jack, where some clubs will not recognise them of less weight than 3 lb., and proprietors of private waters prohibit their capture, or, rather, retention, under 4 lb.—live baiting or the dead gorge in the latter places not being permitted. Mr. Marston is rendering effective assistance to anglers by his various movements, and I am sure he will be encouraged and supported in carrying them out; and, referring to his latest, as Messrs. Francis Francis, Frank Buckland, and Stephen Ponder were the pioneers of fish-culture in England in respect to salmon and trout, he will become, as I have said before, the pioneer of coarse fish propagation, the latter being the most desirable for the benefit of all-round anglers, whose number is legion. B.

AUTUMNAL GRAYLING FISHING.

By FRANCIS WALBRAN.

(Continued.)

RESUMING the list of flies that are most suitable for this class of fishing, we next come to:

No. 11.—SMALL OLIVE BLOA.—Wings, starling's quill feather, stained in onion dye; body, yellow silk; cobbler's wax; legs, olive stained hackle; tail, two strands of the same. Remarks: This fly should be dressed small, and is a certain killer of grayling when they are on the feed during September, October, or November.

No. 12.—THE BROWN OWL.—Body, brown fur from a hare's face, ribbed with fine yellow silk; wings, the pale brown quill feather from a brown owl's wing; legs, a red hackle stained in copperas water. Remarks: This is a very favourite fly with some of the local fishermen on the Wharfe, both in early spring and late autumn; one gentleman of my acquaintance uses it all the season, and speaks very highly of its killing properties, but I cannot say that I ever met with much success when I used it; however, being a noted fly in this district, I include it in my list.

No. 13.—THE LITTLE BLACK.—Body, orange silk, with a morsel of magpie's harl to form the head; wings, taken from the dark part of a starling's quill feather; legs, a furnace hackle. Remarks: An excellent fly for grayling during the time that the ant flies are upon the water. I once killed thirteen good grayling with this fly alone on a dull day in September, when fishing on the Yore, near Ripon, and have ever since had a very high opinion of it.

No. 14.—THE BLUE MIDGE.—Wings, feather from water-hen's neck; body, lead coloured silk; legs, grizzled hackle. Remarks: This is a fly recommended by Jackson to be used on mild days in autumn and early winter, especially when likely for rain; on such days I can vouch for its killing properties, as I have sometimes had very good sport with it both on the Yore and Wharfe; it must, however, be dressed very small and neatly.

No. 15.—THE PALE BLUE BLOA.—Body, mole's fur spun sparingly on straw-coloured silk; wings, the fine pale blue feather from a sea swallow. Remarks: Jackson does not mention this fly at all, neither does he the whirling blue dun. I am rather surprised at this, as they are both on the water at the same time, and are equally well taken by grayling; Ronald calls it the little pale blue dun, his pattern being very similar to the one given above.

No. 16.—THE GREY GOOSE DUN.—Body, lead-coloured silk; legs, dark dun goose hackle; wings, starling's quill. Remarks: This pattern is one given by Mr. Ford, in the work of his alluded to previously; I have not yet tested it myself; although I hope to do so shortly. Since the first portion of this article appeared I have received a letter from Mr. Ford, in which he tells me that this fly is a good grayling killer, and I can easily believe it, judging from its appearance. Mr. F. recommends the angler to vary the shades of body and wing.

No. 17.—THE EDEN FLY.—Wings from the outside wing covert of the sea swallow; legs a honey dun hackle; body, pale buff, or light straw-coloured silk, waxed with transparent wax; tail, two or three fibres from a buff hackle of a Cochin China hen; Remarks: This pattern is given by Mr. Aldam in his incomparable work on artificial flies. I had some made up on the strength of his recommendation, and found them kill both trout and grayling very well on the Yore and Wharfe. The best months to use it is from the end of June until the end of October.

No. 18.—DARK GREY MIDGE.—Wings, dark grey, feather of partridge; body, brown or olive silk; legs, grey partridge or grizzled hackle. Remarks: Jackson gives this pattern, but, for my own use, I prefer a simple partridge hackle, made either with yellow or orange silk or body.

Since the issue of the first portion of this article, I have received numerous letters from brother anglers, who have kindly sent me both patterns and samples of grayling flies, but I am especially indebted to A.R.I.E.L., whose charming piscatory stanzas are always so welcome to the readers of this journal, for a really splendid collection of flies. The patterns had been given to him by a friend in Derbyshire, who is a very great expert among both trout and grayling, and the flies that were sent to me were tied from these patterns by Mrs. F. Y. Brocas, 4, Mill Street, Hanover Square, London. This is the first specimen of this lady's handiwork that I have seen, and I certainly never saw a more beautiful sample of small flies—the duns in particular are most artistically tied, the wings standing up in a very natural manner. I cannot classify this collection or give their proper names, as I do not know them, but no doubt Mrs. Brocas will be able to supply the patterns to any angler wishing to give them a trial. I may mention, however, that one set of flies comprised five patterns, that are a cross between the orange bumble and the cochybondhu, all varying in the colour of their bodies and hackles. They appear to me very likely flies to induce Mr. Salmo Thymallus to show up on days when there is no particular fly upon the water, and I hope during next week to give them a careful trial.

To some anglers who believe in only a limited selection of flies, the foregoing may seem to be a rather extensive list; but I use the greater part of them myself, and can answer for their practical utility in this, my favourite branch of the gentle art. I will now, however, leave the subject of flies, and, after giving a few hints to beginners, will conclude my paper with a glance at the other methods of taking grayling during the winter months.

Your casts should be made of either single hair or the very finest drawn gut; for although, when in the humour, a grayling rises more boldly than a trout, if your tackle be coarse or your fly be a bad imitation, he will refuse it at once. One of the finest qualities that a would-be proficient at grayling fishing must possess is a quick eye and a ready hand, as many a time all that the angler sees is a white gleam under the surface of the water—when you see that strike at once with a gentle turn of the wrist, and nine cases out of ten you find yourself fast in a fish. When hooked never attempt to hold him as you would do a trout, but let him run out as much line as he likes. I very seldom lose a grayling when once I have hooked him, and I attribute it entirely to this cause, as their mouths are so tender that the least drag is sufficient to tear the hook from its hold; the landing net should always be used. When grayling will rise to the fly, which is generally the case if the weather is at all likely, I should not wish to use other means for their capture, but there times when they turn sulky, and refuse flies both on the surface and below the surface of the water, but at such times the angler will find that they will take either a small red worm or a maggot readily. The tackle must consist of about three yards of the finest drawn gut, a No. 2 hook, a single split shot, placed about twelve inches above the bait, and a very small unobtrusive quill float. Fish the edges of the streams, eddies behind stones, and at the tail end of the pools, your bait being about six inches from the bottom. As soon as ever your float gives the slightest indication of a bite, strike at once with a gentle upward stroke, and play the fish gently as in fly-fishing. When using maggots for bait, it is a good plan to carry a little well-soaked pearl barley with you to throw in as feed from time to time, as it draws the fish together, and does not necessitate the waste of maggots, which are articles of value during the winter months.

Another way to fish for grayling during the winter is by using the "grasshopper," which is an artificial bait, only resembling the insect, from which it derives its name, in colour. It consists of a No. 5 hook wrapped round with thin sheet lead until the size of a small gooseberry, only longer in shape; over this crimson and green wool is wrapped in alternate rings, and the affair is complete. What the fish take it to be is a marvel to me; suffice to say that they do take it, and generally the largest grayling. The method of fishing it is to attach it to a fine gut cast about three yards in length; put two or three maggots into the hook, and

cast the bait into any swirly hold or deep stream likely to be tenanted by grayling, allow it to touch the bottom, and then draw it up a few inches gently, sink and draw again and so on until the whole of the water is thoroughly searched. As soon as ever you feel the tug of a fish strike instantly.* Curious to relate, this method of killing grayling is confined almost entirely to the streams of the Worcester district; in fact, on some waters in that county it is prohibited on account of its slaughtering properties. But although, out of curiosity, I have tried it in Yorkshire, yet I cannot say that I met with great success, and several other anglers of my acquaintance have tried it with similar results. The same gentleman who so kindly sent me the red tag and several other Worcester patterns of grayling flies, also sent me two or three specimens of "grasshopper," varying in both size and colour, giving me the fullest instructions for their use, but, according to my experience, they do not answer on the grayling streams of this county. Possibly the fish are more highly educated, and consider these monstrosities an insult to their good taste. One can enter into Mr. Ronald's theory of palmer's representing caterpillar, but I am certain that no living creature yet existed that in the slightest degree resembled these combinations of wool and lead. I should also add that the gentleman referred to recommends a long bamboo roaching rod for this class of fishing.

This, I believe, exhausts all the recognised means of taking grayling during the autumn and winter months; but there is still another way in which they are taken at times and concerning which I have been more puzzled and entered into more arguments than any other subject connected with trout and grayling fishing. I allude to taking them when spinning the minnow for trout; how many times I have been derided for even naming such a thing, and how many times I have put the scoffers to rout by proving it to them practically I should be sorry to have to recount, but I believe that I can assert without fear of contradiction, that I have killed as many, if not more, grayling with minnow than any other man in Yorkshire, on one occasion taking four fine fish in succession. A.R.I.E.L. has enlightened my mind more than any other author on the subject, his explanation being that grayling will, and do, take the minnow when presented to them under certain conditions; and consequently, as very few men fish the minnow in exactly the same way, the diversity of opinion arises. I have generally found them take the minnow under the following circumstances, and should feel much pleased if A.R.I.E.L. would kindly inform us if his own experience is identical:—

1st. When the water is perfectly low and clear.

2nd. When wading up-stream, and employing the very finest of tackle and smallest of minnows.

3rd. When using the natural minnow only.

4th. When spinning very slowly, or when the bait is just veering round with the stream.

I may add that I have met with a single exception to the 3rd condition, viz., one day when a friend of mine took three fish with a small Devon minnow much to his astonishment, as he previously had been sceptical on the subject.

In conclusion, I hope that the above remarks may elicit some further information from such experienced grayling fishermen as Mr. Eaton, Mr. Bullock, of Derby, Messrs. Foster, Bros., A.R.I.E.L.'s friend "X," or many others whom I could mention, and who have, no doubt, various reasons to adduce.

Of course I wish my readers to clearly understand that I do not for one minute recommend the minnow as a bait for grayling, but simply mention the fact that they do take it at times; and should, if possible, like to solve the question why some anglers catch them frequently when fishing in this manner for trout, and other men, possessing perhaps more skill and greater experience, have never once accomplished the feat.

* [This description of using the grasshopper is not quite correct. A small white quill float is placed two or three feet from the bait; you then let the bait sink slowly to the bottom and mark the depth of each dip by the float; if at your next dip the white float does not go so far under water, strike, for the grayling rises and meets the descending bait, and the great secret is to know, from the stoppage of the float for a second, when he has done so, then you strike gently.—Ed.]

A FEW NOTES FROM WESTMORELAND.

OUR fishing season is now over here, at least so far as trout salmon, and that genus is concerned. No doubt plenty of sport could yet be had amongst the coarse fish, roach, pike, and perch in the various streams and pieces of water where they abound. But, as a rule, our Westmoreland fisherman turns up his nose at such fish. It is not very long ago that one man fishing in the Preston and Kendal Canal, close to the latter place took in about two hours some 45 lb. weight, 2 pike averaging about 2 lb. weight each. This canal would be a splendid place for fish were it not run off so often. Lately certain lengths have been drained yearly, or even oftener, to allow repairs to the banks where they

may have given way. At times a good many anglers from the Lancashire colliery districts visit the canal near Kendal. Generally they bring plenty of provender with them, a lantern, and camp out in the open all night, coming, say on the Saturday afternoon, and returning home on Monday. Tickets are now required for fishing in the canal, but the cost of them is but nominal. In the Kent we have in places plenty of roach, and sadly too many pike. Windermere swarms almost with pike and perch; but the fishermen do not care about going out for them in the autumn and milder winter months. Indeed such fish in the north here are not valued nearly so highly as they deserve to be. Most of the tarns and lakes likewise contain perch, and many of them pike. Winfell tarn, about four miles from Kendal has an abundance of jack and rudd, and roach. Skelsmergh tarn is full of roach. I once saw a small carp taken out of this latter sheet of water, the only specimen I ever saw in Westmoreland. There has been very good salmon-fishing in this district during the season, both nets and rods taking more than usual. The largest fish caught with the nets was 32 lb., the best on record for this river; with the rod one of 16 lb., altogether, I should say, the rods had about 60 salmon for their share in that river. The nets would probably take a ton of fish, morts and salmon, from the Kent itself. Then more were of course caught on the sands. The Leven and Duddon have not yielded so well as has been known in other years. A few salmon were caught in Windermere. Throughout the whole district of the Kent, Bela, Leven and Duddon Board, trout fishing was, during the past season, not quite up to the average. In the spring char were very plentiful in Windermere, and towards summer capital takes were had by fishing with the plumb line. One of the county police caught a man grappling near Brigsteer last week. The unfortunate poacher threw out a sea trout which almost hit the constable on the head. Doubtless he will be prosecuted. Nothing further has been made of the fish poisoning which occurred between Burneside and Kendal nearly two months ago. The fish disease is very bad amongst the salmon, salmon-trout, and morts in the lower portions of the Kent just now, indeed, it has been so for two months or more. The other day, though the water was swollen and discoloured, I saw about eight salmon and a large number of trout badly affected with *saprolegnia ferax* in about a mile of water. Most of the trout lay at the bottom of the river dead. It appears to me that this mysterious disease is likely to be more destructive to the fish here than it was about three years ago.—SPRINT.

THE GRESHAM ANGLING SOCIETY.

THE rules and regulations of this very flourishing society have just reached us, and very good they are. A very capital feature in connection with this club is the reading of papers on angling subjects by members. Mr. T. Crumplen, the energetic hon. sec., recently read a valuable paper on the "Decrease of Fish in the Thames and its Causes," which we hope to have the pleasure of publishing. On Thursday last, Captain Alfred read a paper on "Jack Fishing;" on the 24th, Mr. Wheeldon will discourse on the "Science of Angling." Mr. Jardine is down for what must prove a very interesting paper on "Up-stream Fly-fishing v. Down-stream Fly-fishing"; and Mr. Geo. Austin for one on "Izaak Walton and Sir Thomas Gresham," Dr. Brunton, Mr. S. C. Harding, and other members are also on the list. They deserve the encouragement of all anglers, and we trust other London clubs will follow suit; we notice with pleasure that the Piscatorial Society does not mean to be behind the age in this respect, and last Monday night Mr. W. B. Adlington read a paper at that society on "Jack Fishing," which was very greatly appreciated by the members. The Piscatorials should get Mr. Adlington to read a paper on fishing for trout with the "Alexandra" fly. Few anglers have had more experience or killed more fish with this deadly fly-minnow. We are sometimes asked to "keep dark" on this Alexandra business, but the sole aim and object of our paper is to throw light on all angling matters, and to give a fair field to all.

WEST CENTRAL ASSOCIATION OF LONDON AND PROVINCIAL ANGLING CLUBS.

A SPECIAL, and important meeting will be held on Friday, the 18th inst, when it is requested every society enrolled, will send delegates. Chair taken at 9 p.m.

T. HOOLE, Hon. Sec.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

RIVER REPORTS.

MID-THAMES.

"My business in this state
Made me a looker on."—SHAKESPEARE.

I have been a fairly industrious "looker on" at angling for the past week, but have failed to see or hear of any take likely to set the Thames on fire, or hesitating anglers ablaze with envy and emulation. Heavy rain has evidently fallen high up the Valley of Thames, for the river has risen very rapidly and has become of the proverbial pea-soup colour and consistency. Roach are feeding very well, as exemplified by some good catches by the Messrs. Harrison in the Hurley water. Those experts on Sunday, getting some 16lb. of these river sheep, two chub, going together 7 lb., and 4 lb. of eels. Mr. Lumley also had 4½ lb., and Mr. Birch has given the rod to a nice take of fish, best going 1½ lb. At Bisham, Messrs. Leyland and Taycop have had a friendly match amid the roach, the fish getting much the best of it in groundbait, and the contest resulting in a dead heat, one fish each only rewarding the excited combatants. The splendid trout stream at Wycombe has been utterly ruined for years by the accidental bursting of a bleach tank in a paper mill, but of this more in my next, after a personal enquiry and inquest on the bodies of some 6 cwt. of beauties accidentally poisoned.—MARLOW BUZZ.

Thames (Goring).

There has been no fishing here for some time. Water has been too thick, but is now in good order for roach fishing. By Sunday, if it keeps fine, will do well for jack and perch. I have been out to-day, and took some good roach, largest 1 lb.—J. BUSH.

Thames (Halliford).

The river is now in excellent order for seasonable fishing. Mr. Innis fishing with me on Sunday last caught one barbel, and a nice lot of roach (ledgering). Mr. Castle and a friend fishing with me on Monday caught 7 barbel and 6 roach (ledgering). Mr. Field fishing with me a little while this afternoon caught 1 barbel 3 lb., and a chub of 2½ lb., also 6 nice roach. Weather fine, wind south-west. Prospects for fishing very good.—GEORGE ROSEWELL.

Thames (Kingston).

The river has been much discoloured all the week, but is now in better condition than it has been for some time past. I should say that jack and perch fishing was the best. I have not been out since Sunday. I got a few fine dace but the roach did not feed. John got a few good roach one day, and a jack 6 lb. I have only seen a few fish taken from the banks. Should it keep fine the chub will feed.—JOHN JOHNSON.

Thames (Richmond).

Since my last report, owing to the mild change in the weather, I expected to send some good returns, but it has not been the case. My best days being with Mr. Green on Sunday, 10 lb. Mr. Bansback and son on Wednesday, about 19 lb., other days 4 lb. to 7 lb.—E. BROWN.

Thames (Shepperton and Weybridge).

The water is in very good condition for roach fishing. Not much prospect for perch and jack for the next few days. Mr. F. Purdue, one day, one dozen and a half very good roach, and three sizable perch; Mr. H. Purdue, three hours fishing, one dozen roach, four weighing over 1 lb. each; Mr. H. House, one and a half dozen perch, kept twelve, the other returned to the river. A gentleman fishing in his own boat caught four and a half dozen roach, returned all to the river but one and a half dozen; myself, two days, four and a half dozen roach, one jack about 2 lb. and one perch.—W. ROGERS.

Thames (Twickenham).

Wind, north-west. Water a little discoloured, but nothing of any consequence to interfere with anglers. I have only had twelve punts out during the week, averaging about eight dozen good fish to each punt. Next week the tides will suit well for whole day's fishing. This day I have had four punts out, and each have brought in a fine lot of roach, including some good dace. Mr. Spreckley and Mr. Brougham, with the new river keeper of the T.A.P.S. and Mr. Rough, of the Thames Conservancy, made a visit to the whole of my punts, and others out fishing this day; and, according to my customer's reports, they were well pleased with the samples of fish that were readily shown from each punt's well.—A. PERRIN.

Thames (Windsor).

Water this morning is coming down rather thick. I tried the barbel before breakfast, but they would not have it, though I know they are there. Some nice roach have been had with worm and gentles, but not in quality. One of the Windsor fishermen had last week three jack, going 11 lb. and Paice, of Etonwick, on Sunday last had 5 barbel, going 7½ lb. White, jun., of Windsor, has been getting some nice roach with gentle. A good push of water wanted badly to remove decayed matter, etc. Should then be some sport to be had.—B. R. BAMBRIDGE.

(Dove).

Sport has again been very good amongst grayling this week. The fish have been rising well in the middle of the day, and we have had a fair number of rodders out, the weather having been very fine and mild for November. The best killing flies have been the cockwing bumble and the grey palmer. I should think it would not be too much to say that the average of takes has not fallen short of six brace per rod. Chub, too, have been biting well at greaves and gentles. Five of these fish were captured on Tuesday, near Uttoxeter, scaling 15 lb., one of them alone bumping the weights at 3½, not had for the Dove.

Trout still keep rising to the grayling flies, many having been caught this week. The river, though high, is in fairly fishing order.—THE SPLODGER.

Exe (Exeter).

This river has not improved very greatly this week, and to the changeable weather may fairly be attributed the very poor sport. Another thing, too, the waters have been much out of condition, being at times very thick and coloured, which never conduces or helps to conduce to successful angling, and many anglers have been very eager to avail themselves of every opportunity of fishing during the remaining portion of the season; but, like the commencement, sport was very indifferent. So the season closed, and the salmon and the "daisies" with the dorsal fins for the next few months are to enjoy nature; at any rate, from the cunning and art of the fair and true sportsman. Salmon and peal are pushing up in numbers, the latter especially, which speaks well for next season. During the cold days the water fined down rapidly; but Jack Frost was succeeded by a watery shift in the wind, which was but little needed to stir up the grouts again, after which it is hoped ere long the various holes and stickles will disgorge some of the piscatorial prizes that lurk in their bosoms. Jack are plentiful. Perch are schooling up, and give excellent sport to the lucky angler whose minnow happens that way to be cast. Roach and dace are very fine, but decidedly not so plentiful as last season. Rudd are in goodly numbers. With regard to chub, another brace has been taken, making the second brace taken from the Exe known to me during the past three years; consequently, we cannot say they are plentiful, but suffice to say the yare in the river. I have, since my last report, been called on the carpet by a disciple of the gentle craft, and been requested to expunge the chub from all further reports, because he never saw, never heard, and is quite certain there is no such fish in Devon, leave alone the Exe. Well, I cannot, after the ocular demonstration experienced, succumb to this, especially from one who denies even such a species as the rudd, and, as my reports are copied into our local *Exeter and Plymouth Gazette*, I would wish to convince him that many friends will come forward and testify as to their being. Without quoting from Yarrell, i. 358, or Couch, iv. 190, p. 44, it would be as well, my friend being an Exonian, to quote from our learned local friend, Mr. E. Parfitt, from his Paper, read at Torrington, July, 1875, on the Fauna of Devon. "Fishes," part XII., wherein at page 21 is stated:—"This, I am informed by Mr. Reading, is taken in Devon." Herrings are being taken in the estuary, but not to any extent. At present the catches varying from one to five hundred per boat, but it is expected before this report appears, the bulk will have greatly increased, as the Clovelly men are doing well.—FRANK GOSDEN, Exeter.

Ilfracombe (N. Devon).

Sea fishing has not been so good this week owing to the unsettled state of the weather. Friday, boats had some good sport with conger, ling, and skate; very few herrings were caught. Saturday, all boats out; some brought in five maize, others two, and some only quarter maize; one boat from Clovelly brought up 9 maize of herrings, and a lot of hake. Sunday morning another boat came up with 8 maize and some fine hake; several boats went out in the evening—their catches were the best for the week; over 30 maize of herrings was brought in by all the boats, and some fine pollack, weighing over 18 lb. each. Monday, fishing very slack; fisherman afraid to put their nets in the water as there are too many vessels passing up and down in shore. Tuesday, very fair quantity of fish taken, each boat having their share of herrings, hake, and whiting. Wednesday, weather squally, boats unable to put out; wind blowing strong from the S.E.; fishermen all very busy barking their nets. Thursday, weather still bad, with strong wind from S.W., with drizzly rain. There is some fine ling and conger caught from the jetty with handlines evenings.—E. COMER.

Lea (Broxbourne).

At last I can report the water in splendid condition, and all fish well on the feed. Roach, perch and jack have been taken in large quantities during the past week.—T. B.

Lea (Rye House).

The water is very bright, the wind south-east, but very mild. There were a few nice roach taken on Monday, some over a pound. They were taken close to the house with paste.—WM. COWELL.

Medway (Tonbridge).

The river certainly ought to be named the Mudway, for it continues as thick as ever, and when it will fine down again appears to be a grave uncertainty, at any rate to—THE MEDWAY WATER RAT.

Ouse.

Water in splendid order for rod, pike, &c. Cutting sedge at river side, which is rather troublesome, but not seriously so. Baits chiefly in use are gentles and brandlings. Paste at a discount. The catches mentioned below include a few silver bream and dace. A great many anglers have been out since last report, and all have done well, as the following will show:—Nov. 2, G. H., of Ely, 8½ lb. roach, in one three quarter hours; Nov. 4th, Messrs. Ascroft, G. Fielden, Cambridge, 22 lb. splendid roach; Mr. Crick, Newmarket, 20 lb. roach, in four and a quarter hours, largest going 17 oz. This is the best take of the year in this water, considering the time. Nov. 5th, Mr. J. Tapper, Newmarket, 10 lb. roach; Mr. F. C. M. Whitehead, Cambridge, 11½ lb. roach; Mr. W. H. Whitehead, Cambridge, 15½ lb. roach, largest 1 lb.; Dr. Cooper, Cambridge, 14 lb. roach; Messrs. J. Cole, G. C. Hardy, St. John's Wood Piscatorialists, 34 lb. roach. Nov. 6th, Mr. Harper, Ely, a pike of 5 lb. Nov. 7th, Mr. Fielden, Cambridge, 14 lb. roach; Mr. Ascroft, Cambridge, 13½ lb. roach; Mr. Henry Lea, Cambridge, 19 lb. roach; Mr. James Goater, Newmarket, 13½ lb. roach; Messrs. J. Rae, G. A. Pace, Newmarket, 29½ lb. roach; Messrs. J. Cole, G. Hardy, St. John's Wood Piscatorialists, 28 lb. roach. Nov. 8th, Mr. W. Thurston, Cambridge, three pike, 4 lb. 2 oz., 4 lb., and 2 lb. 2 oz. respectively, and 9 lb. roach; Mr. S. O. Batman, Littleport, pike, 5½ lb. and 5 lb. roach.—CHARLES SOUTH.

Thorney Broad.

The water is still in first-rate order for fishing, and anglers would do well to give the roach, dace, chub, &c., a trial while the mild weather lasts. There have been some fine shows of fish taken this week. The following is a list of those shown at the house:—November 4, Mr. Simpson, 1 chub, 4 lb. 4 oz.; Mr. Rools, 33 roach, 20 lb., some of them going 1 lb. 8 oz. November 5, a gentleman that I do not remember to have seen here before, had 12 nice roach about 10 lb., the largest 1 lb. 12 oz. November 6, Mr. Stevens 2 chub 5 lb. 8 oz. Mr. Griffin caught a nice trout, perch fishing, which he returned to the water at once. November 7, Mr. Andrews, member of the Piscatorial Society, had a nice show of roach and 43 dace, for the weight of them I must refer your readers to the society's report. November 8, Mr. Rools about a dozen roach, weighing 8 lb., and 1 dace, 14 oz. November 9, Mr.

Browning 25 roach, 15 lb., some of them over 1 lb. November 10, Mr. Drake 6 roach about 5 lb. I have heard of many more fish being taken, but they have not been shown at the house. Anglers should use plenty of ground bait for roach (bran and bread).—E. GODFREY.

Trent (Alrewas).

The water has scarcely been in proper condition all the week, and little to note has been done. The beginning of the week Messrs. Chapman and Bullock had a few nice chub, and Dr. Dunnis reported taking one nearly 4 lb. with Gregory's Colorado bait whilst spinning for jack. Anglers fishing in the lakes and reservoirs in the neighbourhood of Birmingham have had some capital luck in pike fishing. The best take which has been brought to my notice came off last Saturday. The president of the Birmingham and Midland Piscatorial Association, fishing with Mr. Cope and another, landed 18 nice fish. The two largest weighed 10 lb. and 9 lb. respectively, while the remainder were all takeable fish. Yesterday Mr. John Allday, with a few friends, had some very fine sport at Earlswood. The capture represented a dozen nice pike. The best brace were taken by Mr. Sale, and as they were the first pike this enthusiastic angler has captured they were duly wetted with a bottle of "cham.," and with best wishes from his brother anglers for further and greater success. The weather is remarkably genial for the time of the year, and the river is reported to-night as rapidly getting into proper fishing order. Grayling are rising well, and good sport is in the prospective, should the wind and weather continue in the present satisfactory state.—JAMES GREGORY.

Thursday Night.

Trent (Newark).

As anticipated in my last note, the water came down very thick and high by Saturday, and as a natural consequence not much has been done in the way of sport, although this last day or two worm fishing might have been indulged in; but I know of only one or two anglers being out, and they only met with indifferent sport, a few roach being about the extent of the captures. I visited a large pond, a short distance from Newark last Saturday, to again try the jack but found them dead off the feed; four runs, and only two fish rewarded me. A bleak on Gregory's Archimedean Spinning tackle, killing one, and the "Clipper" was the death of the other; a rare bait, for an artificial, is that same Mr. Gregory's "Clipper." On looking over my last week's note, I saw that that inveterate joker, the printer, had transformed "grassing" into "grappling;" where I mentioned the seven runs from jack. [I had had, but only succeeded in grassing four (but it did not matter much, for I got my fingers, that is, grappling irons, across them, so, taking it all in all, the remark was very appropriate). To-night the water is getting into good order, and in a few more days, if the present condition of things should continue, all kinds of winter fishing should be in full swing. Gentles, if gettable, for roach, only mind and don't overdo the ground bait; pith or scratching for chub; and pike, if can get a few bleak or small dace, try them either livebating or spinning. If you cannot get any small baits, try a "Clipper." Weather very mild considering the time of year; and altogether I think the prospects look very fair for the next few days. The prize that I won at the FISHING GAZETTE Tournament came to hand a few hours after sending off my last report, and a grand lot of artificial baits they are; worth 50s. instead of 20s. as mentioned in the prize list. They are enough to make every good spinner that was not at the tournament wish he was. They are a credit to Mr. Gregory as the maker. I don't know that I ever saw so fine a lot in any one angler's outfit. I have now broken the pipe of peace, and gone on the war-path, and got fairly on the trail of the jack, and, with the help of this grand prize of artificial baits, I hope to do something in the way of slaughtering jack, and make every jack up and down the river about here tremble when he hears the name of—TRENT OTTER.

Trent (Nottingham).

In the beginning part of the week the water came down much discoloured, and the weather at the time being unusually mild for the time of the year brought the bream on the feed for the first time this season, and some of the anglers have been much puzzled to understand the cause, it was simply this, the temperature for some time has been so low, and consequently the water so cold, that bream refused to take worms, but this week, on several occasions, they have not only taken the cockspur worm freely on the hook, but took the groundbait in good form. The result was some good basket of bream were brought down from Weston and other noted spots up the river. Several of the fish weighed in at the clubs going over 4 lb. each, and in one or two of the baskets were found some capital roach and dace, which at last took the worm freely in that noted length at Willington. The sample being unusually good. Now, from what I have stated, the angler will doubtless understand that there is still plenty of fish in the upper part of the river, and it only required a favourable time to catch them, and I might add that all the fish that bite at this time of the year are all feeding well, and the water is in splendid condition for worm fishing, but the anglers for pike and chub will have to wait a few days longer.—W. BAILEY.

Wye and Derwent (Derbyshire).

Both rivers are in first-class condition for fly-fishing, especially the higher lengths of both rivers. Sport during the week, since Monday, has been good with both bottom and top, and baskets from 5 brace up to 9 brace per angler have been made off of both streams. The killing flies have been the bumbles, furnace, black and ash duns, the furnace killing the greater quantity of fish. The bottom fishers on most parts of the Derwent, have done well during the week with worms and maggots, one gentleman killing some good baskets off of the Darley Dale water with maggots and worms.—GEORGE JAMES EATON.

Yore (Yorkshire).

Since my last week's report a fall of snow, followed by excessive rain, produced a heavy flood in this river. By Monday, however, it had subsided sufficiently to admit of worm-fishing, and on that day I killed thirteen grayling weighing 6½ lb., using that bait. On Tuesday I fished in company with Ralph Colbeck, a capital all-round angler, who devoted himself to salmon fishing with fly, while I gave the grayling another turn. My take was nine fine grayling, and towards the close of the afternoon Colbeck succeeded in landing a nice little grise weighing nearly 5 lb.—it took the "silver doctor," which is a good fly on the Yore in a full water. On Tuesday night a drizzling rain set in, which threatened to interfere with angling on Wednesday, but should no more heavy rain fall the river will be in excellent order for fly-fishing before the end of this week.—FRANCIS M. WALBRAN.

"Whelk-ome little stranger," as the hungry fisherman said when he hitched up a whale.—Moonshine.

CLUB REPORTS.

GRESHAM ANGLING SOCIETY.

The weekly meeting of this society was held as usual on Thursday, Mr. A. Jardine presiding. Mr. T. Crumplen (hon. sec.), read the minutes of the previous meeting, and also the correspondence, including a letter from the president, Lord George Hamilton, expressing his gratification at the high character of the papers read before the society, and the steady increase in the number of its members. Letters were also read in reference to some water the society is in treaty for, and from Mr. H. E. Wood, of the Angler's Hotel, Walton-on-Thames, in reference to the facilities he proposed to offer the angling community. Following this came Captain Alfred's paper "On Jack Fishing," which it is needless to say was a very careful and elaborate essay on the subject, such as could only come from a master hand, all the different methods of fishing being separately dealt with in the clearest manner possible. The discussion which followed was extremely interesting—catching, cooking, and so on, being thoroughly dealt with by the various speakers. Mr. Wheeldon, of *Bell's Life*, made an extremely telling speech—in fact, two, both to the point—and added considerably to the pleasure of the evening. Among other curious topics, Mr. Crumplen suggested that "lucius" (*Esox lucius*) was derived from some great captor of the pike in ancient times (Captain Alfred stating that the pike was the crest of the Lucy family), and although this view was questioned by Mr. Jardine, it appeared from Mr. Bryant, who was well acquainted with etymology, to be a highly probable explanation—Mr. Crumplen mentioning analogous instances of derivation in other departments of science. The paper was listened too with deep attention, and on the motion of Dr. Lloyd, seconded by Mr. Bryant, a hearty vote of thanks was accorded to Captain Alfred for so valuable a contribution. It was moved and carried that the Society's papers be printed and distributed at a fixed price, any profit to go to the Anglers' Benevolent Fund. It was also resolved to send a telegram to Wycombe, assuring the Preservation Society there of the sympathy and support of the Gresham Angling Society in the calamity arising from an accident at the paper mill, by which they have so seriously suffered. A pike of 11½ lb. was weighed-in by Mr. Knechtli, a beautiful fish, fitting sequel to the 60 lb. by Mr. Hunt last week, also a splendid tray of roach, taken on a fine hair line by Mr. Graham Bennett at Lea Bridge. A very hearty vote of thanks was accorded to Mr. A. Jardine.

PISCATORIAL SOCIETY.

As was generally expected, the roach competition of Monday last attracted a large number of members to the club room, at Ashley's Hotel, Covent Garden in the evening. Mr. Daniel Goodger was unanimously voted into the chair. The result of the contest was as follows:—Mr. Walker took the first prize of four guineas, with 23 lb. 4 oz. of roach from the Hampshire Avon, and Mr. Thomas Huggett, the second prize of two guineas, with 20 lb. 10 oz. of roach from the Hampshire Avon, and third prize of one guinea was won by Mr. C. P. Wheatstone, who weighed-in 13 lb. 9 oz. of roach from Mapledurham. In addition to these, Mr. T. R. Sachs showed 5 lb. 15 oz. of roach, the largest 1 lb. 13 oz., and 8 lb. 4 oz. of dace from Ringwood; Mr. Andrews, 9 lb. 4 oz. of roach, the largest 1 lb. 6 oz., and three dace, 1 lb. 10 oz. from West Drayton. Mr. Robert Barker, 11 lb. 14 oz. of chub from Sonning, the largest 3 lb. 6 oz., and Mr. Pattison, 6 lb. 12 oz. of roach from the Thames. The total weight of roach and dace was 90 lb. 5 oz. Two new members were elected, and several others were proposed for election. Mr. David Goodger, in proposing the health of the successful competitors, congratulated those present on the continued and increasing success of the society, and assured them their desire to maintain a friendly relationship with all anglers was its chief aim.

STAVELEY ANGLING SOCIETY.

The above society's anniversary dinner was held at the Elm Tree on Tuesday evening, the 8th inst., when the members and their friends, numbering sixty, of whom fifty are members, sat down to an ample repast provided by their host. After the cloth was drawn, Mr. G. C. Crofts, president of the society, took the chair. The usual loyal toasts having been given, the chairman proposed the health of J. B. Barrow, J.P., and in an expressive manner thanked him in his absence for so kindly giving the members the privilege of angling in the Rotter, Dove, Lea, etc., which was responded to by the members with musical honours. The following toasts were also given and heartily joined in: "Success to the Society," "The Occupiers of Land Adjoining the Stream," "Host and Hostess," etc. The club is in a flourishing condition, and is mainly composed of working men, who have had several matches and outings during the season. A very enjoyable evening was spent, accompanied by songs by Messrs. Briggs, Thorsfield, Goodwin, Dunfield, Tudsbury, etc., accompanied by Mr. Oldfield on the pianoforte.—M. W. TUDSBURY, sec.

Nov. 10.

FRIENDLY CITIZENS.

The half-yearly dinner of the above was held at the Hercules Tavern, Leadenhall Street, on Monday evening last. The dinner, provided by Brother and Host Maidwell, was capital. The toasts of the evening were: the Queen, and the Society, proposed by the chairman, Brother Abbott, in an interesting and amusing speech, and responded to by the whole of the brethren. The speeches were intermingled with some capital songs and music, by Brothers Styles, Simmons, Maidwell, G. G. Taylor, Billie Taylor, Musto Foster, &c. Visitor Thurlow presided at the piano, ably assisted by Dick Garner. Votes of thanks were accorded to the chairman, vice-chairman, treasurer, and secretary.

GOOD INTENT.

The members of this club began their November Sunday fishing for twelve prizes, in the river Lea, last Sunday, the heaviest gross weight of any to win, which is according to club rules. The jack fishermen had the best of it; roach being scarce. J. T. Richards weighed-in 10½ lb. of jack; Mr. C. Cox, one jack, 2 lb. Fifteen members weighed-in roach, all under 2 lb. We hope to make up for it next Sunday. I am happy to say all the tickets sent to this club on behalf of the Casting Competition held at the Welsh Harp for the benefit of the Anglers' Benevolent Society, will be paid for by the club, none to be sent back; hoping other clubs will do likewise, seeing the great amount of trouble and expense yourself, Mr. Editor, and many other gentlemen have been put to.—RICHARD MURPHY.

(For continuation of Club Reports, see page 560.)

MR. R. BALDERSTON'S TABLES OF FLIES USED AND RESULTS.

I SEND the tables in answer to your correspondent's question. I think they will be useful to your fly-fishing readers:—

Flies.	Fish caught.	Times used.	Average.	Most caught on one occasion above 7 in number.
Light grey mallard wing; body, bright green peacock's harl, legs orange, red hackle	532	108	4'928	35
Cochybonddu	474	152	3'118	31
Black palmer	426	143	2'979	20
Ronald's whirling dun ..	307	74	4'148	38
Blue dun	255	51	5'000	24
Black gnat	253	62	4'080	28
Orange red hackle, of Pennel's form	239	49	4'877	19
Orange fly	159	36	4'416	30
Red palmer	151	79	1'911	10
Hawthorn fly	133	41	3'244	18
Red ant	118	36	3'277	11
March brown	109	21	5'190	23
Cowdung	90	15	6'000	28
Iron blue	81	19	4'263	30
Orange blue dun	76	16	4'750	25
Light mallard, orange bodied	72	11	6'545	23
Grouse hackle	69	15	4'600	16
Black ant	63	27	2'330	9
Light mallard, peacock harl body; legs, black hackle	60	11	5'454	8
Jenny spinner	52	33	1'570	
Fern fly, ribbed with gold twist	52	18	2'888	
Light mallard, peacock harl body; legs, furnace hackle	50	8	6'250	
Quill dun	47	8	5'875	16
Holland's red spinner ..	43	6	7'166	23
Broughton point	43	18	2'280	11
Fern fly with yellow silk body	41	16	2'562	10
Little pale blue dun ..	41	21	1'952	
Landrail hackle	41	21	1'952	8
Gravel bed	39	9	4'333	14
Yellow dun	37	10	3'700	17
Water cricket	36	20	1'800	
Francis	35	15	2'333	10
Needle brown	32	6	5'333	15
Dark mackerel	31	14	2'214	
Wings, partridge and grey, double; legs, black, transparent hackle	29	18	1'610	
Blue bottle	26	17	1'529	
Stone fly	25	10	2'500	
July dun	24	12	2'000	16
Peacock	24	13	1'846	9
Oak fly	23	8	2'875	9
Pennell's green	21	5	4'200	13
Grouse fly, not hackle ..	20	3	6'666	13
Double red palmer	20	9	2'222	8
Pennell's brown	19	5	3'800	9
Grey drab palmer, transparent hackle	19	5	3'800	8
Legs, transparent brown hackle; wings, light red; body, light grey silk	19	7	2'714	12
Sand fly	18	6	3'000	9
Dark starling hackle ..	18	7	2'571	
Snipe light hackle	18	10	1'800	
Barm fly	18	5	3'600	8
Bracken clock	17	5	3'400	8
Red spinner	15	5	3'000	
Light mallard, red worsted body, red hackle ..	15	6	2'500	
Governor fly	14	5	2'800	
Green drake	13	7	1'857	
Large grey mallard	13	7	1'857	
Dotterel dun	13	9	1'444	
Dark drone	12	5	2'400	
Starling fly	12	5	2'400	9
Alder fly	11	2	5'500	11
Partridge hackle	11	4	2'750	
Shamrock willow fly ..	11	9	1'222	
Plover fly	10	3	3'333	9
Cinnamon fly	10	5	2'000	
Wasp fly	10	3	2'000	
Yellow sally	9	3	3'000	
Grey dun	9	4	2'250	
Turkey brown	9	4	2'250	

Flies.	Fish caught.	Times used.	Average.	Most caught on one occasion above 7 in number.
August dun	9	5	1'800	
Red fly, February red ..	7	3	2'333	
Coachman	7	3	2'333	
Iron blue transparent hackle	7	3	2'333	
Light starling hackle ..	7	5	1'400	
Marlow buzz, with long tinsel-ribbed body beyond hackle	6	2	3'000	
A kind of blue dun	6	2	3'000	
Greenwell's glory	6	3	2'000	
Brown palmer	6	11	0'545	
Woodcock hackle	5	1	5'000

Fish taken from the flies 4953
Fish that dropped off when these flies were used 193

Total 5147
Flies used 99
Average 2785

The flies were employed on 224 days, giving an average of fish per day 22'973. No casts which did not effect a single capture have been used for supplying flies for the list. On some days many casts of from two to eight flies were brought into use.

Mr. Editor, in answer to the request of your correspondent W. T. S., I give the accompanying table of fish caught by 99 flies, used during a period of several years for the capture of trout and grayling, but more especially the former. For dace, bleak, rudd, roach, chub, and carp I have distinct tables. The numbers given are the direct results of absolute totals; I have however, other averages, which show the comparative deadliness or selective attraction, of flies, deduced from the fractions which indicate the relative number of fish taken by each fly of any particular cast. These perhaps are of equal or greater value, for a bad fly may obtain many fish on a good day, whilst a cast of excellent flies may be almost unavailing on some particularly unfavourable occasion. Tables I also have of separate years, countries and districts; but the results of the last three years do not form a part of the appended list. To enter more fully into the subject at present would, I fear, occupy far too much of your space, otherwise I have no desire to withhold any information I might give; but, Mr. Editor, you are aware that, when I enter on the subject of flies I am apt to become uncommonly voluminous.

ROBERT BALDERSTON.

[We are sure our fly-fishing friends who are not wedded to the "three fly" system will study Mr. Balderston's tables with great interest. We should be glad if Mr. B. would give us his table of what he finds the most deadly flies. We can dispense with fractions, and will ask Mr. B. merely to name the flies, and put after each their comparative value, 20 marks to be highest. Thus many favourites will be entitled to 20, others to 15, and so on. If he will bracket them together in the months or periods in which they are used the table will be still more practical and valuable.—Ed.]

SOME OF ENGLAND'S DAINTIEST FISHES TRANSFERRED TO AMERICAN WATERS.

MORTALITY ON THE VOYAGE.—ONLY NINE OUT OF OVER ONE HUNDRED CARRIED SAFELY ACROSS THE ATLANTIC.—RELEASED AT BRIGHTON BEACH.

So far three experiments have been made in transporting live turbot and soles to the United States. Mr. Frederick Mather brought over English soles in 1878, as did Captain John Mortimer. The third and last experiment was made yesterday. About 10 days ago the United

States Commissioner of Fish and Fisheries, Professor Spencer F. Baird, instructed Mr. F. Mather, the Assistant Fish Commissioner, Mr. E. G. Blackford, the New York State Fish Commissioner, and the Secretary of the American Fish-cultural Association, to make all necessary preparations for the reception of a certain number of live turbot and soles which were to arrive by the *Parthia* from Liverpool, and to consult as to the best locality where the fish might be placed. The *Parthia* arrived on Wednesday evening, and early yesterday morning Mr. Frederick Mather, having made all arrangements for the reception of the fish, the United States revenue cutter *Grant*, Captain Fengar, was stationed, with steam all up, at the foot of the Cunard dock. The fish had been collected by Mr. Jackson, of England, after having been caught in the Irish Channel. In order to insure their being in good order, the turbot and soles had been taken as quickly as possible to the Southport Aquarium, so that they might, in a measure, be acclimatised. By this method it was hoped that any of the fish which might have been hurt would at once declare themselves. In order to give the fish every possible advantage of judicious attention, they were placed in charge of Mr. A. W. Armistead, a gentleman who has a fish-breeding establishment of some repute in Scotland. The *Parthia* sailed on the 15th of this month, and in two wooden tanks, made on purpose for the voyage, 75 soles and 35 turbot were placed. The voyage was a fairly rough one. Yesterday, on counting the fish, only six turbot and three soles were found. The rest had succumbed, very much to the disappointment of the fish-culturists. Mr. Armistead, whose attention to the fish had been constant during the voyage, could hardly account for the loss. The water had been changed at proper intervals, always having due regard to temperatures. It seems quite probable that certain arrangements in the water tanks, such as of cross pieces of wood, may have hurt the fish when the vessel rolled. As the proper method of transporting these fish can only be acquired by experience, the loss of so many will certainly encourage the introduction. It might have been wiser not to risk so many fish in one vessel, but to have divided them up into smaller lots, for without any apparatus at all, save some glass globes and by aerating the water, Captain Mortimer, during a very long sea voyage, succeeded in bringing over quite a number of fish, his loss being comparatively small.

By 10.30 o'clock, the turbot and soles having been transferred to a smaller vessel, they were taken on board the *Grant*, and, in charge of those appointed to care for them, they were carried down the Bay. A place had been designated off Coney Island, about three-quarters of a mile from the entrance to Sheepshead Bay, as the best locality for the fish. The reason for selecting this special water was because no ponds were near, and, besides, the amount of food necessary for young fish would be large, and again, on account of the sandy bottom. The *Grant* having come to in about five fathoms, a yawl was manned, the small tank with the fish was put on board, and the boat was rowed near land, until a depth of about 2 fathoms or 12 feet was found, when Mr. Mather placed the English fish in American waters. Both turbot and soles, when placed in their new quarters, did not seem to hesitate for an instant, but with a rapid movement and in the liveliest way made at once for the bottom.

As has often been told in these columns, we have neither the sole nor the turbot in American waters. The nearest approach to the first is our flounder, and to the second what is designated as the Newfoundland turbot. The pole flounder lately found by the Fish Commission is, as far as excellence as to taste goes, at least an approach to the *Solea vulgaris*, the English sole. In London and throughout England the sole is very extensively used, and if the statement is to be believed not less than 96,000,000 of them are marketable every year in London alone. They will average about one and one-half pounds, but the late Frank Buckland writes of having seen some eight pounds, and having casts of other twelve pounds. The flesh is exceedingly sweet to the taste and delicate. The turbot is certainly the best of European sea-fish, and the *Rhombus maximus* is the great table fish. It is not, however, any better than our pompano. The ordinary weight of this fish is from five to eight pounds, but specimens have been preserved of thirty pounds. Both sole and turbot swim in the same waters and their fecundity is very great. In a turbot it is supposable that there are over 14,000,000 of eggs. These fish are caught with the beam-trawl, side by side, and innumerable are the vessels off the English and Irish coasts which fish for them. As a description of the sole may be of use, it may be generally described as longer as to its width than our flounder and with shorter fins. The turbot is much broader for a flat fish than anything else caught in our waters.

Though fish-culturists may be hopeful that these few fish which were placed in our waters may thrive, they are by no means sanguine. It is hardly possible that a dozen fish placed in a single locality with hundreds of miles of water around them, will remain in the same position. Even should they grow, it has not been satisfactorily determined whether these fish were of different sexes. But what this experiment has shown, even if nothing is ever heard of these fish, is that they can be transported.

But there are other ways of acquiring greater security as to the propagation of foreign sea-fish, and that is one which is exceedingly simple. It is to have a breeding pond or a preserve in the proximity of New York. If there had been such conditions yesterday almost all the chances of loss would have been eliminated. A certain sum of money has been apportioned by the State to the New York Fish Commissioners, and they should at once, before doing anything else, secure a favourable locality where such a preserve for fresh and salt water fish-breeding can be made. Then when fish come from abroad they can be kept until the period arrives when they are about producing their eggs. Then one or two fish, if they be of different sexes, can become the source of millions of other fish. The small fish might

be kept and reared up to a certain point of growth and then given their liberty.

In studying the mortality of the fish brought over, it was greatest on the second day out, 36 fish having died. If they were not injured on the ship, it is likely that they suffered during a short land carriage from the train to the dock. At sea the maximum temperature of the water was 59°, the minimum 51° Fahrenheit. The temperature of the water off Coney Island where the turbot and soles were placed was 57°.—*New York Times*.

CLUB AND OTHER JOTTINGS.

By L. B.

ON Friday evening last a specially convened meeting of the working committee of the West Central Association was held at the Portman Arms, Great Quebec Street, Portman Square, Mr. P. Geen, the president, in the chair, some important business being got through, including, among other matters, the enrolment of a new society, viz., the Jovial Anglers, held at the Jolly Anglers Inn, Richmond. In answer to claim for same, the secretary was empowered to pay three separate sums of £1 for as many convictions obtained against poachers by a Thames river keeper.

The thorough investigation of a charge made against two anglers of abusing the privilege cards on the London and South-Western Railway, resulting in the committee, after a long and careful investigation, deciding to cancel same.

On Monday evening, the 7th, a special meeting of the United London Anglers Central Committee was held at the Bald-Faced Stag, Worship Square, Finsbury, Mr. Samuel Morgan presiding. There was a very good muster, thirty-eight societies being represented besides a number of gentlemen from the W. C. A., A. L., and P. A. S., including the chairman, vice-chairman, and hon. sec., Messrs. Bonvoisin, Beckett, Hoole, also Messrs. Penny, Dean, Field, Dix, &c. After the reading and confirming of the minutes of the previous meeting, the secretary, Mr. R. Ghurney, gave a report of the highly satisfactory reception of the joint deputation from the Eastern and Western Association by the authorities of the Great Eastern Railway, particulars of which appeared in the FISHING GAZETTE at the time.

The next business was by no means so agreeable, cancelling the privilege ticket of a person against whom a clear case of abuse was proved. This also was on the London and South-Western Railway. The important question of the transfer of privilege tickets between the two Associations was also unanimously agreed to, as it previously had been done by the W. C. A. To make clear what is meant by this, suppose A is an angler belonging to a society enrolled only on the books of the East Central Committee, and would at the commencement of the season take a privilege ticket from that body, for which he would pay them the usual amount for current year. Now, should A, after he had held his ticket for a few weeks or months, either from change of neighbourhood or any other reason join another society enrolled only on the W. C. A., he would, according to the arrangement arrived at, be entitled to get his ticket transferred, or rather would have another ticket issued to him for 2d. by the secretary of the W. C. A., or vice versa. Whereas, in the absence of the arrangement, he would have to pay full charge for a second ticket, though he might have held the first only a few weeks, and possibly never used it. Mr. Phillips and one or two other gentlemen asked that the arrangement just arrived at between the two other associations should be made to include the third, viz., the Central. Some discussion took place, in which Messrs. Murphy, Beckett, Manning, Hoole, Cundall, Ghurney, Newman, Noble, Bonvoisin, Phillips, and Theobalds took part, satisfying Messrs. Phillips, Theobald, &c., that, however willing the E. and W. Central Associations might be to work in unity with, and include the third, or Central, in any movement for the general good, they could only do so at the request of that body.

The memorial from the T. A. P. S. to the Board of Conservancy, the full text of which appeared in last week's FISHING GAZETTE, was then read, discussed, unanimously agreed to, and passed round the room for signature. Some routine business was then transacted, the meeting terminating with the usual vote of thanks to the chairman.

Messrs. Hoole and Vanner, of the Hammernsmith United, fishing at Richmond on Monday last, with Job Brain, took 13lb. 10 oz. roach and dace, Mr. Vanner beating his brother Bob nearly 2 to 1. Messrs. Penny and Pitts, of the same society, 25 lb. odd roach, from Henley on Sunday last.

Mr. Mann, at Clapham, near Bedford, gives permission to anglers using his house to angle from his land in the river Ouse. Now, the Bedford Angling Club claim the fishery rights in this portion of the river; whether the claims have any foundation or not I am not prepared to say, if so, there is a right way and a wrong way of enforcing them. The Secretary of the Bedford Angling Association will, no doubt, understand what I mean, but lest he should not I would inform him. I refer to what took place on a recent occasion when he was on one side of the river, the London anglers quietly pursuing their amusement on the other, and he carried on a conversation with them, in which, to put it mildly, he *didn't* use Wal'on's language, and say "I love anglers, for they be such gentle, quiet men," ending his undignified tirade by threatening that since they would not go away he would send those who would systematically annoy them, and to his credit (or otherwise) he was as good as his word; for subsequently the association keepers put in an appearance, and acting, as one may naturally suppose, "upon instructions" from the opposite bank, continued for a considerable time to pelt the unfortunate piscators.

floats and tackle with stones. Nor can the anglers who, on the railway platform the other evening, politely, but firmly, refused the chief inspector of police's request for their names and addresses, and referred him to Mr. Mann, be blamed; a request which, however, was immediately withdrawn when that gentleman was made acquainted with the fact that my friends had been angling from Mr. Mann's field, and with his permission. The association is said to be very unpopular in the neighbourhood, and it is scarcely to be wondered at if this high-handed sample is a fair one of their general mode of protecting their water, and enforcing what they are pleased, rightly or wrongly (on this I give no opinion), to consider their rights.

The next meeting of the committee of the "Thames Rights Defence Association" is convened for Thursday, 10th inst., at half-past 4 p.m., at Simpson's Hotel, Strand, when it is anticipated business of importance will be under consideration.

Mr. P. Geen sends me the following cutting from an Australian paper, sent him by his cousin, Mr. W. K. Phelps, who is settled at the Antipodes. These are the curious sights many of us Cockneys hoped the Westminster Aquarium would have treated us to. Alas! for our hopes:—

SHOOTING FISH, PALMER RIVER.—"Yaboonah" writes:—"This fish swims near the surface and can squirt water with such force as to knock a butterfly over at fully 6 feet from the surface. The caterpillar hanging on its thread, and the fish squirting water beneath it is really worth seeing. The shooting fish is of a yellowish colour, brown back, with three dark spots on sides, and is like the mangrove mullet in shape; weight from 8 oz. to 1 lb.; capital sport with light rod; bait, small blade young grass and green grasshopper, keeping well back from water. For tandem, fish at night; use worms only."

Apropos of forcing fish, Mr. Harry Wynn, a member of the North-Western Angling Society, last week presented the society with the remarkably perfect weapon of a saw fish, secured by his brother during his last cruise from China.

The next West Central Association, No. 1 District, visit will be paid to the North-Western Angling Club, the Lord Southampton, Southampton Road, Havestock Hill, N.W., on Monday evening, when it is hoped there will be a goodly muster of piscators.

Haslett, the well-known Chertsey fisherman, writes to-day:—"I have not much news at present, but am glad to say the cold chill has got out of the water. I think there must have been snow in it. I tried the old swim at the weir last week, with Mr. Allen, result one jack 6 lb 8 oz. (with a lob worm), and three fine perch. On Monday, at Penton Hook, with the same gentleman, one trout 3 lb, (also taken with a worm), which was taken to Mr. Forbes, of Chertsey, for the purpose of trout culture. I am baiting some swims, and hope next week to be able to write you that I have dropped among them to some purpose."

Our Editor's suggestions about artificial coarse fish propagation are too good to be passed over, backed as they are by the offer of substantial help, and if the initiatory step is taken I feel sure the club anglers of London will generally respond to it.

There is another scheme which should go hand in hand with this one, and, in fact, the furthering of the one would necessarily assist the other—viz., the licensing of available and suitable waters, within a certain radius of London, which, from their present neglected or dilapidated condition, could be had, in most cases, for a mere song, but stocked and carefully looked after for two or three seasons could not fail to prove a morally and pecuniarily profitable investment, if only in decreasing the present heavy strain on what I may call our metropolitan rivers.

On Sunday last Mr. Marshall, the chairman of the North-Western Anglers, and myself had a nice run down from Staines to Penton Hook and back. We gave the chub a turn, but the pith and brains had gone wrong in the night, and—whether the oldest and most odiferous wasn't the cheese after all, I can't tell, but the loggerheads wouldn't have it, which didn't at all interfere with our enjoying our outing and the glorious weather.

The West Central Association (No. 1. district) visit was paid this (Wednesday) evening to the Norfolk Angling Society. The chair was ably filled by Mr. W. Woolridge, the vice by Mr. Walter Pearce, secretary of the Marylebone Angling Society. Owing, no doubt, to the attraction of the illuminations and the fact that Wednesday is the meeting night of a great many angling societies, the attendance was not so numerous as might have been expected, or as host Galloway—who, as I stated last week, is indefatigable in his attendance when a similar compliment is to be paid to another society—deserved. Fourteen clubs, however, were represented, and the singing, as is often the case at moderate meetings, was throughout excellent. As stated above, the next visit goes to the North-Western Anglers on Monday evening next.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[Advtr.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated TROUT FLIES which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[Advtr.]

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

FROM BELL WEIR TO OLD WINDSOR LOCK;

OR,

WHAT HAS BECOME OF OUR JACK AND PERCH?

BY A THAMES FISHERMAN.

SIR,—The day's fishing is done, the punt has been cleaned, and all things placed in readiness for to-morrow's early start up-stream to the best 1½ miles jack and perch fishing the Thames can now boast of. The warm meal with which our return in winter is welcomed has been disposed of, with that relish which outdoor work and many hours of fasting alone can give. One of my long boots, after sundry lusty tugs by my son, has surrendered at discretion, but, greatly to the amusement of a certain damsel present with us this evening. Number two for some time absolutely refused to be moved without the leg, and when it did come off, it was so suddenly as to send the youth, damsel, and boot—somewhat mixed—to the other side of the room. The excitement caused by this little incident has passed away—the young couple are busy, very busy. The wife has taken down her knitting, and is rapidly adding row after row to the stocking which shall complete the pair for her undeserving old man. The pipe has been filled, and, as I enjoy it, I wonder if there is a happier four than we in all England. I believe I should have fallen asleep in less than no time, had not the old lady in spectacles and knitting needles sung out, in an unnecessarily loud voice—(I was not asleep, sir; I will admit I saw a float bob)—"How about your promised letter to Mr. Editor, father?" Yes, to be sure; I must do that to-night, as, possibly, I shall be too late and tired on my return from the old river to-morrow. The morning's journey is a long one, indeed, farther than I should care to push a punt previous to such a hard day's fishing as I shall have. Fortunately, I meet one of my oldest customers, who will readily pay the man whose services I have secured to tow me up.

Through Staines to Egham Lock we shall travel at the rate of three miles per hour. Now, reader, follow me as I go, and learn from no easily purchased experience where to moor your punt or to drop your line from the bank, and I will write from my mind's eye, as I smoke another pipe, of the splendid swims I have successfully fished, and which you may fish as profitably if you will but follow the advice of one who knows, and loves, every inch of our grand old river. We shall reach Egham Lock at six, how strange, it's just sixteen years to-day, and it was at six in the morning, that two gentlemen came down the river and attempted to shoot the weir. I called loudly through the fog and partial darkness for them to stop, there was some attempt to do so, but too late, bang went the punt against a pile, and one of the two was in the wild waters of the weir (he must be a good swimmer who shall live long in boots and great coat in this water). Luckily the back eddy formed by the rush that took him over brought him back to our feet, on the weir, and we seized and dragged him out, apparently none the worse for his morning's swim. I believe that the gentleman whom I assisted out of the weir, on that cold, dark, and frosty morning, was Mr. Hoole, whom I so frequently read of in the GAZETTE. As we leave the lock, notice how quietly the water flows as compared with the rapid stream below. Now, ye roach fishers, if you should ever be in quest of a pitch or two which shall afford a good day's winter fishing, choose them here from amongst a score, which can readily be discovered near the boughs which cover the opposite bank for a full mile up stream. The boughs hang well out over some easily baited and fished eddies, varying in depth from six to ten feet, and every now and then there is a break in these woody harbours which is just sufficient to give the bank angler space to wield his long rod. A few years since you might have taken many dozen perch in a day's fishing from these swims at this season. In the spring I have seen the boughs covered with perch spawn; but I am sorry to say the mania for steam launches, driven at a furious rate, sprang up, and their chopping waves have year by year forced the ribbons of spawn from their anchor to be lost in the depths of the weir below, where the necessary sun can never reach them. Don't forget to try a small well scoured lob once or twice in each swim, for if you fail to catch the last of the perch you may lay hold of some of the monster tench, for which they are noted. Next we sniff the tar factory, and if you can stand the smell here you may fish one of the best barbel swims in this long reach. It can be, and frequently is, fished from the tow-path; and a bootmaker of Egham (friend Waxey) has taken some extraordinary fish by throwing out his ledger, laying his rod upon the path, and standing well back. On we go, and as we travel the stream changes sides—instead of flowing gently against the tow-path it rushes with considerable force under the trees, bushes, and boughs which clothe the high and crumbling bank opposite. Skilled chub fishers, come and try your skill; the chub are here, and have been these many long years. Now and then I have coached a customer that could work this tit-bit; but unless you have served your apprenticeship it will be better for you to keep your tackle for the next mile, where we shall find the stream flowing more quietly under the high banks of Ankerwycke. Before us is a mile of magnificent chub water, and if from now until March next you shall fail to take two or three brace of chub per day, with which, as a true sportsman, you will be satisfied; then there is something wrong, and you had better come to me or some other professional for advice. We must not forget the second good barbel swim, as we pass the sharp turn in the river where at flood time it rushes against and over the road, from Staines to Old Windsor. Should you decide to bait this swim with worms, be very liberal; as this hole is the home of innumerable eels as well as barbel and chub, and I may add that it used never to fail me, when I wanted a few good perch.

Should bank anglers be here when the waters are out and coloured, try just above this deep hole, you will then find a nice large eddy, with a depth of five feet; and, if it be a mild day, it's ten to one in your favour that you hook some ancients from the hole below.

Next, we reach the mead, and I must perforce pause and turn my thoughts, as I always shall; so long as my old timbers are permitted to hang together, to the days of my boyhood. Here a good father taught me my first lesson in history, a lesson that caused the blood to rush through my boyish veins with pride, as I thought of our forefathers, who dared to make a tyrant king tremble. Yes. We stand upon Runnymede, and opposite is Magna Charta Island. Before we leave the Mead, you must please allow me to say a few words about the large bed of rushes at the tail end of the island; this, at one time, was the haunt of large numbers of perch and jack; but, unfortunately, the launches have murdered the one and the trailers the other.

It was to this spot, after the three days of failure, that I brought the True

Gentleman, nine years ago. It is said that every Englishman will claim to be a judge of a horse until he has purchased a trouble on four legs. I never remember a customer that could not paternoster, yet how few fail to show their utter ignorance at the first cast.

Quietly dropped the fine gut paternoster, with small lead, a minnow, and a 5-inch dace; slowly came the lightest of lines through the rings of a perfect rod on that day. Every inch of water was worked that the point could reach, and three fine perch were landed without a cast. Then a wider circle was as carefully fished, and so on, until the pitch was finished with a take of twenty-one perch and seven jack. I then pushed into the centre of the rushes to show him the splendid fellows I knew to be laying up. Was there ever such a commotion as answered to that thrust of the pole? In every direction they flew, leaving such numerous dirty water trails behind them, so as to effectually hide those that remained.

Years after this scene, the True Gentleman invited me to London and took me to the Aquarium. We saw the seals fed, and the commotion in the tank caused him to liken it to the commotion we saw in the bed of rushes yonder.

As we leave the mead and take the road that skirts the river to the Bells, we shall pass another famous barbel swim, possibly the best of the three if baited well and carefully. No mere throwing in any of quantity of worms will answer, you must have plenty of clay that you may ensure the swirling eddies and under-currents. Do not carry the bait to a spot in this long, broad, deep and uneven bottomed swim, where the ledger cannot be used. Should you be successful you will get hold of fish that will try your tackle, and you will be skilful if you can persuade all you hook to forego a rush which shall regain for them their rocky retreat.

After passing the Bells you will see a fisherman's cottage, on the right bank, that's Haynes' home—a right good fellow, who knows the business as it should be known, and who has taught his eldest son to row, punt or fish with the best of us; indeed, for two of these qualifications he stands first, as may be seen by the records of the Thames regattas.

Immediately alongside the cottage are some excellent, deep, quiet roach swims, known as Haynes' boughs. If any one desires a day in a punt without a fisherman he may always rely on getting one from my friend, H.

Old Windsor Lock is now in sight. We shall find the lock-keeper the right sort, ever ready to let you up or down. If a bank angler would like to try the deep hole from the rear of the lock garden he has but to ask for permission. We go through the cut—it's only a quarter of a mile—and then we shall be landed at the head of our fishing. What jack and perch will fall to the skilfully wielded rod only to-morrow can tell; but I can tell you now we shall be fishing one and a half miles of the River Thames where trailers do not come and where steam-launches are never seen.

I know, sir, there are jack and perch yet remaining in that portion of the river over which we have travelled; but as you pithily and funnily put it in your footnote to Professor Balderston's, or "No Ground Bait's," letter, "Life is far too short to be devoted to the stalking of solitary fish." (I laughed when I first read that note until my poor old sides shook, a fit of coughing followed, to stop which the wife had to well thump my back.)

What is the most practical remedy for this deplorable state of affairs?

We professional fishermen are vitally interested in your readers' answer. Our bread has been difficult to earn during winter in times past; but if we shall have to earn it in the future without the aid of these two fish, it will go hard indeed with the less careful amongst us. I admit our selfish interest, yet I am bold to ask advice from all true anglers, because they have always shown kindness and consideration to your humble servant,

A THAMES FISHERMAN.

[There can be but one answer, and that is—re-stock the water. Help us to carry out our proposed society for the cultivation of pike, perch, &c. As regards the steam-launch nuisance, we prophesy the public generally will not stand it much longer.—ED.]

THE CULTIVATION OF COARSE FISH.

SIR,—I am glad you are taking up the question of the cultivation of coarse fish, an idea that long since occurred to myself, and to which I incidentally alluded, before your remarks appeared, in my paper "On the Diminution of Fish in the Thames," read before the Gresham Angling Society.

The salmonidæ have already been well looked after, and deservedly so, but what the vast number of working anglers want to see, is an increase in the number of coarse fish, from which alone their sport is derived. They have already aided in that direction, and the readiness and loyalty with which they adhere to the fence months, is in itself proof of their desire to preserve and increase our stock of fish. If their sport were greater, we might more easily induce them to advance a step further, and go in for specimen fish instead of gross weights.

The proposed society will be of service not only in propagating species, whose habits are known, but may also elucidate matters relative to others, at present obscure, such, for instance, as the spawning of chub.

We should be by nature a nation of anglers, and I trust it will not be needful to send abroad for a manager, as suggested. It will be a disgrace to us, if we cannot find some English man of science, willing and competent to undertake or supervise the work of coarse fish culture, and I hope we shall. I shall be happy to attend the proposed meeting in my private capacity, and have no doubt our society will decide to be represented when the date is fixed.

We must, however, remember that the Thames Angling Preservation Society has not wholly neglected the propagation of coarse fish; it may, in fact, be described as a great propagation society (all preservation societies are), but until the angling laws are assimilated from Oxford to London Bridge, steam launches prohibited during the spawning seasons, and netting and river pollution ceases, I fear your efforts and theirs will hardly be so successful as they certainly deserve.—I am, &c.,

T. CRUMPLEN.

Nov. 7, 1881.

[We are glad to say we have received several promises of support, and are in hopes before long of calling a meeting to discuss the question. When we referred to this subject at the dinner of the Thames Angling Preservation Society in the summer, we mentioned that Mr. W. Oldham Chambers was considering the matter. We feel sure we may rely on his valuable co-operation. We suggested it first, nearly two years ago, to Mr. Charles Capel, but we fancy he finds his salmonidæ as much work as he cares to do as an amusement. He also will help all he can, we feel sure. As regards the "man of science," we shall be right glad to employ an experienced Englishman if he can be found, who will do the work as well as a German pisciculturist. We want merely a practical working manager of one of the German establishments.—ED.]

FISHING AT EYNHAM.

SIR.—I shall be obliged if you will give publicity to the true facts of the case with respect to this fishing. I rent this water from Lord Abingdon, and I issue to all anglers season tickets at the price of 5s. each, subject to the usual fence months and certain regulations as to sizes, of which a printed list can be seen at my house on Swinford Bridge, close to Eynsham Weir. I have no tickets for day fishing, but any one can fish my water without being a season-ticket holder on payment of 1s. a day.

I have seen the letters in the GAZETTE in reply to "Perch's" enquiries, and think it a pity people do not ascertain the correct facts before putting in print things which not only mislead others, but are, as I consider, against my interest. I know Mr. Hobden as a successful angler in my waters, and his remarks are about correct. My water is at Eynsham on the Thames, and extends from Cassington Lock to Pinkill Lock. If you will insert this in your next issue I shall be greatly obliged.—I am, &c.,

H. TREADWELL.

P.S.—Tickets can also be obtained for fishing in lengths of water below mine of Mr. Robinson, Wolvercote, and at the Trout Inn, Godstow.

FISHING AT EYNHAM.

SIR,—In this week's GAZETTE I notice there are three replies to the inquiries of "Perch" on this matter. Of these three, that of Mr. Hobden is no doubt the most correct. I am an inhabitant of Eynsham, and am also an angler, and have fished the water nearly all my life. Mr. Treadwell, senior, lately deceased, issued season tickets, and I always had one from him; and his son, the present Mr. Treadwell, does the same, and I have a ticket now for this season's fishing. This shows, I think, that the fishing is not free, and it also shows it is perfectly public to any one choosing to obtain a ticket. As to day fishing Mr. Treadwell's charge is 1s., but no doubt he would leave it to the generosity of any gentlemen fishing, to pay him more than this if they felt so disposed.—I am, &c.,

W. WALL.

Eynsham, Nov. 7.

THAMES NETTING.

SIR,—Could Mr. B. give us the exact meaning of his remarks concerning our Thames fishermen, for, as they stand at present, we are left in a state of uncertainty. In his remarks of October 22 Mr. B. says: "They have even boasted in my presence, &c.," and, then, in his reply to a "Thames Fisherman," Mr. B. says: "The remark was made by a fisherman," &c. If they are really so numerous, everyone will regret the fact; and, if, on the contrary, the remark was made by only a fisherman, then B. was surely unfair to write such a tirade against the fishermen as a body. It appears to me that the remarks of B. also convey a regret that so many unfounded reports of netting should be circulated, and yet we find him stating matters which cannot fail to induce others to believe the very thing he wishes them not to. Now, does Mr. B. really believe what these fishermen so often confess to him about witnessing these nettings; and, if so, cannot more efficient means be employed to stop the netting? If, on the other hand, B. does not believe them, why put in print that which helps to fan the flame of discontent which seems to be burning. I am sure that most anglers know the T.A.P.S. are doing great things in preservation of fish and prevention of netting in our river, and that we should be greatly pleased if Mr. B. could state that these "boasts of fishermen" were made in times gone by, and not recently, and thus remove the sweeping accusation now lying over the Thames fishermen of our times.—I am, &c.,

R. W. HOBDEN.

23, Blomfield Road, W., Nov. 7, 1881.

[P.S.—I shall be most happy to attend any meeting on the fish-culture question you suggested.]

A "WHITE" VARNISH WANTED.

SIR,—As a constant reader, may I ask you to be kind enough to instruct, not alone myself, but fellow amateurs, as to the best way of preparing a white varnish. The accidents that artificial baits are necessarily subjected to renders renewal in the shape of varnish indispensable; but neither by inquiry or by reference to recipes can I find how to make a white and durable varnish such as is used upon the artificial baits sold at tackle shops.—I am, &c.,

Nov. 10.

DINSDALE-ON-TEES.

SIR,—In your numbers for Sept. 17 and 24 there appeared a very well written account of Salmon Fishing at Dinsdale on Tees. The last month afforded excellent sport on the same water, the two Mr. Surtees from day to day catching fish of large size. Last week Mr. Hall landed the fish of the season, a fine fish, in fresh condition, of 24 lb. On the 31st Mr. Surtees was again successful with six fish, two of 14 lb., and on November 1st again landed eight fish of considerable size.—I am, &c.,

TEES-SIDE.

LIVE TURBOT AND SOLES FOR AMERICA.

SIR,—I am expecting a shipment of live turbot and soles to-morrow. They come from Mr. C. L. Jackson, Hill Fold, Bolton, formerly naturalist of the Southport Aquarium, to Professor Baird. They left Liverpool on the 15th, in the Cunard steamer *Parthia*, in charge of Mr. Armistead. I will mail you New York papers with account of arrival.—I am, &c.,

FRED. MATHER,

New York, Oct. 25.

Editor, *Forest and Stream*.

THE SPAWNING DACE.

SIR,—Mr. Hobden's reply to my letter, *re* dace taken by Mr. Walters, is far from satisfactory, for though I can quite understand their value for settling a disputed or open question, I still must say that far too many good fish were destroyed for the purpose, and in this L. B. is with me. I do hope, now that the point is settled, no other report of a similar kind will appear in your valued publication.—I am, &c.,

R. WOOLFALL, hon. sec.

Liverpool Angling Association, Liverpool, Nov. 7.

THE RIVER AT HARPENDEN.

SIR,—In answer to a query of a correspondent—*re* name of river at Harpenden—it is the Lea, which rises some miles further on past Luton, near the village of Leagrave, Beds.—I am, &c.,

H. E. SMILY.

P.S.—I presume you received stamps for admission to tournament (which I sent to office on 24th ult.) all right.

H. E. S.

[Yes, thank you.—ED.]

A CALAMITY IN THE ANGLING WORLD.—THE WYCOMBE ASSOCIATION'S TROUT ALL KILLED.

SIR,—I regret to inform you that owing to the bursting of a tank of bleach at Mr. Marchant's paper mill the splendid stock of trout in the association water below has been completely destroyed. It is computed that five or six hundredweight of magnificent fish, some over six pounds in weight, have been killed. Hundreds have been picked up dead, and the fishing prospects, for the next year or two at any rate, are ruined.

A special general meeting of the members, to consider this matter and to decide what is the best course to be adopted, will be held at the White Hart, Wycombe, on Saturday evening next, November 12, at a quarter-past six. It is hoped that the members will make a special effort to be present, as the future of the association will very much depend on the result of this meeting.

Fish having been destroyed on a previous occasion, it will now have to be decided whether any steps shall be taken by the association, or whether their efforts to preserve the stream shall be given up, and the society dissolved.—I am, &c.,

J. THURLOW, hon. sec.

Wycombe, November 8.

P.S.—There is a train leaving Wycombe at 8.55 p.m. This would enable members from London to return after the meeting.

[We need hardly say it was with deep regret we heard of the sudden destruction of this splendid trout fishery. Unless steps can be taken rendering a repetition of this calamity impossible, we should advise the association to look for some safer water.—ED.]

"FISHING GAZETTE" TOURNAMENT AND THE ANGLERS' BENEVOLENT SOCIETY.

SIR,—Will you please permit the insertion of this reminder?

I sent tickets for the tournament to every society enrolled upon our books. Only about eight, out of the eighty-five, have returned the unsold tickets or cash for those sold. Surely it is not too much trouble for the secretary to attend to this without further delay. The committee are anxious to close the accounts so that it may be known how much the above institution has gained by the transaction. I must appeal to the good sense and benevolence of the secretaries to see to this at once. The money is for a charitable purpose, and should be sent immediately. "He that gives quickly, gives doubly." P.O.O. payable to

T. HOOLE, Mortlake, S.W.

CLUB REPORTS—Continued.

ACTON AND FALING ANGLING SOCIETY.

Members still joining. Mr. Howell, 4 lb. 14 oz. roach and dace; Mr. Cook, 4 lb. 4 oz. roach and dace; Mr. Slatter, 5 lb. 3½ oz., and Mr. Dudley, 4 lb. roach; Mr. Eyndman, one jack 4 lb. ¾ oz.; Mr. Head, dace, chub and perch; Mr. Slatter, 5 lb. 1 oz., Mr. Dudley, 3 lb. 11 oz., and Mr. Howell, 4 lb. 1½ oz., roach; Mr. Head, 4 lb. 9 oz. roach, dace and bleak; Mr. Howell again, 3 lb. 5½ oz., Mr. Slatter again, 3 lb. 10½ oz., Mr. Dudley again, 3 lb. 1½ oz., roach and dace. All these fish were, with one exception, taken from the Thames) at or near Twickenham. One member presented a fish which was carefully measured with an ivory rule, and found to be very much undersized, at one end it was short quite 1-16 inch, so of course not passed. The new piano has been performed on more than once by members and friends. A competition between Teddington and Kew Bridge is to come off some day this month.—BLACK BAG.

ANGLERS' PRIDE.

The members of the above club fished for a series of prizes at the Rye House waters on Sunday last, with the following result:—H. Scott, 1st; J. Beeley, jun., 2nd. T. Marshall and W. Ferry both claimed third honours, and will fish for it again on some future occasion. The other members in rotation being H. Mallett, T. Fiddes, H. Haines and J. Sear, having roach, dace and perch from the Stort.—T. MARSHALL, sec.

Nov. 8.

ANCHOR AND HOPE ANGLING SOCIETY.

A match took place at Kingston, on November 6; fourteen members competing. A. Shakel, first prize; D. Davis, second; B. C. Booth, third: A. Glass, fourth; and several other members weighed-in fish.—A. SHAKEL.

Nov. 8.

BRIGHTON ANGLERS' ASSOCIATION.

The members of the above held a competition on Thursday, the 3rd inst. The weather being cold, and a pouring wet day, not a great many showed up. At the finish, Mr. W. Saunders was hailed the winner; Mr. G. Saunders, second; Mr. Noble, third; the other prizes were not taken. Messrs. Tree and Anscombe had a day out: Mr. Tree took 5 lb. of bream and Mr. Anscombe 3 lb. Weather, dull; water, rather thick. Sea hooks are now at work amongst silver whiting. Several good takes since Sunday. One boat hooked 40 score, and other boats between 20 and 30 score.—GROUND BAIT.

BURDETT ANGLING SOCIETY.

An excellent display of fish was shown at this club on Sunday last. Mr. Ratcliffe showing roach; Mr. Bullen, roach and dace; Mr. Frye, roach and dace; Mr. B. Smith dace, and Mr. W. Smith, who went jack fishing for the first time, was rewarded for his skill and patience with a nice specimen of that fish, we had also a good show of roach on Monday by Mr. G. Ratcliffe.—T. G. WALKER.

Nov 10th, 1880.

CLAPHAM JUNCTION ANGLING SOCIETY.

Mr. J. Innes and Mr. Hutchins of the above club weighed-in some nice roach and barbel on Sunday last 8 lb. 5½ oz., and W. Maslin added to the stock two pretty fish, captured by himself at Walworth, which caused great excitement in the Club-room; after being weighed, were made a present to the secretary, who had them cooked for breakfast, and much enjoyed them. Members are requested to attend on Thursday next to clear the books, as there is a long list of prizes to be fished for.—E. WILSON, Sec.

Nov. 7, 1881.

CITY OF LONDON ANGLING SOCIETY.

The following members weighed-in fish on the 6th:—Mr. Mortimer, 3 lb. 9 oz. of roach from the Rye House; Mr. Castell, roach, dace and chub from the Stort; and Mr. J. Chambers, bream and roach from Amberley. Several others were out but did not show up in the evening.—CAS.

DALSTON ANGLING SOCIETY.

A roving competition took place last Sunday. The most successful members were:—Messrs. Bunn, Fortescue, Nunn, Eagles, Midson, Long, W. Richardson, Malby, Slade, Anderson, Kidd, Willday, and Barson. Our next pegged-down match takes place on Sunday next, at Watford, for a series of club prizes. Members to start by 7.30, from Broad Street.—S. MALBY, sec.

Nov. 6.

GOLDEN BARBEL.

On the 6th the following members weighed-in fish:—H. Harrison, chub, roach, perch, and dace, 12 lb. 10½ oz.; Mr. Gough, roach, 13 lb. 5 oz. Mr. J. Green succeeded in getting among the roach and dace above Windsor (I think all brother members will be pleased to hear that Mr. J. Green, on the 7th, was the recipient of a very substantial recognition for his services from the Society of Old Friends, in the shape of a very handsome gold watch and a purse containing £22 5s. 1d.—success to the Old Friends); Mr. T. Lee, roach; R. Fellows, roach; Lumbey, roach; E. Harrison, roach; E. Hall, dace, the gross weight going about 50 lb. Mr. Allen and Bigsby have volunteered to be the examiners of the piscatorial trophy cases.—PIXIE.

HAMPSTEAD ANGLING SOCIETY.

The members of the above society fished at Bourne End in strong force for a prize, kindly given by Mr. Dillon, fishing tackle manufacturer, of Victoria Road, Kentish Town. The members were not successful, the prize being confined to roach, 1 lb. or over. Many very nice shows of roach were brought home by members of the club. Messrs. W. and C. Messenger, having two fine trays of roach. Mr. Chiel, a fine show of bream from Weybridge.—T. H. HAYWARD, Sec.

Nov. 9, 1881.

HAMMERSMITH UNITED.

On Sunday we had a good show of fish, principally roach, from the Thames, taken by Messrs. Pitts, Penney, and Hitchcock. Mr. T. Hoole on the 7th had some nice roach from Twickenham. Last week Mr. Aldridge succeeded in landing a chub at Egham weighing 4 lb. 13 oz. A match will be fished on Sunday next at Shepperton for a fish supper, and several prizes will be given. The supper will take place on Thursday next, when a testimonial will be presented to our chairman, Mr. H. Jones.—VORTEX.

LITTLE INDEPENDENT.

On Sunday evening our table presented a very pretty appearance, the trays being well filled. The following members contributed to same:—Mr. Grey, roach and dace, 8 lb.; Mr. Wightman, roach and perch, 3 lb. 12 oz.; Mr. Harwood, roach, 3 lb. 8 oz.; Mr. Atkinson, roach, &c., 2 lb. 6 oz.; Mr. Such, perch, &c., 1 lb. 8 oz.; Mr. Hopton, roach, dace, &c., 2 lb. 2 oz.; Mr. Heelas, perch; Mr. Scott, roach and dace; A. Evans, roach; Petrie, roach; Raine, perch and roach; Mr. Humphreys, dace. Mr. Brown, Coffee House Tavern, Charlton Street, N.W., took three jack on Saturday, at Ponder's End.—W. BROWN, hon. sec.

Nov. 8.

ORIGINAL ALEXANDRA SOCIETY OF ANGLERS.

We had a fine show of fish on Sunday last. Mr. C. Hewett, roach; Mr. W. High, roach; Mr. C. Newton, jack; Mr. E. Dymond, jack; Mr. Morton, jack; Mr. M. Dymond, jack.—E. DYMOND, sec. pro tem.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

The above society were well represented on Sunday last. Mr. T. Longman weighing-in 12 lb. roach, 5 lb. chub, and also dace; Mr. W. Longman, with a brace of jack and also some perch, both from the Thames; Mr. Neagus had roach from the Lea, Waltham, and was, therefore, the winner of the first prize last Sunday. The members fish a pegged-down match on Sunday next, at the Forty Guinea Water, for a silver-plated tankard, presented by the worthy treasurer. Time of starting—8 o'clock train.—THOS. WM. LUCY, sec.

Nov. 10.

ROYAL GEORGE ANGLING SOCIETY.

On the 6th inst. Mr. Tutter took 8 lb. of roach, Mr. Guynan 7 lb. Messrs. Chart, B. Hughes, G. Hughes and Holden also had takes of roach and dace. A series of prizes will be fished for at Chertsey on the 13th.—H. MILLARD, sec.

Nov. 8, 1881.

[In future send your report to 12, Fetter Lane.—ED.]

ROYAL PISCATORIALS.

The secretary of this society (Mr. F. Dale) had some decent sport at Datchett last week among the dace. Mr. T. Hughes had a few days out of town, the result of which was a nice show of jack was seen in club-room on Thursday and Sunday evening.—PIXIE.

ST. JOHN'S WOOD PISCATORIAL SOCIETY.

I have much pleasure in informing you that one of our members and a friend went down to the River Ouse, at Healy in No folk, and had a fine catch of roach and bream, many of the roach scaling over 1 lb; but, unfortunately, they caught no jack, which would not feed at all. The total weight for the two days was 74 lb.—J. EDWARDS.

WALWORTH WALTONIANS.

On the 4th a member out with E. Brown, of Richmond, for a few hours succeeded in getting a nice show of roach. The same gentleman will give for competition on the 18th December, two gallons of gin, the winner to receive it before Christmas. On the 5th December, Messrs. Brown and Cain started for Weybridge; on the 6th they returned the former with a tench weighing 2 lb. 5 oz. and some roach and perch. Mr. Cain had 2 lb. 5 oz. of roach. Both these gentlemen enjoyed the soothing influences of Father Thames at night time, and a steady downpour of rain from 12 till 7 the next morning. "Oh! a jolly fisher's life 'tis the best of any"; so I say. What do you think, Mr. W. Brown?—PIXIE.

WEST CENTRAL ANGLING ASSOCIATION.

The change in the weather last week was the means of our members having a capital show of fish on Sunday last. Mr. A. Taylor weighed-in roach and dace from the Thames; Mr. Bradley, roach and dace from the Thames; Mr. White, roach and dace from the Thames; Mr. W. Wilcoxson, roach, dace, perch, and a barbel of 3 lb. (taken with a hair line while roach fishing), from Chertsey; Mr. H. Wright, dace and chub from Bailey's water, Ponder End. The two prizes for this month are for the gross weight of dace and the largest perch.—R. I. BEARD, jun., sec.

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.

SATURDAY, NOVEMBER 19, 1881.

FISHING AT LITTLEPORT, ON THE OUSE.

(By R. B. MARSTON.)

WHILE on a visit to some friends in Cambridgeshire a short time back, I was offered an opportunity for a day's fishing at Littleport, which I eagerly embraced. I had taken no tackle with me, and, indeed, had no intention of fishing; but while

chatting over a pipe with my host and his son, I found the latter was an enthusiastic disciple of Walton, though too young to know much about it. "If you are so fond of fishing," said my host, "you should have a talk with our friend Mr. George who lives close at hand; he will tell you all about the fishing hereabouts; he is sure to look in this evening, and I heard him say he was going to have a day very soon—why do not you arrange to go with him?"

He had hardly spoken the words when Mr. G. himself appeared at the window, holding up a bait-box with the lid open for our inspection. "Oh do not let him bring those horrid things in here," cried my host's wife.

It is a wonderful thing how angling breaks down all distance and diffidence between strangers; in a very few minutes Mr. George and I were deep in the mysteries of our craft. Talk of Freemasonry! Why, the spirit of angling will kindle a stronger feeling of fellowship in an hour than Masonry in a year. When we shook hands at parting for the evening, we seemed to have known each other for years, and had arranged to have a day's fishing together on the morrow. I stipulated that our juvenile friend should accompany us, much to his delight.

I had given directions to be called at six next morning, but somehow or other I never find any difficulty in waking early or getting up for a day's fishing, though ordinarily it is the most difficult task of my life. This is a sad confession to make, but certain "curtain lectures" on the subject frequently remind me it is too true. "Oh you terrible fishermen! I believe you would get up to go fishing even if the town were on fire." I console myself with the reflection that Mr. George is doubtless composedly listening to similar remarks as he shaves himself this bright frosty morning. Frosty! As I look out of the window the house roofs and trees and roads glisten with the loveliest rose tints, as the hoar frost reflects the sunlight. Not promising for roach fishing, I think to myself, but at any rate a lovely day to spend in the country, and Mr. George has promised to introduce me to the famous Ouse and the almost equally famous Charlie South, of Littleport. We have a walk of some three miles before us, and, punctual to the minute, Mr. George appears. I have to borrow leggings and a fur cap from my host, a "stove pipe," as our Yankee friends term it, not being quite the thing to go a-fishing in. A glorious walk over ground like iron, through a pleasant country of farm land and orchards bring us to the station. "Change for Ely" at Cambridge, "Change for Littleport" at Ely. Yes, but we have forty-five minutes to wait for the Littleport train, and that will give us just time to look at the Abbey. Bits of English history come to mind as we reverently walk through the noble building—visions of the time before it was, when the land was all water and the water all fish. Ely derives its name from the eels, which have always been a great source of revenue and food to the town, and even now many of its inhabitants get their living by catching and selling eels. The Abbey of Ely was founded twelve centuries ago by the Lady Æthelthryth, the wife of Egfrith, King of Northumbria. In the year 868 Ely Abbey was burned by the Danes and the monks slain or dispersed. But they soon re-built their Abbey, for less than two centuries later, when England was under Danish rule, and good King Canute was sailing on the Ouse and the vast fen waters which surrounded the Abbey, every schoolboy remembers that—

Merrily sung the monks of Ely,
When Canute the king rowed thereby,
"Row, boatmen, row near the land,
And hear we these monks sing."

I trust my readers will pardon this little digression. To me one of the chief charms of fishing in England is the historical interest so often attached to the districts into which the pursuit of our art leads us.

The distance from Ely to Littleport is only five miles. Mr. George was in such a hurry to get ahead of three other anglers. he had noticed, that he left his jersey behind him in the train. I picked it up and hid it until he should miss it, because he had only just previously been telling us what store he set on it. "Come on," he cried, when we got out at Littleport, "come on," or those fellows will get South's best rods, and perhaps all his bait." So away we three went as fast as we could walk, and had soon left our rivals a good distance behind; but they knew our little game, and we soon heard rapid footsteps behind us on the line—for the nearest cut is along the line to South's house—and presently a panting angler, divested of all impediments, passed us at the rate of twelve miles an hour, and booked rods for his party. A few minutes later our rivals and ourselves were laughing over the scramble, both sides explaining their haste to arrive from a desire to wish Mr. South a good morning.

I had often heard of Mr. South, and an article which appeared in the GAZETTE some two years ago by a young customer of his had impressed me both with the fishing and Mr. S.—Mr. George

had been singing his praises all the way along. I am glad to say the reality fully came up to my expectations, for a better angler, or more jovial, jolly and good-natured a specimen of John Bull I do not wish to meet. I was considerably amused by the blunt manner in which he lectured Mr. G. for bringing us to catch fish such a frosty morning. "You don't expect a bite, do you? Why, I had to break the ice to get water for the kettle this morning." Mr. George explained that catching fish was only a secondary consideration, the principal object of our visit being himself. Charlie winked at this, but was good enough to say we might get hold of a few, and that at any rate it would not be his fault if we did not. South is in the employ of the Great Eastern Railway Company, and has charge of a level crossing on the line, within a few yards of the river. I had a very pleasant chat with him, and am glad to say I easily persuaded him to promise to send us a report of the state of the river and the "takes" every week. And anglers may rely on any report Charlie South sends being correct. He will not tell them to come if there is no chance, neither will he give them credit for a fin more than they catch. I happened to mention that friend Bonvoisin had spoken to me of him, and I could not have had a better name to conjure by. "Know Mr. Bonvoisin! Why he and I are almost like old pals—I wish I saw him oftener. I'll put you on his favourite swim. My eyes, what a clever hand he is with the roach rod! I shall never forget the thirty or forty pounds of fine fish, not counting the small fry thrown back, which he got one day, and what a day it was. Rain! I never saw such rain, and there he stuck till he hadn't a dry stick on him, and had to turn it up at last for fear of being washed out, and because his fingers were so wet he could not bait his hook, his paste was all pap."

Mr. S. ran on in this strain all the time he was preparing our tackle. He keeps a dozen rods and lines all ready for use, and provides baits and ground-bait at a moment's notice, though of course it is better to drop him a line beforehand, so that he may be fully prepared. He makes his own rods, and keeps a store of good tackle, and this in itself ought to secure him plenty of customers. We were soon ready, and, after a glass of beer at the neighbouring inn, started for our swims. The Ouse at Littleport is a fine broad river, with any amount of depth and a gentle tidal current. The scenery is not very grand, one hardly expects it to be in the fen country, but it has a certain quiet charm of its own, and then the fishing is first-class.

I think if London anglers who, week after week and year after year, spend their fishing days on the over-fished Thames, Lea, and Colne, would turn their attention to the waters preserved by the Cambridge and Ely Angling Association they would do wisely, and for the benefit of such of them as may care to take my advice, I will here introduce a few practical statistics. Mr. George is a member of the society, and a most energetic and enthusiastic one too; he gave me the address of the hon. secretary, Mr. W. Purchas, 62, Sidney Street, Cambridge, and from him I obtained the following particulars respecting the club, of which, by the way, I hope shortly to become a member. The president of the society is the Rev. Dr. Porter, Master of St. Peter's College, Cambridge, and the management is entrusted to a committee of twenty-four gentlemen.

The object of the society is the "Preservation of the Fisheries of the Rivers Cam and Ouse and their tributary streams and adjacent waters." The annual subscription of members of the society is not less than half-a-crown. All unfair fishing, including, I am glad to see, trailing, is prohibited. Any member may obtain two free day tickets for friends "not resident in the county of Cambridge."

The following is a list of the waters now in the hands of the society and open to its members, making in all about "thirty miles of preserved waters in the Cam, Great Ouse, Little Ouse, and Lark." Some of this water is suited to trout; the Lark, I expect, as I see Mr. Fred. Jennings and Mr. W. B. Caldwell presented several thousand trout fry to the society, and they were introduced this year. May they prosper! :—

The following are the present hirings by the Society :—

The Cambridge Corporation Fisheries, from Sheep's Green to Barnwell Pool, about 1½ miles, rent 42s.

A fishery, extending from Barnwell Pool to Ditton Dock, about one mile, rent 50s.

Several fisheries, from Ditton Dock to the Jolly Anglers, eleven miles, from Mr. J. Morley, £20. This amount includes Mr. Morley's services as watcher.

About 1½ miles, from the Jolly Anglers down to the first jump below Denson's, at Upware, hired of Mr. Denson.

The fishery extending from the Horse Jump down to Dimmock's Cote, Wicken Fen, hired of Mr. Isaac Aspland, farmer, about one mile.

The fishing from the Cote to Pope's Corner, at a peppercorn rent, two miles.

A right of fishing in that part of the river fronting Thetford Common, belonging to St. John's College, hired of Mr. J. Lester, half-mile, 20s.

Between Pope's Corner and the Newmarket Railway Bridge comes a piece of free water.

A right of fishing between Dimmock's Cote and Ely Bridge, hired of Mr. H. Dench, about three miles, £8. The Ely Local Board of Health own the water opposite the bathing sheds. There is some free water just below Ely.

The fisheries of the South Level Commissioners, extending from the Old Fantail Mill down to a point just above Littleport Bridge, including about a mile of fishing in the river Lark, 5½ miles, £5. Also several ditches on the moor at Littleport, hired of Mr. Little and Mr. Barrett.

Swavesey fishery, from a point known as the Poplars, Holywell, down to a point called the Lode, in the parish of Swavesey, about two miles, £4.

The watchers employed to look after the above preserves are Mr. J. Morley, Ditton; and Mr. Denson, Upware; Mr. Cross, Ely; Mr. Gooby, Littleport; and Mr. T. Metcalf, Swavesey.

The Great Eastern Railway Company have, during the past year, kindly extended their favour, by issuing to members of the Society residing at Lynn and Wisbech, return tickets at single fares to Littleport and Swavesey. Return tickets at single fares are issued at present in addition to the above as follows :—Between Cambridge, Waterbeach, Ely, Littleport, and Swavesey, and from Newmarket to Ely, Littleport and Swavesey.

There have been one or two prosecutions for illegal fishing during the close season, and netting is being greatly suppressed.

The annual dinner took place at the Lion Hotel last October, and was presided over by Rev. J. Porter, president of the Society.

A meeting, followed by a supper, was held at Ely on the last night of the close season, and was a most successful gathering.

The number of members has increased upwards of 100 during the past year. The following figures show the distribution of the membership :—Cambridge, 403; Ely, 43; Lynn, 40; Newmarket, 35; Littleport, 17; total, 538.

BAITS, ONE SHILLING PER SCORE, may be obtained by Members at the following places :—Anchor, Silver Street; Banham's, Jesus Sluice; Morley's, Ditton and Bottisham Lock; Denson's, Upware; Bryant's, Ely; Appleyards, Ely; Black Horse, Littleport; J. Gooby, Littleport. Members are earnestly requested to return all undersized fish to the water.

Ely is only about two hours' journey from London, and if the rest of the thirty miles of fishing is as good as what I saw of it at Mr. South's place, I am perfectly certain it would simply astonish many of our London anglers. Then look at the entrance fee—fancy, only 2s. 6d. a year. Why, we pay as much as this a day for fishing a few hundred yards of vastly inferior water near London.

But to return to our actual experience. In the first place, the frost was against us; secondly, we had a bright sun on a bright water. Notwithstanding this, and although our young friend was a perfect novice, we caught over 8 lb. of fine roach, and with hooks on gut which any roach within twenty miles of London would simply laugh at. I confess I wished I had had some crystals with me, on fine drawn gut. Mr. South acknowledged the tackle might have been finer, but, as he very pointedly put it, when he sometimes loses as many as a dozen or twenty hooks per day, it did not pay to find finer. His rods, lines and floats are very good, but, of course, I would recommend anglers to take their own if possible, at any rate, a few hooks on fine gut. We fished from the bank, in about six feet of water. No boat is necessary or obtainable as far as I know. We used bread paste, and I heartily wished I had had some of Mr. King's paste with me. It makes such a beautifully white, tenacious bait, and is a real boon to the roach-fisher. I got six good roach with it in the Colne the other evening in about twenty minutes, and when it was almost too dark to see a bite. It must be mixed with about an equal part of stale bread paste, otherwise it is too sticky to use. My wife always uses it, partly because it sticks on the hook so well and certainly she has had some rattling good fish, both dace and roach, when using it. She says she knows what it is made of, but it would be hardly fair to Mr. King to let the cat out of the bag by taking advantage of a lady angler's knowledge of cookery matters. Suffice it to say it is a very nice article of food, and that fastidious anglers of either sex will find it as clean and dainty a bait as they can use. I saw several good jack moving on the shallows opposite the swim we were fishing, and wished I had proper jack tackle with me, our reel lines were all too short to throw across with. I am certain an American spoon on a gut trace would "fetch" them. There is plenty of fish of all kinds, and now that netting is being stopped, there will soon be more. Mr. South told me perch were rather scarce. I saw an angler near us fishing with Nottingham float tackle and worm get two small ones; he must have been fishing in ten or twelve feet of water, and threw out well into the stream. Besides the perch, he had a few very fine roach, and two jack under 2 lb. each, all taken with marsh worm. When I suggested he might use paste with advantage, he merely replied, "Big 'uns or nothing. I never use any bait but worm." He was evidently an old hand, and said the fish were "dead off the feed." I find I am rambling on much farther than I intended, so I will close this account of my first visit to Littleport, with thanks to Mr. George and Mr. South for a very jolly day, and with some hopes that what I have said will induce our London anglers to support the Cambridge and Ely Angling Association. I feel certain any respectable angler, rich or poor, will be welcomed by the society, which, with thirty miles of water at their disposal, will have no need to limit the number of the members for a long time to come. When there are a thousand members, and they all fish at the same time, they will still have each some fifty yards of water!

By the way, I nearly forgot to mention that decent accommodation can be had at the inn, close to South's place; and also in Littleport itself, at one or two places. By "decent accommodation" I do not mean all the luxuries of a big hotel, including a big bill, but all an angler wants.

EXAMINATION OF PUNTS AND FISHING IN THE THAMES TIDEWAY.

VERY glad to see you, gentlemen, engaged in so good a work as the examination of punts in the tideway, was the feeling which addressed itself to those who were busily occupied in the work on the afternoon of Thursday and Saturday of last week, and the reception so given to putting a check on the retention of undersized fish was of the most encouraging character. Commencing under the lock at Teddington, where James Kemp and a venerable piscator were raking for dace and getting some remarkable good specimens of the species—passing through the glorious deep at Twickenham, where John Bushnell and others were making some splendid shows of roach—continuing the course behind the Eel-pie Island, where, amongst other boats, two of Mr. Perrin's punts were nobly occupied in competition against each other, principally with the roach—then the enquiry from one as to the prospects of the other—the reply that at present "they were not in it at all," this answer producing vigorous action on the attendant fisherman by the introduction of a further supply of ground bait, the parting application, "Tell Mr. Perrin his punts are doing well, and the sizes of the fish quite satisfactory." Progressing then through one of the best of swims near Petersham Ait, where Job Brain with his client were picking out some fine roach, and, turning round the corner, finding Kit Brown with a customer, getting a few good roach, and terminating the visit below Richmond railway bridge, where three members of the Richmond Piscatorial Society were trying which could do the best, and then, in another boat just below, with anglers was Mausell, who has been laid up for some time, but now so far recovered as to resume his business amongst the fish. This is simply chalking out the course which was pursued through the number of punts on Saturday last, but the general result and kind recognition of the inspectors would require a more lengthened expression of words to give even an adequate idea of what passed at the various boats. The value of angling clubs in the encouragement of fair fishing and the capture of proper sized fish by their members was apparent. In addition to the Richmond Piscatorial Society, there were representatives of the new society at Acton, called the Acton and Ealing, the West Ham Brothers, and other clubs. The ready exclamation of these anglers that their societies would not allow them to bring into the club-room any fish of only a quarter-of-an-inch under the recognized standard was a great proof that the Central Associations to which they are affiliated was doing a noble work. It was also evident the fisherman attendants were equally pleased with the anglers to have their wells examined, and as the Inspector's boat was coming alongside, they got the well all ready for the dip of the net. How frequently those engaged in the examination of the punts had to exclaim as the net came out of the wells laden with good-size and numbers of well-conditioned fish, "What a splendid lot of fish!" How contradictory to the statements of some, that there is not a sizeable fish to be caught at Twickenham—here were roach up to a pound each, and dace measuring eight inches in length—not here and there one—but in takes that could be estimated by dozens. Very few indeed had to be rejected as too small, certainly not more than half-a-dozen were returned to old Father Thames again. Surely proof like this must set at naught those idle rumours as to the paucity of fish, and evidence the statements, in regard to size, as directly untrue. The contrast in the examination of punts now to what it was fifteen years ago when the work was first commenced is strikingly different. It was then regarded as an iniquitous proceeding, and very oppressive to the anglers. Attempts were made to commit breaches of the peace, and persons on the banks were invited to attack the examiners. The fishermen passed opprobrious epithets, and evinced no willingness to submit to the inspection; but there was great proof evidenced of how the slaughter of the innocents was going on when the first and early conviction was for taking and destroying about seven dozen roach, not more than four inches in length, and this was followed by others equally bad. These convictions broke the neck of the opposition, and gradually, as the work was conducted in the most courteous manner, both anglers and fishermen felt the necessity of the law being vindicated, and the practice of retaining small fish given up. There is now no insulting cries of "Brougham's babies" being sneeringly directed in visits down the river. The present president of the Thames Angling Preservation Society has, during the last few years, in the most striking manner, energetically revived the movement of examining punts, and by in-

culcating amongst fishermen and anglers the value of true sport, the inspections have become "a work of faith, and a labour of love," if a labour it can be called. The visits of last week certainly evidenced the satisfactory character of fishing in the tide way—the general civility of the fishermen, and the hearty welcome of the anglers from whom it was difficult to refuse a lubrication. Not a complaint against anything was raised, but a desire to unite in the work, and as it is intended to make these visits more frequent, the great result to be accomplished by them will be a direct negative to unfounded reports, and the strengthening of a better feeling amongst all connected with the river. It has been well said, "He is the free man whom the truth makes free, and all are slaves beside," and Burke has strikingly portrayed the necessity of union in these words, "When bad men combine, good men must unite or else they will fall one by one unpitied sacrifices in a contemptible struggle." I have given these quotations from memory if they are not strictly correct, I have no doubt some of my critical friends will tell me.

B.

TROUT AND GRAYLING FISHING ON THE DOVE.

By R. B. MARSTON.

(Continued from page 515.)

IN my last I left the angler just below the second dam in the grounds of Ilam Hall, trying to get a secure foothold on the slippery stones of the Manifold. At the foot of this dam there are some beautiful streams; every foot of water should be carefully searched with the flies, and particularly the quieter, dark-looking water between the rougher currents. On these quiet places the white foam floats in patches, and solid-looking lumps, but they are all on the surface, and your fly will go through them, and sink an inch or two in the most deadly fashion. Many a splendid trout have I caught amongst these froth-beds away down in Devonshire, in the northern border streams, and indeed in every rapid trout stream, the kind of stream I love best of all. I daresay many of my readers have noticed that it is more difficult to catch a trout in these quiet places where he sails about at his ease, than in the stream where he must keep behind some big stone and dart up into the current for his prey rapidly going past him. I have frequently noticed this. In the quiet water he either comes up slowly and critically, and probably refuses, or he comes like lightning, and often fairly beats your quickest strike. My experience is that in all still water it is more difficult to strike quickly enough than in a stream, at any rate, more difficult to hook fish. I got one or two fish out of these quiet bits below the dam, but not a rise in the stream until I got my end fly within an inch of the wall on the other side of the river. The stream runs strongly under this wall, and I got two good rises within an inch or two of it; but missed both. Passing under the pretty ivy clad bridge just below the dam, I find a succession of beautiful streams; every likely spot is carefully fished, but not a rise is got, the fish are not moving here, and I am beginning to get tired of slip, slip, slip, and no result. At last in the last stream of all, which runs into the long stretch of dead water above the second bridge from Ilam Hall, by letting my line work down some thirty yards I got a good rise, and struck my fish, it proved to be a fine grayling. I could kill him I knew if I waded down to the quiet water he was in, but if I did so I should lose all chance of getting other fish out of this stream, and Mr. Waterfall had assured me it was one of the best on the Manifold, so I determined to risk pulling him up stream, getting him first out of the main current. He was fighting splendidly; in fact, when you get a big grayling at the end of a long line, with the current on him, he pulls more powerfully than a trout. I got him safely up full twenty yards from where I hooked him. He then rolled over and over into the full strength of the current, and although I slacked line instantly, the weight was too much, and the hold on his tender mouth gave way. I had still the consolation of knowing I had not disturbed the water to any great extent, but I got no more rises, and so walked on, past the dead water, to the bridge at the village. Just below this bridge, and in front of Mr. Waterfall's house, there is a splendid piece of water. A wide, rapid, shallow stream goes into a deep hole, forming splendid eddies on either side. The best way to fish it is to wade down the middle, as a bed of stones and gravel runs out into the pool, leaving deep water on either side. I placed my honey-dun bumble on the opposite bank, just under a branch, then drew it gently off, and the stream carried the cast under the boughs over a lovely eddy, which I could not have reached by a direct throw. I felt sure there was a fish here, and sure enough the all-welcome flash appeared—no rise, for the flies had sunk a little—and the next instant a good trout of $\frac{3}{4}$ lb. was splashing on the surface, shaking his head like a terrier with a rat. I slackened line, so that he might sink, for this manoeuvre

of splashing on the surface put the chances too much in favour of the fish. After a good fight he gave in. The fishing for the next hundred yards or so is somewhat difficult, as it is overhung with branches, but there is room for the side cast, which I tried all the way down without a rise. At the end of the holly hedge, and where the river leaves the road, the fishing is open, and just at this point heavy grayling always lie, there being some beds of fine sand just here. I got a small trout here, but the grayling were not moving. In fact, I was somewhat unfortunate in the time I had selected for my fishing. The trout-fishing was nearly over, and the grayling had not fairly commenced. I wish I had made it a fortnight later. "There is a fish jumping over there," said a voice behind me, and on turning round I saw my wife, who had come to bring my macintosh. I looked in the direction indicated, and was just in time to see the expiring rings of a rise. He was in about six inches of water, right under the opposite steep bank, for the banks on both sides now get steep all the way down to the Dove junction. Wading out as far as I dared, I threw my fly a foot above Master Trout, and he rose splendidly. I had twenty yards of line out, if an inch, and I had to strike pretty heavily over my left shoulder. "Do not let him go," said my wife, watching the fun with the greatest interest; "what a beauty!" I had got him within a yard of the net when the line came away. "Oh, what a pity! Never mind, if you throw quickly, perhaps you may get him again." I explain that I may get him again to-morrow, but that for the present he is too sad and wise a trout to look at any fly. If the foothold had not been so horrible I should have killed this fish, but when I ought to have been attending to him I was absorbed in gymnastic motions to keep on my feet. "Do come out. You will fall over for certain!" my wife says; and, to tell the truth, I am not sorry to get a rest and something to eat. After lunch I decided to walk down and fish only for rising fish, if there were any. There are some lovely streams and pools in this last bit of the Manifold, and in a breeze I am certain they would yield good sport. Half-way down the last pool but one, I saw several grayling rising. This revived my energies, and it was not long before I had my line over them. The bed of the river is here very level, and covered with small stones, fairly easy to walk over in spite of their slipperiness. I got a brace in about ten minutes, both with the grey palmer—a fly I had from Mr. Foster, of Ashbourne, and which I found a first-rate killer. It is wonderful how near you can get, when wading, to rising grayling. Two or three little fellows rose persistently so close to me that I could have knocked them with my rod point. As I could get no big fish to move, I got out, and went down to where the Dove comes in, to fish in earnest in the "up-stream" style.

What a pleasure it was to get into the clear, cold Dove, with its firm foothold, after the treacherous Manifold! Turning your back on the main river, you enter the little stream under a natural bower of entwined trees, and the pretty pool and stream before you are the first of a series of some thirty or forty like them, which form the lower course of the stream, and, in my opinion, afford the best fishing until you get to the wooded water half-way up the dale. I must reserve my experiences on the Dove for another occasion.

(To be Continued.)

TESTIMONIAL TO MR. BONVOISIN.

WEST CENTRAL ASSOCIATION OF LONDON AND PROVINCIAL ANGLING SOCIETIES.

8th November, 1881.

Chairman, P. Geen, Esq., Hill View, Addlestone, Surrey, Hon. President of the Association. Treasurer, F. C. Clench, Esq., Woodbine Cottage, Mortlake, S.W., Chairman R.P.S. Committee: Messrs. Murphy, Field, Vincent, Ghurney, Welch, West, Star, Castell, Noble, Becket, Marshall, Adeane.

At the annual meeting, in April last, it was decided that an appeal should be made to the London anglers for funds wherewith to present a fitting testimonial to Mr. Bonvoisin, chairman of the association.

For many years Mr. Bonvoisin has laboured unceasingly, and without reward, in our service, ever watchful of the interests of all anglers, never sparing himself, his time, or money, when either was necessary for the fulfilment of his duties.

Every angler will now have an opportunity of assisting to show that we are not unmindful of such services, and at the same time assist to testify to our great respect and esteem for one who has laboured so zealously on our behalf.

The following gentlemen have kindly promised their assistance Captain Alfred and T. Spreckley, W. H. Brougham, R. B. Marston, H. B. Eyre, A. Jardine, F. H. Leman, A. Nuthall, J.

Pattison, C. P. Wheatstone, W. J. Wetenhall, T. Abbott, H. Dickerson and A. Pitts, Esqrs.—I am, dear Sir, yours truly—T. HOOLE, Hon. Sec., Mortlake, S.W.

[We have elsewhere in our present issue referred to this testimonial, which we trust every angler who knows how Mr. Bonvoisin has worked for the interests of angling will heartily support.—ED.]

THE EEL NETS ON THE NORFOLK RIVERS.

EEL SETS ON NAVIGABLE WATERS.

ON Monday evening a meeting was held of the joint committees of the Yare and Bure Preservation Societies, who had been summoned at the instance of E. Birkbeck, Esq., M.P., to consider whether any, and if so, what steps should be taken with reference to the use of eel sets in the Bure and other tributary rivers. The chair was taken by Mr. E. Birkbeck, M.P., and there was a large attendance, including the Deputy-Mayor of Norwich (S. Grimmer, Esq.), Mr. E. Field, Mr. R. E. Burroughes, Mr. I. O. H. Taylor, Mr. A. J. N. Chamberlin, Mr. H. W. Stafford, Mr. C. Davis, Mr. B. W. Jolly, Mr. Harmer, Mr. T. Southwell, Mr. J. W. Skipper, Mr. F. Sutton, Mr. F. C. Steward, Mr. W. Brown, Mr. J. Stanley, jun., Mr. Baldry, Mr. C. Daniels, Mr. W. Moll, Mr. A. Palmer, Mr. C. T. Green, Mr. A. Barnard and others.

After considerable discussion, it was resolved, on the motion of Mr. Baldry, seconded by Mr. A. J. N. Chamberlin:

"That a sub-committee be appointed, consisting of Mr. R. E. Burroughes, Mr. E. Field, Mr. I. O. H. Taylor, Mr. Davis, Mr. O. Chambers, Mr. A. J. N. Chamberlin, Mr. E. Birkbeck, M. P., and the Secretaries of the Yare, Bure, Ant, and Waveney Preservation Societies, to communicate with the gentlemen claiming the right of placing eel sets in the several rivers and their tributaries within the area of the Norfolk and Suffolk conservancy district, to point out the injury done by the eel sets, and without admitting the right of such owners, to invite them to allow the passage of fish up stream on occasion of salt tides, and to report as to the number of eel sets, and the result of the communication."

On the motion of Mr. Chamberlin, seconded by the Deputy-Mayor, a hearty vote of thanks was accorded to the Chairman for his public spirit in calling this meeting, and for his readiness at all times to do good to his fellow-men.

Mr. Birkbeck briefly acknowledged the vote, and this concluded the proceedings.

[We await with considerable interest the report of the sub-committee, for the speakers at the above meeting were divided in opinion, one side affirming that the eel sets only caught eels, and the other that they caught large quantities of all kinds of fish. Mr. Christopher Davies laughed at the idea of these eel nets damaging the fishing, except occasionally, when they stopped the retreat of the fish before the "salts." We know one fact, and that is, that the eel is the greatest destroyer of other fish that exists, is ten times worse than even the pike, for it eats eggs and fry in millions. If a few other fish are now and then caught in the eel nets, they are as nothing compared to the fish life that would be killed by the insatiable eels, which would go free if the eel netting were interfered with.—ED.]

CLUB AND OTHER JOTTINGS.

By L. B.

THE West Central Association No. 1 District visit was paid to the North-Western Angling Club, on Monday evening, 14th inst. Mr. Harding occupied the chair, Mr. Packman proving an efficient vis-à-vis; thirteen clubs were very numerous represented, the spacious room being crowded. Mr. Ernest Symonds officiated at the piano, and some capital singing, toasts, &c., made time pass most pleasantly. Among the gentlemen who distinguished themselves by their vocal powers were—Messrs. J. H. Stead (the "Cure"), Waltham, and Letch. A feature of the evening was the bringing up by Mr. Kelsey from the tidal portion of the Thames of within a few ounces of 19 lb. of splendid roach and dace. Not bad for a beginner. The next visit in this district goes to the Phoenix Angling Club, due notice of which will be given.

Apocryphal of fish, the jack are beginning to move again at the Welsh Harp, and a number of good fish were taken last Sunday. Among others, a nice one of 15 lb. Mr. Plumptre, sen., tells me they, however, were feeding very gingerly, and in the majority of cases made for the small baits, instead of for the full-sized dace which are generally most killing here.

The quiet, civil-spoken angler, however humble his station, will generally be readily granted many little privileges from gentlemen, lords of manors, millers, and others, if such are properly asked for, and that the great bulk of our London club men, are quiet and respectable, and law-abiding men, I am able from my long acquaintance

with them to positively state, but that there are some blackguards who have from time to time crept in to our ranks, is also an undoubted fact, as may be judged from the following, which forms part of a letter received this day from an intimate friend, and resident in the neighbourhood referred to :—

"I have had news from Rickmansworth. There is a piece of free water there, near Moir Park, on the Watford Road, part of which can be, or has been, fished from a piece of land owned or rented by Mr. King, of Hampton Hall. This gentleman has up to now kindly let anglers go on his property, but lately they have abused this privilege in a very shameful manner; for instance, last Sunday they, to light a fire, took anything that came to hand, destroying hedges, &c., finally kindling it upon the roots of a valuable tree, when requested by Mr. King to put it out, they threatened to punch his — head, and to pitch him into the — river. So now, he says, no one shall fish from his place again; he is heartily sick of this sort of thing, and I know for certain he has ordered bills notifying the same to be printed. I hope you will not deem this a trifling thing to bother you with, but I feel convinced this sort of behaviour is doing a good deal of harm, and shutting out respectable anglers, and setting decent people, who might prove good friends, against us. I can assure you every word of the above is true, and if publicity could be given to it, it might be the means of warning others to just keep a civil tongue in their heads."

I wish I had a little good news about the fishing. I was all up the Canal yesterday—no go—I did not see a single fish taken. A few small jack taken in the Colne at the back of the High Street, all undersized, but the natives, as you know, buy everything, if only two or three inches long."

The Trafalgar Angling Society has removed to its old quarters, at the George and Dragon, Greek Street, Soho, where the members will always be pleased to welcome any brother piscator who will give them a look up.

Haslett, of Chertsey, writes to-day (Wednesday): "The water is better for fishing, and if we do not get much rubbish and water from above, I think we shall get some fish, as the river is now down to summer level; but there is no understanding it, one day it is low, next day it rises, and down comes the rubbish. I think they must be continually drawing up the weir tackle above. I got a few roach last week, and in three days 1 bream and 31 roach, up to 1½ lb.

On Sunday last the members of the Hammersmith United Angling Society fished a match at Wraysbury, the losing side to pay for a supper, which comes off on Thursday, 17th.

A prominent member of this society has expressed his determination of ascertaining the identity of "A Thames Fisherman," and exacting satisfaction (of a fraternal kind, of course) from him for having caused the haven of his rest and the hope of his heart, "Haynes' Boughs," to be literally besieged by anglers on that day, all of whom had evidently read "A Thames Fisherman's" graphic description thereof.

The swans on the Thames are justly abhorred by all true anglers, but how about the cygnets? Perhaps the chairman of the Richmond Piscatorials will state his opinion thereon—from an epicurean point of view—as I hear he lately dined off a cygnet. An expression of opinion on this point would be of considerable value, coming from such an excellent gastronomic authority as Mr. F. C. Clench. N.B.—There is no truth in the report that Mr. F. C. C. has been inundated with inquiries from anxious friends as to "how on earth he got it down, and whether it hurt him much?"

A correspondent writes me the following:—"I met on Saturday, returning from a fishing trip, a member of the — society, who related to me [a conversation he had that morning had with a bird-catcher, who was going to Staines to catch startlings, which he sells at 4s. a dozen for shooting matches, and who said: 'When I can't ketch no starlins, why, then, if it's all quiet, I has a little bit of fish.' 'What do you mean,' asked the member of the London Society. 'Why,' says the snapper, 'I puts my nets into the water, and very soon gets out a pail of live roach.' "This," my correspondent adds: "must, I suppose, be in in the small side streams, but, if it's true, might not the T. A. P. S. just as well get the fish, and put them back into the river?"

I am not going to say that to do what the bird-catcher boasts of is impossible, or that he had not attempted something of the kind, but I do know that bird nets are very different in their shape, and the material with which they are manufactured, than fish nets. They are made of by no means coarse whitey-brown thread, have no weights, corks, or anything else requisite for fish-netting, and are in no way suited for rough work.

Still, there would be no harm in the river-keepers keeping an eye on the bird-catching gentry, when they happen to be lying anywhere in too tempting proximity to the river.

Messrs. Hobden and Geen are off to Eynsham on this Friday morning. With two such redoubtable "braves" on the war path, what a slaughter of "finnyuns" there will be to record next week? At least, let's hope so. Query, has P. G. taken with him any of those moss-scoured lobs he speaks off almost lovingly?

PRIVATE FISHERIES IN THE THAMES.

AT the Maidenhead County Police Court, on Tuesday, a water-bailiff of the Maidenhead, Cookham and Bray Thames Angling Association was summoned for having unlawfully attempted to take fish in a part of the river Thames in which Sir Roger William Henry Palmer has a private right of fishery. Mr. R. A. Ward appeared for Sir Roger Palmer, and Mr. F. A. Jones (solicitor to the Angling Association) for the defendant. Mr. R. A. Ward quoted the 29th Victoria, and

said that Sir Roger Palmer had a private right of fishery from the Guards' Club to the Cliveden Estate, which he purchased from Sir Robert Harvey. He added that Sir Roger did not ask for a vindictive penalty; he only wished it to be known that he had the right of fishery within the limits mentioned. Sir Roger Palmer was then called and said: I am the owner of the private right of fishery from the Guards' Club up to the Cliveden Estate—over the whole breadth of the river. On October 12 I saw Gill with a net near my residence, and asked him if he thought he had a right to fish without the permission of the owner. He said he thought he had, as a water-bailiff. I said he had not, and he then asked me if I would give him permission; but I declined to do so, and he left. In reply to Mr. Jones, Sir Roger said he had not with him the title-deeds in which his right of fishery was defined, but that his solicitor had promised to send them to him. Mr. Jones said this private right which Sir Roger Palmer claimed had never been heard of till now, and it seemed that Sir Roger claimed a right over the whole breadth of the river. There has always been fishing in this part of the river, and no objection had hitherto been raised to it. There was no notice board, and there had been no caution as to trespass. Under these circumstances it was only reasonable that Sir Roger should be asked to produce the deeds on which his alleged right was founded. Mr. Ward said that if his friend pressed for the production of the title-deeds—if he was not satisfied with Sir Roger Palmer's testimony, he must ask, on Sir Roger's behalf, for an adjournment of the case. The case was accordingly adjourned for a fortnight.—*Land and Water.*

THE POLICE AND THE EDEN CONSERVANCY BOARD.

THE following is reprinted from the *Westmorland Gazette* of November 12th, 1881:—

We have been requested to publish the following letter addressed by Mr. Chief Constable Dunne to Captain Gandy:—

[COPY.]

Chief Constable's Office, Carlisle, 9th Nov., 1881.

SIR,—In reply to your note of the 3rd inst., I have to state that your letter which I received and replied to on the 17th ult., was taken to Kendal as requested in your letter of the 18th October. It, however, seems to have been mislaid somewhere. I have written to the Clerk of the Peace asking him to send it on to you if he has it among the papers which I gave him at the Sessions.

As there seems to be so much misunderstanding regarding the law giving Conservancy Boards power to have their bailiffs appointed additional constables, I think it desirable to again draw your attention to 28 and 29 Vic., cap. 121, sec. 27, which distinctly says "that nothing herein contained shall prevent Boards of Conservators from obtaining the services of additional constables under 3 and 4 Vic., cap. 88, sec. 19, for the purpose of carrying out the provisions of this Act. Such constables to be paid by the said Board." The lawyers are of opinion that this is quite conclusive as to the legality of a Board having their men so appointed and paid for. The system has been adopted in other counties, and it has worked beneficially in the public interest in the carrying out of all measures that are necessary for the protection of life and property, and the better prevention and detection of crime. No objections have been raised in any other county, or trouble, or difficulty interposed. On the contrary, I hear that the appointment of additional constables for this or other purposes is regarded with great satisfaction by the Quarter Sessions of the counties in England and Wales, especially as the public get the benefit of their services without having to contribute any portion of their cost.

It is quite true that at Appleby and Kirkby Stephen the officers of police were allowed upon the application of the Board, and some magistrates, to issue the licences under the Freshwater Act. That was done entirely for the public convenience. The police received no pay for it. But the Eden Board having now two officers of their own in the district they can issue the tickets and do what is necessary without putting the persons who may require licences to the trouble and expense of having to write for them to Carlisle. Surely there could be nothing illegal or improper in giving the Board that assistance?

What is it that underlies all the objections that you have raised to the carrying out of the fishery laws within the Conservancy district? If you can show that any one has a well founded grievance to complain of would it not be better to at once lay your complaint before the Home Office, or the Conservancy Board, who would I feel assured do everything that is necessary to have the same fully investigated and justice done to all concerned? I have been asked what is the meaning of your statement in the *Westmorland Gazette* of last Saturday as to certain "persons who object to police supervision under the garb of additional constables." Well I would rather leave that to the discomfitment of others. All I can say is that I hope and trust those objections, whatever they may be, with all the other allegations which have been made, will be in due form submitted to the proper authorities for a thorough and searching investigation without the slightest bias or prejudice on the one side or the other.

In the interest of the police and their efficiency and good repute, I must ask you to have the goodness to consider this as public as your letter of Saturday last.—I am, sir, your most humble servant,

(Signed) J. DUNNE.

To Captain Gandy, Skirsgill Park, Penrith.

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[Advtr.]

RIVER REPORTS.

MID-THAMES.

"That which we have we prize not to the worth
While we enjoy it; but, being lack'd and lost,
Why, then we rack the value; then we find
The virtue that possession would not show us."

SHAKESPEARE.

The river is in prime order for all-round angling, and my advice to hesitating anglers is that they will be lost unless they take advantage of the present good health of Father Thames, for a few days only may turn the tide of fine weather and water and launch us into mid-winter, with all its nipping propensities of frost and whisky, instead of the present delightful piscatorial surroundings, piscatorial and foliaginous, of Mid-Thames. Roach are now well on, the water being just the nutty-brown tint so beguiling to the endorser and acceptor of the bill of fare. Perch are doing like their brother finny-uns, and chub are requiring a lot of nerve and nerve matter to entice them to destruction. Barbel have departed to the piscatorial happy hunting grounds, but jack are decidedly on the rampage. My reports from various mid and upper Thames stations all contain decent reports of catches of roach and chub too numerous to detail, and also sanguine anticipations of good sport to come, in consequence of the mildness of the weather and the excellence of the water—two desirablenesses which are sure to bring down patrons to the too often, at this season of the year, washed-out or frozen-out Thames fishermen. At Pangbourne and Stratley grand bags of roach and chub have been had by Messrs. Johnson, Poynton, and Jones; at Henley, Mr. Nicholson, a brace of good jack; Mr. Witham, one day, 3 jack, the best going 8 lb.; Mr. F. Hoblyn, in the Wargrave waters, 3 jack, largest scaling 9 lb.; Potter, the fisherman, alone, some good jack near Regatta Island, but I refrain from giving weights for fear of advertising a good horse who bolts from the right course; Mr. Phillips, 16 lb. of roach on one occasion near Henley; Mr. Fritz, 22 lb. of roach in the Henley district; Mr. Elcomb 37 lb. of chub in five hours with pith and brain as bait; and Mr. J. Smith, 30 lb. of chub with the same nerve attraction; at Hurley, Messrs. Harrison and Lumley, on Sunday, some 11 lb. and 5 lb. of roach respectively; Mr. Phillips, 6 lb. of roach and a jack of 5 lb., fishing with Hatch, of Marlow.

THURSDAY EVENING.—River in splendid all-round trim, roach and chub being best on, the weather being too mild for perch or jack.—MARLOW BUZZ.

Thames (Goring).

Water in good order for jack and perch fishing. Roach have been off. Prospects at present looks well for this week. We had a good lot of rain here on Wednesday night, but do not think it will hurt the water, as it was getting low. Two days, 8 jack, largest jack 6 lb., and some roach. Monday, four dozen of gudgeon. I have been fishing for over twelve years; I never knew gudgeons bite in November as they did on Monday last. I had one pitch for them, and had a bite every swim.—JOHN RUSH.

Thames (Halliford).

River in good order for reasonable fishing. Different gentlemen fishing with me during the week; their takes have been as follows: First day, Mr. Innis fishing with me, caught 6 barbel and 4 roach. Second day, Mr. Palmer, 7 barbel, 2 chub, and 4 roach. Third day, Mr. Field, 5 barbel, 2 returned to the river, a few roach and dace, and 1 eel. Fourth day, Mr. Wilson, 8 barbel and a few roach. All the above fish were taken ledgering.—GEORGE ROSEWELL.

Thames (Kingston).

The river is in good form for all sorts of fishing. I have only been out once and got a few chub, one day 3 barbel and 1 chub, best barbel 4 lb.; next day a dozen nice roach. I have heard of a few stray fish taken by private boats, best 4 lb. I should think perch ought to feed if any one would come to try.—JOHN JOHNSON.

Thames (Monkey Island).

Water in good condition for all-round fishing. The jack have been running well this last week. I believe a fortnight ago I mentioned having seen a great many jack moving near Monkey Island. Ned Andrews has been fortunate enough to get among them with a gentleman, he having two fish, in splendid condition, weighing one 17 lb. and the other between 14 lb. and 15 lb., and three other good fish, making a total of 48 lb. in one day. He had several other very good takes of six fish in one day and five another day. My son, out with a gentleman, one jack, 3½ lb., and, unfortunately, lost two very good fish. The same day he had a nice show of roach. There has been several other jack taken in the neighbourhood.—ROBERT PLUMMER.

Thames (Richmond).

The river is in capital order for roach fishing, but the fish are not feeding at all freely; they feed very well from Wednesday till Sunday last, but since then they have not fed so well. But by the time this is in print they may be on again. All the punts have been out most days, and the takes are as follows:—G. Howard, five days, best day 12 lb. of roach, 1 barbel 2½ lb.; H. Howard, six days, best day 16 lb. of roach; H. Mansel, four days, best day 13 lb. of roach; C. Brown, four days; Job Brain, six days, best day 17 lb. of roach; J. Bushnell on Wednesday last, out with Mr. Duck and friend, 20 lb. of roach; on Thursday, with Mr. Lowe, 28 lb. of roach to his own rod; Friday, with Messrs. Howell and Cook, 17 lb. roach; Saturday, with Mr. Pipe and friend, 30½ lb. roach; Sunday, with Mr. Hinton, 16 lb. of roach and dace.

Since then I have been fishing private waters with the last-named gentleman, and am engaged for a week. H. Wheeler has also been out four days.—JOHN BUSHNELL, fisherman.

Thames (Twickenham).

Wind, N.W., and weather like a spring day, the biting wind in the middle of the week did not improve our takes. On Wednesday my men had quite a difficulty to get fixed, and one punt had its head pole broken in two with the force of the wind. I have only had ten punts out this week, and our principal fish have been roach. Mr. Johnson, of the R.P.S., has been getting some nice fish in the deeps, amongst them a very nice perch weighing 1½ lb., which has been sent to Kensington to be set up. Pert Hamerton, Joe Dobbin, and George Coxen have brought in a nice show of fish on Thursday. If the wind continues favourable, I hope to give you some good reports next week.—A. PERRIN.

Thames (Walton).

The water was rising on Friday last, and every appearance of continuing, but has been falling since Sunday. Water clear at banks, but cloudy in stream; fairly good for angling. This week, as shown by the report, has been bare of anglers, and those that have been out have only had about two hours or so angling. There are plenty of fish reported, but they want catching. Nov. 9, 10, 11, and 12, no fishing. Nov. 13, Mr. Wilderspin (this perch was caught with a fine gut, No. 12 hook, intended for live bait), one perch, ¾ lb., and one and a half dozen roach. Nov. 14, Mr. Wilderspin, one perch, 1¼ lb., and one dozen roach in two hours. Nov. 15, George Hone, one bream, 3 lb., and one roach, 2 lb., and one barbel, 2 lb. The last bream taken here was October 15, and barbel, October 11. It is reported that there are a quantity of fish below the Tumbling Bay, and some big ones among them. The wind is getting up at the time of writing, and beginning to rain.—HENRY E. WOOD.

Thames (Windsor).

Water looking A1 for perch, jack, and chub; but very little has been done here, and it is I think the same everywhere on the Thames. I was at Cookham yesterday, and Godden tells me they seemed to be quite off the feed, though he has had some capital take. I saw a very pretty jack, a patron had caught out with him, going 6 lb. Another gentleman whom I came across in the train, had been out all day Henley way, and had not had a touch, though the water looked charming. Corporal Major Knott, of the Royal Horse Guards, had a nice dish of perch from private waters in this neighbourhood going respectively 2½ lb., 2¼ lb., to 2 lb., 1 lb., ¾ lb. The 2½ lb. fish I have sent to Cooper for preservation.—B. R. BAMBRIDGE.

Ancholm.

The continuance of fair weather during the past week and the presence of a fine coloured water have proved particularly favourable to anglers, but few reports have, however, come to hand. Owing to the cleaning out of some trout ponds and the addition of new sluices thereto, I have personally done nothing this week; but the pike are beginning to take the spoonbait and other offerings, but here, as elsewhere, this department of angling seems to be going to the bad. There is, therefore, the more need of the establishment of a society for coarse fish culture recently mooted so ably in this journal.—THOMAS FORD.

(Dove).

The river has been in pretty fair order all the week, and grayling have been biting well on the bottom. There has likewise been a fair rise on the surface, but I fancy things would have been much improved if the nights were frosty. So far we have had no cold weather. The last three weeks have been more like September than November, and, as is well known, a spell of really sharp atmosphere is always required to bring Dove grayling (and I suppose any other) into first-rate feeding condition. The flies that have been killing best are the same as last week, the dark October and the cockney. The users of maggots and small cockspurs have caught lots of big grayling on the bottom. In fact, I find that the heaviest samples are almost invariably captured while angling with these lines on the bottom. I hear of great quantities of chub, roach and bream being obtained in the lower waters, and also a few barbel. The mild weather seems, in fact, to have brought this fish on the feed again. Fike, like grayling, want some frosty weather to sharpen up their appetites.—THE SPLODGEK.

Ilfracombe (N. Devon).

In sea fishing there is very little to report this week. The weather has been very unfavourable for all fishing. When an opportunity offers they venture out, and have returned with very fair catches. Sunday evening, a few boats out; there catches were about a maize or maize and half in a boat. On Monday morning some boats caught three maize of herrings, others five and a half maize, and a quantity of hake and whiting. A few conger and ling also were caught; one boat had their train of nets cut in two by a steamer. After searching several hours they found them very much damaged; two of them quite useless; since then no boats have ventured out. The wind blowing from N.W., with a heavy sea. Thursday, wind moderating a little.—E. COMER.

Lea (Rye House).

The water is in good order fishing. The weather is mild; the wind south-west. Their have been some nice fish taken this week, Mr. Mags, two jack, 10 lb.; Mr. Harding, one jack, 8 lb.; Mr. Deancoster, two chub, 5 lb.; Mr. Woodey had a nice show of roach. On Monday some nice chub and roach were taken.—WM. COWELL.

Lea (Ware).

The water here is nicely coloured, and in first rate order. Chub, perch, roach and jack are dead on a native "Bradey." Took a jack 9½ lb. at the Boom the other day. I am too wild to speak about the sport last Sunday, "Chub." Our worthy friend Bell did very well with roach last Sunday, and he deserves to do so. Mr. Olford took some nice jack again last week. I had three nice perch to-day close at home.—VON LEEFLO.

Medway (Tonbridge).

The water is in first-class condition for angling of all kinds, and jack and roach are well on the feed. On Thursday the weighing-in club had a competition, most of the anglers went in for jack, but owing to a run of water coming down just after they began, none of 2½ lb., the club size were taken. Mr. J. Cox and Mr. G. Hewitt at last tried a back stream for some bottom fishing and in this they were successful. The former angler took first honours with a splendid roach, and the latter took two small ones, and secured second honours. The bait used in both instances was a worm. During the week Mr. Hewitt and Mr. Swinnard have been busy amongst the roach, while Mr. West, J. Stanley and others have done well with the jack. There will be plenty of sport if the weather continues fine.—YE MEDWAY WATER RAT.

Use.

Water is still in splendid order for all-round fishing, and looks well for some time to come, if the south-west wind, which is blowing a gale while writing, would not bother us so much, and keep the anglers off the water; for, though a good wind for anglers, it lies bad for this reach of water if too much of it. The following are some of the best takes since last report:—Nov. 11. Mr. R. Hills, Cambridge, 20 lb. roach in four hours—a splendid lot; Mr. Ascroft, Cambridge, 11 lb. roach; Mr. S. Allpress, 5½ lb. roach in one hour twenty minutes. Nov. 10. Mr. Clarke, Newmarket, 13 lb. roach; Mr. Howlett, Newmarket, fishing with Mr. A. Antony, London, 23 lb. roach. Several other anglers were out, but owing to rough wind their catches only ranged from 7 lb. to 4 lb. Nov. 11. Mr. Ascroft, Cambridge, 12½ lb. roach; Dr. Cooper, Cambridge, 10 lb. roach in four hours and a-half; Mr. W. H. Whitehead, Cambridge, 9½ lb. roach in four hours and a-half; Mr. W. Purchas, Cambridge, 16 lb. splendid roach; Mr. R. Hills, Cambridge, 15 lb.—largest roach, 1½ lb. Nov. 12. Mr. F. J. Hulford, Ely, 5 lb. roach in one hour and a-half; Dr. Moxon, Cambridge, one pike, 4½ lb.; Messrs. Heading and March, Ely, 14 lb. roach. Nov. 14, Mr. Ascroft, Cambridge, 12½ lb. roach; Mr. Fielden, Cambridge, 12 lb. roach; Messrs. H. C. Cook and E. B. Smith, Cambridge, 12 lb. roach—largest, 1½ lb. Nov. 15. Mr. George, Bassingbourne, fishing with another gentleman, 10 lb. roach.—CHARLES SOUTH.

Titchfield.

Another otter, measuring 4 ft. 1 in., from snout to tail, and weighing 22 lb., was trapped by Mr. Delme's keeper, near the iron mills, on Wednesday last. This makes four dogs and one vixen caught near the same place in the last twelve months. The most successful method of trapping them is to set two traps near to each other, and as soon as the otter is caught, he begins to plunge about and try to escape, which he very often does, but if he happens to put a foot into the second trap, it is a case with him. On the same day a trout that had apparently been killed by a heron, was picked up on the bank. It measured 20 in. in length, and if in season would have weighed from 3 lb. to 4 lb., a very large size for this river.—RED PALMER.

Trent (Newark).

The water is now in capital condition for all kinds of winter fishing; but last night we had a very heavy downpour of rain; the water literally swept down in sheets; but, as it did not last very long, in all probability not much difference will be made in the water; sport, as a rule, has not been so good this week, as I should have thought, a few anglers having fair catches, but the majority only met with indifferent success. R. Chilton has had a fair basket or two just lately, and among his fish last Saturday were 14 flounders, rather a remarkable circumstance, considering the time of year, and other baskets that have come under notice, contained only from 20, down to 6 roach, dace, and bream. I had a suspicion last week that there must have been snow broth in the water, and I have since heard that there had been a heavy fall of snow in the higher districts of the Trent. The gentle as a bait seems to be nearly played out for this year, as worms succeeded in killing the most fish this week. Tonight the prospects look pretty good, a wriggly tail end of a lob, or a nice cockspur should do the trick for a few roach, dace, or bream, while chub ought to begin to take any winter bait freely, such as pith and brains, scratchings, or even a pennyworth of tripe, and pike fishers should try their favourite places with their own particular favourite bait.—THE TRENT OTTER.

Trent (Nottingham).

The river since Monday has been in capital condition for both pike and chub fishing, the water having cleared down to its usual winter height, and the anglers for jack have been very busy; in fact, some of them have put in full time; and although a good number of fair sized pike have been captured, principally with live bait, none that I have seen exceeded 10 lb., though several reached 6 lb. and 7 lb. each. The best sport was had on the upper part of the river, but I am not allowed to mention the exact spots, only when it is a sub-scription water, then when anything good has been done, the making it public is a benefit to those who have the letting of the tickets. At Shardlow, I hear some fair baskets of fish have been had livebaiting, and one gentleman in the Weston length took three nice fish, the largest 8 lb. This was persuaded to take a spinning bait in a backwater, so by this it will be seen it is not always so well to stick to one style of fishing. The anglers down the river, while fishing strictly preserved water, took some good fish, and although two or three of the spots were known to contain some large ones, they could not be tempted to feed. Chub have also been biting fairly at both scratching and pith and brains, the latter bait doing most execution, and I will here just remind those anglers who visited the upper part of the river, that it is almost a waste of time to attempt to catch chub with scratching. It may do very well lower down the stream but not above the Derwent. Since the water began to fine down, bottom-fishing with worms has been at a discount, though a few good roach have been had with the bait, and one or two bream. The river is still low and clear, but heavy rain fell last night, so it is impossible to tell what is going to come.—W. BAILEY.

Trent (Alrewas).

The river has been in good fishing order all the week, but I can only learn of few anglers who have met with decent luck. Mr. W. Reynolds had a nice take of roach last Friday, weight 11 lb., and just over 6 lb. on Tuesday, principally taken with gentles. A few grayling have been taken with the fly, with a maggot on the point of the hook, but nothing of any size. Pike and chub fishing has been almost a dead letter. As far as the river has been concerned, a few small ones have been hooked live baiting, but not large enough to retain. Fishing for pike in the pools in the neighbourhood of Birmingham has been much more lucrative, and some fair takes are reported. Mr. Councillor Oliver Pemberton, as usual, takes the highest honours for quantity if not for quality. The latter, however, was destined for the youngest son of Mr. Pemberton, who bids fair to become as good and enthusiastic an angler as the genial president of the Birmingham and Midland Piscatorial Association. Fishing at Sandwell on Saturday, the youngster hooked a pike live baiting, which, after twenty minutes' good fun, was successfully landed. It proved to be a male fish, weight 18 lb., and was really a splendid specimen. The fish has been presented to the "association," and has been placed in the hands of "Cooper," London, to preserve. Other takes are reported of Messrs. S. Burnett and John Allday. From Solihull the largest fish was taken by the latter—6 lb. Several minor catches to hand, but too numerous to mention. I have just returned from the river. The water is slightly discoloured from last night's rain, and the river rising. I tried the chub with pith and brains, but it was no go. I caught a few roach with gentles and the cockspur worm, but none of any size. I can only attribute the fish not feeding so well as at the beginning of the week to the change from the genial weather we have experienced of late to a much colder temperature. The wind also was very erratic, blowing at times so strongly that it was difficult to keep a float in the water.—JAMES GREGORY.

Wye and Derwent (Derbyshire).

We had a very great quantity of heavy rain on Wednesday night, which caused both rivers to rise on Thursday and thick and muddy water is now now running down them. This rain falling will put a stop to fly-fishing on both rivers for a few days. Sport during the week with both the fly and bottom has been very fair, and good catches have been the order of the day. The wind has been very rough and boisterous on most days, which has made fishing anything but an enjoyable occupation. Stream fishing with maggots in the Nottingham style has been well practised during the past week on the Derwent, between Derby Bridge and Matlock, and some handsome dishes of good-sized trout have been captured. The bottom fishers who have been fishing between Cromford and Ambergate have been killing a good quantity of coarse fish and a few grayling, the grayling being about ½ lb. each fish. Several pike have been killed off of the Derwent during last week with both line bait fishing and by trolling with small dace for bait. The bottom fishers will no doubt do well after this rain.—GEORGE JAMES EATON.

Yore (Yorkshire).

After despatching my report last week I had several other good day's grayling fishing, my best being on Thursday, when I killed twenty nice fish, partly with worm and partly with fly. I found the most killing flies to be the honey dun bumble, gray goose dun (Mr. Ford's pattern), and two flies out of the collection that "A.R.I.E.L." sent to me, one of them is a very small dun, body tied very thin with bright orange silk and starling's quill feather for wings, and the other is like a large bumble dressed with a thick body of red and orange silk mingled with peacock's harl—I fished this fly at the end of my cast, and it took the largest fish. Salmon fishing ends to-day (Tuesday), but my correspondents state that no fish were taken during the last few days. Weather and water very favourable at present for grayling fishing with the fly.

Thursday.—A heavy gale of wind and rain has caused the Yore to rise, so that grayling fishing is at an end for a few days.—FRANCIS M. WALBRAN.

LIVERPOOL ANGLING ASSOCIATION.

The third annual dinner of this association took place last evening (Nov. 8), and was a complete success. Upwards of forty members sat down to the substantial dinner, placed before them by Mr. W. Jones (the treasurer), and did ample justice to the good things prepared for them. On the removal of the cloth, the chair was taken by Mr. Pratchett, whilst Mr. Leaman occupied the vice-chair. The toast list was proceeded with, and that of the Queen, Prince and Princess of Wales and all the Royal Family was duly and patriotically received and the National Anthem sung with great *eclat*. The next toast, "The Liverpool Angling Association," coupled with the name of its chairman, Mr. Pratchett, was ably moved by Mr. Leaman, who, in doing so, gave a short *resumé* of its history and progress; how, from a handful—a baker's dozen—a little over two years ago, it now numbered over a hundred members, most of them good and true anglers; how, from a few pounds (not more than five) in its first year given as prizes, there had been this year upwards of thirty guineas competed for; and he confidently hoped that this amount would be considerably exceeded in the coming year. In replying, Mr. Pratchett endorsed these figures and ably replied to the toast, giving a fair exposition of angling generally, its delights, the pleasant places you visit, and the complete brotherhood that exists amongst the members of the craft wherever and whenever they meet. The toast of the "Donors of Prizes" was then given, and coupled with the names of Messrs. Ellinger and Boulding, Mr. W. Walker, Mr. Ramsay, Mr. Chandler, Mr. Haigh, and Mr. W. Jones. Mr. Boulding, in replying for himself and partner, spoke very lovingly of the "gentle art" and its followers and of those around him in particular, and stated that the prizes the firm had been enabled to give during the past year were presented for the sole purpose of expressing their feeling towards the "Association" and their hope for its prosperity and success, towards which they would do all they could, and concluded an able speech by promising for the next season a silver challenge cup. Mr. Walker and Mr. Ramsay also replied in kindly terms to the toast, both expressing their sincere wishes that the association would continue its prosperous career, and promising to do all they could to help the future prize list. Mr. Chandler, in the course of his humorous, but touchingly-worded remarks, expressed the pleasure and satisfaction he felt in having joined the association and of having made the acquaintance and acquired the friendship of its members, and concluded by promising a fern case, value three guineas, as a prize next year. Mr. W. Jones next enlarged, in a most eloquent speech, on the subject of angling generally, and the pride and gratification he felt that this particular association had its quarters in his house, and said he trusted that for many years to come the members would meet under his roof, and concluded by assuring those present, they had no firmer friend than himself. The toast of "The Officers of the Association" was then given, coupled with the name of Mr. H. Jones, treasurer, who, in responding, dwelt strongly upon the thorough way in which the officers and committee had done their work, and asserted, he said, without fear of contradiction, that it was owing to their joint and constant exertions, and the way they all pulled together, that the association had been placed upon a sure and sound basis. The toast of "The Press" next followed, coupled with the name of Mr. Machway, the *Mercury's* representative, and he, in replying, assured the members that he had enjoyed being present very much, and was delighted with the evident goodfellowship that existed amongst them. Mr. Boulding then gave what he was kind enough to call the toast of the evening, "The Honorary Secretary." In putting the toast, Mr. Boulding made the most complimentary reference to the exertions the hon. sec. had made in the interests of the association and of angling generally, and hoped he (the hon. sec.) would long occupy the position he filled so ably. The hon. sec., Mr. Woolfall, in his reply, stated he was amply repaid for anything he had done by the more than kind way in which the toast of himself had been proposed and accepted, and hoped the members would accept his warmest gratitude for the expressions of satisfaction that had been given all round with the way in which his duties had been carried out, and concluded by saying if they continued to trust him, and to encourage and support himself and the executive by their attendance at the weekly meetings, he would do all he could in his position for the society in the future as he had in the past. In the intervals of the toasts and speeches, songs and recitations were given by various members; one of them, Mr. Spencer, most ably presiding at the piano. Mr. Spencer also sang some first-class songs, amongst them being "Rocked in the Cradle of the Deep," which he rendered magnificently. Messrs. Leaman, Evans, Chandler, Ellinger, Higson, F. Hood, Stevens, H. Jones also contributed a variety of songs, and helped, by their vocal abilities, the harmony of the evening to be thoroughly sustained. Then followed the National Anthem and "Auld Lang Syne," after which, amidst the general expressions of good will, the company separated, highly pleased with the entertainment and with each other.—R. WOOLFALL, hon. sec.

THE PROPOSED TESTIMONIAL TO MR. BONVOISIN.

IT is with unfeigned pleasure that we call the attention of our readers to the particulars which will be found in another column respecting the proposed testimonial to Mr. Leo Bonvoisin. Ever since we have been acquainted with and interested in the doings of London angling club life, we have admired the untiring, never-daunted, capable chief who is at last to have some practical recognition of the service he has rendered. As one of the most popular and respected of the chosen leaders of London's ten thousand anglers we feel that further words of ours, asking strong and hearty support for this testimonial are unnecessary. It is only necessary to look back on the great events in the angling world to see Mr. Bonvoisin always to the front in all of them, whether it be fighting a big railway company for concessions, establishing an Anglers' Benevolent Society, getting the fence months established, defending angling rights on the Thames, &c. These things are easily remembered, but the thousand and one little things which lead up to and are the outcome of these events have no historian. No one knows the time, money, labour and thought ungrudgingly given to them in the interests of the sport to which he is so devoted.

ANSWERS TO CORRESPONDENTS.

GEO. WATSON.—The best way to get a list of the London angling clubs is to send 6d. in stamps to W. H. Brougham, Esq., Swayfield Villa, Hounslow, for a copy of the T.A.P.S. Blue Book, which contains the best list of the clubs you can get.

THAMES ANGLER.—We think you will have little difficulty in getting some good pike fishing, &c., at Dorchester.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

COARSE FISH CULTURE AND CRAY NOTES.

SIR,—I notice your remarks about propagating coarse fish in to-day's issue, and allusion to my name. I say now, as I said then, I sympathise with the movement most heartily, and will give it support when sufficiently developed. As to taking any practical part in the work, I fear I am unable to do so, as my space is limited, and my time is fully occupied with what is, to me, more important work. What makes me take so great an interest in it is, that I want gudgeon and minnows in large quantities to turn into our lake next, say, February, as they will root up the mud and gradually send it down. In this mud there are vast quantities of minute blood worms, so they ought to grow very fine and do well.

Allow me to give my best thanks to Mr. Robert Balderston for his table of flies; there is something really good, sound and practical in it, for which all true anglers ought to be truly obliged. I wish there were more men who took notes, and were really observant at the water side. People don't think enough before they do things, or write about them. They leave things to others, and so, very often, either fail themselves or cause others to do so.

Here is a case in point. I had a large order for sea-trout eggs for New Zealand; I cast about how to get them. One man said I could get them on his water if I paid all expense—the spawner a fee of £5, and £1 per thousand for freshly impregnated ova. That would not do, so I looked about elsewhere, and had a very kind letter from a landed proprietor, offering very reasonable terms, which I accepted. I got all ready, and had a very satisfactory letter last Thursday, saying the river was full of very fine fish coming up, and if I went on Monday all would be in trim.

On Monday evening we made a start, my manager and myself, per limited mail from Euston, got nearly shaken out of our wits in an apparently new carriage—got to our destination next day. Saw the keeper, who was full of hope, amounting, in fact, to an assurance of certainty, and next morning drove 12 miles to the head waters of the stream, where the watcher assured us he had seen forty fine fish up for spawning the day before. You may guess we lost no time in putting on needful waders, getting all in order, and seeing what we had to do. In the result we found a few fine fish, in the finest order, or “well mended,” having spawned about three weeks before! It was all “kid” or deception, I believe. I no more think forty fish had been seen than that less than forty had been taken out. I believe that every man and boy in the part of Scotland I refer to is a poacher. They tell us they know the habits of the fishes most accurately, and I have no hesitation in saying I fully believe it, and also that they make full use of their knowledge for their own benefit.

Well, to continue my story, we walked over a long stretch of water and saw four or five more spent fish, all as wild as hawks, evidently poached to death as nearly as possible, and, after much loss of time, weary waiting in the road, and misery of mind and body, our carriage came for us, and bowled us home in the dark. Next day I was fairly done up, so sent my manager with the keeper to the other stream, near the hotel; result—four spent fish; so the order was “home, sweet home,” and away we went by steamer and the limited mail. This time all was comfortable, but low spirits make bad companions, more especially when one has to sit on a box outside Charing Cross station for an hour at 4.30 on a November morning. It was a lovely morning certainly, but the weirdness of the Strand at 4.30 to 5.30 is something more than I can tell. The obliging inspector on our line, to whom my thanks are due, did all he could to make us comfortable, and my manager indulged in a cup of hot coffee, whilst I did the like in some capital ale at a little “pub” nearby, so we got into the 6.20 train, got out at Bexley, where the carriage was soon entered, and we bowled away home to breakfast, and our reflections, were none of the sweetest—all through want of observation, candour, and truth on the part of Scotchmen. I, of course, acquit the landowner of all blame, but do most severely censure the people in charge of the fisheries of that

part of Scotland. From all I found out, many old hands knew the habits of the fishes, the hours at which they could be taken by net or spear, and, so far as I could glean, the men who were paid to protect the fish were either unable or unwilling to interfere. This season I have, of course, utterly failed to procure sea trout ova for New Zealand, but I hope, if spared, to be more successful in the future. What I want is to find some stream in the South of England, such as the Hants Avon or Devon Dart, where I can post a trust-worthy man, such as my manager certainly is, to see and observe the sea trout and salmon, and either himself collect, or enable by advice, me to collect the ova needed. I am perfectly certain it is a most simple affair, if only one can get to deal with people who are not all born poachers, which I regret to say, I believe the Scotch and Irish lower orders are. I regret to make such a statement but I have good reason to believe it to be true. Any suggestion or advice the Editor or correspondents of the FISHING GAZETTE can offer for next season will be very thankfully received by me, and duly acknowledged in these your columns.—I am, &c.,

CHAS. C. CAPEL,
Cray Fishery, Foot's Cray, Kent, Nov. 12, 1881.

SIR,—Your proposition to cultivate coarse fish has met with great favour among the members of the society to which I have the honour to belong, and I am sure it cannot fail to do so in all other societies, that is if all coarse fish are included. Mr. B., in your issue of the 12th inst., says that his idea is we have plenty of roach and dace in the Thames, and that it is a matter for consideration whether these fish should be included. I say, to make the undertaking a success, they must be included, that is, if you are looking for support from anglers in general. Suppose there are plenty of roach and dace in the Thames (which I doubt very much), we can do with plenty more there; and we want them also for other waters where there is a scarcity, and where bank anglers would have a much better chance of getting a fair show of fish than they have at the present time from the banks of the Thames.

I believe the bank anglers would leave the Thames to those who can afford to hire a punt if they could get the almost depopulated rivers and streams (which are more suitable for bank angling) restocked and the breeds crossed. Ask them what kind of fish they would like to have, and you may depend they will not leave roach and dace out of the list.

I daresay there are many who prefer perch and carp to roach and dace fishing, but where there is one of the former I am sure there are twenty of the latter, and why is it? because it is prettier sport and they like it better. What better sport can a bank angler have than a good day among the roach and dace with drawn gut or hair tackle?

There is not much art required to catch perch, and there is too much required to catch carp, for are they not always artful and therefore too full of art to allow an artful angler to make a good show of them in the club room, and compete in the scales against roach and dace.

My object in writing this letter is to inform you that our society will send a delegate to the meeting for the discussion of the scheme, and that it will have our support in a practical form if it is to be carried out in a manner that will benefit all anglers alike, which it must do if all coarse fish have a fin in it.

I quite agree with Mr. Crumplen, and hope that we shall not be obliged to send abroad for a manager to come and teach us that which is surely known by many of our own countrymen, and who would be found when wanted. I know of one who might undertake it.

One word more. Why not ask owners of fisheries if they will support the scheme? I think they should, and would do so if asked, for it would be hardly fair for societies alone to stock waters where they have to pay for fishing.—I am, &c.,

G. R. H.,
A member of the Penge Angling Society.

VARNISHES FOR RODS, &c.

SIR,—In reply to your correspondent “Nemo” in F.G., 12th inst., asking for a white varnish, I beg to forward the following recipe which I think will answer very well. The ingredients can be obtained of most chemists, the only objection being the price of the mastic which is rather high. Gum sandarach or juniper, 1½ oz.; mastic, ½ oz.; elemi, ½ oz.; white shellac, ½ oz.; methylated spirit of wine, 8 oz. Powder the gums coarsely in a mortar, and digest for a week in a bottle with occasional agitation, and pour off clear from any insoluble matter there may be. Another correspondent asked a week or two back for a rod varnish, I think, but I have mislaid my GAZETTE, containing his letter, so do not remember exactly. However, I dare say the following will be found to answer his requirements. Orange shellac, 1 oz.; white resin, 1 oz.; Canada balsam, ½ oz.; methylated spirit, 8 oz. Prepare as in former one.

I have thought of bringing out two or three improved varnishes for the whipping on hooks, traces, rods, flies, &c., and for general use among anglers, but am afraid there would be a difficulty in inducing tackle dealers to keep them for the reason that they would rather do the varnishing themselves; and, as bottles are not allowed to be transmitted by post, there would be no means of conveying them to purchasers.—I am, &c.,

CHEMICUS.

November 14th.

FISHING AT EYNHAM.

SIR,—I beg to tender my best thanks to both M. and “Chub,” for their very courteous replies to my enquiries, respecting Eynham, and so soon as I have made arrangements to visit that locality I shall certainly avail myself of the further information so kindly offered; the only difference is one of these gentlemen, says: “It is all free fishing on the Thames at Eynham,” whilst the other says “the fishing at Eynham is not free, and that it is a continuation of the Isis.”

Referring to the remaining letter, signed R. W. Hobden, he refers to the Thames Right Defence Association, of which, according to his own account, he is proud to be a member. The Thames Rights Defence Association I thought was defunct, as I have heard so little of it lately, but, at the same time, I am surprised that a member of that association should condescend to fish in water (in the Thames) where a charge is made, he should have resented any attempted charge for simply being allowed to fish from a towpath which flows through Lord Abingdon's property.

Mr. Hobden's takes may have been large at Eynham, but he has no right to assume (as he has done) that his takes have attracted my attention to this particular spot. May I ask him if in the face of the two other letters, written without any bias (as his own should have been) the Eynham water can be called public; this will doubtless be “equally satisfactory to Perch,” and also to other gentlemen.—I am, &c.

THOMAS F. OLIVER (“Perch”).
Grosvenor Club, S.W.

GRAYLING TAKING THE SPINNING-MINNOW.

SIR,—In compliance with Mr. Walbran's request, I have much pleasure in placing at his service my experience on this most interesting subject—I think I may even say this very vexed question. Mine is not a large experience, but it may possibly be deemed a somewhat decisive one.

During the trout season of 1858 I was a member of an angling club fishing the Tean-Brook, a tributary of the Dove which falls into that river near Uttoxeter. In that—my first touting season—I took four or five grayling when spinning the *natural* minnow for trout.

The next occasion on which I spun a minnow in any grayling stream was one day, or rather one late evening and the following early morning, in July, 1863, when I fished the Dove in Dovedale in company with "X," as mentioned in my article, "Reminiscences of Dovedale." On that occasion, out of four good grayling which we killed with the minnow, one fell to my 'prentice-rod.

From that day till the autumn of 1879, I never wetted a line in any grayling water. But at the end of September in that year I went—on the courteous invitation of your contributor, Mr. W. J. Bullock, "the Otter of the Arrow"—to fish with him for grayling in the Arrow about the charming village of Eardisland, in Herefordshire, his native place. On my arrival there a flood was running off, and the water was too thick for grayling with the fly. So our first essay, was, at my suggestion, a spin with the minnow for trout. We neither of us were favoured with a run from a *fario*. But just below a small fall at the head of the waste-water pool of the mill of that most hospitable of friends (Friend Hundley) there, where the water was somewhat clearer, I, spinning, and rather sinking and drawing a small minnow on the finest of hooks and the flimsiest of drawn gut, hooked a grayling of about $\frac{3}{4}$ lb. It managed to foul the line round a sunken pile; and ultimately it broke away. But before I or Mr. Bullock—*ferente*—lost the fish, he had seen it and had satisfied himself that it was a grayling. He could hardly, however, bring himself to believe that it was fairly hooked. For not only had he just spun over the very water where I hooked the fish, but he had been in the habit of spinning the minnow in that river for more than thirty years, and had never hooked a single grayling, a fact which, indeed (in answer to an enquiry of mine), you will recollect he had stated some few months before in one of his pithy and practical articles on spinning for trout with the natural minnow (in his one of the old styles) which appeared in your paper. On one other day only did I spin in the Arrow.

The next and the last occasion on which I have spun the minnow in a grayling river, was at Whitsun, '80, when I went with "X" to pick up the rudiments of fly-fishing-spinning at Corwen on the Dee. He spun for three days, and on one day took three good grayling. I spun for a part of the first day only, contenting myself with humbly and intently watching the fishing of my teacher during the remainder of our time there. But within about the first hour of my practice I took as its first fruits, as the very first fish which I caught in the new style, a grayling of about 3 oz. Not so bad an augury?

Although, therefore, my experience of taking grayling with the spinning minnow is not an extensive one, am I not warranted, nevertheless, in regarding it as a rather remarkable one? tending in the strongest manner to show that it is no such very wonderful freak of nature, after all, nay, that it may be made an almost everyday occurrence to take grayling by that mode of angling, provided only it be practised under the true conditions necessary for ensuring success, viz., lowness and brightness of water, smallness of minnow, fineness of tackle, and slowness of spinning. Drawing up stream or across stream is the best way of spinning for grayling, inasmuch as the spinning thus is slower than it would be in drawing down stream. And no doubt—as F. well observes—sinking and drawing is the form of spinning best adapted for taking grayling as being most in harmony with the habit of that fish. I allude to its almost vertical rise to seize a bait. In fly-fishing-spinning that mode of working the bait is not practicable, but the loss is more than compensated for by far greater gains.

Still, I cannot wonder in the least degree at Mr. Bullock and many another "old hand" at spinning the minnow—anglers who all their lives have spun for trout under very different conditions, yet with great success—never taking a grayling when spinning, and consequently never believing that it is to be so taken, and that "as easy as a glove," till they have had very good proof, by ocular demonstration, of the apparent miracle. For those sceptics are in the best of company; they have very high authority for their fallacy. Was not Sir Humphry Davy (who has given us, you know, that new and true definition of the angle, or, if you please, of the *right* angle—as a line with a fly at one end, and a philosopher at the other—an angler as acute as ardent? And yet, in his *Salmonia*, in the dialogue on fishing for hucho, I read as follows:

"Hal.—Well, what sport have you had since I left you?

"P.—We have each caught a trout and two large chubs, and have had two or three runs besides—but we saw no huchos; and though several large grayling rose in one of the streams, and we tried to catch them by spinning the minnow in every possible way, yet they took no notice of our bait.

"Hal.—This is usually the case. I have heard of anglers who have taken grayling with minnows; but it is a rare occurrence, and never happened to me."

I am, I know, well within bounds when I state that "X" and his pupils have caught many hundreds of grayling by minnow-spinning, more especially of late years in fly-fishing-spinning. When spinning in the spring now, they often find the large grayling a very great nuisance.

All that I have written refers to spinning the *natural* minnow; for I have always been taught to treat "the artificial" with comparative contempt.

Of course, in fishing for grayling only, the spinning-minnow, even at its best, is too uncertain a bait to be depended upon, at all events for the best sport. I take this opportunity to crave pardon of "A Constant Subscriber," and of all other your readers, for not having yet performed my promise of describing in your columns the trout-spinning of the future—as I have ventured to call it—that fly-fishing-spinning. If I *must* be "free to confess," I may as well admit that I did sketch out a description of the invention shortly after my trial-trip to Corwen. But I was not satisfied with the article; and since then I have felt more and more that I should like a little more practice with the new art, so as to become a little more of a learner before I come to be so much of a teacher of it; for, somehow, ever since I acquired the A.B.C. of that most elegant of angling accomplishments, my fishing, such as it has been, has lain far more among chub, and pike, and salmon, than amidst the trout. But I live in hopes of studying a good deal more deeply that subtilst of piscatorial philosophies this next season—*nulla dies sine linea*. And then, after that, in the fullness of the right time, I shall redeem my promise, and tender to you my performance, in a wrapper, neatly endorsed (as if by the writ of the late Lord Eldon): "*Sat cito, si sat bene*." In the meantime, will not your readers, one and all, patient as true anglers always are, permit me to take the full benefit of so excellent a

motto? I hope so. The art is far too high for me to risk its ruin by any rash and rude revelation of its ravishing mysteries.

I should have much liked to add here a few words as to the real trolling for grayling—the fishing for it with the sunk and drawn grasshopper—the natural grasshopper mounted on the artificial one. I think Wilson of Leominster could soon show Mr. Walbran (who, I am sure, would only be too delighted to learn), that *that* lure is as deadly in the Yore as in the Arrow, or the Lugg, or the Tems. But, alas! your space, Mr. Editor, and my time, for that little disquisition, are not just now in the happiest of conjunctions.—I am, &c.,

A.R.I.E.L.

London, Nov. 14, 1881.

L. B. AND THE BEDFORD ANGLING CLUB.

SIR,—In your last week's paper I notice that an anonymous correspondent, L. B., contributes a pathetic account of how some friends of his were maltreated recently by my orders, when peaceably engaged in angling. He admits twice over that he does not know (nor does he seem to care much) whether the fishing rights at the place in question belong exclusively to the Bedford Angling Club or not. It seems to me that this is rather an important point. Now, I can inform him that this club rents the whole of the fishing rights there on both sides of the river from the owner, and that Mr. Mann, although he may find it very convenient and profitable to "give permission" to his customers, has no fishing rights whatever, nor dare he himself be seen fishing from his fields, of which he is an annual tenant. L. B.'s friends know very well what they are about, and invariably refuse to give names and addresses, because they do not fancy a summons. Referring us to Mr. Mann is a mere pretence, as they and I are well aware of. On the day referred to I certainly did not pay those persons any compliments, Waltonian or otherwise. I believe I called them poachers, and I most decidedly consider them so still.

When L. B. has a private fishery of his own, and a neighbouring innkeeper "gives permission" to a number of strangers to fish the water, L. B. will, no doubt, be charmed to see such "gentle, quiet men," and will invite them all to dinner after their day's sport, but we really cannot afford to manage our affairs here on such truly philanthropic principles. I deny altogether L. B.'s assertion that this club is unpopular, except amongst the class, to be found everywhere, who would net the river from one end to the other if they could—and amongst those who deliberately poach in private waters, are too cowardly to give their names, and have naturally a strong objection to what L. B. is pleased to call a "high-handed sample of our mode of enforcing what we are pleased (rightly or wrongly) to consider our rights."

Not long ago two persons found fishing in our water produced tickets to our keeper proving them to be members of a well-known London Angling club, and gave addresses as well. The latter proved false, and in making enquiries at the headquarters of the said club in London, the landlord took the names up to the committee, who were, he said, then holding a meeting, and returned shortly saying that the names were not on their books. Such members of London clubs are not held in particularly high esteem down here, and need not expect to be left in undisturbed enjoyment of this club's private waters, L. B.'s sympathy and friendship notwithstanding.—I am, &c.,

E. BICKNELL, Hon. Sec., Bedford Angling Club.

THE WATERWORKS AND THE THAMES.

SIR,—I was glad to see a confirmation of a firm belief which I entertain, in your issue of last week, in R.'s letter, "Propagation of Coarse Fish." What I allude to is the diminution of fish in the Thames by their being able to enter the reservoirs, or by their being sucked in by the rush of water.

Now, I enjoy the privilege of being able to fish some of the principal of these reservoirs, and I feel confident that the rush of water from the Thames being so great must inevitably force in shoals of little perch, &c., which may happen to be cruising round the gratings or pipes in the river; and, sir, not only are small fish drawn in, but I can assure you that not unfrequently jack of 3 or 4 lb. manage to get in.

A year or two ago many bream of 8 lb. and over were netted from the Barnes reservoirs. Is it probable that these fish had grown to that size, from say even $\frac{1}{4}$ lb. and under, in the water from which they were taken? I confess it seems improbable that such deep fish as bream of over 2 lb. should be able to have ingress to the different companies' waters, for if they could get in much heavier fish of different species would be capable of doing so.

It seems that the system by which water is let into the reservoirs from the Thames requires alteration. Either the holes of the gratings are too large, or they are so placed that any shoal of fry coming within a short distance are inevitably sucked in, or perhaps after all the grating are not kept perfectly sound; but whether either of these hypotheses be correct or not, it seems to me a fact beyond doubt that myriads of helpless fry are swept into these miniature lakes never again to return to the river which first saw them exist, thereby depriving it of an innumerable quantity of what should be its occupants.

To this matter it appears only reasonable to hope the energetic consideration of the Thames Angling Preservation Society will be directed, and may they be able to reckon the remedy of this evil among their many other good works.—I am, &c.,

H. G.

The Firs, Cricklewood, Nov. 15.

THAMES FISHERMEN.

SIR,—I want to thank you for giving "A Thames Fisherman," the chance of standing up in our defence, and saying that which no fisherman can deny to be true.

Mr. Brougham is the only man to be found amongst the lot of your readers who differs from him, and he would like the difference settled by "A Thames Fisherman" altering his mind.

Now, sir, I want to know how that can alter the facts, which are the following:—

Mr. Brougham, on October 22, distinctly states "they have boasted in his presence of having stood by and seen the river netted, thereby robbing their customers."

I say it is not true. We never said anything of the kind, and I will prove it out of Mr. Brougham's own mouth. In last week's GAZETTE he says the remark was made by "a fisherman," so it was not "they" after all.

We want the name of that one man, Mr. Brougham, and if you cannot give it, please not to call Thames fishermen robbers of their customers. A worm will turn, you know.—I am, &c.,

A FISHERMAN.

SALMON ROE WANTED (!)

SIR,—I shall be glad if you can tell me, through your paper, where I can obtain salmon roe, and how to preserve it.—I am, &c., P. H.

[We have had some queer queries sent us, but this is about the most cheeky, outrageous insult we have ever received. It is not intended as an insult, but fancy asking the FISHING GAZETTE where to get and how to preserve that unlawful poaching thing, salmon roe. We do not give P. H.'s address for fear the anglers of his town should call and "duck" him.—ED.]

THE LAKE, WIMBLEDON PARK.

SIR,—I hear some one has been giving the lake a bad name in your paper. Now I should like to let you know what sport we have been having this season. Mr. Ward, of Putney, took in June last 19 lb. of bream in one day, and 17½ lb. another, and other gentlemen made some good catches. Now, as regards the carp, there were some good ones taken, the largest weight 12 lb. The weight of carp taken in the season was over 200 lb. Now for the jack—there has been some good sport. Mr. Seppings, of Southfields, Wandsworth, took 52 lb. of jack in three days, the largest weight 11½ lb.; we have had taken since the 17th of October over 100 lb. of jack. Now, sir, I can let you know why we have not got many roach—because we have too many jack. I hope you will let my friend or friends see this.—I am, &c., A. WOOLGAR, Lake Keeper, Wimbledon Park. November 12.

[How about the statement of the setting of trimmers and night lines. Is it true or not?—ED.]

"WHAT HAS BECOME OF OUR JACK AND PERCH?"

SIR,—The above question is asked by your correspondent, "A Thames Fisherman," and notwithstanding his quasi-answer about "the mania for steam launches" and "ribbons of spawn," I believe the real answer to the question to be "Ask the Swans."

These birds, which appear to increase steadily in numbers do, I believe, more towards clearing the boughs of these ribbons of spawn than the launches. I have been told by an eye-witness that he has seen congregated swans making a meal off the spawn on the boughs and reeds, and doubtless the same thing has been observed by many fishermen and river-keepers. Anglers are a daily increasing body, and apparently Thames fish are not; something, then, should be done to put an end to this wholesale destruction of spawn.

Either the various preservation societies should collect the spawn-covered boughs and reeds in the respective waters over which they have control, and place them where they can be easily protected from the swans, and also, to a great extent, from the wash made by steam tugs, which is, as a rule, bigger than that made by the much and often rightly abused steam-launches; or else a combined appeal should be made to the City Companies, whose property the swans are, if possible, to put some restraint on the movements of the birds during spawning time, or to waive some of their rights and diminish the number of these beautiful but destructive creatures.

Anglers are now a recognised part of the community, and are, as a rule, treated with a generous courtesy by the public at large, who would doubtless be ready to dispense with the presence of a few swans, in order that the brethren of the angle might meet with a reward more worthy of their skill and patience than they do at present.

Hoping that these suggestions (should they appear in the FISHING GAZETTE) may lead to some step in the right direction.—I am, &c., BLANK DAY.

[Last year the T.A.P.S. did good work in getting the swans incarcerated while the perch were spawning. We should much like to see these graceful poachers made into one big pie.—ED.]

RIGHTS OF FISHING IN THE RIBBLE, AT WALTON-LE-DALE.

SIR,—On September 8 I went to fish the Ribble, at Walton-le-Dale, near Preston, and I called at Mr. Prescott's, the public-house near the bridge, to ask him which was the best place to get some sport, when he informed me that the mouth of the river Darwen was a very good place to fish. I then, of course, asked him which was the best way to get there. He told me that there was a new tenant at the Nursery Gardens, named Mr. W. Throughton, and the said Mr. W. T. had told him that any anglers coming from Bolton, or any one that looked respectable, might go to the river through his gardens. Well, of course, I went through his gardens to the river; and I caught five chub, one roach and one eel, as the tide was receding. I then went to the public-house for refreshments, and as I was coming back I met Mr. W. T., and he asked me where I was going. I told him, when he ordered me off immediately, and informed me that he had never given Mr. Prescott liberty to send any anglers through his gardens at all, and that he would not allow any one the privilege to fish the Ribble there. Now, I may say that the river Darwen empties itself into the Ribble close to Mr. W. T.'s gardens, and it is a very noted place for Bolton anglers to go to; and no one has ever been stopped before for fishing there. Now, what I want to know is, can Mr. W. T. stop any one from fishing there at all, as the fence of his gardens is 8 or 10 yards from the river at this particular spot? and I always thought it was a right for all the Queen's subjects to fish where the tide ebbed and flowed. Perhaps some of our Preston friends will let us know through your valuable GAZETTE whether Mr. W. T. can stop any one from fishing there or not.—I am, &c., WILLIAM DUCKWORTH.

Cross Guns Angling Society, Bolton, Nov. 7.

[Mr. Throughton has a perfect right to prevent any one entering his garden, and if his garden borders the river he can prevent any one fishing from it, but he has no right whatever to prevent any one fishing in the tideway, unless he can produce some special charter giving him the right, or prove that it is his by "immemorial use;" if he cannot prove this, and it rests with him to do it, the right of fishing belongs to the public. See "Oke's Fishery Laws," edited by Mr. Willis. B.A.L.—ED.]

WORMS.

SIR,—Your correspondent "Mark Antony," asks in the FISHING GAZETTE of October 22, the following question:—

"Can any of your numerous readers inform me whether worms that are cut in halves with the spade when digging regain their original forms: and, if so, in what way does the tail portion form a new head, and how does it obtain nourishment to enable it to perform this extraordinary feat?"

For my own part I cannot give any proof from ocular demonstration, neither have I yet been able to peruse Mr. Darwin's late exhaustive treatise on worms; but when at school, some forty years since, I was given to understand that

worms so mutilated, viz., with the spade, were not destroyed, but actually formed separate animals. Fortunately the old school-book is still in my possession, and bears the printer's date of 1829, from which I cull the following, in hopes it may meet the views so much wished for by "Mark Antony," an answer not having appeared to that effect. "Worms unite both sexes in themselves, at once impregnating and being impregnated in their turns. Their eggs are laid in the earth, and become hatched in twelve or fourteen days by the genial warmth of their situation. During the winter these animals bury themselves deeper in the earth, and appear in some measure to partake the torpidity of the insect tribe; but in spring they revive. And as a proof of the simple organisation of worms and their degradation in the scale of being, they are also capable of being multiplied by 'cuttings.' Each section gradually acquires what was wanting to complete its form, and, in a few months, the minute parts of the original creature attain their natural size and proportion. Thus, one of the most seemingly abject of lives is the most difficult to destroy, and, in proportion to the dangers to which the tribe is exposed, Providence seems to have allotted it qualities requisite for its preservation."—I am, etc., FRANK GOSDEN, Exeter.

[The supposition that earth-worms can be propagated by cuttings is a well-known popular delusion, in common with the general belief that the thickened knot (*clitellum*) situated in advance of the middle of a worm's body is the healed junction of two wounded parts. The tail-end of a divided worm invariably dries, but under favourable circumstances the wounded anterior end has occasionally been known to heal, and the mutilated worm to drag on a precarious existence.]

THAMES STYLE v. NOTTINGHAM STYLE.

SIR,—If the subject of the "Tournament" is not yet exhausted in your columns, perhaps you would kindly find room for a few remarks supplementary to your own of last week on the relative merits of the Thames and the Trent styles of casting.

You were certainly right in saying that a fisherman of the latter school has a vast advantage in being able to fish from a bank where weeds or brambles abound; also in a high wind when the Thames spinner has such difficulty in coiling his line at his feet so that it shall run easily through the rings without entanglement. For mere distance throwing, too, the Trent fisher has another advantage in being able to use a much finer line, which, of course, exercises far less "drag" upon the bait thrown than a heavy one; though I fully anticipate that if the weather is fine at the next competition the distance thrown by the Thames spinners will exceed that of the Trent men, because, in spite of the finer line, the revolution of the Nottingham reel, however delicately poised upon its axis, must cause a greater loss of power than the mere picking up of the line from the ground of the other method. Even the other day, at Hendon, although the weather was far more adverse to the Thames than to the Nottingham style, the Trent champions (with the one notable exception of Mr. Little's splendid throw) were distanced by the men from Maidenhead.

Now, as to the true art of working the bait, and the keen sport of playing the fish when hooked, there can be no comparison between the two systems. The one man plays his line with the tips of his fingers and thumb, wherein is situated the most acute sense of touch; the other with the mere mechanical winding of a wooden reel. And, although by winding in the bait with the reel it spins more evenly the whole way back, still, to my mind, that is less attractive to the fish than a bait played with a series of graceful leaps, as many of our Thames men know so well how to work it. Again, in playing the fish when hooked; of course, grinding him in on the reel is an effectual way of "putting the screw" on him, but there cannot be the same exquisite sense of sport as is enjoyed by the man who feels every struggle and plunge communicated through the line to his fingers; much in the same manner and as acutely as the other sense—hearing—is exercised by two persons conversing from a distance by means of the telephone. The difference between the finger work of the one system and the mechanical work of the other, is as great, as in art, is the difference between a fine water-colour drawing and a chromolithograph.

One word on another subject, and I will bore you no more. I was very pleased to see the weights of the baits used at the tournament given in last week's GAZETTE, as it will, I hope, satisfy those who, I hear, have expressed disappointment at the distances thrown. You, sir (or one of your correspondents), the week before the event, doubted the 60 or 70 yard casts, so often spoken of in club rooms, &c., and I think that if one were to try and verify any of them, it would be found either that the distance was only "strided" out, or that a heavy weight (such as was shown at the Welsh Harp, and unanimously rejected by all the competitors) was used to accomplish it.

In conclusion, allow me to thank you for having inaugurated these interesting friendly competitions.—I am, &c., V.

[Having just got back (10 p.m., Wednesday) from a jolly day's spinning in the Thames style we can fully endorse V's remarks about the pleasure afforded by feeling the bait spin and feeling the fish fighting; at the same time, we think that the Nottingham angler will claim he can spin fast or slow, can stop his reel and let his bait dive like a goose bait, &c.; at the same time it is a curious fact that whilst two of us used the Thames style and did well, a more skilful angler with us spinning from the reel did not do so well, getting but one fish against our ten.—ED.]

LARGE PERCH.

SIR,—Having seen so many reports in the FISHING GAZETTE about large perch, I beg to say that I was in the employment of the late Mr. John Cooper, naturalist, upwards of 33 years. During that period the largest perch preserved in his establishment weighed 5 lb. 1 oz. I presume it was the one "Esox Lucus" saw many years since at Holroyd, fishing tackle makers, in Gracechurch Street.

I will give you a brief history of it. Upwards of thirty years ago, Clapham, the keeper to Mr. Sage, the owner of Dagenham Lake, brought two pike, 20 lb. each, to be preserved. On that day Mr. Cooper had a perch, 3½ lb., come in for preservation, and observed to Clapham that it was a large specimen. Clapham thought very little of it, as there were perch in the lake between 6 and 7 lb. Mr. Cooper offered him a sovereign to produce one of that weight. About a week had elapsed when he came with the above-mentioned perch, saying that it was upwards of 6 lb. Upon putting it in the scales it balanced 5 lb. 1 oz. Mr. Cooper gave him the sovereign, remarking that it was the largest perch he had ever seen. When preserved it was exhibited at Holroyd's about three weeks. Mr. Sage having heard of it, requested the fish to be sent to Dagenham. Mr. Cooper, being an obliging man, acceded to his wish; the

remuneration he got was two more perch, one 3½ lb. and the other 3 lb. Respecting the 10½ lb. one there must be a great mistake. I remember the present Mr. Cooper, previous to my leaving him, having a skin filled out by some local stuffer, to be fitted into a case. That fish was not so large as the one from Dagenham. I think it must be a pike-perch, as we cased one or two of that species.—I am, &c.,

WM. GIBSON, Naturalist.

19, Richmond Grove, Barnsbury, N., Nov., 1881.

CLUB REPORTS.

ANGLERS' BENEVOLENT SOCIETY.

Since the last report, I beg to acknowledge the receipt of the following subscriptions, with thanks:—A. Jardine, £1 is., annual; A. Rogers (Izaak Walton), 10s. 6d., annual; J. Boalch (Walworth Waltonians), 5s.; E. Hoffman (United Essex), 2s. 6d.; G. Grimes (Gresham), 2s. 6d.; and M. H. Rodell, Clarence Gate, Regent's Park, 5s., annual.—R. GURNEY, sec.

Nov. 16.

ANGLERS' PRIDE ANGLING SOCIETY.

Several members of this club were out on Sunday. Mr. T. Fiddes, 3½ lb. roach; Mr. J. Soar, roach and gudgeon; Mr. J. Dealey, jun., roach and gudgeon; Messrs. H. Haines, D. Dodson and F. Nash also weighed-in fish. A very nice show of gudgeon.—T. MARSHALL, sec.

Nov. 15.

BRISTOL GOLDEN CARP ANGLING ASSOCIATION.

On Friday, November 11, the Committee of the above association had a contest on the association waters, which proved very successful. At the close of the contest the competitors journeyed to the club house, the White Hart Hotel, Old Market Street, and partook of a beefsteak and oyster supper, served up by our worthy host (Mr. W. G. Leigh). The cloth having been cleared, preparations were made for an enjoyable evening. Mr. J. Hadden occupied the chair and Mr. H. Inch the vice, Mr. F. Gazzard presiding at the piano. The vocal talent was grand, which comprised the noted Mr. G. Pullin, Mr. Ross, the venerable H. Warr, and Mr. F. Cornish. The usual loyal toasts were given, likewise the drinking of health to the chairman, host and hostess, pianist, and vocal talent. After spending a most enjoyable evening, the members dispersed at a reasonable hour.—LEWIS WRIE, sec.

BRIGHTON ANGLING ASSOCIATION.

The fine condition of the rivers in the Brighton district has induced several members to go out. Mr. Ash took, on Sunday, at Berwick, 6 lb. of bream and perch; Mr. Tree, 3 lb., at the same place; Mr. Anscombe and G. Saunders had smaller takes. Three of Mr. Ash's bream were brought to Brighton alive and placed under Mr. Tree's care till Monday, and they are now in the Brighton Aquarium, doing well. Mr. Power and G. Foord had good takes of silver whiting and gurnard, last Sunday, only two miles at sea. Wind, south-south-west.—GROUNDBAIT.

Nov. 16.

BROUGHTON ANGLING CLUB.

The members of this club held their dinner in connection with the closing of the past trout season, Mr. Griffin, of the Apple Tree Inn, in the chair, Mr. D. Hooper in the vice. There was not so good a muster as expected. Amongst those present were Messrs. A. Bosworth, J. B. Bosworth, Alfred Bosworth, J. Hill, J. Deakin, of Malvern, C. Halier, W. H. Carey, J. Griffin, H. Watkins, C. Watkins, &c. After the loyal toast the hon. sec. read a short report, part of which we give:—"This club is formed for the object of carrying out as far as possible the protection of fish against poaching, and the committee recommend all its members to assist the water bailiff at all times in so doing." The following gentlemen were the most successful up to end of last month: Mr. A. Bosworth, 90 lb. of dace, roach and chub; Mr. Guillams, best take of trout in one day; Mr. J. A. Griffin, 37 brace of trout and best brace of grayling, 2 lb.; Mr. Hopkins, 24 lb. of white fish; Mr. Carey, trout, chub, dace, &c.; Mr. A. Bosworth, best fish 3 lb. 4 oz., a chub; Tandy, 11 chub, weighing 9½ lb., one take, and others are upon the list, but not to the front; yet there are four months for the white fish and pike. We expect some good takes after the water has run off. The rivers are full of snow-water, and fish are shy and lie close. We have eight prizes this season. A most enjoyable evening was spent, and the health of host and hostess was heartily responded to. It may be interesting to many readers of the FISHING GAZETTE to know that I have a roach now alive that was taken with the hook, and put into a basket with a dozen others; it was quite lively after being weighed, and in the basket from half-past four o'clock until half-past nine; it was a very foggy night. Mr. A. Bosworth gave it me, and it is doing well in my tank.—J. A. GRIFFIN.

St. John's, Worcester.

BURDETT ANGLING SOCIETY.

On Sunday last we had another very fair show of fish at this club. A good many members went out to find some sport, but only the following gentlemen were successful—Mr. Hastings, roach; Mr. Ratcliffe, roach and dace; Mr. Coughlan, roach; Mr. B. Smith, a very nice take of dace from Waltham; Mr. Samuel Fouch, a very interesting bachelor angler, who is always full of fun and jokes, was duly appointed master of the scales for the rest of the season. Mr. Ratcliffe again favoured us with a nice show of roach, from Richmond, on Monday.—T. J. WALKER.

Nov. 17.

CENTRAL ASSOCIATION OF LONDON ANGLING CLUBS.

This association continues to make satisfactory progress, and possesses comfortable quarters at the Star and Garter, St. Martin's Lane, Charing Cross, the worthy host, Mr. F. C. Hatfield, who holds the position of treasurer, doing all he can, and no man can do more, to make success a certainty. Two new angling clubs were enrolled at the last meeting—"The Second Surrey," at the Queen's Head, Brandon Street, Walworth, and "The Crown," at the Crown and Sceptre, Friendly Street, Deptford. Mr. R. Stebbings makes an active secretary and Mr. J. C. Murray a thorough business chairman.

CITY OF LONDON ANGLING SOCIETY.

The following members weighed-in on the 13th inst.:—Messrs. Payne and J. Chambers, roach and bream, from Amberly; Mr. Castell, roach, from the Stort; and Messrs. Mortimer and Mark, a good show of roach, from the Rye House.—CAS.

DUKE OF CORNWALL ANGLING SOCIETY.

The members of this society have been meeting with capital success during their new half-year. Having removed to their old quarters, the Duke of Cornwall, Lismore Circus, they appear likely to have a successful season up to the

end of the year. On the 6th ult., Mr. B. Sargeant headed the show with 23½ lb. of splendid roach and one jack of 2½ lb., Mr. W. Hyde being close with a capital collection of roach, perch, chub, and dace; Mr. Evans some 5 lb. of roach. Several prizes were still to be had from Boxmoor, and Mr. Robinson ventured there, taking first, Mr. W. Kettle running close for second; but as they were down for roach only, their shows were somewhat small. Even those stakes were beaten on the 13th, Mr. Evans having a roach and losing a jack, estimated at all sorts of weights; Mr. Arthur Sargeant, a brace of jack, 9 lb. But the "plumber" was Mr. Hannagan, with 3 lb. of roach, one chub, 4 lb. 7 oz., brace of jack, 9 lb. 8 oz., and one of the handsomest specimens of *Esox Lucius* that your correspondent ever had the pleasure to see—weighing 2 oz. short of 14 lb.—which has been sent for preservation. But this young angler's first fish ought certainly to have been wetted, if not toasted.—J. HICKFORD, sec.

FIRST SURREY ANGLING SOCIETY.

Owing to the non-attendance of members last Wednesday the match, which was to have come off next Sunday, has been postponed until Nov. 27. It is hoped that the members will show up well next week to make final arrangements.—P. D. MANNING, sec.

GOOD INTENT.

The members of this club finished the second Sunday out of the four for the month's competition, the jack fishers having the best of it up to the present. Mr. Ovines brought in close on 10 lb. jack, Mr. Cox jack; twenty members weighed-in roach, the heaviest weight being 4 lb. The roach appear dead off on the Lea. Mr. Bonnick brought in a handsome perch on Tuesday from St. Margaret's, 3 lb., sent to Cooper's. The members voted £2 2s. to Mr. Bonvoisin's testimonial, hoping it will be a great success.—R. MURPHY.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

Sunday, November 6: Mr. Theobald, 7 lb. 7 oz. roach; Mr. J. A. Fitch, one jack, Mr. W. Parkin, 8 lb. 9 oz., including a nice chub, 3 lb. 4 oz.; Mr. J. K. Fitch, 3 lb. 13 oz.; all from the Wey. Mr. Armstrong, 4 lb. 5 oz. roach; F. Watling, 4 lb. 3 oz. roach, from the Thames; Messrs. Hutchings, Kirk, Butler and Smith, roach, from the Colne. Sunday, November 13: Mr. Stammer, 3 lb. jack, from the Welsh Harp; Messrs. Baker, Theobald, J. K. Fitch, G. Parkin, W. Parkin, Hutchings, and J. A. Fitch, roach, from the Wey; Messrs. C. Warren, F. Watling, Smith, Armstrong, Young, and Warne, roach, from the Thames. Mr. F. Watling won a spinning rod given by Mr. Dillon, tackle maker, Victoria Road, Kentish Town.—J. A. FITCH, jun., sec.

Nov. 15.

GRESHAM ANGLING SOCIETY.

The members of this society met, as usual, on Thursday evening, T. P. Cooper, Esq., in the chair. The hon. secretary stated that the society now numbered about 190 members, and that the memorial in favour of an alteration in the Thames Conservancy Bye-laws, having been signed on their behalf by the president, Lord George Hamilton, M.P., had been duly forwarded to the Thames Angling Preservation Society. The fish taken during the week were small, and mostly returned to the water, but a jack of 9 lb. 14 oz. had been weighed-in by Mr. Cooper, the chairman of the evening. The society expected to rent some water in the course of a few days, and if so, Mr. Cooper's prize of the value of £2 2s. will be fished for in it. This being an off night, when no very special business was to be transacted, some of the members gave musical selections, Mr. Winterbottom presiding, with his usual ability, at the piano. There was also a ballot for new members, and Messrs. B. Simkins, J. Budd, E. J. Hoffman, A. Benningfield, J. T. Long, C. Bates, and R. Robertson were elected. Other candidates will be balloted for at the next meeting. Mr. Wheelton will give his paper on "The Science of Angling" on Thursday, the 24th inst. at 7 p.m., when Mr. S. C. Harding will preside. The committee anticipate a large attendance, and will do their best to accommodate members. The evening of Thursday, December 1, is to be devoted to music, when Mr. Winterbottom, Mr. Harding and friends will reproduce the old Waltonian airs. Secretaries of societies, and gentlemen interested, are welcome to attend any of these gatherings on signing the visitors' book.

IZAACK WALTON ANGLING SOCIETY.

Mr. B. Crook won Mr. T. Davison, jun.'s prize for the heaviest weight of any kind (bar chub), taken on the first two Sundays in November. Mr. E. W. Turner's prize for chub was not taken, but by request of Mr. Turner, it is to be fished for on Sunday next, the 20th inst. Two special prizes were fished on Wednesday, 16th inst.; Mr. W. H. Mechem secured first honours, Mr. G. Bliss, the second. The half-yearly distribution of special prizes will take place on Wednesday, the 30th inst., on which occasion it has been proposed and agreed that the members have a supper. Members who intend being present will please send in their names to the secretary not later than Sunday, the 29th insts. No names can be received after this date.

Nov. 17th, 1881.

JOVIAL ANGLERS.

This club met on Sunday evening last, when Messrs. Green, Smart, Kollemann and Jeffrey weighed-in fish from Shepperton, and Mr. Steade had a nice show of dace from Richmond. The club is now in good working order, and its members are steadily increasing.—H. M. PLATT, secretary.

Nov. 7.

LARKHALL.

The first smoking concert of the season was held on the 9th inst., when some 70 members and friends assembled in the club-room at the Larkhall, Clapham, and spent a most enjoyable evening. Mr. F. Croutet opened the proceedings by a good rendering of "The Bay of Biscay," which was well received. Messrs. Lovett and Edmondson sang in their usual finished manner, their duet being greatly appreciated. Mr. Broadlake gave some good serio-comic songs, and our worthy president, Mr. G. F. Spencer, and his brother, W. Spencer, won hearty applause by the telling delivery of their recitations. Of the excellent songs that were sung, special mention should be made of those by Messrs. Cranch, Creak, Owen, Mitchell and Taylor. Mr. Charles Hallé, of the Royal Aquarium, played two solos with his accustomed good taste, and gave the utmost satisfaction by his efficient accompanying.

The next concert is fixed for Wednesday, December 14, when a large muster is anticipated. The following members have been fairly successful during the past week: Mr. Westley, from Datchet, perch, 1 lb. 15 oz., and from Richmond, roach, 3 lb. 3½ oz., dace, 1 lb. 6 oz.; Mr. Morris, Weybridge, perch, 3 lb. 11 oz.; Mr. Bird, Shiplake, weighed in some fine tench, three fish going 7 lb. 10 oz., which were much admired, and two chub, 3 lb. 2 oz. and 4 lb. 5½ oz., perch 12½ oz., roach 4 lb. 7 oz., and from Hertford a fine sample of dace, 5 lb. 11½; Mr.

G. Watkins, from Egham, chub 1lb. 2oz., and Mr. E. Watkins from same place, perch, 3lb. 10½ oz.; Mr. Taylor, from Hertford, 1 jack, 4lb., dace, 1lb. 4½ oz., roach, 3lb. 13oz.; Mr. G. Spencer, at Egham, took a lengthy jack in bad condition, weighing 10lb. 5 oz., and another 2 lb. 10 oz., and one perch, 15oz.; Mr. W. Spencer at the same place killing his first jack, 3lb. 5½ oz.; Mr. Kerry weighed bream, roach, and dace from Richmond, and Mr. Penn roach and dace from the same place, but both takes were small.

LITTLE INDEPENDENT ANGLING SOCIETY.

A large number of our members were out on the 13th, and the majority weighed-in, but the takes were generally small. Mr. Hurwood 2 lb. 11 oz., Mr. Letch 2 lb. 8 oz., Mr. Petre, 2 lb. ½ oz. roach, &c.; Mr. Laich, perch; Mr. Scott, perch; Mr. Wightman, perch and roach; Mr. H. Moore, perch; Mr. Heelas, roach; Mr. Grey, roach and dace; Mr. Raine, perch and gudgeon; Mr. Humphreys, roach and gudgeon. On Wednesday Mr. P. Banfield tried his luck at the Rye House, and got some jack and roach, one jack weighing 4 lb.—W. BROWN, hon. sec.

Nov. 4.

ODDS AND EVENS ANGLING SOCIETY.

Tuesday, November 22, has been set apart, at the Grecian Theatre, for the benefit of Mr. Charles Watling, sen., member of the above society, who, through depression in trade and many heavy losses in business, is compelled to appeal to his brother anglers and friends for assistance. Mr. C. Watling, sen., having been connected with angling clubs for thirty years, and at various times rendered great services to the anglers of London, the committee trust this appeal will be well supported. Please apply to Mr. J. Fitch, jun., Robin Hood, Southampton Street, Pentonville.

ORIGINAL ALEXANDRA.

We had a fine show of fish on Sunday last, Mr. E. Brockett roach and dace, Mr. C. Hewett roach, Mr. Blackledge roach, Mr. Newton jack, Mr. Sharp jack, Mr. M. Dymond jack. Our winter concerts commenced on Monday last, and proved a great success, and it will be continued through the winter months.—E. DYMOND, secretary pro. tem.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

On Sunday last eighteen members of the above society fished a pegged-down match at the Forty Guinea Water, and after a spirited contest Mr. J. Drew was declared the winner. Mr. Neagus had a show of roach from the Stort, and Mr. Lucy, sen., jack from the Lea. On Monday next, Nov. 21, a general meeting will take place to receive the delegate's report, and on other important business.—THOS. WM. LUCY.

PHOENIX ANGLING SOCIETY.

The fish ran rather shy the last week or so, but nevertheless Mr. G. Bentley and Henry Maynard and Henry Parker have been up to their old game again, and captured a very nice show of roach and perch, weight 19 lb., Messrs. Milton, Crisp, Hamilton, Lochmuller, and Reed contributing their mite. The next return visit of No. 1 District Angling Societies will take place here on Tuesday next, November 22, when we shall be pleased to see all old friends.—W. ELBOURN, sec.

November 15.

ROYAL GEORGE ANGLING SOCIETY.

On Sunday last a series of prizes were fished for at Chertsey. Most of the members were new to the place, so did not settle down so comfortably as might be expected. Winners of prizes:—first, Mr. Harnack; second, Mr. B. Hughes; third, Mr. Holden; fourth, Mr. Wilcox; fifth, Mr. F. Millard. Mr. Hughes also took a prize for the largest fish bar jack, won with a bream weighing nearly 2 lb.; Messrs. Guyman and Trotter, a splendid show of roach, from the Lower Thames.—F. MILLARD, sec.

Nov. 16.

SOUTH LONDON.

On the 11th Mr. Brown, from Chertsey, had 6½ lb. roach, and on the 13th 7 lb. roach; also Mr. Brewood, who tied him with 7 lb. roach; Mr. Mitchell, 3 lb. roach; Mr. Head a small jack, 3 lb., all from Chertsey; Mr. Boorman, a jack 3½ lb., from Edenbridge, same day; self was at Chertsey on the 15th, and got 3 lb. roach.—G. H. FIELD.

November 17th.

STANLEY ANGLERS.

At the weekly meeting on Wednesday last it was unanimously resolved to support the memorial of the Thames Angling Preservation Society in reference to certain proposed alterations in the bye-laws, as published in the FISHING GAZETTE about a fortnight or three weeks since. Mr. C. P. Wheatstone, as president, occupied the chair, and Mr. W. H. Brougham was also present to speak on the various points. Whilst cordially supporting the memorial in every particular, there was a strong feeling expressed to close the season for jack-fishing at an earlier period. Mr. George E. Walker has undertaken the secretarial duties in succession to Mr. Charles Laidlaw, who has resigned, and the members appear to have made a happy selection, as Mr. Walker has both the ability and the will to make the society prosperous, and has already evinced a desire to make punctuality in attendance one of the elements to ensure success. The arrangements of Mr. Jarvis, the worthy host and treasurer, in providing tripe on the occasion of these weekly meetings, is a popular movement, and, being done so well, is immensely appreciated. A report of the fishing at Walton and the state of the river was received from Mr. Wood, of the Anglers' Hotel, together with a "special tariff for anglers," and read by the secretary, which great satisfaction, and Mr. W. H. Brougham confirmed the desire of Mr. Wood to promote the interest and sport of the anglers.

SURREY PISCATORIALS.

The result of the competition among the members of this society, which took place on the 9th, is as follows:—1st, Mr. Duck, 8 lb. 6 oz. of roach and dace; 2nd, Mr. Pugh 7 lb. 12½ oz. tench, roach, and dace, the largest tench going over 2 lb. 12 oz.; next came the worthy chairman of the society, Mr. Meadow, with 7 lb. 2 oz. of chub, from the Colne. There were also two prizes for honorary members, these were taken by Mr. C. Bansback, jun., and Mr. Watson, with roach from Richmond. Messrs. C. Bansback, sen., Hayward, Beckett, and Murray also had fish, bringing the gross weight up to 50 lb. The next competition will take place in December; how and where, will be open for discussion on Wednesday next. The prices for this occasion will be as follows:—1st, £2 2s., given by Mr. Linstead; 2nd, £1 1s., by Mr. Walker; and a guinea given by Mr. Smithers. I have been informed that Mr. Pugh has sent his tench to be preserved, and also that Mr. Meadow intends to have his chub preserved; and when finished will be added to the collection of the society.—PIXIE.

UNITED BROTHERS.

Scarcely anything worth reporting this week, only just enough to say we had something to weigh. F. Watts, roach, from the Thames; and J. Edber, roach and dace, from the Medway. There is just one other item I should like to report, viz., the reports which have been published recently in reference to the Medway—notably last week—in which "The (not "Ye") Medway Water-rat" says "The river ought to be called the Mudway, &c." Now, to say that a river is thick when the reverse is the case, is, to say the least, very misleading, and cannot be condemned too strongly. A friend of mine was down at Tunbridge on Sunday, the 13th, and he says the water is and has been in good condition for three weeks past. Perhaps Mr. Hollomby will explain, if he sent the report, which I hardly think probable.—WILLIAM BELTON.

Nov. 14.

WALTONIANS.

Nov. 6.—Very handsome show by Mr. Phillips, roach, 11 lb. 14 oz.; chub, 2 lb. 9½ oz.; Mr. Watkins (T.), also a very handsome show of roach and dace, 9 lb. 3½ oz., also three perch, 4 lb. 9½ oz. A prize, fished for at Moulford, was won by Mr. Putnam with jack and roach, 4 lb. 10½ oz.; Mr. Togwell had roach and dace, 5 lb. 7 oz.; Messrs. Malcom, Waltham, and Good, jun., also weighed-in; and I weighed a jack from Broxbourne, 2 lb. 7½ oz., and a small show of roach. Nov. 9.—Mr. Malcom, roach, 4 lb. 4 oz.; I also weighed a very handsome little jack from Broxbourne, weight, 6 lb. 14 oz., taken with a paternoster. Nov. 13.—Mr. Roland had roach and dace, 9 lb.; Mr. Phillips, roach and chub, 7 lb. 3 oz., largest chub, 3 lb. 12½ oz.; Messrs. Grace, Greenfield, Starr, Read, Malcom, Good, jun., and Waltham, also weighed-in fish.—N. J. MARRIOTT.

Nov. 15.

WALWORTH WALTONIANS.

Mr. Weatherhead and Mr. Grigg were out on the 9th and 10th, they succeeded in getting some roach and chub on both occasions. On the 11th the erasing of a name from the books of the society for breaking the rules of the same was met with unanimous approbation. On the 13th a competition took place at Windsor, for a silver watch given by Mr. Feuillade. A guinea pair of boots by Mr. Boalch, and 10s. 6d. by Mr. Delehay. Honorary members were allowed to compete on this occasion, and the following is the result. Mr. Delehay won the watch, Mr. Mawby (H.M.) the boots, and Mr. Bayley, the 10s. 6d. The next competition will take place on Tuesday, November 29th for a set of tankards given by Mr. South. Box of cigars, pipe, and a ½ lb. of tobacco, by Mr. W. Taylor. Mr. Blake will give half-a-dozen bottles of wine for the same day. Mr. W. Brown has informed me, in a very polite manner, that it was on the 5th of November that he and Mr. Cane visited Weybridge, and not on the 5th of December as stated in your last issue. He says, "You must have been indulging in a sample of that two gallons of gin that is to be given by a member for the 18th of December, or something else." Well, Mr. W. Brown, I might have put December to the date of your nocturnal visit to Weybridge after writing about that prize, but as to the sample of the "juniper juice," I must say that I have not received it, nor do I indulge in that liquor, the waters of Burton being more to my fancy.—PIXIE.

November 15.

WEST CENTRAL ANGLING SOCIETY.

We had another capital show of fish in the club room of the above society on Sunday last, taken from the Thames by the following members:—Mr. Taylor, roach and dace, one dace scaling 6 oz.; Mr. White, roach and dace, one dace scaling 5½ oz.; Mr. Bradley, dace; and Mr. Webster, jack from Amberley. A concert will take place at the club room, the Cross Keys, Theobald's Road, on Tuesday, Nov. 22, for the benefit of J. Wilcockson, late a member of the West Central Angling Society, who has been out of employment and laid up with paralysis for a long time. Members of other clubs who will kindly give us a look up on that evening will be sure of enjoying themselves with a good entertainment.—R. I. BEARD, jun., sec.

Nov. 14.

AMERICAN METHOD OF PUTTING ON A LIVE BAIT.—An Indiana fisherman gives the following as the best method of hooking minnows alive for bait:—"Take a piece of black cotton thread a foot long, tie the middle of it tight under the barb of the hook; now take the bait in the left hand, lay the hook on its left side, the barb up by the shoulder of the bait, with the shaft along the belly; now pass the thread over the shoulder and around under the fish, and tie to the shaft of the hook, then pass the thread along the shaft until under and back of the back fin, then tie tightly around the shaft of the hook, then pass the thread on each side of the fish up to the back, just back of the back fin, and tie with a bowknot. This fastens the bait securely without hurting it, and you will have the liveliest and best bait ever used. As the shaft of the hook lies along the belly, it keeps the bait in proper shape, and as the fish usually takes the bait head first, you are sure to hook your fish. With just a little patience at the first trial, you will find that you can tie on the bait very quickly, and then have the best bait you ever used.—Chicago Field.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

GREGORY'S SPINNING BAITS. The Gregory, the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedeian spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedeian fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout FLIES which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

NOTICE.

—o—

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 11, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 188, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterlido-road.
Mr. D. W. Willoughby, 21, Lombard-market, Battersea, S.W.
Mrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.
Mr. Alfred Young, "The Golden Perch," 174B, Oxford-street, W.
Mr. T. Barnett, 26, Church Street, Lisson Grove, N.W.
Mr. J. Smith, 7, Tottenham Court Road, London.
Mr. Edwin Stevens, Newsagent, 220, Kentish Town Road.

or

Mr. B. R. Barnbridge, 74 and 75, High Street, Eton, Bucks.
Mr. Cowan, 33, South Frederick-street, Edinburgh.
Mr. H. Whitty, 15, Basnett-street, Liverpool.
Mr. C. J. Greene, 54, London-street, Norwich.
Mr. R. Ramsbottom, 8r, Market-street, Manchester.
Mr. James Gregory, Vyse-street, Birmingham.
Mr. Wm. Bailey, Jun., 1, Sabina-street, Nottingham.
Messrs. Nutting and Co., 70, Edgbaston-street, Birmingham.
Messrs. W. C. and J. Penny, Booksellers, Froome.
Mr. E. Perks, Evesham-street, Redditch.
Mr. J. Walsh, Bookseller, 5, Harpur-street, Bedford.
Messrs. H. and C. Treacher, Booksellers, Brighton.
Messrs. Gaynor and Son, 10, Royal-terrace, Richmond, Surrey.
Messrs. O'Handlen and Co., 48, Victoria and Temple-streets Bristol.
Mr. Wilkes, Gunmaker, Leeds.
Messrs. Cayless and Sons, Midland Tent Works, Loughborough.
Miss G. Wells, 1, Sussex-street, Nottingham.
Mr. Wm. Atkinson, Fishing Tackle Maker, Lancaster and Kendal.
Mr. John Wells, 4, London-road, Nottingham.
Messrs. Mitchell and Co., 50, Market-street, Manchester.
Mr. J. Croisdale, 56, Briggate, Leeds.
Mr. John Keeling, the Golden Salmon, 7, Digbeth, Birmingham.
Mr. John Heywood, Manchester.
Mr. John Cocks, Baker Street, Weybridge, Surrey.
Mr. Wm. Reid, No 14 gate, Darlington.
Mr. R. Pearsall, 11, Great Western Arcade, Birmingham.
Mr. G. T. Gibbons, 10, Bridge Street, Salisbury.
Mr. Thos. Heppleston, Manchester.
Mr. J. Perry, Minster Parade, Reading.
Mr. S. Dale, 7, St. John Street, Nottingham.
Mr. H. Booth, 88, Prospect Street, Hull.
A. W. Warner, 121, Broad Street, Birmingham.

News-vendors can obtain the journal through their London Agents.

* * The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s.; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C.

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

SATURDAY, NOVEMBER 26, 1881.

PERCH AND PERCH - FISHING.

By J. HARRINGTON KEENE.

PERCH-FISHING is, to me, very fascinating. To witness the gallant fight of a large perch, and, above all, to feel his severe struggles, is one of the treats of the angler's experience. Yet it sounds cruel to say so, and cruel it would unquestionably be

if the sensations of a fish at all equalled those of a human being. But this I cannot acknowledge to be the case, and perhaps I may here be allowed to digress a little in the direction of the "feelings of fishes."

"Do fish feel pain when hooked?" is, perhaps, the best way to put the question; and it must be further added that the pain referred to is not the momentary pang alone, but its possible continuance during the whole process of playing, landing, and subsequent asphyxia in air, which must be considered before we can arrive at any conclusion respecting the cruelty or otherwise of fishing. In regard to the soft-mouthed fishes, such as roach, tench, carp, etc., it may at once be conceded that pain, if felt at all as pain, on being hooked, is greater than in the case of the bony-lipped pike or perch. With the latter the nerves of the mouth are fewer and less sensitive, and consequently less pain follows on the piercing of the hook's point. But the question arises, "How far are we justified in applying the term *pain*?" Judging from the frequent instances of fish—of prey especially—being pricked, breaking away, and returning again to the bait, it would seem that the word, as we understand it, is a misnomer. Indeed, I frankly confess I believe that it is not incompatible with the nature of a strong, agile fish of prey to rather enjoy the struggle than suffer the poignant anguish which such struggles in more sentient animals would seem to indicate. In the case of a warm-blooded animal, the higher organisation seems to furnish certain susceptibilities which, revolting against interference, react, causing pain just in proportion to the development of the organism. In the fish, the lack of intelligence; or its extremely low order, must render nil the anguish of anticipation; and if there be few nerves, and those of not high appreciative power, the actual pain resolves itself at most to inconvenience, which, in turn, may be rendered pleasant, in that it causes one of the greatest of physical pleasures, namely, the exercise of vigorous and strong muscular powers. The athlete rejoices in antagonism of strength. The greyhound rejoices in the exercise of its powers of swiftness and endurance, so does the horse. Warm-blooded creatures of prey delight in the chase—why should not the cold-blooded marauder of the water delight in the struggle between itself and the frail line?

But to return to perch-angling. The rod which I have found most useful is one which admits of a sharp strike, and ought, therefore, not to be too long, because the necessary stiffness implies weight; nor too short; because, when the bait is some distance from the angler, it is obviously unlikely that a good, instantaneous strike can be brought to bear on the mouth of the fish. About ten feet is the most useful length for paternostering from a punt, for I will refer to this style of fishing first. Let it not be understood that I direct the tyro to strike at once on perceiving a bite. This should never be done; but sufficient time—say while one can count ten—should elapse before the instant strike is made. By this time the bait has been fairly taken in the fish's mouth, and it is improbable to miss hooking the perch when such is the case. A perch usually takes the minnow head first.

For perch-fishing, I always use a dressed fine plait line, and I, in every case, when fishing for fish likely to inhabit weeds, prefer a greenish coloured article. Now there is a complaint often made concerning the difficulty of getting a good green dressing, and many lines which cost a lot of money and look beautifully dressed with this colour turn out very indifferently, owing to the peeling off of the application. The real fault, however, is in using a coloured dressing at all. Why not dye the line, as I always do now, with Judson's dyes, to whatever tint you desire, before dressing it. I have never found that these dyes hasten the rotting of good silk, and it is a certain thing that they permeate the entire fibre so that the line will always bear the same colour to the last thread. Having thoroughly dried the line, I apply the ordinary boiled oil and gold size dressing, and this is repeated every season, as long as the line lasts.

Apropos of dressings, it may not be out of place to give a few of the formulæ I have tried from time to time, and found good, as at this time of the year many are looking up their perch and jack tackle. (1) 2 oz. gold size, 4 oz. boiled oil. (2) Teaspoonful boiled oil, resin and beeswax each pieces about the size of a walnut, pulverise the resin, and slice the beeswax. Put them together in a jam pot in boiling water till dissolved, stirring with a bit of wood; put the line in while the mixture is warm; clear off superfluous dressing with a piece of sponge or wash-leather. (3) Boiled oil, 1 pint; beeswax, ½ lb.—melt in a jam pot in boiling water; put the line in while mixture is hot. (4) ½ pint boiled oil, beeswax as large as a filbert; Burgundy pitch as large as a walnut; teaspoonful of copal varnish. Soak when the mixture is quite warm. (5) After the line is quite dry from the last dressing immerse it in gold size, stretch it quick, and cleanse it from superfluous dressing by means of rag and sponge; again dip it in gold size, and cleanse; then steep it in an india-rubber solution—this may be made by digesting shreds of india-rubber in salad oil; cleanse and dry. It will take a long time to dress the line in this

way, but after it is done it will be found wonderfully smooth, and entirely waterproofed. (6) $\frac{1}{2}$ gill oak varnish, 1 gill boiled oil. (7) White india-rubber in chips, 2 oz.; half pint methylated spirit I am doubtful of the last dressing—(7)—never having tried it, and shall feel obliged by any correspondent trying it, and reporting results. Mr. King (the maker of the natural bait) sells a very nice solid dressing which, as a temporary application, may be recommended. He calls it "Ceroleum," and it contains beeswax in some quantity and resin, I think.

To resume, however, about actual perch-tackle. The next consideration is the bottom arrangement, a paternoster, which I prefer made of salmon gut for the main line, and fine gut for the hooks—that is, when only perch are expected. As, however, it very often happens that pike are present in the water, gimp may be advantageously employed for the hooks—it should be fine, and in proportion to its fineness so ought the quality of it to be: hence, "buy the best." The sinker, a plummet, should be painted green, or some dull colour, and be of cylindrical cone shape so that it may not catch in the weeds. A couple No. 8 swivels should be tied in the main line of the paternoster. The hooks may be No. 10 triplets, or No. 6 or 7 Dublin Limerick.

(To be continued.)

PROPAGATION OF COARSE FISH.

HITHERTO the progress in the artificial propagation of fish in this country has been so slow as to be a matter of surprise, and although much has been done within the last few years in the artificial propagation of salmonidæ, the culture of freshwater fish generally has received little or no attention whatever. The suggestion of Mr. R. B. Marston is a move in the right direction, and it is to be hoped that anglers and others who have devoted any thought to the subject, will ventilate and discuss the subject amongst themselves, and also in the columns of the FISHING GAZETTE, and so create interest in a matter of such vital importance to our angling prospects. The valuable practical suggestions of "B.," in the FISHING GAZETTE of the 12th inst., are what is required, and if others will follow his example, it would undoubtedly be a great help towards the proposed meeting arriving at something definite. If a society of the kind suggested can only be started, I feel sure that, with the great and continued spread of angling all over the country, it cannot be other than successful; but I think the efforts of such a society should be devoted to the propagation of the better sorts of our freshwater fishes, other than salmonidæ, and to the introduction of some of the excellent—both from an angler's, and an edible point of view—American fishes.

With regard to the cultivation of carp, it is an open question whether or not the money and time required for it might not be better employed in the cultivation of other fish; for although the introduction of the best varieties of carp has been for several years a favourite object with the United States Fish Commissions, it now appears from their report there is very little demand for the fish, and that it is not appreciated there as a food fish, and their experience might be brought home to us, for if its edible qualities will not recommend it, it is certain that its qualities for sport will not. Now, with regard to some of the American fishes, notably black bass, it is far otherwise. Black bass gives first-rate sport in all branches of angling, and is an excellent fish for the table. Successful attempts have been made to introduce this fish into English waters by the Marquis of Exeter, and, I believe, others; and, although the cost and trouble of getting them over from America, in case the proposed society could not obtain them here, would be greater than getting over the best varieties of carp from Germany, it would be infinitely better for anglers, and, when once a good supply of stock fish is obtained they might be multiplied to an indefinite extent. I find by the American reports, that about 100 black bass were introduced some years since into the waters of the Upper Potomac, and they soon became so plentiful as to play an important part in the food supply of the interior of the State. Hundreds of families residing in the region drained by those waters are saved thousands of pounds of meat annually by the introduction of this wholesome change of diet, and the fine fishing in the streams has attracted anglers from all parts of the country to enjoy the bass fishing, nowhere to be excelled. It must not be understood that I put our waters on a par with the American waters, which, like everything else in America, are on a "great" scale; but we can follow their example as far as our means will allow. And although our beautiful Thames is only a "darned creek," as an eminent member of the United States Fish Commission is pleased to term it, it, and our other rivers, are capable of great things if only properly cared for; and I am sure that the said "eminent member," from what I have heard and read of

him, would do all he possibly could to help us in the introduction of American fish to English waters.

If a society, like the one proposed, can succeed in increasing our better class of coarse fish, and in introducing others, and so afford better sport, it will follow that the noble army of anglers will vastly increase, and that, instead of being numbered by hundreds, we shall be numbered by thousands.—Yours, &c.,

King's Lynn.

"Respecte finem."

[Why are anglers so shy of carp? Some one said the other day that they were too difficult to catch! We should think the more difficult a fish is to catch, the more worthy is he of being caught; and as for sport—well, a 2 lb. carp will give as much sport as any fish, except a trout or barbel. We should like to see some black bass introduced, and wrote some weeks ago to America for prices of ova and fry. They will only thrive, we think, in deep, cold streams or lakes, with rocky bottom. We do not propose to get any fish from Germany. By the way, carp are good eating, if properly cooked. Her Majesty the Queen eats them frequently.—Ed.]

JOHN HORROCKS.

(DIED, JUNE 15.)

IT is with great regret we learn of the death of Mr. John Horrocks, an Englishman, who, for the last forty years, lived at Weimar, in Saxony. He had carried on the business of a brewer before leaving England, and went to Weimar for rest. He was a most enthusiastic fly-fisher, and has done more than any one towards creating a taste for this highest branch of the angling art amongst our Teutonic relatives on the Continent. A few years ago he published a really beautiful and valuable work, entitled, "The Art of Fly-fishing for Trout and Grayling in Germany and Austria," with the express purpose of teaching the art. We value our copy of it highly. Mr. Horrocks was greatly respected by his adopted countrymen, and the German "Fishing Gazette," speaks very highly of him, saying "he was a true English sportsman," who looked upon fish as valuable just in proportion as they afforded him sport, their value as food for the people being but a secondary consideration in his eyes, consequently he had not much regard for professional fishermen who get their living by the use of the net. He "strictly preserved" a stretch of water in the neighbourhood of Weimar, the beautiful town he resided in, and both by example and precept, fostered a love for true angling in the Fatherland. Any English angler who may visit Weimar should not forget to pay a visit to the last resting place of John Horrocks.

CLUB ANGLERS AND PRESERVED WATERS AT WATFORD.

WE are asked, for the benefit of certain anglers who may find themselves in a fix if they persist in wrong-doing, to publish the following:—

"I should be very glad if you could put a line in the GAZETTE that would appeal to the anglers who come to Watford. Some other gentlemen and myself rent and preserve the water (the Canal) that runs through Cassiobury Park. Our water is from Castro Bridge to No. 166 Bridge; in spite of conspicuous notices that the water is 'Private, &c.,' many of these anglers fish our waters; some of them are members of clubs. Three or four weeks ago I found fifteen or sixteen of them fishing, and went and civilly spoke to them; not one moved, and I had to get one of Lord Essex's keepers and two more men to turn them off. The fishing that is open would not be as good as it is were it not that we carefully stock and preserve our reach, and as one of our members is the engineer to the Grand Junction Canal Company, he will not allow the barges to use nets, which they freely did before we took the fishing in hand. We do not wish to make examples of any of these men, but every Sunday it is the same, and we shall be compelled to adopt more stringent measures. They would not like to go home minus their whole kit some day. Excuse my bothering you with our little lament."

We hope that by inserting this "lament," the threatened unpleasantness may be averted. There is not a particle of excuse for any angler, rich or poor, who deliberately goes and fishes in a water he knows to be preserved; and, for our own part, we feel no sympathy with such poachers, who bring disgrace on the whole body through their selfishness. There is not an angling club in London which does not annually spend at least twenty pounds in prizes for fishing matches, and many clubs spend hundreds of pounds for this purpose. Why do not they devote some of this money—say ten or fifteen pounds a year—to renting a piece of water of their own? They would soon get their

money back by issuing day tickets to outsiders if they cared to do so. The Bedford club has recently had to complain, and it must be remembered that however generous a club may be it cannot exist if its waters are open to every outsider who chooses to fish them. We should like to know what would be the effect of throwing all waters open to all anglers: would any fish be left in a year or two? No one would be responsible, and no one would move to stop netting or poaching if the preservation societies were done away with. Take the case of the Bedford club, how could it possibly keep its members if the officers did not do their duty; and if the club broke up, who would preserve the water, and prevent poaching? In our opinion these preserved stretches of our rivers are the mainstay and support of the free waters, which are in many cases stocked with fish entirely from the preserved portions. Fish do not remain stationary, and every flood distributes fish from the preserved to the unpreserved waters.

THE SALMON DISEASE IN THE TWEED.

THE dreaded *saprolegnia ferax*, which during the winters of 1879 and 1880 caused such havoc amongst the fish in the Tweed, has this year made its appearance sooner than on any other occasion, it having been observed at the beginning of the present month. In the last two winters a general opinion prevailed that the fungus might be attributable to the cold weather and the ice, but this year such a theory cannot hold good, as the river has not yet been frozen, and the weather is remarkably mild. Some people think now that the disease can only be due to pollution, and the Tweed Commissioners are taking evidence privately on this subject to ascertain if possible whether or not it is the fact. Fortunately the number of cases detected in the Tweed this season are not yet numerous, but as the fungus is contagious, fears are entertained that it may again work much havoc amongst the fish, especially as the disease has made its appearance a month sooner than in 1879 and 1880, and the river is well stocked at present. One day lately no less than 73 salmon, grilse, and trout were killed by anglers on the Tweed.

TROUT-FISHING AT WEYBRIDGE.

“WEYBRIDGE is about twenty miles from the metropolis, and is an excellent locality for genuine fishing purposes. Trout are often pretty plentiful. At the time we are penning these lines we have seen a capture of this fish made, on an angling excursion, by Mr. Alfred, jun. of 54, Moorgate Street, City, which is a splendid specimen of Thames trout-fishing. His creel contained thirteen fish in all—one was 12½ lb. one 7 lb. and one 5 lb., and the residue were of more than average size. These were caught by an artificial bait (an imitation of a small gudgeon, manufactured by himself), by spinning. Two of these fine fish are now preserved, and may be seen at the above fishing-tackle establishment. Such an exploit as this shows that the trout must have become pretty numerous in the river, and that the late regulations respecting poaching and netting have operated beneficially for the interests of the fair angler.”—From “Angling and Where to Go,” by Robert Blakey, published in 1854.

[We wish Mr. Alfred would give us a short account of this exploit of his, which we came across in Blakey's book just now.—Ed.]

COARSE FISH PROPAGATION.

IT is with much pleasure we refer our readers to the correspondence on the above subject in this week's GAZETTE. We are delighted to get such hearty support from Mr. W. Oldham Chambers, Gold Medallist in Pisciculture at the Norwich National Fisheries Exhibition, and go with him in spirit to the utmost limit of his glorious future for this proposed society. We think, however, that this proposed society should, at the outset, attempt nothing but the propagation of all our coarse fish. “And quite enough, too, our readers will say.” It will then interfere with no interest, for nothing of the kind exists. We cannot agree with Mr. Chambers that our suggestion has been coldly received. On the contrary, we have received so many promises of support that before long we hope to announce that a meeting for the consideration of the subject will be held at the Society of Arts, and we are preparing a scheme to place before the meeting.

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

THE TRAWLING MODEL.

TO BE PRESENTED TO THE PRINCESS OF WALES.

THROUGH the kindness of Mr. Soman, of the Norwich *Argus* we give above an illustration of the ingenious model made by Mr. Burwood, of Lowestoft, which was shown at the National Fisheries Exhibition, and which is shortly to be presented to the Princess of Wales in celebration of her attendance here at the opening of the show by her Royal spouse. This clever piece of work is enclosed in a large glass case, which stands on a support of appropriate design and admirable execution. The main features of the model are two vessels—one a trawler engaged at its labours, the other sailing into harbour with fish. Two of the best Lowestoft boats have been chosen for illustration—the *Lahloo* and the *Paramatta*, which latter gained the prize in a recent match for craft of its class. In the model there is also a boat, containing two men, which is supposed to be passing from one vessel to the other. The whole system of this mode of fishing is thus clearly brought before the eye. By means of elaborate mechanism the mimic sea is agitated, and the craft on its bosom pitch and toss

with striking effect. By way of explanation, it may be mentioned that the trawl lying at the bottom of the “sea” consists of a long beam, which is kept off the ground by an iron at each end. Behind this beam stretches the net, the upper edge fastened to it while the lower is attached to a heavy rope, the bottom of the sea being thus swept in a half circle, and the fish gathering in the net, which extends back into a long poke, or cod.

The model will in a few days be on view at Messrs. Boswell's, in London Street, and it is expected that it will be handed over to the Princess of Wales in about a fortnight, by which time Mr. B. V. Winch, the leading spirit in the affair, hopes to collect the balance necessary to defray the expense.

The following is the inscription on the silver plate in front of the stand:—

“NATIONAL FISHERIES EXHIBITION, 1881.

“Presented to her Royal Highness the Princess of Wales, by the Mayor, Sheriff, Deputy Mayor, and other citizens of Norwich, as a slight memento of her Royal Highness having graciously assisted in opening, at Norwich, the First National Fisheries Exhibition held in Great Britain.

“SAML. GRIMMER, Mayor.”

GREGORY'S SPINNING BAITS. “The Gregory,” the “Flexible Cleopatra,” the “Oxford,” and the “Colorado,” pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name “Gregory” is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

NOTICES OF BOOKS, &c.

KNOWLEDGE: An Illustrated Magazine of Science; plainly worded, exactly described. Conducted by Richard A. Proctor, B.A. Vol. I., No. 1. November 4, 1881. Price 2d.

"KNOWLEDGE" is a weekly magazine intended to bring the truths, discoveries and inventions of science before the public in simple but correct terms—to be, in fact, the minister and interpreter of science for those who have not time to master technicalities (whether of science generally or of special departments.) With these words, Mr. Proctor, the well-known author and lecturer, ushers in the first number of a valuable addition to the scientific periodicals of the day, and a welcome boon to the reading public in general. His programme is varied and full of promise, and meets the requirements of every one interested in science. The ablest exponents of science will contribute original articles and serial papers explaining scientific methods and principles, and descriptions of new discoveries and inventions will invariably be freed from the technical language in which they are customarily presented to scientific societies at home and abroad. It is also intended to provide a correspondence section for full and free discussion, and especially for inquiry into matters which readers of the original articles may have found difficult or perplexing. Reviews of scientific books suitable for general reading will, of course, find insertion; while the demands of mathematicians, chess-players, and whist-players, will be met in a manner at once useful to learners and interesting to proficients. But that which will most effectually secure the success of "Knowledge" is the Editor's determination to exclude everything that is not plainly worded and exactly described. Scientific word-mongers are herewith warned off, especially the man we once heard of, who thought concise language a pitiful and pernicious economy of words; and who, while ready enough to admit that language was large, considered it scarcely equal to his mental conceptions. On one occasion this individual characterised change as a "perichoretical synechy of pamparallagmatic and porroteroporeumatical differentiations and integrations," and further declared that this definition touched upon perfection; for, besides being accurate and harmonious, it shaved etymological parsimony as closely as the most niggardly-minded could desire. What happened to him after this we are unprepared to state with certainty; some say his fate overtook him in the form of lock-jaw, others that his friends suppressed him by unlawful means. But if still at large, as there is some reason to believe, one thing, at least, is sure: neither he nor jargon-grinders like him will ever gain admission to the columns of "Knowledge." This fact alone ought to make subscribers rush in by thousands, and, to use the words of Mr. Proctor's well-selected motto, help to "Let Knowledge grow from more to more."

GOOD THINGS MADE, SAID, AND DONE FOR EVERY HOUSEHOLD. Published by Goodall, Backhouse and Co., Leeds.

If any of our readers want to make a present to the ladies of their household of a thoroughly good, useful cookery book, they have only got to mention the name of our paper, and send address and a penny stamp to defray postage, and they will receive from Messrs. Goodall, Backhouse and Co., Leeds, a copy of the above work, which is well worth a shilling. If any one adopts our advice, and is not thoroughly satisfied with his bargain, we will take back the book from them and refund their outlay.

IMPORTANT DEFENCE OF FISHING RIGHTS ON THE THAMES.

MAIDENHEAD COUNTY BENCH.

Before J. Hibbert, T. J. Hercy, I. J. I. Pocock, Esqrs., and Sir George Young, Bart., and Sir G. A. C. East, Bart.

THE CLAIM TO A PRIVATE FISHERY.

On Tuesday the adjourned case was heard in which Joseph Gill, a water bailiff of the Maidenhead, Cookham, and Bray Thames Angling Association, has been summoned "for that on the 12th October he did unlawfully and willingly attempt to take fish in that part of the river Thames in which Sir Roger William Palmer has a private right of fishery."

Mr. R. A. Ward appeared in support of the prosecution.

Mr. Wildey Wright, barrister-at-law, instructed by Messrs. W. A. Crump and Son, of 10, Philpot Lane, London, solicitors to the Thames Rights Defence Association, and Mr. F. A. Jones, of Maidenhead, appeared for the defendant.

Mr. Ward, in his opening, said the case was brought under the 24th sec. of 24th and 25th Vic., and Sir Roger Palmer was the owner of a set of islands in this neighbourhood, on one of which he lived, and that he claimed a private fishery from a point nearly opposite the Guards' club-house up to the Duke of Westminster's estate at Cliveden, except a few yards where the weir runs across the river. Mr.

Ward went on to say that he took it that in this country there was no spot of ground that had no owner; that every spot belonged to somebody, and that, in fact, every square yard of the Thames had an ownership. In the tidal part of the river the bed originally belonged to the Crown, and any person claiming a right therein must show his title from the Crown. But in the case of a non-tidal river, like the Thames at Maidenhead, the ownership belonged to the riparian owners, and no length of time could possibly create a right to the public to fish anywhere in the river. It was clear that the owners of the soil upwards and downwards had a right to any minerals under the river, and to any fish in the river. But Sir Roger Palmer, not being the owner of the banks, was obliged to produce his title deeds. Mr. Ward then produced a deed of conveyance from Sir Robert Harvey and his trustees to Sir Roger Palmer, dated 14th Dec., 1868, which conveyed to Sir Roger Palmer rights over the waters of the Thames within the points mentioned, and the messuages, land, and eyotts belonging thereto, whether covered or uncovered by water. The accompanying schedules specified several small eyotts, one of which Sir Roger's residence is built, and two fisheries—one of 16 acres and another of 19 acres. He repeated that in a non-tidal river like the Thames at Maidenhead, the presumption was that the owner was a private person, not the Crown, and the deed produced was sufficient to show that the right in this case was vested in Sir Roger Palmer. Mr. Ward then cited various cases in support of his contention that non-user did not disturb this right of fishery, and that there was no public right of fishery in non-tidal rivers. Sir Roger Palmer did not, he declared, desire to press for a large penalty. He only came there to maintain what he believed to be his right. There had been some feeling on the part of the public that Sir Roger Palmer wished to discourage angling in the river in the part over which he claimed a right. But, in fact, Sir Roger was one of the vice-presidents of the local angling association, one of its earliest promoters, and an annual subscriber to its funds, and he certainly did not wish to discourage angling. Mr. Ward remarked, in conclusion, that he was very much afraid the case might collapse on a point outside its merits, inasmuch as his witness, Mr. Ricardo, was disposed to think that the fishing he saw was in a part of the river other than that to which the prosecution related. He hoped, however, that the case would be decided on its merits, and not on a point quite outside them. He then called

Sir Roger William Palmer, who said: I am complainant in this case, and live at Glen Island. I produce the deeds of conveyance to me by Sir Robert Harvey, dated 14th December, 1868. On the 12th October I saw Gill in punt on the river nearly opposite my landing place. [Sir Roger indicated the spot on the Ordnance map.] He was standing in the punt with a net. I told him he had not the right to fish there without leave from me. He said he thought he had, because he was a water bailiff. I told him he had not. He then asked me to give him leave. I said "No," and he then went away.

By the Bench: He asked leave to fish with a net.

Examination continued: I gave him no authority to fish there or elsewhere. The Thames at Maidenhead is not a tidal river.

Mr. Wildey Wright postponed any cross-examination. There was no evidence, he said, at present.

Charles Ricardo was the next witness. He said: I live at Ray Mead, near Sir Roger Palmer. On the 12th October I saw the defendant on the river in a punt with a casting-net over his shoulder.

The witness pointed out a spot on the Ordnance map near the mill, and Mr. Ward admitted that the case could not be carried further, save in respect of the alleged fishing in water adjoining Sir Roger Palmer's dwelling-house, by way of indictment for misdemeanour at Quarter Sessions—a length to which Sir Roger was not prepared to go.

Mr. Wildey Wright: I should think not, indeed.

The magistrates thereupon dismissed the charge.

Mr. Wildey Wright said the case must have broken down in the long run. The proceedings were about as groundless as they possibly could be. "I hope," he added, "that Sir Roger Palmer will not set up again a claim which has no foundation in law or common sense. We shall fish and our children's children will fish in the Thames, as our fathers' fathers fished."

The learned counsel applied for costs, and the Bench ultimately allowed £8 8s.

EXTENSIVE ROBBERY OF FISHING TACKLE FROM MESSRS. ALLOOCK'S FACTORY AT REDDITCH.

REDDITCH PETTY SESSIONS.—WEDNESDAY, NOV. 9TH, 1881.

Before R. S. Bartleet, E. W. Heywood, J. Smith, and V. Milward, Esqs.

JULIA DAW and Annie Perks, in custody, were charged with receiving and stealing a quantity of gut lines and hooks, to the value of £13, during the month of September, the property of Messrs. S. Allcock and Co. The elder prisoner (Daw) was further charged with inciting the younger prisoner to commit a felony. Mr. Buller, of Birmingham, prosecuted, and Mr. Cheston, of Birmingham, defended. Mr. Buller said he proposed at the outset to withdraw the charge against the younger prisoner, as the prosecutor was satisfied that what she had done had been at the instigation and under the order of the elder prisoner. He also proposed to call her as a witness. He would explain the case at some length, in order that the Bench might more readily follow the evidence. Some four months ago, in Littleworth, the younger prisoner met the elder prisoner, who suggested to her to steal her some wax from the manufactory, which she did, and took it to the elder prisoner, who, when she had got the wax, induced the

younger prisoner to take other things, threatening her that if she did not she would inform Mr. Allcock what she had done. Acting on that, the girl continued to purloin many articles, and thus, partly by threats and partly by a payment of 2s. or 3s. weekly to the younger prisoner, the elder prisoner was enabled to procure a large quantity of prosecutor's goods. A short time since Mr. Ramsbottom, of Liverpool, received a letter from the elder prisoner offering gut lines at a price that aroused his suspicion, and he accordingly wrote to her for certain articles. On Friday morning last the younger prisoner was seen by a young boy to take some lines and put them in her basket. She was then sent on an errand, when her basket was searched, and sixteen dozen of lines were found in it. She was taken into custody, and searched, and upon her was found a part of a post card sent by Mr. Ramsbottom to Mrs. Daw, requesting her to send him certain things; and on the day previous the girl took certain articles which were found in Daw's possession when she was arrested. He (Mr. Buller) proposed to divide the case, for convenience, into four parts—first, the London case, in which he would show that a person named Avery received six dozen lines from the elder prisoner, and disposed of them to Messrs. Carter and Co.,* at less than half of the wholesale prices; secondly, the Liverpool case, that of Mr. Ramsbottom; thirdly, goods found on prisoner's premises; and fourthly, with inciting to steal. Mr. Buller remarked that partly from family affairs and a sense of public duty his client's position was a most painful one. Mr. Buller spoke in terms of warm commendation of the course taken by Mr. Ramsbottom, to whom much credit was due for discovering the thefts, which were most serious, some 600 dozen gut lines having been taken since the last stock-taking.

The younger prisoner was then discharged, and entered the witness box. She gave her evidence as follows: I am sixteen years of age, and have worked for prosecutor for about three years. I met Julia Daw in Littleworth three or four months ago, when she said, "You might help me to some wax from the shop." I said I would try, and got some wax, which I gave to her son, William Daw. I saw her some few days after, when she said, "You might get me some hair hooks." I sent her some by her little boy, William Daw. The last time I took her any was on Thursday last, the day before I was arrested. Between the time of my taking the wax and Thursday last I had sent things to her, several times weekly, some weeks three times, and some weeks four. On the Thursday I gave her gut hooks similar to those produced. I have taken her some gut hooks two or three times, or on more occasions than that. They were wrapped up. I took the parcels from the warehouse without examining them. Prisoner did not give any directions how to take the goods away, but afterwards she said, "If I were you I would use a big pocket and not a basket." I sometimes got 2s., and sometimes more, from the prisoner for taking the things. I got the money weekly. She made me various presents and said I must be very careful and not make a fool of myself. She said we should not be found out because she had got gut from the "gut Spaniards," and bills from the hook warehouses. She said if I did not keep on bringing things she would tell Mr. Allcock.

The Chairman: How long ago.

Witness: About a month ago, I think. The day I was arrested I had taken a quantity of gut lines, and put them in my basket. I was charged with stealing them, and given into custody before nine in the morning. The part of the post card produced was brought to me by prisoner's son, William Daw, the day before I was arrested. After I was in custody I gave it to Sergt. Moss. In consequence of her giving me the post card I committed the theft. (Mr. Buller explained that the post card came from Mr. Ramsbottom, of Liverpool, and was an order for certain goods). All the goods I took were the property of Mr. Allcock, and from his premises. I am a forewoman, and have free access to where they are kept.

To Mr. Cheston: I was sixteen last April. I am no member of any particular congregation, but go to the Wesleyan chapel mostly. During the last four months I have been in the habit of going to chapel. I was at Mr. Daw's house last Thursday night ten minutes or half an hour. I was not there by myself at all. I was not in her house on Wednesday night, but I was on Tuesday night for about the same time. I was not by myself. If any pieces of paper were lying about I had no opportunity of picking them up. If the police had not taken me I should not have said what I was going to do with the things. Sergt. Moss charged me with stealing the things.

Mr. Cheston: What was said to you to induce you to tell the story you have told?

Witness: Nothing was said to me.

Mr. Cheston: Without any inducement you told the story straight off.

Witness: The master asked me before the policeman came. He told me to tell the truth, and said it would be better for me; before the policeman was sent for. He did not say if I told him what I was going to do with the things I would not be prosecuted. I did not tell him all; I told Sergt. Moss as I came up to the station on Friday morning. He told me on Friday morning at the office that I should be discharged, but that I must tell all I knew about it. I told Mr. Buller this morning more than I told Sergt. Moss.

Mr. Buller said the communication made to him was privileged, and it was then the girl really knew that she would be discharged.

* With reference to Messrs. Carter and Co., we think it only fair to that firm to say that amongst a small parcel of goods received from Messrs. Avery and Son, of Redditch, with whom they have had dealings for years, there were a few things which, it now appears, formed part of the lot stolen from Messrs. Allcock. Messrs. Carter, of course, had no suspicion of this, and immediately on hearing of the affair gave Messrs. Allcock all the information in their power, and attended at Redditch to give evidence, but were not called upon to do so.

After some further cross-examination by Mr. Cheston, as to witness's means of identifying the hooks produced. Mr. Cheston held a short conference with Mr. Buller, who then addressed the Bench to the effect that if they would consent not to proceed in the other charges, the prisoner was willing to plead guilty to one charge, in order that it might be dealt with by the magistrates. And here he might say, without mentioning any names, that a number of people engaged in the trade were known to have purchased goods at very much less than wholesale prices, and if it went forth from the Bench that in any future cases they would be severely punished, it would have a wholesome effect. The prosecutor had consented to withdraw the other charges, but not because he could not go on with them, as there were witnesses from London, Liverpool, and other places, but he had consented to reduce the charge to one under 40s., in order that it might come under the Summary Jurisdiction Acts, hoping that the proceedings might act as a caution in future. After some consideration, the Bench consented, and prisoner was then charged with stealing $3\frac{1}{2}$ gross of gut hooks, value 8s. 9d., to which she pleaded guilty; and Mr. Cheston briefly appealed to the prosecutor to recommend the prisoner to mercy.

The Chairman said that the Bench regretted that, in the interests of the public, the prosecution had taken the course they had, for it was well known that the trade was encompassed with many difficulties. Goods of considerable value could be placed in a very small compass, and great reliance had to be placed in foremen, and checks used in other trades could not be carried out. The Bench felt that the responsibility had been thrown on their shoulders, and that it was necessary, in the public interest, to give the outside punishment which they were able to give under the Act—namely, three months' hard labour. If she had been sent to Worcester, prisoner would probably have been sentenced to two years' imprisonment. He hoped this case would be a caution to young people. The girl had lost her character, and set a shocking example in her position as forewoman; she no doubt had been treated with the greatest possible kindness by her employer.

[We understand that since stock-taking on the 1st of September, 1880, to October, 1881 (13 months), Messrs. S. Allcock and Co. are deficient in the special class of gut lines, known to the trade as "Refina" and "Drawn Gut" lines, value at wholesale list price £145 10s.. Since stock-taking, October 1st, 1881, to November 1st, 1881, they find deficient in stock 108 dozen, value £21. The above is only one class of lines and does not include other goods.]—*Redditch Indicator*.

BONES IN HEAD OF PERCH.

MR. J. HARRINGTON KEENE, in his interesting paper on the "Perch's Personal History," in *FISHING GAZETTE* of Nov. 12, states:—"It is affirmed that there are two round bones in the perch's head which are a remedy for 'stone,' where these two round bones are, however, I could never discover." I also find in his excellent work, "The Practical Fisherman," the following:—"Aldrovandus also praises it, and old doctors, with characteristic whimsicality, were used to prescribe two (imaginary) round bones from the perch's head, as a remedy for 'stone.'" Not knowing this gentleman's address I have forwarded to you two bones from my collection, taken from the perch's head. They are not particularly round, but there is not the slightest doubt but what these are the bones spoken of, and they are called "otoliths," "brain ivory," or "ear-bones." Hoping they will arrive safely,

FRANK GOSDEN, Exeter.

[We send the bones to Mr. Keene.—ED.]

WE are very pleased to learn that the well-known firm of Messrs. W. Sparkes, Hall and Co., of 308, Regent Street, bootmakers to the Royal Family, have been very successful in the introduction of the "Carmichael portable boot-tree." The British public have taken to it very kindly, and a large business has been done, not only at home but in India and the colonies. This is the result of a good idea put into practical shape, through the medium of a firm who always do things well. Those who know what it is to force their leg into a well shrunk wet boot after a day's fishing or shooting, can fully appreciate the blessing of this portable boot-tree—so easy to carry, so inestimable in its results. Any of our readers who have not seen it would do well to pay a visit to Messrs. Sparkes, Hall and Co.'s establishment.

There was a curious scene in the Ring after the Bretby Nursery. Sir John Astley was heard to cuss the American speculator, Mr. Walton, who had backed his colt Medicus without asking Sir John's permission. This Walton is evidently another complete angler, but it is scarcely gentle to accuse him of fishy practices.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-boxes, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

RIVER REPORTS.

MID-THAMES.

"My business in this State
Made me a looker-on."

SHAKESPEARE.

The Thames is now in the pink of colour for the most fastidious of anglers to exercise his specialty in, or ride the most rampant of hobbies thereon and therein. Roach are revelling in a mignonette tinted medium; chub are basking in a November sunshine unprecedented, and only asking, wide-mouthed, to be fed with wriggly tail of lob or luscious spinal cord. Perch are very wary, but jack are not equal to the enchantments and lure of their masters. At Pangbourne and Streatley a gentleman has had some grand chub and perch, and at Henley Mr. Elcomb, with Parrott, has taken some decent jack. At Hurley Messrs. Harrison, Lee, Lumley, and Henry, fishing from the Treats hostelry, the Bell, have had respectively 5 lb. of roach, 12 lb. of roach, 1 jack 5 lb., and 2 ditto 5 lb. and 6 lb. At Monkey Island a gentleman of the artful sort had 30 lb. of perch. At Maidenhead Sir R. Palmer has set up a claim to the entire and sole right of fishing from the bridge to Cliveden. In a test case this supposed right has been set aside before the magistrates on Tuesday, with eight guineas costs against the said "Sir Roger." Mr. Willey Wright was for the defendant, and wound up his remarks in this fashion: "I hope Sir R. Palmer will not set up again a claim which has no foundation in law or common sense. We shall fish, and our children's children will fish, in the Thames, as our fathers' fathers fished." Let every angler lay this unctio in his soul, and subscribe to its defence if occasion arise.—MARLOW BUZZ.

Thames (Richmond).

I have only two days to report. Saturday, with Mr. Brinkley, about 20 lb. roach; Sunday, with Mr. Aldridge, about the same weight. After reading *Bell's Life* on Saturday, and seeing Kit Brown and Henry Wheeler trying their best in that splendid piece of water above Petersham Ait with no success, I have made up mind to take to another job for several days. Most of the fish that I have reported have been taken near the Orleans Club-house, where it is almost impossible for any illegal fishing.—E. BROWN.

The rain of Tuesday night has coloured the water, but not too much as to put a stop to the fishing, and should we get no more by the time this is in print the river will be in splendid order, as the river is low now, and everything that could be wished for as regards the elements; it is an older head than mine that can remember such a November for fishing before, and with the exception of Friday, we have been without fog, even then it turned out a splendid afternoon, and well my patron knew it, as he caught 12 roach that scaled 10½ lb. I hope our up-river brother fishermen are doing well, for here yesterday there were not enough punts; this sounds well for November. I think some days whether it is not August; but when you look up to Richmond Hill, the trees that were full of leaf then is now bare. The takes of fish have been from 9 to 14 lb. per punt each day, and as follows are the times each fisherman has been out: G. Howard, 3 days; H. Howard, 4 days; C. Brown, 5 days; H. Wheeler, 4 days; E. Brown, 2 days; Job Brain, 5 days; Holland, 4 days; J. Bushnell, 4 days. There have been a few barbel caught this week, but they had not near the life in them as in the summer.—JOHN BUSHNELL.

Thames (Goring).

Water now very thick; do well for roach in a day or two if it keeps fine. Prospects look bad, for this week at present. On Thursday, last week, after sending my report, took 6 dozen of gudgeon and some fine perch. On Sunday 4 dozen of roach. On Tuesday took one jack, weighing 14 lb., and some good roach and chub.—JOHN RUSH.

Thames (Halliford).

The water is now a little coloured, and in good order for bottom fishing. A lady and gentleman fishing with me on Saturday last caught one barbel, one bream, and about one dozen roach. Second day, Mr. Innis, fishing with me, caught one chub and 7 lb. roach. Third day, Mr. Hughes, fishing with me, caught three barbel and nine roach (ledgering), the three largest roach weighing 4 lb. 1 oz.—GEORGE ROSEWELL.

Thames (Walton).

Water in good order on Sunday, but variable since; heavy south-west winds—very rough—to-day rising. From the weather to-day and yesterday and the water rising, I should imagine that the fishing should be good; bream are biting.—HENRY H. WOOE.

Ancholm.

The long-continued genial weather of the present month is quite exceptional, even in the memory of the proverbial oldest inhabitant. But so far as this stream is concerned, it has not been productive of any very special results in the angling line. The reports which have from time to time come to hand have been of the most meagre description, and your correspondent has considerable difficulty in making up anything like an interesting set of notes. The few ponds in this neighbourhood have yielded equally poor results. Scarcely any respectable results have followed the flying visits made to them. Can it

be that the fishes, like human beings, have been so puzzled about the weather that their appetites have disappeared? I hope to be able to send better news next week.—THOMAS FORD.

Exe (Exeter).

The capture of pike in the river does not come up to the anticipations of the regular pike anglers. Though the weather is somewhat unsettled, the water is in prime condition, some splendid perch have been grassed, and the "daisies with a dorsal fin" have been observed in large numbers, and also of good size, making their way to the higher waters; and a promising season may be again looked for next year. There have also been good runs of salmon, both before and since the close time commenced, which also promises well for the spawning season; the late floods enabled many to get over the various weirs, and are seen several miles up the river on the spawning beds. The roach and rudd seem coming on better during the last day or two, but dace are very scarce. The estuary fishing has not been quite so plentiful lately, but the captured fish have been very fine, consisting of pollack, bass, bream, herrings, and sprats.—FRANK GOSDEN.

Lea (Ware).

There ought to be some good sport during the next few days; S.E. wind blowing. The water is nicely coloured, and in good condition. Some nice roach were taken last Sunday by the Brothers Chart and Jack Bell, from the Boom to the second telegraph post. Mr. Olford took a jack here this week weighing 4½ lb.; there are plenty, but they want getting.—FRANK LEEFE.

Lea (Rye House).

The water is in good fishing order, the wind south and mild. There have been some nice fish taken this week; Mr. Black caught two, they weighed 12 lb. On Saturday one gentleman caught one weighing 11 lb., and another gentleman two of 9 lb. On Sunday Mr. Woodey had some nice roach.—WM. COWELL.

Medway (Tonbridge).

The water here is thickly coloured and flows with a rapid current; if the rain keeps off until Sunday it will be fishable for roach and dace. Of the latter there have been some good catches the beginning of this week.—YE MEDWAY ANGLER.

Ouse.

Water to all appearance first-rate, but angling about the worst I have ever known it at this time of the year. The best I can mention this week are as under:—Nov. 16—Mr. Ascroft, Cambridge, 7½ lb. roach; Mr. Holland, Newmarket, 7½ lb. roach; blowing a gale all day. Nov. 17—Messrs. W. C. Carr and F. S. Wykes, of Cambridge and London, 14 lb. roach; Mr. Rowton, Cambridge, 9 lb. roach. Nov. 18—Major Ferris and Captain Heley, of Ely, 10 lb. roach; Mr. Postans, Newmarket, 6 lb. roach; frost in the morning took them off feed. Nov. 21—Messrs. Smith, Cooté and Wilkinson, Cambridge, 15 lb. roach, &c.; Mr. W. C. Carr, Cambridge, 7½ lb. roach. Nov. 22nd—M. Fielden, Cambridge, 6½ lb. roach; Mr. Ascroft, Cambridge, five roach weighing 3 lb.; Mr. George Basingbourne, 6 lb. roach; Mr. Rowton, Cambridge, 6½ lb. roach. Nov. 23—Ten anglers out to-day, but though they all took fish, the best catch was made by Messrs. J. Cole and T. H. Edridge, St. John's Wood Piscatorialists, with 12 lb. roach, largest roach taken by Mr. W. Thurston, Cambridge, about 1 lb. not weighed.—CHARLES SOUTH.

Trent (Nottingham).

Although the weather has been very stormy here, and altogether unfit for outdoor sports, some of our rodsters will not be denied, more especially when they know the water is all right for chub and pike fishing, and to keep this class of anglers from the riverside would be a great mistake, because they know perfectly well that the weather just suits their little game. Now it happens that the weather stops most of the anglers, because they are afraid of catching a cold. I will venture to tell these that unless they go out at the proper time they will fail to do any good. This is, in my opinion, one of the secrets in angling neglect one favourable opportunity, and the chances are you will not get another for some time to come. This is the reason some of our rodsters take advantage of what they consider a good chance of catching a few fish. This sort of work has been done during the present week. A good number of pike have been captured, and also some fair baskets of chub. Scratching this time doing the best work, which was, no doubt, owing to the mildness of the weather. Worm fishing while the river remains so low will be at a discount, and the anglers cannot do better than go after the pike and chub.—W. BAILEY.

Trent (Alrewas).

As far as this locality is concerned I cannot glean of any angling news the past week worth reporting, but few anglers have visited the river, and sport has been of the most limited character. On Saturday I had a day of pike fishing in private water, with the President of the Birmingham and Midland Piscatorial Association. I only succeeded in taking a few small fish, but had the pleasure of landing a brace of good ones for the President, weighing respectively 19 lb. and 11 lb., both fish were in first-class condition, and afforded capital sport. Messrs. Allday and S. Bennett out on the same day in private water in the neighbourhood of Stourport, met with fair luck, the fish taken did not run large. Mr. Allday having the misfortune of losing a regular scorcher by fastening himself round some sunken water lilies, broke his tackle, and escaped with his hooks. Mr. Allday relates a little anecdote which occurred to him whilst fishing, landing a jack about 5 lb., he observed by the distended stomach of the fish he had been sumptuously regaling only a short time before. On cutting the fish open, he discovered a live fish, which, on being taken from the pouch, and placed in the water, swam away, little, if any the worse for the confinement. I have never met with a similar case, although I have different times taken perch with small live fry in their mouths. The river to-night is not reported in good fishing order. A few hours' rain completely upsets all kind of calculation; it is next to useless to give an idea of the prospects as it is raining heavily, while I am writing this report.—JAMES GREGORY.

Yore (Yorkshire).

There has been some good angling since last week, after the fresh that I mentioned in my report had receded; the catches, however, have been principally made by bottom fishing, the water not being in order for fly. Ralph Colbeck, on the last day of the season, killed two nice salmon weighing 15½ and 17½ lb. respectively. He had fished on several days previously without success, so that his luck changed just at the right time. Weather to-day (Wednesday) stormy, and inclined for more rain.—FRANCIS M. WALBRAN.

THE DETRACTORS OF OUR ART.

PHILOSOPHERS differ as to the best mode of treating one's enemies. While one section bids us leave the slanderous alone "to bite the file," and walk upright, in despite of their malicious attacks, another would have us refute and defend ourselves against every aspersion that affects our character, however slight. Which may be the better course is difficult to determine. There are men generous enough not to listen to, or believe, any statements impugning the honour or probity of another unless they personally possess proofs of the value of such assertions. Whether, however, it be the better policy of an individual to run a muck at every breath affecting his character must be left to the individual and relative circumstances. It is different with public men and communities, as it is so well known that no public man was ever permitted to raise his head above the surrounding crowd, than it became an object to be ignominiously pelted at; and thus "party" is formed, sides are taken, and his very enemies become the cause of his popularity. Communities have ever been the target against which few or many direct their shafts, either poisoned or blunted, and therefore the fraternity of anglers can scarcely have hoped to have gone scatheless. Yet how few are those who have thought it worth their while to put pen to paper and record their dissent to our cherished sport; the delight and solace of thousands. Indeed we can count our detractors on our fingers. Let us do so: there is Lord Byron (lame, and incapable of following a captive salmon for fifty yards), Dr. Johnson, the great lexicographer, who was pourtrayed by Sir Joshua Reynolds,—the engraving from which picture adorns the quarto edition of the Dictionary, and from which we learn that the Doctor was incapable of reading the manuscript he holds before his eyes without placing it close to his nose. Purbblind—what chance with a roach bite, or the rise of trout or grayling? Then follows Dean Swift, who, more in fun than in earnest, would raise a smile at our expense; and lastly, as far as I can recall the result of my reading, there is that writer of unquestionable amiability, Leigh Hunt, whom I know to have more than once, in company with Theodore Hook, Charles Kean the elder, and others, at the Swan, at Ditton, enjoyed a dish of Thames perch and gudgeons, caught by the angler, with as much gusto as the rest of the company.

But to my text; my purpose being to revive what this admirer of nicely-cooked perch and gudgeon, caught with a "hook and tortured worm," wrote in disparagement of the pursuit, the result of which, for the nonce, tickled his palate into praise and contentment. The essay will be found amongst his fugitive papers, but from whence I culled it at this moment I cannot recollect. It is entitled

"ANGLING.

"The anglers are a race of men who puzzle us. We do not mean for their patience, which is laudable, nor for the infinite non-success of some of them, which is desirable. Neither do we agree with the good old joke, attributed to Swift, that angling is always to be considered 'as a stick and a string, with a fly at one end and a fool at the other.' Nay, if he had books with him and a pleasant day, we can account for the joyousness of that prince of punters who, having been seen in the same spot one morning and evening, and asked whether he had had any success, said no, but in the course of the day he had had a 'glorious nibble.' But the anglers boast of the innocence of their pastime: yet it puts fellow-creatures to the torture. They pique themselves on their meditative faculties, and yet their only excuse is a want of thought. It is this that puzzles us. Old Isaac Walton, their patriarch, speaking of his inquisitorial abstractions on the banks of a river, says:—

'Here we may
Think and pray,
Before death
Stops our breath;
Other joys
Are but toys,
And to be lamented.'

So saying he 'stops the breath' of a trout by plucking him up into an element too thin to respire, with a hook and a tortured worm in his jaws.

'Other joys
Are but toys.'

If you ride, walk, or skate, or play at cricket, or at rackets, or enjoy a ball or a concert, it is 'to be lamented!' To put pleasure into the faces of half-a-dozen agreeable women, is a toy unworthy of the manliness of a worm-sticker. But to put a hook into the gills of a carp—there you attain the end of a reasonable being; there you surely show yourself truly a lord of the creation.

To plant your feet occasionally in the mud is also a pleasing step. So is cutting your ankles with weeds and stones.

'Other joys
Are but toys.'

The book of Isaac Walton is a delightful performance in some respects. It smells of the country air, and of the flowers in cottage windows. Its pictures of rural scenery, its simplicity, its snatches of old songs, are all good and refreshing; and his prodigious relish of a dressed fish would not be grudged him, if he had killed it a little more decently. He really seems to have a respect for a piece of salmon; to approach it like the grace, with his hat off. But what are we to think of a man who, in the midst of his tortures of other animals, is always valuing himself on his harmlessness; and who actually follows up one of his most complacent passages of this kind with an injunction to impale a certain worm twice upon the hook, because it is lively and might get off! All that can now be said of such extraordinary inconsistency is, that having been bred up in an opinion of the innocence of his amusement, and possessing a healthy power of exercising voluntary thoughts (so far as he had any), he must have dozed over the opposite side of the question, so as to become almost, perhaps quite, insensible to it. And angling indeed does seem the next thing to dreaming. It dispenses with locomotion, reconciles contradictions, and renders the very countenance null and void. A friend of ours, who is an admirer of Walton, was struck, just as we were, with the likeness of the old angler's face to a fish. It is hard, angular, and of no expression. It seems to have been subdued to what it worked in; to have become native to the watery element. One might have said to Walton, 'Oh flesh! how art thou fishified!' He looks like a pike dressed in broad cloth, instead of butter."

The above is only about a third of the paper from which I quote. As for the unsavoury conclusion Leigh Hunt draws from the portrait of Walton, it stands conspicuously alone amongst those of numbers of wise and good men who have given a decidedly opposite opinion. If, however, Leigh Hunt would have elected to be judged by the same test, I have only to refer to the title page of the "Indicator," published by Tegg, 1865, in which this writer appears like a malefactor after deservedly receiving sentence of death, and I admit is no more a resemblance of the really excellent original than a cow is like a race-horse.

CLUB AND OTHER JOTTINGS.

By L. B.

THE improvement I spoke of last week in the jack-fishing at the Welsh Harp continues, and a number of good fish have been had this week.

Apropos of jack, Mr. J. H. Stead (the "Cure") had last Sunday four nice fish and two or three good roach from the Thames at Wraybury, the lot weighing between 10 lb. and 11 lb.

Those bank fishermen who can wield the roach pole and are not frightened at a walk to and from the water, continue to get some good bags from the Hurley waters.

The shows of freshwater water fish one sees on the marble slabs of leading fishmongers often cast in the shade the little lots proudly exhibited at some of our best metropolitan clubs. On Monday morning I saw at a well-known establishment close to the General Post Office several jack, some of which would have weighed close upon 9 lb., a number of carp from about 4½ lb. to 7 lb. each, and one good tench. This (Wednesday) morning in Bond Street, at the establishment of an equally well-known scaly dealer, I saw exhibited, and I presume for sale, all alive, oh, and swimming about in a shallow tub of water a number of whacking tench and two large carp.

Where do these fish come from? Holland, I am told. Is that correct, Mr. Editor? and if so, some statistics as to the number annually imported into this country, if such could be obtained, would no doubt prove of interest, and indeed might be of use in the not far distant future?

From Chertsey, Haslett writes: "Things are somewhat quiet. I have had one chub, nine perch, and several jack, the last, however, did not run heavy. I am going to try again for them to-morrow, and I think I can find two or three good fish."

In a contemporary we read "that the Prince of Wales has consented to become the President of the "Norwich International Fisheries Exhibition of 1883." Surely our East Anglian friends are not going to have an exhibition at the same time as the projected one in London, and this last must be the one referred to by the piscatorial scribe in our contemporary's columns.

The committee of the Thames Rights Defence Association have had an important meeting, and some decisive steps to check riparian rapacity and protect public rights have been decided upon.

And while on the subject of so-called riparian rights, just a word to Mr. Bicknell, the secretary of the Bedford Angling Club, who, in his letter last week in answer to my remarks, manages entirely to ignore the most essential point thereof, and to otherwise be thoroughly inconsistent, I merely said that if his club had fishery rights, there was

a proper and an improper way of enforcing such. I questioned, and still do question, whether the means Mr. Bicknell and his satellites employed were either dignified or manly. I refer, of course, to his shouting offensive names across the water, which he admits, ("I believe I called them poachers"), and to the deliberate and well-sustained stoning—the latter can be called nothing else than outrageous—and I had really hoped Mr. Bicknell would have offered some explanation; but, alas, have since heard that instead of being an isolated case, it would seem to be a practice, as others are said to have been subjected to the same ordeal. Next we have Mr. Bicknell presuming "that I do not care much whether the fishing rights at the place in question belong exclusively to the Bedford Angling Club or not." There is not a single syllable in my letter to warrant Mr. Bicknell in presuming anything of the kind, and I carefully guarded twice over, as he admits, against giving any opinion one way or the other, as doing so was entirely outside my proposition, which, as I cannot too often repeat, was merely "which were proper and improper ways of enforcing alleged exclusive fishery rights."

Mr. Bicknell then goes on to say Mr. Mann has no right to give his friends and customers permission. Mr. Mann, on the other hand, positively asserts he has, and, what is more to the point, does. We, who are impartial, have at least a right to consider one assertion as good as the other until we have some conclusive proof to the contrary.

Referring Mr. Bicknell to Mr. Mann is not a mere pretext, it is a reality, and I still opine is the right course for my friends to adopt; and I see nothing cowardly, as Mr. Bicknell (who is evidently very fond of calling people ugly names) says, in their refusing to give names and addresses, which, they maintain, he has no right to ask.

Their case is clear; they argue thus:—"We have fished with the permission of the owner or renter of the land uninterfered with for many years, and still, having the said person's full authority, intend to continue doing so, whatever may be said to the contrary by a small set of monopolists, notwithstanding."

But, for the sake of argument, let us grant the club exclusive right to this comparatively little bit of water, the case stands thus:—Here are a number of persons who have secured a long stretch of water, in fact all the water worth fishing, from which they have practically excluded visitors and strangers, particularly the poorer ones, by refusing to issue day tickets and doubling the annual subscription in the case of non-residents—engaged in an attempt to oust a few unfortunate London working-men anglers from the one little corner left them in that neighbourhood, and by such means. When Mr. Bicknell was a good little boy at school—many years before he became a full-blown secretary—did he ever read the fable entitled "The Dog in the Manger"? If so, he seems to have forgotten the moral it contains.

The No. 1 West Central Association District visit to the Phoenix Angling Society took place on Tuesday evening. There was a capital muster, and some capital songs were sung, Messrs. Bentley and Robert Marshall occupying the chair and vice respectively. The next visit will be paid the Prince of Wales Angling Club, the Victory, Nuneham Street, Edgware Road, on Monday, 28th inst.

I had hoped to report some good sport from Eynsham, as I stated last week, but the Fates were against my friends, Messrs. Geen and Hobson.

Mr. Geen, who is a most patient but unsuccessful Thames trout angler, however, on Saturday last, hooked and landed a four pounder (about), which, needless to add, was immediately returned to the water, but strange to relate would not leave the vicinity of the swim for considerable time. Mr. Geen also got a nice perch scaling 2 lb. Poor Mr. Hobson, who was prevented on Friday at the last moment from going down with Mr. Geen, writes that on Saturday he left home at 9.15 a.m., travelled 60 miles by rail, walked five, had three hours fishing, caught one roach, returned to Oxford, rode 60 miles back, getting home at 7.30 p.m., and, not to be beaten, actually weighed his solitary specimen in at his club, the Hammersmith United. Truly anglers are persevering as well as patient men.

Mr. Hoole writes:—"The magnificent seal captured by Mr. Charles Grant has been splendidly set up by Mr. Gardner, of Oxford Street, and the Hammersmith United Angling Society have added it to their already numerous and valuable collection of trophies, which can be seen upon application at the Builders' Arms, Bridge Road, Hammersmith."

THE DESTRUCTION OF FISH IN THE WYCOMBE TROUT STREAM.

LAST Saturday week a general meeting of the members of the Wycombe Angling Association was held at the White Hart Hotel, to consult upon the steps to be adopted in view of the recent destruction of fish in the lower reaches by the bursting of a tank of bleach at the Rye Papermill. Mr. Francis Wheeler presided over a large meeting, including Colonel Cox, Mr. J. O. Griffiths, Q.C., Dr. Llewellyn Thomas, Messrs. V. Emanuel, F. Briden, W. Lovell, J. Rawson, W. J. Shone, W. Skull, W. H. Spicer, T. Stratford, J. Howland, J. Timberlake, J. Englefield, R. H. Plaistowe, R. Puttick, J. Abbott, W. F. Purdy, C. K. Poulter, J. Jones, J. R. Faulkner, J. Kibbels, O. Wright, E. E. Phillips, J. J. Bolding, W. Hudson, A. J. Thurlow, D. Ball, and T. H. Butler, with Mr. J. Thurlow, the hon. sec.

The Chairman said they were all aware of the cause which had brought them together. There was no doubt that the millowners were liable for what had occurred, and he hoped they would meet the Association in a liberal manner, so that any unpleasantness might be avoided. He believed that they deeply regretted the damage they had unwittingly caused.

The Secretary observed that the Association had sustained an irreparable loss. What he might fairly call a reach of water unrivalled in England was ruined for two or three years, and the labour of some years had been swept away in a moment. However it was no use crying over spilt milk; the thing was done, and what they had to consider was the course they would adopt. He had received a large number of letters from members and others expressing the greatest sympathy with the Association, and in several cases offering subscriptions towards re-stocking the stream. Among those read was one from Mr. Marston, Editor of the FISHING GAZETTE, who, although not a member of the Association, expressed the greatest regret at the disaster, and offered fifty brace of trout towards re-stocking the stream. Mr. Gilbey, of Wooburn House, wrote that he was very sorry for the destruction of the trout, and offered to give £5 towards any subscription for re-stocking. Mr. F. Hoblyn (London) sent a telegram offering a similar sum, and also to treble his subscription next year if the Association continued. General Hankey (London) wrote:—"From what I glean, I should imagine that the damage done to the Association water is simply irreparable, or almost so, and that it will take many long years, instead of 'a year or two' before you can repair such mischief, for 'fish of 6 lb.' are not grown in a day. Still I hope the Association will not be allowed to fall to the ground, and that with care and patience and the necessary funds, the Wycombe trout, which have not their equal in the length and breadth of England, may yet once more be seen of equal or superior size to any we have just lost." Letters were also received from Colonel Carington, M.P., Mr. Ffennell, editor of *Land and Water*, Mr. Man (London), Mr. Gould (London), Mr. F. Halford, Dr. Brooks (Henley), and R. F. Jackson (Marlow), and a telegram from the Gresham Angling Society, London. Colonel Birch Reynardson, in a sympathetic letter, mentioned that he had known a similar case in Hampshire about four years ago, when "all the trout were supposed to be killed; however, there are now more trout than ever, so I think the Association need not despair." Mr. Thurlow continued that he believed there was a desire on the part of the proprietors of the Rye mill to meet the matter. He had taken upon himself to make an appointment with them for Monday; and he would suggest the wisest course would be for the Association to appoint a deputation to meet them and endeavour to come to terms. The Association did not wish to be vindictive, although there was no doubt the millowners were legally responsible for heavy damages.

Mr. Emanuel proposed and Mr. Phillips seconded that a deputation be appointed as suggested.

Dr. Thomas remarked that according to the value per pound of dead trout on the slab, the fish destroyed were worth something like £100, and they could not get them alive for three or four times that price. He had come down from London prepared to offer five or ten guineas towards the prosecution of the firm, but if they were willing to meet the matter on fair terms he should say no more about it.

Mr. Rawson suggested that as in the circular calling the meeting it was stated that the members would have to decide whether the Association should continue to exist, a resolution upon that point should be first passed. He proposed that notwithstanding what had occurred the Association should continue its work. This was seconded by Mr. Puttick and carried unanimously. The proposition appointing the deputation was also agreed to, and Messrs. Emanuel, Wheeler, Englefield, Colonel Cox, and the Secretary were requested to act.

The next subject discussed was the powers to be given to the deputation. Various modes of compensation were mooted, £75 being the least sum mentioned, in addition to which it was thought Messrs. Saunders should give the Association members the right to fish in the stream just below their mill. This would allow the Association to offer its members 2½ continuous miles of fishing. Ultimately it was agreed to give the deputation full powers to arrange terms.

Some conversation then followed as to what steps should be taken towards re-stocking the stream. The Secretary said he had been looking round, and thought he knew where to lay his hand on perhaps 150 brace of Wycombe trout, but none of them very big. Perhaps under the circumstances some of the neighbouring gentry who had fish of this breed might help them. Lady Dashwood and Sir Samuel Wilson, the new occupant of Hughenden Manor, might perhaps, if the matter were properly represented to them, feel disposed to assist. One point on which he wished to consult the members was whether they should re-stock with anything besides Wycombe fish. On this point he read a letter from General Hankey, strongly urging the members not to allow the breed to become mixed—"For my part," he wrote, "I think it is suicidal policy to turn in any but Wycombe trout—you cannot improve upon your own perfect Wycombe breed." The members decided to adopt General Hankey's advice, and turn in nothing but Wycombe trout. Mr. Emanuel, on behalf of Dr. Thomas and himself, offered to hatch out ova from the Wycombe stream at their breeding-place, and return the fish so bred, and this offer was gratefully accepted. Mr. Emanuel undertaking that the fish should be kept distinct from other breeds. The decision to turn in only Wycombe fish necessitated the declining of Mr. Marston's offer, but a unanimous vote of thanks was passed to him for his kindness and sympathy.

The proceedings concluded with a vote of thanks to the Chairman.

Two excellent photographs, showing groups of the dead fish taken from the stream, were exhibited in the room, copies of which may be had from the artist, Mr. J. P. Starling, Wycombe.

The interview between the millowners and the deputation took place on Monday. Mr. Haines and Mr. Stickings, on behalf of the firm, promised to have the tanks removed from the stream at once, so as to prevent any possibility of repetition of the occurrence. The question of compensation was discussed, but was deferred in order that the two members of the firm present might consult an absent partner.

The Association had arranged to give a dinner to some of the men employed at the mills on the stream, with a view to excite an interest in the preservation of the fish; and, notwithstanding the unfortunate disaster referred to above, we understand that this came off at the White Hart on the following Tuesday.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

THE OLD RIVER—HOW TO GET THERE, AND HOW TO FISH IT FROM BANK OR PUNT.

By A THAMES FISHERMAN.

SIR,—Previous to commencing the subject of this letter, permit me to refer to your note appended to my last, in which you ask for the professional fishermen's assistance to carry out your proposal to cultivate pike, perch, &c.

I shall be glad to do anything I can, but it is so little as to be almost worthless, unless you will kindly value my anxious hope for the success of your project. I have just made application to my banker for a draw of five shillings; the reply was: "I will tell you what it is, father, what with the terrible waste of pens, ink and paper that goes on for the writing and re-writing of your letters, and now to ask for five shillings, as if money grew among the cabbages, it can only end badly; you will write us all into the workhouse yet." I am glad to inform you, sir, that we have split the difference, and I herewith send you thirty stamps. The wife wants to know what amount would be the result were every London angler to give half-a-crown? I have got over that little difficulty in figures, by not knowing how many there are who could and ought to do so.

Possibly many of you readers may think it a matter of little or no moment what a Thames fisherman's opinion may be on such a subject as the propagation of fish. I have opinions which are the fruits of careful thought and experience, and, at the risk of being thought presumptuous, I will state them. Such voracious and easily captured fish as pike and perch are becoming scarcer each year; and, unless efficient steps are taken in the immediate future, these two fish will become extinct in public waters within a radius of fifty miles of all large centres of population.

We must remember, while making our calculations, that the rising generation will be an educated one, and therefore we have a right to expect that the love of nature, and the craving for innocent health-giving sport, will be immensely on the increase. Within the past seven years, anglers have multiplied by a large figure, but their present number only faintly represents the multitude of the future. Our duty as men is as plain as A, B, C. We must be up and doing, and try to leave our waters as well stocked as we found them, or our followers will have just ground for saying that their predecessors were either stupid or selfish.

I shall come to your meeting, sir; I am sorry to say the wife has determined to come with me. Never mind, she's all right if I can prevent her starting on a speech.

The mile and a half of the river Thames known as the old river, or Fleet, cannot compare for beautiful landscapes or stirring historical associations with many another reach with which my calling has made me familiar, yet it may fairly boast of being an angler's paradise. Unfortunately, like many other good things, it is very difficult to get at. Should you be coming from London to fish it with the aid of a punt, you have the choice of three stations, all of which are more or less distant from your fishing, viz., Staines, $4\frac{1}{4}$ miles; Egham, $3\frac{1}{2}$ miles; and Datchet, $1\frac{1}{2}$ miles. I am pleased to say that the bank angler can more easily get here. He, by travelling to Wraybury, has only to follow his train for about a mile and he will find himself landed on the banks, where he may roam up or down in search of a swim without fear of molestation, his greatest difficulty being to choose the best from among so many good ones.

The punt angler who has done the journey to the weir-head, without the services of a fisherman, will find himself in a difficulty as to shooting over; unless he be a perfect master of his punt he will do well to take my advice and not attempt to let her drop through the sluice-gate, as it is a most dangerous and unnecessary performance for an amateur to attempt. Unnecessary, because there is another way of getting over—by taking a little extra trouble—which is perfectly safe.

There are bushes projecting over the water on the left side. Let the punt gently down by them until you reach the last, then draw her nose to the bank, and on looking round you will see that her tail hangs ready to drop over. Have your tow-line in one hand, and with the other grip the bush in such a manner as shall assist you in springing to the bank; make the spring, let loose the line, and you will soon discover that there is just sufficient water to carry her over. Don't cause a check, as the speed will assist her to ride over all obstacles. When she is safe in deep water, and travelling down at a great speed, give line. Don't tug violently and break, or you will be in a terrible fix. Stop her gradually; she will soon answer to the strain; jump in, and you are afloat on the old river.

Having shown you the way to this paradise, into which neither of the two great enemies to anglers—steam launches and trailers—are permitted to enter, and which, from its tiring distance from a fishing station, is comparatively little fished, I hope you will give me your attention while I describe the haunts of each species of fish, and the best methods of catching them from the bank or the punt.

Should you pay your first visit during the spring or summer, don't move your punt from the spot where you first get into her until you have tried the boughs which are within throwing distance on your left. Cast a ledger out with a small round bullet, and let it roll under the first bough, then throw in a small ball of clay, with half a dozen worms cut in halves. I have done this scores of times, and I don't think it ever failed to bring a fish. Once I remember that

instead of the knock, knock, of the perch, as expected, the rod was almost tugged from the hand as the fish rushed out and up to the weir.

"At last I have a Thames trout," was the expressed hope of my customer. I looked for the somersault in the air which a good trout will always turn, but instead he fought stubbornly for the granite blocks that lay underneath the furious rush of the sluice. The only plan was at all hazards to lift his nose just a trifle, so that the weight of water might force him back from this dangerous spot; up he came, and we saw amidst the foam a monster barbel. For full ten minutes more he tried his hardest to regain his haunt; but it was not to be. That Monday night it weighed in London 10 $\frac{1}{2}$ lb., and I am told that it is now as perfect a specimen as that clever man Cooper ever put behind a glass.

Work the eddy on your right with a paternoster, as this is the hunting ground, for minnows, of the numerous perch which head up in the spring.

You may with profit spend a day in this snug corner, with your eyes now and then diverted from your rod to the pictures around you. Nature has not done all that she is capable of, but it is a pretty scene, and you will not gaze upon it for long without a feeling stealing over you of "its all my own." The busy world comes not here, though close at hand; you have only to raise your eyes some six feet above your level to see boat after boat, with its gaily dressed occupants, pass noiselessly by—the waters drown every sound—and as they enter or emerge from the cut they have more the appearance of puppets in some grand show than that which we know them to be.

While here we ought to moor our punt in the centre, and with light cane rod, a Nottingham winch, fine running line, small piece of cork, two yards of gut, and a triangle hook, pay down a bleak or small dace, with the chance—very remote—of taking one of the proud old trout for which the scours immediately below are noted.

The boughs on our left are a continuation of those we fished at starting; try the three last for good roach, you will find a depth of 6 feet, with a straight, steady run.

The next half mile on this side is jack water, especially is it so in spring and summer; indeed, until the first heavy flood in autumn, by which they will be driven lower down to slacker water.

On our right, extending from within 100 yards of the weir, is a long row of withies, growing out from the undermined and wasting bank. Had we time, we would land, crawl to the edge, take a peep, and see how fully the chub appreciate the home which the rush in flood time has made for them. Here the fat and lazy, and the small and active, swim in and out amid the labyrinth of roots. Come, lovers of chub-fishing, come with the first hard frost, and bring your well-cleaned (not cooked) brains, and about 24 inches of pith, which will make twenty-four good coverings for your fine-gut triangle hook. Chop the brains small and use them with the greatest care; cast in about a thimbleful at first, and if that takes the direction your float will travel, throw in six times the quantity. Take 1 inch of pith and, with your hook concealed in the centre, drop it carefully over the side, and let your float gently down to the water, so as to give time for the bait to sink clear of your line. Always remember that for successful chub-fishing with this bait you must keep it off the bottom and well in front of your float; to effect this, slightly check the line as it draws from the winch; if there is no response to such kind attention in five minutes, move to the next swim, where, possibly, the ground-bait intended for the last has preceded you causing quite an eager commotion. Now is your time; keep cool, and you may get a couple of brace of the aforesaid fat and lazy ones.

Next we reach some broader, quieter eddies. Notice how easily they may be fished from the bank. A short time since I was passing this spot with two customers, while a bank angler was in the act of carefully lifting out a good roach; as the punt went slowly by they and I saw a little bit of paste put upon a hook, and immediately above it a very small ball of ground-bait. It was very gingerly lowered, and almost as soon as it could have reached the bottom the slightest of strikes denoted that there was a bite, and to judge by the top joint another good roach would soon be upon the grass. If my customers were correct it was Mr. L. Bonvoisin, of your paper, who so quickly taught us this little lesson in roach fishing.

The broad, shallow, sandy slack, fringed with short rushes, before us on our right is one of the spawning beds for roach; and about the third week in May it presents a curious spectacle. The mass of roach collected here causes the water to assume a dark slate tint, a shade of colour well known to the poacher, who has no need to approach too closely to see what is there; the net is drawn carefully round it, and the river is so much the poorer.

Let us hope, sir, that the day is not far distant when preservation societies will consider their work with a view of giving protection, not indiscriminately, but at such times and places as a study of fish shall readily point out.

On the left bank is a notice board proclaiming that unpardonable selfishness still survives—"Trespassers Beware." We need not trouble, it only refers to a small portion, where there are no bank swims.

Alongside is the splendid trout shallow known to all Thames fishermen. Last season I saw three good fish feeding at one and the same time, and for a moment we hoped that our bait would have been seized. Several times they fed, and each time our lure travelled down over them, with the usual result. I declare, were I not a professional, I should say that Thames trout-fishing is not worth the candle; most emphatically I say they are not worth, neither do they require, any expenditure of time or money for their propagation, both of which are sorely needed for other fish.

Up with the weight, let the punt drift with the rapid stream, and as she goes we may feel thankful that our evening's meal does not depend on a trout, to catch which it may take you longer than it shall to get seven years older.

As we round the bend there are some excellent swims, where the bank angler may come. I should bring an extra rod and use it with a ledger. Let it be a two ounce flat lead, that it may have a chance of remaining where you throw it, but there should be at least one yard of gut between this formidable piece of metal and the worm. The knowing Putney anglers will show you, if you meet them here, how they manage to take home such baskets of fish.

Try between the withy trees, slyly if the water is low and clear, but should you be fortunate enough to find it high and a little coloured, you may stand boldly forward. Your take will only be limited by the time and skill devoted to its capture; to the bank the fish must come for rest and food while such a water is running.

The last tree hangs more out over the river than the rest, and under it is the noted barbel swim, to fish which I have pushed my punt further than I can ever hope to do again.

The last time I came here I was early, yet too late. As we rounded the corner we saw that it was already occupied by a punt, in which there was a gentleman, a lady, and a boy, and as I sat down to assist with my customers to decide

what we were to do, I saw the gentleman strike a fish, and then ensued one of the grandest struggles I had seen for many a long day. Everything favoured the fish—a heavy stream was running, and if, with the aid of this he could only get fifteen short yards down stream, he would have no difficulty in regaining his liberty. There in the deep hole lies a tree, branches and all, as washed from a spot 500 yards up stream, where it toppled into the river. Many a good fish that could, and ought to, have been prevented, has done this little rush clean off the reel, much to the astonishment of sundry customers who were not too clever by half at barbel fishing.

To-day the battle is pretty equal. A score of times at least the fish came within a yard or two of home, to be got back to the punt bit by bit, and when he could no longer keep the bottom he rolled over and over on the surface in such a manner as would have broken any tackle had not line been given. Back it was coaxed again, and had I been in the punt it would have been near enough to have reached it with the net. The lady made an attempt, but it was too far off. The next time it came back she made another try and failed. The gentleman said something which I fancied caused her to lose confidence, and instead of keeping her net a little under water for the fish to come into it, she was holding it ready to drop when told. The gentleman gave the word, but instead of putting it under, she, with exhausted nerve, dropped it on his nose, and so ended the struggle between Mr., Mrs. and Master Phillips and a twelve pound barbel.—I am, &c.,

A THAMES FISHERMAN.

P.S.—Should any member of the Waltonian Angling Society read this, will he kindly inform Mr. Phillips that I have a few chub swims waiting for him or some other good hand?

[Many thanks for the subscription to our proposed society. We shall not forget that the first cash received for the purpose of propagating coarse fish came from "A Thames Fisherman."—ED.]

"A THAMES FISHERMAN'S" LETTERS.

SIR,—Surely our thanks are due to "A Thames Fisherman" for his graphic and interesting description of the river above Egham Weir. I have a slight knowledge of it and was able to follow every spot described, having fished them with my friend Mr. P. Geen. Unfortunately, I can quite agree with the writer that the perch are not so numerous as they were and that the big chub caught are few and far between, but there they no doubt are, as witness one lately taken by a member of the Hammersmith United Club, which weighed nearly 5 lb. The "Thames Fisherman's" letter, read while waiting in Richmond station, quite decided me to alter my plans for Saturday's fishing, and to visit again the old boughs; and I learn that on Sunday this portion of the river was more numerously attended than ever. These interesting and descriptive letters are what we want in the GAZETTE, for they cannot fail to familiarise the best portions of the river to the uninitiated angler, and it is to be hoped, Mr. Editor, there will be a continuance of them.

I do not think it was Mr. Hoole who fell into the weir on that cold winter's morning—it was Mr. P. Geen, who is also one of the best punters and swimmers on the river, and who has often told me the mishap was caused by his hearing the shouts of "somebody" who was telling him he was going out of his course.—I am, &c.,

LEDGER LEAD.

"A THAMES FISHERMAN."

SIR,—I have read with considerable surprise and pleasure the letters by a "A Thames Fisherman." Surprised at the ability displayed, and pleased to see such valuable information given to my brother anglers through your paper. I have fished the water between Bell Weir and Old Windsor, in the company of my oldest and most esteemed friend, Mr. P. Geen, for several seasons together, and many scores of good takes have reached the Hammersmith United Club from Haines Boughs.

I am prepared to endorse everything your correspondent, "A Thames Fisherman," says in respect to that locality, except those remarks referring to my "cold bath." The mistake is quite excusable, as I certainly was one of the two who attempted on that dark, bitter cold morning to shoot the old Bell Weir. I must say I was very much against the venture, but my friend had made up his mind to make the attempt (I never knew him to alter his mind when once it was made up).

It may be of some service to those too plucky piscatorialists to give them the particulars of what nearly terminated fatally for one of us; it makes me shudder when I think of it. It would have been a most lamentable thing for more than a few. The anglers would have lost one of their best friends, a wife the best of husbands, and children the best of fathers. We slept at the Green Man, Wraybury, on a Wednesday night about six (not sixteen) years ago, got up between five and six (it was pitch dark), unmoored our punt, and dropped down towards the Bell Weir, on our way to fish at Penton Hook. Could not make any one hear, although we bawled out "Look! look! look!" as loud as possible; so my friend said, "I shall not wait, Tommy. We will drop over the weir." I tried to persuade him against it, because it was too dark. It was no good; he had made up his mind to make the attempt. Up stream again, put the punt in a line for the shoot, was the work of a few moments. Some one on the weir shouted out something; it was impossible to hear what, for the roaring, rushing sound of the water was too great to hear one's self speak; but my companion tried to ease her while we listened to what was said. He, standing right at the end of the bow, and touching the bottom of the river with the pole, made the punt swerve, and before I had got the words "Look out! we are going to collide!" out of my mouth, bang she went, knocking me into the bottom of the punt, and my poor old friend, P. Geen, into the boiling water. Thank God, the punt went ahead, and got jammed between the piles, so that by the time P. G. came to the surface I was able to help him into the half-swamped punt, with the assistance of the unintentional cause of the accident, for I feel confident had it not been for his shouting we should have gone over all right. We are both convinced that "A Thames Fisherman" meant to give us good advice.

P. G. was not to be done out of his day's sport. We woke the people up at the Angler's Rest, and they were more than kind, doing all they possibly could to set matters right again. It was a treat to see P. G. toasting his clothes before a fire big enough to roast a bullock, rigged out in a pair of my trousers and my great coat. Those who know the two of us will know what a capital fit they were. I was a long time baling water out of the punt; when I had finished I looked into the drying-room to see how things were progressing. Behold P. G. getting into a flannel shirt, all scorched to pieces, as were most of his clothes, for his patience would not stand being taxed any longer. We got on board once more about ten o'clock, and sailed for Penton Hook, where we arrived without any further mishap, caught a lot of fish, and amused

our fellow-members with our day's adventures when we arrived home. I caught a very bad cold, and the "Knight of the Bath," was none the worse for the ducking.

Moral—never attempt to shoot weirs.—I am, &c.,

T. HOOLE.

P.S.—The weir was undergoing repair, and before we could recognise, in the confusion, who "A Thames Fisherman" was, there were five men helping us to get the punt off the piles. Of course we gave them as large a reward as possible, and if "A Thames Fisherman" will send his name and address to myself or Mr. P. Geen, he shall receive another token of our gratitude. I sincerely hope he will continue his letters, for he evidently knows a lot about his subject, and his hints will be highly appreciated by all who like to see their brother members, as well as themselves, get a dish of fish.

FISHING AT EYNESHAM.

SIR,—I regret exceedingly that the truth about the fishing at Eynesham should have proved so unpleasant to "Perch," and that I am still unable, even after his peculiarly inconsistent letter this week, to offer any further information; neither can I consent to be drawn into offering an opinion as to the public right to fish the water, not even "in the face of the other two letters written without bias" (of which I can detect slight signs in Mr. Oliver's letter). Which two letters are also quite free from the correct information, as will be seen on reference to the replies of Mr. Treadwell and Mr. Wall, in last week's GAZETTE. I must point out to Mr. Oliver that I have never said I paid "for simply being allowed to fish from a towpath"—the tickets permit fishing from both banks of the river; also that as my takes of fish are the only ones recorded in the GAZETTE as from Eynesham, I was quite justified in assuming that they had attracted his attention as named in his first letter. I should be much more in order in telling Mr. Oliver that he has no right to assume the Thames Rights Defence Association to be defunct because he does not happen to hear of its doings. No doubt "Perch" is a highly desirable and indispensable member of the club, which has the felicity of owning him among its members, but that gives him no right to treat with such undisguised contempt the correct information of those who have taken the trouble to reply to his inquiries.—I am, &c.,

ROBT. W. HOBDEN.

COARSE FISH CULTURE.

SIR,—I am instructed by the members of the Patricroft Social Anglers Society, to inform you that they highly approve your suggestions of the formation of a society for the cultivation of coarse fish, and that in the event of your succeeding in forming one, they will subscribe to its funds.

The distance is too great for the club to send a delegate to the proposed meeting, but they wish it and you every success, and hope that you will publish a report in your paper.—I am, &c.

W. R. M., Sec.

63, King Street, Manchester, November 18.

A GOOD JOKE.

SIR,—Our jocular mutual friend, the printer, makes me, in my last week's letter, talk of "my first touting season." It should, of course, have been "my first troutling season." There is, however, just this scintilla of truth, or of verisimilitude about that pleasant *lapsus typographæ*, that were I to begin to tout, my first attempt would certainly be to obtain a good day's troutling.—I am, &c.,

A. R. I. E. L.

London, Nov. 21.

ANOTHER JOKE.

TO THE PRINTER,

SIR,—In my note to one of the letters in last week's paper, you make me say that a Nottingham angler can work his spinning bait like a *goose* bait! I wrote *gorge* bait. Your compositor is again not far out, for, in some parts of the country, it used to be the custom to tie a fish-bait to a goose's leg, and then frighten the bird on to a lake containing jack; as the bird uses its leg in swimming, it imparts motion to the fish-bait very similar to the deadly, sink and draw of the gorge-bait style.—I am, &c.,

EDITOR F. G.

THE BIG PERCH.

SIR,—The question of the 10½ lb. perch. In reply to Mr. W. Gibson as to the weight of a perch from Dagenham Lake, viz., the one brought by Clapham, of 5 lb. 1 oz., wherein he says he remembers a skin having been sent by a local suffer.

Mr. Gregory wrote you, the skin of the 10½ lb. perch was sent to Mr. Cooper for preservation, whereby Mr. Gibson's statement is so far corroborated, bringing the skin sent by Mr. Reynolds and that seen by Mr. Gibson as identical.

But how great the discrepancy, when it is stated "that fish was not so large as the one from Dagenham." I took notes at the time I saw the fish, and, as I happen to have my note book by me, I will take out the leaf containing said notes, and enclose it in this. I am satisfied the fish has nothing to indicate a cross of the pike about it, but is a splendid specimen of a real magnificent perch. Any one who may see it would be well satisfied that it must have been of the weight stated, and that the 5 lb. 1 oz. fish from Dagenham is simply "nowhere" as being a match for it, in weight, at least.—I am, &c.,

Eliza Cottage, Chandos Road, Stratford, E.

P. F. DAVIS.

[The extract from Mr. D.'s note book runs:—"Perch, 10½ lb.; length, 27 inches. Killed ten years ago in Burton Broad, by Lord Hastings' coachman." We wish Mr. Davis would get this big perch up to town. We will pay carriage and get the question settled.—ED.]

SIR,—I cannot get over that big 10½ lb. perch. I have written twice to John Cooper, who—they say—stuffed the fish, but no reply yet. 5½ lb. is the largest perch I ever had, and Buckland never even saw a larger perch than the 4½ lb. fish in my dining-room. The talk about that Dagenham 7-pounder and the one of 9 lb. from the Serpentine is all nonsense. There was not a ½-pounder when the Serpentine was cleared out. Then, Whittlesea Mere, the biggest perch was hardly 3 lb., and I took great trouble to ascertain this when the lake was drained, the engineer being an old friend of mine.

I hope Mr. Keene will give us his experience.

An old taxidermist said to me the other day, "The real weight is about 3 lb., and it is no use trying to make it more; you know that as well as any man."

Some years ago, a London gentleman out with me got several fish over 2 lb.

and one of them was nearly a 3-pounder. During dinner my groom quietly slipped 10 oz. of lead into his stomach, and, of course, he then weighed $3\frac{1}{2}$ lb. Well, the fish went to the club and was weighed, then to the taxidermist, who returned the lead, which I had back. "Well," said my friend, "I got the prize after all, and he was the best fish of the year, and I got it fairly—no troy weight for me."—I am, &c.,
ESOX LUCIUS.
[This big perch must be a sea-perch—this ends the marvel.—ED.]

VARNISHES, &c.

SIR,—Permit me to thank "Chemicus" for his ready information as to preparing a white varnish. I quite agree with him as to the obstacles thrown in the way of the amateur by Messrs. Gilowbowthur and Co., the courteous tackle makers, in his pursuit of that most pleasant pastime, making his own tackle, and the mysteries they seek wherewith to hedge around each simple operation.

I venture to think that if "Chemicus" would advertise the varnishes he speaks of they would, if an improvement, as he suggests, and sold at a reasonable profit, command a sale, and friends in any especial district would readily club together to procure it in such quantity as to make railway carriage preferable to post.—I am, &c.,
NEMO.

CLUB REPORTS.

ANGLER'S PRIDE ANGLING SOCIETY.

The trays of this club were well filled on Sunday with roach, Mr. H. Haines having 6 lb. Mr. J. Deeley, jun., $2\frac{1}{2}$ lb.; Mr. T. Marshall, $1\frac{1}{2}$ lb.; Mr. T. Fiddes, $1\frac{1}{2}$ lb.; Messrs. J. Soar, F. Nash and J. Deeley, sen., also weighed in.—T. MARSHALL, sec.

Nov. 22.

BERMONDSEY BROTHERS.

The above club fished on Sunday last at Pangbourne for their fourth list of prizes. The first was won by Mr. Ayton, with 7 lb. 8 oz. of roach; second, by T. Mitchell, with 5 lb. of fish, a tench of 2 lb. 11 oz. being among his take; third, Mr. Owles. Mr. Allen, 6 lb. of roach, taken before the match commenced, other smaller takes from the members.—WM. ALLEN, sec.

Nov. 22.

BRIGHTON ANGLERS' ASSOCIATION.

The competition last Sunday was fished under difficulties: thick water and heavy showers. Mr. Anscombe took first prize with 5 lb. jack; Mr. Ash, 3 lb. jack; 3rd, Mr. Collins, one perch $\frac{1}{2}$ lb. The annual meeting took place on Monday evening. The agenda was change of officers and other business. The society have fortunately again secured the services of Mr. Anscombe as hon. secretary; Mr. Gambling, chairman; and Mr. Upton, as treasurer. Wind south-west, and very strong since Sunday.—GROUND BAIT.

Nov. 26.

CITY OF LONDON.

Only two members weighed-in on the 20th, Mr. Mortimer, roach from the Rye House, and Mr. Castell roach from the Stort. Mr. Fowler's prize will be fished for on Sunday next.—CAS.

JOVIAL ANGLERS.

This club held their meeting on Sunday last, when Messrs. Kolemman, Eydemann and Smart weighed-in fish from Shepperton, and Mr. Stead a fair show of dace from Richmond. There were two prizes offered to be fished for from the bank, between Richmond Bridge and Teddington Lock, by Messrs. Howard and E. Brown, both professional fishermen of this place. Mr. Howard's prize is a very elaborate box of all kinds of fishing implements, and Mr. E. Brown's is a rod, winch and 100 yards of line. We continue to add to our number, and are now over thirty.—W. H. PLATE, sec.

LITTLE INDEPENDENT ANGLING SOCIETY.

A good number of the members weighed-in last evening, but the takes again ran small. Messrs. G. Watson, jack, 6 lb. 4 oz.; Letch, roach, 3 lb. 3 oz.; Grey, roach, perch, &c., 2 lb. 5 oz.; Mead, roach, 1 lb. 12 oz.; Heelas, dace and gudgeon; Suich, perch; Harwood, roach and gudgeon; Wightman, roach; Scott, perch and gudgeon; Petrie, roach and chub; Raine, roach. On Wednesday, 16th, Mr. P. Banfield brought in a nice eel from the Rye House, weighing 2 lb. 7 oz.—W. BROWN, hon. sec.

Nov. 21.

THE NEWARK PISCATORIALS.

At the weekly meeting of the above society, held on Tuesday evening, November 15, a very instructive and amusing lecture was given by Mr. J. W. Martin, "The Trent Otter," subject, "The Natural History, the Habits, and Characteristics of the Pike." The chair was occupied by Mr. Brooks, the president of the society, who, in a short and pithy speech, introduced the lecturer to the meeting. The lecture, which lasted an hour, was listened to with the greatest attention, the frequent laughter and applause testifying the approbation of the listeners. "The Trent Otter," in the course of his remarks, traced the history of our pike from the earliest recollections, explained from whence and wherefore he got his name, gave several laughable anecdotes about the weight pike are said to have attained, and about the ferocity and voracity of the jack, and also explained their wonderful powers of digestion, &c., &c. Indeed, it may be said that he treated the subject in an exhaustive manner. In proposing a vote of thanks to the lecturer, Mr. Weaver, a member of the Newark Town Council, said that he had listened with a great deal of pleasure and profit to the very able lecture just delivered, and hoped that during the winter Mr. Martin would give them the pleasure of listening to another lecture on the natural history of some others of our fresh-water fish, a remark that met with general approval. Mr. Mawson seconded the proposition, and it was carried unanimously. Mr. Martin, in his reply, expressed his willingness to do so, and thanked the members and their friends for the kind way in which they had received his remarks. A vote of thanks to the chairman brought the proceedings to a close.

NORTH-WESTERN ANGLING CLUB.

The return visit to the North-Western Angling Club, No. 1 District, took place on Monday, 14th inst., and was a great success, over 100 anglers being present to join in the harmony of the evening. On Mr. Osmon, the district officer, calling the roll, it was found that there were thirteen clubs represented, viz., Waltonians, Duke of Cornwall, Phoenix, Bostonians, Cambridge Friendly, Golden Barbel, Globe, Prince of Wales, Marylebone, Norfolk, Westbourne

Park, Little Independent, and City of London. Amongst those who distinguished themselves in rendering the songs of the evening were Mr. Leitch, with the "Flying Dutchman" and "The Vagabond," Mr. Stead, the well-known "Cure" and angler; Messrs. Warwick, Bob Marshall, Star, Roland, Jackson and Barr (on a miniature concertina and banjo), Kelsey, Aldis and others, all of whom met with great approval. Mr. Jules Harding in the chair, faced by Mr. Packman in the vice. Fortunately one of the members had been out, Mr. Kelsey, who brought a very nice show of roach and dace from the Thames, weighing in the aggregate 19 lb. 2 oz. During the week Messrs. Plumptre and Grindley had jack from the Harp; Messrs. Underwood, Stead and Harding, jack from the Thames; and Mr. Patchin, roach from Blunham.—F. HILL, sec.

PHENIX ANGLING SOCIETY.

Last Sunday the River Mole was like pea-soup, and not much fish was taken. Fifteen members competed for two prizes, but not enough fish being caught, the prizes will have to be fished for next Sunday. Mr. G. Bentley had a nice tray of roach, 9 lb. 11 oz.; Messrs. H. Parker, Crisp, Elbourn, Bartrip, Upton, Milton, Reed and Gray also contributing.—W. ELBURN, sec.

THE PISCATORIAL SOCIETY.

The final competition for the season was a contest for the best show of perch, and Monday last was selected as the day for the issue. The attendance at the club room, Ashley's Hotel, Henrietta Street, Covent Garden, on Monday last, was very numerous, both of members and visitors. There could not have been less than eighty gentlemen present; the large room was crowded to an overflow; tables had to be enlarged; and increased number of chairs. Mr. Thomas Gillatt, one of the oldest and most respected members of the club, presided on the occasion, and amongst the members present were Messrs. F. G. Pearce, James Lander, Henry Gray, Thomas Huggett, T. R. Sachs, W. H. Brougham, W. B. Adlington, C. P. Wheatstone, B. Perelli-Rocco, F. H. Lemann, Norman F. Harrison, J. Pattison, George Gillatt, G. Skinner, E. Foreman, J. Ross Faulkner, W. J. Wilkinson, David Goodger, &c. The visitors were principally members of the Friendly Anglers, who meet at the Albion Tavern, Albion Street, Hyde Park, who were present in return for a visit made by the members of the Piscatorial Society on the previous Wednesday. There were Messrs. W. Paine (treasurer), C. M. Le Good (hon. sec.), N. Henderson, H. A. Connerton, J. Wiltshire, H. E. Blockley, H. J. Welch, A. T. Davis, John Sachs, Jonathan Pennington, &c. Mr. Sachs, jun., who has been almost round the world during the last three years, was present, and received a hearty welcome from his old friends. He was looking remarkably well, and it was hoped he would soon occupy his old position as a member of the society, to which he expressed a hearty assent. And now, as regards the competition it was a decided failure in the number of fish allowed to be weighed-in, the minimum weight being 8 oz. A considerable number of fish had to be rejected, which when first taken must have turned the scale, as the smallest particle would have done in the club room. Mr. C. P. Wheatstone was the first competitor to put in an appearance, and brought up nine good-looking perch, but three had to be discarded, although, as it was remarked, half a sheet of note paper would have brought down the balance in favour of the fish. Mr. Shipway was the next to weigh-in, and two perch out of at least twenty were allowed to compete, although, in numerous instances, it was a fine point to decide. These two worthy competitors were the first to show, and according to their order of appearance they ranked in the result. The first prize, of three guineas, was awarded to Mr. C. P. Wheatstone, with six perch from Maple Durham, weighing 3 lb. 9 oz., the largest fish 11 $\frac{1}{2}$ oz. Mr. Shipway secured the second prize, of two guineas, with two perch, weighing 1 lb. 7 $\frac{1}{2}$ oz., the largest 13 $\frac{1}{2}$ oz. from Maidenhead; and the additional prize of one guinea, liberally given by Mr. C. P. Wheatstone for the heaviest fish. The following fish were also weighed-in:—Mr. Thomas Huggett, one jack of 3 lb. 2 oz., and a perch of 8 oz.; Mr. F. H. Lemann, a jack of 3 lb. 10 oz., and a perch of 8 oz.; Mr. E. Green, a jack of 3 lb. 11 $\frac{1}{2}$ oz.; Mr. Cross, a chub of 2 lb. 5 oz., and Mr. Grizell, a jack of 4 lb. 15 $\frac{1}{2}$ oz. A very jovial evening was spent by the members and visitors, numerous complimentary toasts exchanged, and the usual votes of thanks accorded. A paper on "Jack Fishing" will be read by Mr. T. R. Sachs, on Monday evening next, and from the long practical experience of that gentleman in the science of angling, added to the fact that he is an accomplished angler, it is sure to attract a large attendance of members and friends.

QUEEN'S ANGLING SOCIETY.

Several members were out yesterday, 20th November, to compete for a fishing box, which was won by Mr. Hodges, with 11 lb. 7 oz. of roach from Weybridge, a very pretty show; in fact, the best individual show of the season. Messrs. Sanders and Pratt some dace from Hammersmith.—H. THURSGROVE.

ST. GEORGE'S UNIVERSAL ANGLING SOCIETY.

The above society celebrated their removal from the Sir Robert Peel Inn, Caroline Street, to the Dolphin Inn, Unett Street, by holding their third annual dinner and distribution of prizes at the Dolphin Inn, the host, Mr. Stonier, providing an excellent repast, which was thoroughly enjoyed by a goodly number of members present. The usual loyal and other toasts having been proposed and heartily responded to, and the prizes having been presented to the members who were successful at the club contest which took place in the Kidderminster district some weeks ago, on fishing waters kindly selected by brother anglers in that district, Mr. J. Keeling, one of the gentlemen who acted as referee on that occasion, proposed the success of the St. George's Universal Angling Society, and in the course of his remarks testified to the pleasure his brother officials and himself felt in spending so enjoyable a day with the members at their contest, which was conducted in a most agreeable and satisfactory manner. On the motion of the chairman, Mr. James Letherington, a cordial vote of thanks was passed to those gentlemen who liberally presented various and valuable prizes to the society, and that the receipt of those prizes should be acknowledged in the FISHING GAZETTE. The secretary, Mr. A. Roberts, gave an account of the formation and progress of the society, which has been most successful, numbering at the present time about 100 members, and possessing private waters in the rivers Trent, Avon, and Blythe, and stated that the committee would be very glad if any gentlemen owners of fisheries who were disposed to assist angling societies in their efforts to preserve angling waters by renting them, or otherwise, would communicate with the society at their clubhouse if they have any fishing to let, the main object of the society being to provide good angling for the members, and devote the funds of the society to the preservation of waters and the furtherance of true angling. The best thanks of the society having been given to Mr. J. Keeling and Mr. Steward for their kindness in fulfilling the office of referees at all contests since the formation of the society, regret was

universally expressed at the absence of Mr. Steward, through leaving Birmingham for a foreign shore, and hoping that his career in his future home may be a happy and prosperous one. The toast of the FISHING GAZETTE met with a most hearty response, and hoping that we shall not be intruding on your space with this report, and asking you to kindly acknowledge the receipt of prizes from the following gentlemen:—Mr. John Keeling, fishing tackle manufacturer, Digbeth; Messrs. Warner Brothers, fishing tackle manufacturers, Broad Street, and Redditch; Mr. Reubin Heaton, fishing tackle manufacturer, Hospital Street; Mr. Whately, pocketbook manufacturer, Branstons Street; Mr. James Gregory, artificial bait manufacturer, Vyse Street; Mr. H. Jackson, fishing tackle manufacturer, Hockley Hill; Mr. James Dearn, fishing tackle manufacturer, Gosta Green; Mr. C. Steward, artificial bait manufacturer, Key Hill Drive; Mr. C. Brownhill, jeweller, Great Hampton Street; Mr. W. Caney, late treasurer, Pope Street; Mr. James Clabrough, gun manufacturer, Whitall Street; Mr. Samuel Probin, gun manufacturer; Mr. James Fisher, electro-plate manufacturer, Aston New Town.—A. ROBERTS, secretary.

Birmingham.

SURREY PISCATORIALS.

On the 23rd, Mr. Meadway had a capital show of roach and dace from the Colne, gross weight going over 9 lb. A meeting was held at the Society's headquarters, the St. Paul's, Westmoreland Road, Walworth, Mr. Meadway in the chair, to consider the memorial just issued by the Thames Angling Preservation Society. Among the different questions that were discussed was one in reference to the reducing the measure for perch, roach, and dace in the City waters—Would it be detrimental or not? Some of the members think that the above-named fish are quite small enough at the present size without making them smaller. This society would like to hear what the Reading Preservation Association are going to do on this question. This question will be brought on again on Wednesday next. Perhaps the R.P.A. will kindly forward their views by that time; by so doing they will oblige a great number of anglers, as this a question that needs discussing.—PIXIE.

TRAFALGAR ANGLING SOCIETY.

Members and friends of the above society are respectfully informed that the business of this society will be transacted at their old quarters, the George and Dragon, Greek Street, Soho, on and after Wednesday, November 23rd.—R. G.

UNITED BROTHERS.

Although several members were out on Sunday the 20th, only one arrived in time to weigh—J. Curran with roach from the Thames. The old members of the above society will fish a pegged-down match on Sunday the 27th, when I hope we shall have more members, ditto fish, than we had at our last outing. Then it was too cold, this time what will it be? Water to be named on Saturday night the 26th.—WILLIAM BELTON.

WALTONIANS.

Messrs. Malcom, Rolan, Good, jun., Greenfield, and Togwell weighed-in fish, but very small. Shows the order of the day.—A. J. MARRIOTT.

Nov. 20

WESTBOURNE PARK PISCATORIALS.

After writing you yesterday I went down to West Drayton, Godfrey water, and had some sport among the roach, largest fish 17 oz. Two gentlemen had 8 lb. of chub, largest, 4 lb. 8 oz.—H. ADEAN.

WEST CENTRAL ASSOCIATION OF LONDON ANGLERS.

The delegates meeting of this association was held on Friday last, the 18th instant. There was a good attendance, twenty-nine societies being represented. On the chairman (Mr. Bonvoisin) taking his seat, the business was commenced without delay. The minutes of the last meeting having been confirmed, the hon. sec. announced the decision of the committee relative to the case of abuse of the privileges granted by the L. and S. W. Railway, referred to them for disposal. The committee, which met on the 4th inst., after a patient and thorough investigation of the whole affair, cancelled the tickets held by the defaulting parties. Since such meeting of the committee the hon. sec. had received a letter signed by fourteen members of the society to which the parties belonged, appealing against the decision of the committee, which he in due course placed before the meeting. Their delegates also made an earnest and eloquent appeal on behalf of their brother members for a reconsideration of the matter. The vice-chairman stated shortly to the meeting what took place before the committee, after which Mr. A. A. Dean proposed, and Mr. White seconded, "That the decision of the committee be upheld and confirmed," such proposition being carried unanimously. Several letters having been received from the secretary of the T.A.P.S. with reference to the payment of the reward granted by the association to Mr. Walters, late a keeper of the T.A.P.S., also from Mr. Geen, the president of the W.C.A., the same were laid before the meeting. After considerable discussion had taken place, the matter was left in the hands of Mr. Geen for settlement at his discretion, that gentleman representing the W.C.A. on the committee of the T.A.P.S. A question raised by the late secretary of the Queen's Angling Society, was after some remarks, referred to the committee. The Jovial Angling Society and the Brunswick Piscatorials were enrolled with the association, after which, as the time was somewhat late, the hon. sec. called the roll, the following societies being represented:—Acton and Ealing, Bostonian, Bloomsbury Brothers, Beresford, City of London, Cambridge Friendly, First Surrey, Golden Barbel, Good Intent, Gresham, King's Cross United, Larkhall, Norfolk, North-Western, Prince of Wales, Peckham, Perseverance, Queen's, Royal George, St. John's, South London, South Belgravia, St. John's Wood, Trafalgar, United Brothers, United Marlboro' Brothers, Waltonians, Westbourne Park, Jovial and Brunswick Piscatorials. A vote of thanks to the chair and vice-chair closed the business of the evening.—G. TREADWELL.

OBSERVATIONS ON THE SALMON OF THE PACIFIC.

By DAVID S. JORDAN AND CHAS. H. GILBERT.

DURING the most of the present year, the writers have been engaged in the study of the fishes of the Pacific coast of the United States, in the interest of the U. S. Fish Commission and the U. S. Census Bureau. The following pages contain the principal facts ascertained concerning the salmon of the Pacific coast. It is condensed from our report to the U. S. Census Bureau, by permission of Professor Goode, assistant in charge of fishery investigations.

There are five species of salmon (*Oncorhynchus*) in the waters of

the North Pacific. We have at present no evidence of the existence of any more on either the American or the Asiatic side.

These species may be called the quinnat, or king salmon; the blue back salmon, or red-fish; the silver salmon, the dog salmon, and the hump-back salmon, or *Oncorhynchus chowicha, nerka, kisutch, keta*, and *gorbuscha*. All these species are now known to occur in the waters of Kamschatka as well as those of Alaska and Oregon.

As vernacular names of definite application, the following are on record:—

(a) Quinnat—Chowicha, king salmon, e'quinna, saw-quey, Chinook salmon, Columbia River salmon, Sacramento salmon, tyee salmon, Monterey salmon, deep-water salmon, spring salmon, ekulba ("ekewan") (fall run).

(b) Blue-back—krasnaya ryba, Alaska red fish, Idaho red fish, sukkegh, Frazer's river salmon, rascal, oo-chooy-ha.

(c) Silver salmon—kisutch, winter salmon, hoopid, skowitz, coho, bielaya ryba, o-o-wun.

(d) Dog salmon—kayko, lekai, ktawhy, qualoch, fall salmon, o-le-a-rah. The males of all the species in the fall are usually known as dog salmon, or fall salmon.

(e) Humpback—gorbuscha, haddo, hone, holia, lost salmon, Puget Sound salmon, dog salmon (of Alaska).

Of these species, the blueback predominates in Frazer's River, the silver salmon in Puget Sound, the quinnat in the Columbia and the Sacramento, and the silver salmon in most of the small streams along the coast. All the species have been seen by us in the Columbia and the Frazer's River; all but the blueback in the Sacramento, and all but the blueback in waters tributary to Puget Sound. Only the quinnat has been noticed south of San Francisco, and its range has been traced as far as Ventura River, which is the southernmost stream in California which is not muddy and alkaline at its mouth.

Of these species, the quinnat and blueback salmon habitually "run" in the spring, the others in the fall. The usual order of running in the rivers is as follows:—*Nerka, chowicha, kisutch, gorbuscha, keta*.

The economic value of the spring running salmon is far greater than that of the other species, because they can be captured in numbers when at their best, while the others are usually taken only after deterioration.

The habits of the salmon in the ocean are not easily studied. Quinnat and silver salmon of every size are taken with the seine at almost any season in Puget Sound. The quinnat takes the hook freely in Monterey Bay, both near the shore and at a distance of six or eight miles out. We have reason to believe that these two species do not necessarily seek great depths, but probably remain not very far from the mouth of the rivers in which they were spawned.

The blue-black and the dog salmon probably seek deeper water, as the former is seldom or never taken with the seine in the ocean, and the latter entered the Straits of Fuca at the spawning season.

The great majority of the quinnat salmon and nearly all the blue-back salmon enter the rivers in the spring. The run of both begins generally the last of March; it lasts, with various modifications and interruptions, until the actual spawning season in November; the time of running and the proportionate amount of each of the subordinate runs, varying with each different river. In general, the runs are slack in the summer, and increase with the first high water of Autumn. By the last of August only straggling blue-backs can be found in the lower course of any stream, but both in the Columbia and the Sacramento the quinnat runs in considerable numbers till October, at least. In the Sacramento the run is greatest in the fall, and more run in the summer than in spring. In the Sacramento and the smaller rivers southward, there is a winter run beginning in December.

The spring salmon ascend only those rivers which are fed by the melting snows from the mountains, and which have sufficient volume to send their waters well out to sea. Such rivers are the Sacramento, Rogue, Klamath, Columbia and Frazer's Rivers.

Those salmon which run in the spring are chiefly adults (supposed to be at least three years old). Their milt and spawn are no more developed than at the same time in others of the same species which will not enter the rivers until fall. It would appear that the contact with cold fresh water, when in the ocean, in some way caused them to turn towards it and to "run," before there is any special influence to that end exerted by the development of the organs of generation.

High water on any of these rivers in the spring is always followed by an increased run of salmon. The canners think, and this is probably true, that salmon which would not have run till later, are brought up by the contact with cold water. The cause of this effect of cold fresh water is not understood. We may call it an instinct of the salmon, which is another way of expressing our ignorance. In general, it seems to be true that in those rivers and during those years when the spring run is greatest, the fall run is least to be depended on.

As the season advances, smaller and younger salmon of these two species (quinnat and blue-back) enter the rivers to spawn, and in the fall these young specimens are very numerous. We have thus far failed to notice any gradations in size or appearance of these young fish by which their ages could be ascertained. It is, however, probable that some of both sexes reproduce at the age of one year. In Frazer's River, in the fall, quinnat male grilse of every size, from eight inches upward, were running, the milt fully developed, but usually not showing the hooked jaws and dark colours of the older males. Females less than eighteen inches in length were rare. All large and small, then in the river, of either sex, had the ovaries or milt well developed.

(To be continued.)

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 188, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 21, Lombard-market, Battersea, S.W.
Mrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.
Mr. Alfred Young, "The Golden Perch," 174B, Oxford-street, W.
Mr. R. Barnett, 26, Church Street, Lisson Grove, N.W.
Mr. J. Smith, 7, Tottenham Court Road, London.
Mr. Edwin Stevens, Newsagent, 220, Kentish Town Road.

SATURDAY, DECEMBER 3, 1881.

LONDON ANGLERS AND COUNTRY WATERS.

IN our correspondence columns this week will be found a letter from a gentleman who complains of conduct on the part of London club and other anglers, which we must regret has been only too frequently complained of recently; we refer to the practice of fishing in preserved waters without the consent, and in defiance of the parties preserving it. We also print an account

from a Bedford paper, of a prosecution of two London anglers for jack fishing in a preserved water without permission. Now, much as we sympathise with the growing difficulty the thousands of London's working-men anglers experience in finding place to fish, we can only tell them that, unless they unite to put a stop to the illegal proceedings of some of their members they will most certainly find their difficulties increase tenfold. The number of anglers is increasing very fast; this increase is general all over the country; nearly every town of any importance has its angling clubs. Now, the anglers of London are finding that waters which they have been in the habit of fishing without let or hindrance are on all sides becoming closed to them, in the majority of cases in consequence of the formation of some local club. What is to be done? It will be perhaps easier to say first what is not to be done. In our opinion it is a suicidal policy to attempt to assert a right to fish, or to persist in fishing in defiance of notice or warning, unless it is perfectly certain that the parties giving such notice or warning are not entitled to do so, and the only way to prove this is by legal proceedings. To this it may be answered, How can a few poor anglers venture to go to law? probably with some wealthy club! If they cannot do so there is no help for them, and they must go elsewhere. If the country clubs would issue day tickets it would be a grand boon, but they cannot be forced to do so, and any attempt in this direction can only end in creating a worse feeling than already exists. Our correspondents who write hard words about the country clubs should remember that by doing so they are only helping to widen the gulf, and prevent all chance of concessions of any kind. We are writing in the true interests of London anglers; there can be no possible good in taking a sentimental view of the question, and talking of the selfishness of this or that club refusing to allow poor anglers to fish. Why should country clubs be expected to do from any sentimental feeling what London clubs, when they have the power, never do? We could name several London angling clubs which rent and preserve waters in the neighbourhood of London; do they permit outsiders to fish, either because they are poor, or for any other reason? Why, as a rule, even the members are not allowed to bring their own personal friends! and as for issuing day tickets, it is impossible, for this simple reason, that the day-ticket holders would be in an infinitely better position than the club members; who pay from two to twenty pounds a year; in fact, there could be no inducement to be a member, as it would be far cheaper to buy a day ticket on the often rare occasions that the individual could fish the water. If the water were preserved for pecuniary or philanthropic reasons, then the issue of a limited number of day tickets would, in many cases, be advisable. We think the sooner the London clubs accept the situation, and acknowledge they cannot force their way into preserved waters, and are merely making themselves ridiculous by putting forward sentimental grievances, the soon will they come to see that they must act for themselves, and get waters of their own. It must and will come to this if they want to get fishing at all; and every day of delay on their part means loss of water which might be had, and increasing cost of what remains. It is only this week we hear, on good authority, that the land owners and holders in the neighbourhood of Pulborough intend—if, indeed, they have not done so already—to put a stop to free fishing there. No one regrets this more than we do, and we sincerely trust the report is not correct. If it is a fact, we can only advise the hundreds of anglers who fish there not to make the matter another case of grievance and cause for calling names, if they do they will defeat any after-attempts to obtain concessions. This is a case affecting so many anglers in so many clubs, that we should strongly advise their taking it up in a temperate, quiet manner, and sending a deputation to learn the reason why the waters are to be closed to them in future, and endeavour to effect some compromise. If they talk about "selfishness" and "rights," they will most assuredly lose Pulborough as an angling resort.

The only hope we see for the future of London club anglers is, that they will take the bull by the horns, rent waters, and stock these for their own use. There are, as Mr. Jardine pointed out at a meeting of the Society of Arts some years ago, thousands of miles of rivers and canals, which can be utilised for angling preserves. At present they are looked after by nobody, and fished and poached to death. To rent portions of them of the canal or land owners is not only a possible, but an easy matter; other clubs are doing it fast. The expense for rent is a trifle, and we shall hope at our proposed meeting to discuss coarse-fish culture, to prove that the breeding of coarse fish is such an easy and simple matter that any club might do it. If to do what we propose is beyond the resources of some clubs singly, they surely could join together and do it. The great associations could easily procure funds for renting certain stretches of water, and could as easily recoup themselves by issuing day tickets. The Sheffield Association have long ago done this; it is high time London followed their example.

THE GREAT INTERNATIONAL FISHERIES EXHIBITION, 1883.

A MEETING of the General Committee of the above Exhibition was held on Friday, November 25th, at Fishmongers' Hall, when the following members were present:—

Edward Birkbeck, Esq., M.P., Vice-Chairman.
Marquis of Exeter.
Sir Alexander Galt.
Sir Phillip Cunliffe Owen.
Sir Andrew Lusk, Bart., Ald, M.P.
W. S. Shoobridge, Esq.
J. H. Fordham, Esq.
Deputy Bell.
H. L. A. B. C. Burdett-Coutts, Esq.

W. Oldham Chambers, Esq.
J. H. Crossman, Esq.
Captain Fell Woods.
Major Flood Page.
Francis Francis, Esq.
Jethro Hornblower, Esq.
Alfred Jardine, Esq.
John Pender, Esq., M.P.
Thomas Spreckley, Esq.
R. B. Marston, Esq.

The most important announcement connected with this meeting was that H.R.H. the Prince of Wales has accepted the position of President of the Exhibition.

A resolution was passed at the meeting to ask His Grace the Duke of Richmond and Gordon to accept the position of Chairman of the General Committee, and Edward Birkbeck, Esq., M.P. to be Chairman instead of Vice-Chairman of the Executive Committee. Rough private proofs of the prospectus were placed before the committee and it was decided that, if possible, the prospectus should be completed and published early in January, a revised proof is in the meantime to be submitted to the committee for their suggestions and approval. H. W. Towse, Esq., the hon. secretary of the exhibition, read the minutes of the last meeting, and also most satisfactory letters from Earl Granville, and Earl Kimberly, promising aid to the exhibition by drawing the attention of foreign Governments and our Colonies to it. Another most important feature, is the formation of corresponding committees in all the important towns in the United Kingdom and Ireland. This is being proceeded with, and many promises of hearty support, and co-operation have already been received. We are glad to state that the best feeling exists between the committee of the forthcoming Edinburgh International Fisheries Exhibition, and the committee of the 1883 Great International Fisheries Exhibition of London.

THE EDINBURGH INTERNATIONAL FISHERIES EXHIBITION, 1882.

WE have received the prospectus of this important exhibition, and are requested by the hon. secretaries to aid in making it generally known. We will refer our readers to the advertisement which will be found in another part of this paper for the very influential list of patrons.

The exhibition will open on the 12th of April next year, and it is under the presidency of H.R.H. the Duke of Edinburgh, who, as our readers are aware, is an enthusiastic angler. Intending exhibitors should note that no application for space will be received after the 1st of March. We trust English manufacturers of fishing tackle, nets, boats, piscicultural apparatus; fish passes, &c., will support this exhibition, it cannot fail to offer them exceptional advantages, because to most of them it will open up a new and important field for their enterprise. The Scotch anglers are a large and rich body, they do not need to come south for fishing, and consequently English fishing tackle—the best in the world—is not brought much to their notice. The mountain would not go to Mahomet, so Mahomet went to the mountain; Scotch anglers will not come to us for tackle, so those of us who are wise will seize this unique opportunity of cheaply and easily getting at them, and the same thing applies to the sea-fishing industries. We learn from that most interesting little work on the herring and the herring fishery, which has just been published by Mr. J. W. de Caux of Yarmouth, and which we shall notice shortly, that "The Scotch are now by far the greatest herring-fishers in the world; they possess the enormous number of 14,500 herring-boats, worked by some 50,000 men and boys." In the season of 1880 they caught herrings, which at wholesale price fetched, in round numbers, a million pounds sterling!

LOAN COLLECTIONS OF STUFFED FISH.

In a letter we have received from Mr. Archibald Young, one of the hon. secretaries of the exhibition and Commissioner of Scotch Salmon Fisheries, that gentleman says, "I quite agree with you that the collections of stuffed fish were a prominent and attractive feature of the Norwich Exhibition, and I particularly remember Mr. Jardine's collection." Mr. Young hopes that the London clubs, and owners of private collections will send them to Edinburgh, and we know from other quarters that this is the general wish of our Scotch friends. We trust that the splendid collections of our club and other friends will be well represented in Edinburgh. As in the case of the Norwich Exhibition, all expenses will be paid

by the committee, and as regards risk, it is practically *nil*, as special "through" vans will be provided. Medals and money prizes for exhibits and essays will be awarded. In conclusion, we will only add that this Scotch exhibition promises to be a great success, and deserves the hearty support of all who are in anyway interested in fish and fishing. All particulars respecting charges for exhibits, for advertisements in the official catalogue (by the way, as example is better than precept, we may mention that we intend both to exhibit, and advertise in the catalogue), also all other information can be had of the honorary secretaries of the exhibition, at the Highland Society's Chambers, 3, George IV. Bridge, Edinburgh.

SOME NOTES ON ENGLISH COARSE FISH CULTURE.

No. I.

AFTER the departure of the Romans, and at the accession of the Anglo-Saxons, the stews were used for the storing of eels chiefly. Some historians suppose because Bede has told us this, and because it is stated that when St. Wilfrid and Augustine visited this land, the people only knew how to catch eels, that these were eels only in the stews or ponds of the land. True, it is that St. Wilfrid taught the inhabitants better how to capture other fishes, but I cannot but think that it is to the Romans we owe most of the fishes we angle for to-day. The idea seems to me feasible enough. The Romans were eminently enlightened on the subject of fish cultivation. This being so, it is reasonable to suppose that they knew how to carry fish long distances, *ergo*, they imported many of our coarse fish, if not some of the finer. It is clear anyway that they took great interest in this island, so marvelously rich in minerals; and it is almost incredible that, after building fish stews, they should be content with the mere produce of the wild waters of a wild coast.

Pennant has confessed to being unable to give a list of the fishes in existence between the commencement of the Saxon era and the Conquest, and other naturalists have tacitly done the same. There is indeed little chance of getting a complete catalogue, but a little investigation amongst the scant literature of that period, *par* example, Alfred the Great, will furnish us with the following: turbot, haddock, sturgeon, porpoise, whale, herring, plaice, flounders, skate, oysters, winkles, cockles, salmon, lamprey, and "all that swims in the river," which latter expression may be said to be rather too comprehensive. Laws on which those of the Plantagenets and the Tudors were based, were also in action for the preservation of such fishes as were deemed of value; in a word the Saxons were quite alive to the legacy bequeathed by the Roman hordes, and to the great natural advantages of the land they had acquired.

At the time of the compilation of the Domesday Book, we find that the value of some of the ponds attached to the castles of "mylorde," were valued as highly as from 5s. to 12s. yearly which was, as nearly as possible, fourteen times the value of the best arable land, size for size. Of course, 5s. then represented a marvellous deal more than it does now, and it would be absurd to suppose that nothing better than eels contributed to so great a proportionate rateage. Indeed, as eel-pond charges were chiefly paid in kind, the idea is additionally dispersed. In fine, it may be safely believed that ponds and lakes—fish-culture generally, in fact—was thought greatly of by high and low.

The salmon, of course, came in for its share of attention by the legislature, but as general fish-culture is the subject now, I need not do more than recommend my readers to the many works bearing on the exclusive history of this interesting fish. Ponds and lakes, till the last century or two, furnished the means for breeding and encouraging the development of the "coarse" fishes, and as their number so greatly exceeds that of the so-called "game" fishes, it must be considered that when referring to pisciculture, I mean these only. At the same time it may be taken for granted as an historical fact that, in proportion to the solicitude and care bestowed on the formation of ponds and the culture of coarse fish, so the legislature provided for the more valuable salmonidæ. A glance at the authorities above-named will put this beyond doubt or cavil.

Up to the time of Edward III. but slow progress seems to have been made, compared with the rapid growth of interest in the welfare of fishes exhibited between that reign and the times of Henry VIII. More rigorous enactments than ever were enforced in the reign of the Bluff King Hal touching the fishponds to be found in the grounds of every "lord, knight, esquire, gentleman, and others of the king's subjects." (Vide 31 Henry VIII., c. 2.) The "Valor Ecclesiasticus," according to Mr. Hoare, set forth, even as did the Domesday Book, every lake connected with each religious house throughout the kingdom, with its value. Statute

after statute, showing the high esteem in which ponds were held because of their occupants, are to be found, down to 7 and 8 Geo. IV., sec. 15, when they made their last appearance.

If in this introduction to the theory and practice of fish-culture I have seemed to talk more of ponds and lakes than brooks and rivers, by taking a little thought the reader will see why I have done so. Fish culture must be begun, and, to a certain extent, entirely carried out in waters where complete command over them is in the hands of the operator—I mean, of course, artificial fish culture. By watching the regard a people cultivates for its lakes and other entirely controllable waters, a pretty accurate estimate may be formed of what it is doing for the culture of its fishes taken collectively.

There have been very many writers on the formation of fish-farms, or ponds, *et hoc genus*. Dalravus, bishop of Olmutz in Moravia, wrote a capital treatise, which he entitled *de piscinis*, and on it most of our English works on the subject have been modelled. Sir Henry Wotton, provost of Eton, writing to the Earl of Stafford (1628) says: "I did promise you when we were last many met together at Medleys a piece of rural philosophy: Dalravus, in his book *de piscinis*, which I now send you, having borrowed it from Mr. Hales, one of our bursers; and, therefore, when you have perused at full pleasure, I shall desire it again. One thing will appear, perchance, strange to you that a Bohemian gentleman therein named should, in one year, gather *duodecies sestertium* out of his ponds, which, resolved into our money, I take to be about six thousand pounds sterling: and that, for aught I conceive, only by carp and pike, for so I understand his *cyprinos* and his *lucios*. True it is that Bohemia and Moravia are the most Mediterranean countries of Christendom, and their farness from the sea hath taught them the skill of nurturing land fish to an incredible increase, insomuch that they will tell you that an acre of pool there is worth more than an acre of saffron in Austria."

I find that this work was translated in 1599 by G. Churchley, but copies of the work are exceedingly scarce.

Mr. Hoare, in his "Treatise on Fishponds," from whom I have before quoted to the advantage of my readers, gives a most interesting list of fishponds of ancient, and in some cases of present, celebrity in the county of Sussex. This county was pre-eminently the home of coarse-fish culture, and some of the items of information as to the stocking and general ordering of the lakes therein are both curious and interesting. At Arundel, it seems, for instance, that about the year 1430, John Fitzalan, the seventeenth earl of Arundel (better known as the "English Achilles"), artificially reared salmon [I don't think this means artificial spawning and milting] with such astounding success that he had salmon all the year round. It is presumable that he resorted to the process of caponising, or castration, which in the present day seems to be entirely lost sight of as a method whereby salmon may be made to fatten and grow in fresh water. I shall speak hereafter more particularly on this rather important operation. Excerpts are given from the fisherman's book, which go to show with what personal care by subsequent owners of Arundel Castle the culture of the fishes was pursued.

In addition to lengthened particulars as to the ponds of Arundel Mr. Hoare gives information respecting ranges of fish stewes and lakes at Oldpark, Bosham, Oakwood House, Forntington, Goodwood, Hendon Hall, Stanstead House, Staughton, West Dean House, near Chichester Cowdray Lodge, Sheffield Place, Chichester, (of this place Daniel, "Rural Sports," mentions that in 1793 there were taken in a pond near Sheffield Place over 2000 carp, the largest weighing 18 lb. and the smallest $\frac{3}{4}$ lb. Truly, a miraculous draft of fishes! At another part of the pond, says the same authority, two carp, weighing 32 lb. were taken out after residing in it for 16 years, thus proving their growth to have been at the rate of a pound yearly). Panham Park, Burton Park, Barlavington, Blackdean House, Shillinglee Park, Strood Park, Slinford Offington, Muntham Court, Sandgate Lodge, Highden, Knepp Castle, Shipley, Amberley Castle, Castle Goring, Markley Warbleton, Shermanbury Park, Denne House, Horsham, Nuthurst Lodge, Deer's Wood, Ifield, Eridge Castle, Cuckfield Place, Petworth, Warham Court, Rusher Priory, Nyton Park, Aldingbourne, Bolney Lodge, Stanmere Park, Lewes, Buxted Park, Hicksted Place, Twineham, Bayham Abbey, Thernfield Park, Saxonbury Lodge, Searles, Fletching Court Lodge, Lamberhurst (of which Sir Joseph Banks says: "A pond of thirty acres near Lamberhurst, originally stocked with twenty carps or tench to the acre, but which, when drawn, did not produce more than fourteen, owing to four pikes, yielded in nine years carp from 10 lb. to 12 lb. a brace, and tench from 7 lb. to 8 lb."); Hurstmonceux Castle, Gotham (of "wise men" notoriety), The Rectory, Horsted Keynes, and Uppark South Hunting. I have recapitulated all the names of places on which Mr. Hoare expatiates, as proof of the many localities wherein famous ponds in former times have

existed, and been systematically cared for; which are probably now for the most part neglected, either entirely or partially.

The cause of the decline of interest in fish-culture—especially of coarse fish—is not easily discoverable. Gastronomical prejudices have, of course, cropped up, and the cause of these seems also hidden in obscurity. It may be urged by some that flesh meals are more in vogue than in earlier times, but this does not seem quite true in the face of the undeniable cheapness of meat as compared with the estimated value of fish. In Henry VIII.'s time, we are told that a very small pickerel was worth more than a fat capon, and a pike was considered worth twice as much a house lamb in February. One reason why this fish, for example, is not considered of value now, probably, is the fact that from want of proper cultivation through generations, its flavour has greatly deteriorated. The same may be said of the carp, and, indeed, all other freshwater fish. Even the trout, taken from a mountain tarn, where it has been uncultivated and continually breeding in and in, from the beginning of the world, is neither fit to compare with "flesh, fowl, nor good red herring," being more like a lump of cooked blotting paper, than the most delicious pink freshwater fish in creation barring the salmon.

By giving a little care and attention, and a little initial foresight and preparation, to the meanest spring of water, it may be made the manufactory of food alike nutritious and of palatable flavour. It will, of course, take long years to improve the race of fishes we have so foolishly, as a nation, allowed to deteriorate; but it should be the aim of every water owner in a water-locked land to improve the natural resources at his hand. The Germans understand the matter much better than ourselves, and they not only derive larger revenues from water than from land, but their breeds of fish of certain species are superlatively superior to ours.

ELSTREE RESERVOIR, HERTS.

By LEO BONVOISIN.

ELSTREE and Boreham Wood Station, on the Midland Railway, is 11 miles from St. Pancras. Ordinary third-class fare each way by all trains, 1s.; reduced third-class return fare to holders of anglers' privilege cards, 1s. 3d., from Moorgate Street a few halfpence more; average time of journey about 35 minutes. There is a very good service of trains on week days, and a fairly early train from St. Pancras on Sunday morning (7.30.) returning the same day from Elstree at 9.5 p.m., and arriving at St. Pancras at 9.45 p.m. Elstree proper is about a mile or a mile and a half from the station, the road lies mostly up an incline, and in summer is exceedingly pretty. Anglers walking over from the station will do well to look out for a broad railed footpath across the fields. Some distance from the station on the left, as by taking this they will save a considerable bit of stiffish road.

Of Elstree village it need only be said that it is a very pretty little place of some 500 to 600 inhabitants, and is about $5\frac{1}{2}$ miles from the smart and thriving town of Watford. Of accommodation there seems plenty at ordinary times; though, as I found on a recent occasion, it is, when the fish are reported on, during the summer, sometimes sorely taxed to meet the rush of London piscators. I can recommend the Artichoke Inn, where I had a clean little room and bed for the modest sum of 1s.; there is also the Green Dragon, host Hicks, where the charges are equally moderate—this is the London clubmen's rendezvous. Here there is a regular dormitory, containing several double beds for their use. Of this room once this summer, on a week day—or, to be more correct—on a night in the middle of the week (Saturday night is, of course, the big night down here) I was the sole occupant. The light of the moon was streaming in, and whether the effect of an extra strong cup of tea, wondering what sport on the morrow, or the fact that I had gone to bed some three hours earlier than I should have done in London, or all three combined, "Gentle sleep would not weigh mine eyelids down, nor steep my senses in forgetfulness." I lay there tossing and thinking—wooing the "drowsy god" in, I fear, anything but the right manner to ensure success. Gradually a kind of waking nightmare seem to steal over me, in which those beds played a leading part. White and empty, in the cold moonlight they seemed weird and uncanny, and when, determined to shut them out, I resolutely closed my eyes, fancy played me another trick, for it filled them with familiar forms, and several well-known voices sounded in my ears with startling distinctness—voices, two or three of them, alas! long since—but, stop a bit, this sort of thing won't do at all; sentiment is not my forte, though I admire it in others. All my previous jottings for the F. G. have been of a purely practical kind, and, as I stated last week, I have particular reasons for making this little article essentially so. I will therefore merely add, anent my sleeplessness in this dormitory, where, like Robinson Crusoe, I was "monarch of all I surveyed," and enjoyed it

even less—that I did as nine out of ten other anglers would have done, jumped out of bed, slipped on an article or two of clothing, opened the window, letting in the cool night air, and, leaning out, lit my pipe; that after a short dose of this pleasant, and, needless to say, unfailing remedy, I shut the window, went to roost again, and slept like a top till just before daybreak. Cheap and good accommodation can also, I believe, be had at the Plough Inn, while for those who aspire to hotel comforts and charges, there is the Red Lion. Of this last, I have, however, no personal knowledge. Now for the water itself and the fish in it. Elstree Reservoir is not more than half the size of its big brother at Hendon, but much more uniformly deep, and conveys to the eye the impression of being situated in a deeper hollow. Its immediate surroundings are also far more picturesque, and it boasts, when the water is not exceedingly low (as it is this year), of a very pretty little island with two or three tall trees growing upon it, whose waving branches are in summer reflected in the still, deep waters beneath, as only still, deep water can reflect. The *encadrement* of the lake itself consists of the greenest of green meads, hedgerows, steep banks, and of a wood; this last just now (October) doubly beautiful in all the colouring of autumn—colouring in which there is no chaos, no shock to our artistic susceptibilities, though it includes every shade, from the deepest vandyke, or the warmest sienna, to the faintest tinge of yellow; great patches of reddish brown and golden yellow foliage, the early pride of the almost past summer, standing out in bold relief against the still bright greenery of some later or hardier vegetation.

What contrasts, yet what wonderful blendings in details; what apparent confusion in the *ensemble*; what harmony. Here again, as everywhere else, is the hand of the Great Master plainly visible. Here can the weary toiler, removed from all the influences of conflicting dogmas, the warring interests of rival sects, and the too often narrow views of modern religious teachers, commune with nature's God through nature. She will preach the eloquent sermon, while eye, ear—aye, every sense—will take in her sweet truths, reflecting them undimmed upon the soul's retina; and if the impression of this worship "in the temple not made by hands," does not prove more lasting and beneficial than— Well, I admit this is not practical in the sense I spoke of just now, and really I won't offend again.

(To be continued.)

READINGS IN ANGLING CLUBS.

IT is only right to mention that the Piscatorial Society, which holds its meetings every Monday evening in the club room, Ashley's Hotel, Henrietta Street, Covent Garden, was the first angling society to institute the readings of papers, in relation to piscatorial subjects, at the weekly meetings; but from some cause or other they have for sometime relapsed, until revived again on the occasion of the club competition on Monday, the 31st of October, when Mr. W. B. Adlington contributed a very excellent and appropriate paper on "Chub Fishing." There was, however, no notice given of this revival, or I should certainly have made a point to have been present on the occasion, and been privileged to hear, what I have since heard was a very able treatise on the subject; and that I should certainly expect it to have been in the hands of so capital and practical an angler as Mr. W. B. Adlington, who, from a suggestion which has been made in the *FISHING GAZETTE*, will doubtless favour the members of that old society with another paper at an early date. I had the pleasure of attending the weekly meeting of the Gresham Angling Society on Thursday evening in last week at the City of London Tavern, Bishopsgate Street, to hear a paper on "The Science of Angling" from the able pen of Mr. J. P. Wheeldon. There was a very large attendance on the occasion, the chair being well occupied by Mr. S. C. Harding, supported on his right by Mr. Thomas Crumplen, the energetic honorary secretary, and on his left by Mr. S. C. Bentley, a most valuable member of the committee. There were also present in the vicinity of the chair, Messrs. Alfred Jardine, H. J. Alfred, B. F. Slater, Edwin Frost, Carter Millbourn, H. Towse, W. H. Brougham, Dr. Brunton, Dr. Lloyd, &c. After the transaction of the formal business of the evening, and the nomination of three new members, making over 200 in number, the Chairman called upon Mr. J. P. Wheeldon to read an essay on the "Science of Angling," and on that gentlemen responding to the invitation he was received with hearty applause. It would be difficult to give even an outline of the paper which commenced by chalking out some of the earliest histories of the art of angling, and following up the subject to the present time, interspersing his thoughts with some brilliant illustrations of fish and fishing, evidencing great aptitude in making word-pictures, and giving most finished descriptions of scenic beauty, surrounding the swims of certain species of fish, which would make many a lover of the rod wish it was a reality, and himself the angler. His hearty support to the day, as the only available one, to

hundreds and thousands of anglers, called forth great expressions of satisfaction from all parts of the room. It is needless to add that the worthy essayist fully maintained the title of his essay and indisputably proved that angling in the present day was indeed a science, and when he had finished and resumed his seat it was the signal for a general expression of satisfaction, which must have been very gratifying to Mr. Wheeldon's feelings. The Chairman then invited any of the members to enter into discussion on the paper which had just been read, but from what followed it would appear very few questions for discussion arose out of it, as the subject had been so perfectly and completely treated by Mr. Wheeldon. The principal discussion arose out of remarks made by subsequent speakers—Dr. Brunton, Messrs. Alfred Jardine, H. Jervis Alfred, Edwin Frost, Thomas Crumplen, W. H. Brougham, S. C. Harding, and others taking part in the same. A very hearty vote of thanks was unanimously accorded to Mr. J. P. Wheeldon, who, in reply, said he should always be glad to contribute his quota to promote the interests of the Gresham Anglers. In the absence of Mr. Field, who had been obliged to leave the room before the discussion was completed, Mr. Thomas Crumplen referred to the movement of giving a suitable testimonial to Mr. Bonvoisin, and in appealing to the members of the Gresham Angling Society to give it their best support, invited them to contribute something that evening towards it. A liberal collection was then made. In the course of the evening Mr. Thomas Crumplen announced the committee had made the most satisfactory arrangements for a portion of the River Lea as a private fishery for the members of the society, and in this they had received most valuable assistance from Mr. R. Ghurney. The announcement gave great satisfaction to those present, and a vote of thanks was given to Mr. Ghurney for his kind help in the matter, who, being present, expressed the pleasure he always felt in doing what he could for the benefit of his brother anglers. The meeting, having commenced at the reasonable hour of seven o'clock, the business element was concluded by a quarter past nine o'clock, giving those who lived at a distance the opportunity to get home in good time—an example which it would be well for other clubs to imitate, and which would be greatly conducive to their welfare. As soon as the business was over, the chairman announced that his duties were concluded, and the remainder of the evening would be spent in harmony, under the presidency of Mr. T. W. Aveling, the vocal portion being opened by Mr. Alfred Jardine. So much for the merits and success of the Gresham Anglers. And now, referring again to the Piscatorial Society, I have to regret my inability to be present at the reading of Mr. Sach's paper on "Jack Fishing," which took place on Monday evening last. I had long pledged myself to be present in another place in my own neighbourhood to hear a clerical friend of mine deliver an essay on "Superstition in Science," but as that had nothing to do with angling I shall not further refer to it. There can be no doubt as to the readings in angling clubs becoming successful if they are made popular and are not too frequent. Musical evenings or smoking concerts, as they are termed, make an occasional change; and last Thursday, at the Gresham Angling Society the evening was to be devoted to piscatorial minstrelsy, in which I have no doubt some of our musical piscators would shine in good old angling ditties. The Larkhall Angling Society, under the directorship of Mr. G. F. Spencer, its worthy president, has for some time been conspicuous in the musical element, and the club has greatly prospered under it. B.

BIG MINNOWS—FINE GRAYLING—DORSAI. FIN AND LIMIT OF SIZE IN GRAYLING—THE "THAMES FISHERMAN"—COARSE FISH CULTURE.

By J. HARRINGTON KEENE.

WHILST fishing for roach in the Birmingham Canal, near Berkhamstead, recently, I was much annoyed by minnows, of which I took fourteen, one after the other. They were without exception the largest I have ever saw in one sample, and measured as follows: $3\frac{3}{8}$ inch, $3\frac{3}{8}$, $3\frac{1}{2}$, $3\frac{3}{8}$, $3\frac{1}{2}$, $3\frac{3}{8}$, $3\frac{1}{2}$, $3\frac{3}{8}$, $3\frac{1}{2}$, $3\frac{3}{8}$, $3\frac{1}{2}$, and 3. I think this may be fairly chronicled as a remarkable catch.

Not long since, I happened to call in at Mr. Price's, tackle maker, of Seymour Street, Euston Square, and was shown the remarkably handsome fresh caught grayling of $3\frac{1}{2}$ lb. At some time in its history previous to capture, it had had its upper lip torn away probably through great impetuosity on the part of the angler. The rich full cucumber aroma characteristic of the fish still remained.

By the bye, can any one fix the limit of size in the grayling?

And yet another question: for what purpose is the dorsal fin so large?

* * * * *

I have read with considerable amusement, and, indeed, instruction, the letters signed a "Thames Fisherman." Having been a Thames fisherman myself, and coming as I do from an ancestry of fisherman devoted to that river the remarks I am about to make will probably not be deemed presumptuous. First, as to the letter entitled, "The great Curse of our Calling," in which your correspondent inveighs in no measure terms against customers who "deliberately set about making him drunk" or his boy. His complaint would certainly be a remarkably proper one if it were founded on anything more than isolated instances, which, with all sympathy to our "Thames Fisherman," I assert do not occur but once or twice per year in any fisherman's career, unless, of course, Thames anglers have altered in a wonderful manner. The real fault is with your Thames fisherman, not with the customer, in the majority of cases. The customer is only too glad to make his fisherman as comfortable as he can; and I can, from observation and a very considerable experience of attending gentleman out for a day's fishing distinctly say that your correspondent has put an imaginary grievance into charmingly terse prose—indicating that he himself is an exception to the majority of his *confreres*—able to handle the pen as well as punt pole.

* * * * *

For consider who are many of the Thames fishermen of to-day, and I say it without wishing to hurt anybody's feelings. Are they, as of old, derived from a stock of riverside denizens, born, as it were, almost on the old river? With the exception of a few, I answer, decidedly not. The new race is derived from the class of the ordinary labourer or workman whose fondness for the *dolce* far outweighs his desire for the *utile*, and for whom the comparatively easy occupation of a puntsman knowing his business has peculiar charms. Such a Thames fisherman—and I appeal to every Thames angler if there are not plenty such—loves his beer and 'baccy with an affection which, if it were in any supposititious case denied him by his customer, would materially militate against the chance of sport. Surely a man has a free will in the matter, and there is no more excuse for a Thames fisherman getting drunk than for any other man; less, indeed, considering the danger in which he would often place himself and his customers were he intoxicated. As for the harrowing details concerning your correspondent's son, I wholly deprecate the practice of sending out a boy to do a man's work. A "Thames Fisherman" should keep his weak-minded boy at home or pick out the "True Gentleman" type of customer, of whom he speaks so eloquently for his son's guidance.

* * * * *

And about that letter of yours, Mr. Thames Fisherman, on the stretch of water between Bell Weir and Old Windsor Lock. I am afraid you are much more given to queer complaints than to practical description. I have tried very hard to find out the exact whereabouts of some of the pitches referred to in your letter. Surely there are landmarks by which you know the precise spots; why not give them, and earn the thanks of strangers? I'm sure I never found the "mile of magnificent chub water" between Ankerwyke and Old Windsor, though I lived a long time in the neighbourhood; and where is the good barbel swim near the "road from Staines to Old Windsor"?—very vague this. Really if "A Thames Fisherman" hadn't declared himself as such, from internal evidences I should have doubted that he was a professional. As it is, to my mind, and I say it without a particle of ill-feeling, your correspondent has shown us how utterly unlike a professional Thames fisherman he can think and write. Can he, therefore, be representative?

* * * * *

Coarse fish culture has been a hobby horse of mine, since I began to think about fishing matters at all, and I am delighted to find that attention has been drawn to it. In earlier times the nobles of this land were far more assiduous than they are at present, and the monastic institutions yet more strongly encouraged the preservation and culture of coarse fish. The Domesday Book sets the price—and in many cases it was four or five times that of the land—on the fish ponds, and penalties for poaching, &c., were imposed in the reign of Henry II. with great rigour.

* * * * *

Sussex seems to have possessed the most famous fish ponds of England. I have a list with particulars, chiefly of archaeological value only, of thirty-five estates in which famous fish ponds were established and revenues drawn therefrom. The following is an extract from a letter of Henry Seldd, Queen Elizabeth's fishmonger, to Sir William More, of Loseby, concerning some carp he wished to buy. These are his terms, "Scantlinge XIIIJ inches, XV and XVI inches being well fyshed, I will give your

worship XIIId. a pece one w^t another, and above XV inches XIVd. a pece to XVII and XVIII inches, and for above XVIII inches, XVIII a pece." Not a very bad price this for carp.

* * * * *

But really, Mr. Marston, I don't see why a German should be imported for the business. Surely there are plenty of Englishmen of sound practical knowledge of the habits, &c., of coarse fish without sending for a foreigner. I could engage to name several who would and could give the best man from Germany information on coarse fishes or the salmonidæ.

[Shall be much obliged if you will give the names, Mr. K. Mind, we want a man who has had actual experience of *coarse* fish culture, which is quite different from trout and salmon culture. If there are any such who would be content with very moderate pay, we need hardly say we would give them the preference over any foreigner.—ED.]

IMPORTANT MEETING AT MAIDENHEAD.

A CONFERENCE of representatives from the Windsor and Eton, the Maidenhead, Cookham and Bray, the Marlow, and the Reading, Thames Angling Preservation Societies took place at Skindles' Hotel, Maidenhead Bridge, on Monday afternoon last. There were present from Windsor, Mr. A. Stevenson; from Maidenhead, Messrs. T. B. Sharpe, A. A. Wood, C. E. Jolland, and W. G. Day; from Marlow, Major Carson, Messrs. J. F. Jackson and W. C. Faulkner; and from Reading, Messrs. A. C. Butler, W. Ferguson, and F. Brown. Messrs. Thomas Spreckley and W. H. Brougham attended the meeting by invitation to answer any questions, and expressed themselves fully pledged to the memorial adopted by the Thames Angling Preservation Society, which was supported by all the angling clubs of London. Mr. T. B. Sharpe was unanimously voted into the chair, and Mr. A. C. Butler undertook the post of corresponding secretary. The first question discussed was as to the sizes of fish, and the following was the unanimous result:—Trout, 15 inches; jack, 18 inches; barbel, 13 inches; chub, 12 inches; bream, 9 inches; carp, 12 inches; tench, 12 inches; perch, 8 inches; roach, 7 inches; dace and rudd, 6 inches; and gudgeon, 4 inches. The difference being of increased sizes of trout, chub, carp, tench, and perch, compared with the T.A.P.S. memorial. Then came the measurement of fish, the extreme length being adopted. It was also agreed to increase the fence season for jack to July 31. The recommendation of a 20-feet bait net for fishermen, by licence, was cordially approved. A discussion arose as to a proper fence season for trout, respecting which the Thames Conservators were anxious to get the opinion of this conference. It was, therefore, unanimously agreed to keep to somewhere about the present period, and agreed to be from September 1 to March 31. The meeting strongly recommended, if it could be done, to give the magistrates power to imprison poachers without the option of a fine. It was also resolved that as so many of the members of each of the associations were London anglers, a most favourable expression of opinion from this meeting should be given to that portion of the T.A.P.S. memorial in reference to the abolition of netting as low down as Kew Bridge. It was agreed in the proposed new bye-laws—those obtained by the T.A.P.S. in reference to night lines and snatching—should be adopted for the Upper Thames. The question then cropped up as to the desirability of propagating trout for the whole of the Upper Thames, the same as Mr. James Forbes and the T.A.P.S. are doing for the lower portion, and a committee was appointed to consider the same, and to report the result at a meeting to be held on the Tuesday preceding Christmas-day. The committee thus appointed consisted of the Rev. C. C. James, Capt. Cunningham, and W. A. Stevenson, of the Windsor Association; Messrs. T. B. Sharpe, C. E. Jolland, and W. G. Day, of the Maidenhead Association; Major Carson, Messrs. J. F. Jackson and W. C. Faulkner, of the Marlow Association; and Messrs. A. C. Butler, W. Ferguson, and F. Brown, of the Reading Association. Major Carson strongly urged the advantage that would accrue to the protection of the Upper Thames if an association could be established at Henley, and offered, on the part of the Marlow Association, to give every assistance in promoting it. A very cordial vote of thanks was given to Mr. T. B. Sharpe for presiding on the occasion, and the general remark at the close was that it had been a very practical and business-like meeting.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies which for killing purposes stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

GREGORY'S SPINNING BAITS. "The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the Press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

RIVER REPORTS.

MID-THAMES.

"Now 'tis the winter of our discontent."—SHAKESPEARE.

It is mid-mud, instead of Mid-Thames; just now down in the valleys of Berks and Bucks, so, Othello-like, my occupation's gone, and I am left lamenting; but it will not be for long, I opine, as there are already indications of the beginning of the end, as the water is now "mending," and without further juice will drop as rapidly as it rose. Fishing with any degree of success is out of the question, but the enthusiasts, by dint of careful manipulation, and using the wriggly tail of a lob, might entice a few roach from out the pea-soup element, especially if a quiet corner or eddy is come-at-able. I have not one item of interest to report from the past week's doings, in fact there have been no doings. Eels have been running fairly, and those people fortunate enough to own bucks have reaped a welcome harvest; one proprietor getting nearly 5 cwt. on a dark night, and another, at Magpie, getting some capital long ones, and, what is most unusual, a splendid jack going 18 lb. in the pink of condition. This fish was certainly too good to return into the flooded river, with the every chance of its getting on to the meadows and being swept up by the rapacious netters, so it went the way of many a fish, and disappeared down the capacious throat of a Black Boy. Thursday evening: rain has ceased this afternoon, but the river is again mending, not its ways, but its bulk, so good bye to fishing prospects for some days to come.—MARLOW BUZZ.

Thames (Goring).

Water now very thick and a flood. No fishing for a few days, but the water is going down fast. Prospects at present look better, and if it keeps fine will do well for roach by Sunday, and for jack and perch about Tuesday.—JOHN RUSH.

Thames (Richmond).

The river is bank high, with a fast running stream, and water thick. There has not been much doing since my last report. There has been a lot of anglers down, considering the state of the weather. I have been out four times myself, but with little success, and have only caught eleven fish in the time. Brain Howard, Mansell, have also been out, but met with very little success. It will only take a few fine days to get the river in order again, and some bream should be caught then, as the fish always drop down in flooded water.—J. BUSHNELL.

Thames (Walton).

The water was in fair condition, until the 26th, and the weather fine, but as it has been for the last month, when there has been a chance of fishing there have been no anglers. The river has overflowed its banks, and the water is the colour of pea-soup, with a large quantity of drift wood and rubbish floating down. Water falling, wind dropped, and weather very fine. Should the water continue to fall at the rate it is now doing there is every prospect of some good perch-fishing at the end of this week. Nothing done since my last report. Rosewell was out on the 23rd, with a gentleman, fishing for jack, but never had a bite, and the same thing occurred on the 27th, when George Howe was out with two gentlemen trying for perch. I learn that at Halliford, Shepperton, and Chertsey, the water and the fishing are in the same state as here. I saw a seagull the day before yesterday, and yesterday a large flock of plovers were over on the meadows opposite.—HENRY E. WOOD.

Thames (Windsor).

A flood is now coming down the Thames, all low-lying land is submerged, and only in very few places can angling be carried on, and, as the water is as thick as soup, nothing but worm will be of any good. It is just what was required, and debris in quantity is coming down, it; I expect in a few days it will be much higher, as rain is falling heavily whilst I write. I hear a great Northern Diver was taken with rod and line by an angler at Virginia Water near here, on Tuesday last.—B. R. BAMBRIDGE.

Ancholm.

The furious storm of Saturday last seems to have had the effect of driving the local anglers from the water side, and of so serving the fish as to put them off the feed. I have not heard of a single respectable dish being caught during the past week, and it is useless to report the capture of sprats. I have as yet been unable to induce the commissioners to invest any of the profits derived from the sale of tickets in the purchase of other varieties of fish. The black bass, perch, pike, carp, tench, &c., might all be introduced here with benefit to fishermen, and profit to the owners of the water. There is a lack of local enterprise, so far as piscatorial matters are concerned. Owing to mild weather the eels have fed unusually late this season. There is a good stock of these in the South Kelsey Mill Dam in private occupation of E. Walker, Esq.—THOMAS FORD.

(Dove).

The weather has again been very mild all the week. On Tuesday night I thought we were going to have a change to frost, which would bring the pike and grayling on the feed, but no—the summer of St. Martin is not yet over, and the best basket of grayling I can hear of being captured this week is one of only 5½ brace. These fell victims to the needle fly, below Mayfield. The furnace-fly has also accounted for a few brace of fish, but they were not particularly brilliant samples. Pike still continue very inert, lying like logs on the water, and utterly refusing to feed. Owing to the very swollen condition of the river all the week anglers after coarse fish have not had much sport. A few chub and

roach have been taken, together with a catch of barbel near Uttoxeter, but this is about all. We had more rain on Wednesday night and Thursday morning, and the river threatens to become higher than ever.—THE SPODGER.

Exe (Exeter).

The terrible gales we have had lately, especially on Saturday and Sunday, have been very destructive, and angling in the Exe district has been very limited, the wind being so high, and the river being very high also, and the water being much discoloured by the frequent heavy rains being the whole cause. The river is fast lowering, and if the wind and rain holds up the remainder of the week (the river) will again be in fine condition. The takes of pike like last week have not been numerous, single fish for the day's sport being recorded from various stations, and those of no great size, 5½ lb. being the heaviest. Perch and roach fishing is proceeding with vigour, and some good creels have been made, and many of the local anglers have been busy among the rudd, which are now getting very game, and afford good sport, especially with good clean milk bread paste. The herring fishery in the Estuary improving, but most other kinds nil, the sea being too rough to venture.—FRANK GOSDEN, Exeter.

Ilfracombe (N. Devon).

Sea Fishing: There has been some very good catches of fish when the boats could get out to drift for them. Saturday and Sunday it blew a heavy gale from the S.W., so that no boats could venture out, in fact, men had as much as they could do assisting the vessels from driving out of the harbour, as the heavy run parted the ropes and chains. Monday, weather changed, all boats out, and after a few hours' drift they returned to harbour with very good catches of herrings, hake, and whiting. A few boats went out hooking, one of them was successful in securing two fine cod, weighing about 24 lb. each, and one ling, about 20 lb. Tuesday, wind blowing strong from S.E., however, a few boats went out, and brought in altogether about 30 maize of herrings. Wednesday, weather very bad; but the fishermen anxious to make hay while the sun shone put to sea, and were very well paid for their labour, each boat had from 2 to 3 maize, which sold readily at 1 per maize. Thursday morning wind from N.W., boats coming in with very good catches. There is fine sport to be had with ground lines about the fishing rocks, also some good sport with rod and lines from the pier.—E. COMER.

Lea (Rye House).

The water is getting in good order now, it has been very thick these last few days, and no sport. The wind south-east. On Thursday the 24th, Mr. Woolmore bagged three chub, they weighed 12 lb. the three.—WILLIAM COWELL.

Lea (Ware).

Water very thick, but if we have no more rain it will be right for Sunday. Wind S.W. Mr. Haw, "the native butcher," has had three fine takes this week from the Boom to the ditch.—VON LEEFE.

Medway (Tonbridge).

It will be of no use fishing this river for another eight or ten days to come, as we have had a great flood. If we get no more rain by then there will be some good fishing with a light ledger.—J. E.

Ouse (Littleport).

Water the colour of mud and very high. No change or next to none for some days, but, if the frosts hold off, I hope to see some good roaching in about a week. There have only been two or three anglers out. The following are the results:—November 25, Mr. Slater, Littleport, fishing in a pouring rain, got 5½ lb. roach, perch, and dace in about two hours before the water came down thick; November 28, Mr. George, Bassingbourne, came down and determined to fish, though the water was very thick. He got nine good fish, going nearly 5 lb. the lot. November 30, Messrs. P. and H. Holland, Newmarket, 7½ lb. roach and dace. These small catches were only had by sticking very close to it.—CHARLES SOUTH.

Thorney Broad (West Drayton).

The floods have now disappeared, and left the waters in first-rate order for angling, there has been very little done during the past week. The following are takes that have come under my notice. Mr. W. Hawkins, 4 roach over 1 lb.; Mr. Bowls, 3 roach (this gentleman had a fine chub last week, nearly 5 lb.); Mr. Walters, 4 roach; there is every prospect of good fishing this week, anglers should take advantage of the present state of the water.—E. GODFREY.

Trent (Newark).

The water has been in high flood all the week; bank full, and in some places all over the meadows; and so nothing whatever has been done in the way of sport. To-night it is gradually going down, but is still very high and discoloured; but it has been raining very heavily most of to-day, so in all probability by Sunday the river will be again bank full, and angling quite out of the question. Indeed, as far as my observations go, the prospects are in favour of a very heavy flood by the end of the week. These last few weeks I have had the pleasure of using some spinning lines made by the Manchester Cotton Twine Spinning Company, 51, Corporation Street, Manchester, and I consider them to be remarkably good lines, possessing some remarkable good qualities, so requisite in a good spinning line. Their durability is one of their special features; they resist the action of the water much better than a silk line; they are very strong, and, what is very important in spinning from the reel, they are very fine. I consider their No. 7 line to be the best undressed line for rough work that I have used, very strong and not too thick, while the No. 5 is a fine line; and for spinning, where long distances is required to be thrown, is the very best an angler could use. A friend of mine some time ago bought a plaited line, that cost double the money that these lines from Manchester do, and, after using it twice, the action of the water caused it to become as rotten as tow; all that had been in the water had to be broken off, for it was not strong enough to kill a half-pound roach. Now a Manchester line that I have, I have used it very hard at least a score of times and the end is now as good as ever it was. The courteous secretary of the company tells me the great secret in making these treble cable lines, is to have each twist to agree in each strand. If there is one turn more in one of the strands than the others, it will not work correctly, but their twist is all regulated by pinion wheels, so it is impossible for them to vary. Pike spinners that require a good line should write to the company. I have no doubt samples will be sent to any address. I am sure that anglers using them will not be disappointed, as they combine strength, durability, and fineness to a remarkable degree.—THE TRENT OTTER.

Trent (Nottingham).

Although the river has been overflowing its banks during the last few days, the water has not come down too much discoloured for bottom fishing with either worms or maggots, but, strange to say, with a first-class water and as good as could be expected for this time of the year, most of our best anglers have returned at night defeated, not being able to get any of the fish well on the feed. This sort of thing somewhat surprised me, because I knew for certain some of them had operated on two or three of the best lengths we have on the Trent; and when I am told that a couple of noted anglers fished two days and only caught the same number of fish, namely, a brace of roach between them, I cannot understand, when at the time everything appeared in their favour. One or two of our rodsters, however, in the early part of the week, before the recent fresh came on, succeeded in capturing some good baskets of pike and chub. Most of the former were taken with livebait, but one gentleman took a brace of nice jack, averaging 6 lb. each, out of a backwater with a spinning bait, which, although it came off once, is, to my thinking, the wrong thing to do in any of the winter months. The water is still running at a great height, but is in good condition for bottom fishing with worms, which out to be successfully employed during the next few days in places of course suitable for winter fishing, namely slow swims, where the bottom is sandy.—W. BAILEY.

Tweed and Teviot.

Salmon anglers had a most miserable time of it last week, as both rivers were in flood more or less, and only three days have the disciples of old Izaak been able to enjoy their favourite sport. On Monday the river had subsided to a fishable level, and good sport was got. On Floors lower water, M. A. Steel, Kelso, killed seven good fish, five salmon and a couple of grilse—the weights being 28 lb., 25½ lb., 22 lb., 20 lb., 20 lb., 10 lb., and 8 lb.; on Birgham Dub, Mr. A. Denison, London, killed one salmon of 23½ lb. weight; on the Hendersyde under water, Mr. T. Taylor, of Chipchase Castle, killed three salmon and one grilse; on the upper Hendersyde water, Mr. R. Griffith killed one salmon; while on Sprouston dub, Mr. Hadden killed a couple of salmon and one grilse, on the Ednam House water, Mr. Moffat, Edenhall, killed three salmon, 27 lb., 22 lb., and 18 lb., respectively. On the same day, on Floors upper water, Mr. James Elliot, Galalaw, killed two salmon—each about 23 lb.; Mr. Gardner also had one of 23 lb. from the same water. On the Teviot the same day, Mr. Elliot, of Samieston, killed one salmon of 19 lb. Both rivers again came away between Monday night and Tuesday morning, and, of course, put a stop to angling for a couple of days, the flood being fully three feet. These floods, which have been very frequent this season, have enabled thousands of fish to get to the upper reaches and spawning grounds, where they are being illegally taken off the spawning “redds” and from the shallows and pools by poachers by means of gaffs, rakes, and other illegal implements. On Thursday the waters were not in first-class condition, nevertheless many anglers were out, and a few were rewarded for their perseverance. Mr. Taylor, Chipchase Castle, killed four salmon on the lower water at Hendersyde. On Birgham dub, Mr. A. Denison, London, killed a couple—15 lb. and 23 lb. respectively. On the Ednam House water, Provost Todd, Peebles, killed one of 18 lb. and ran a grilse. On Floors lower water, Dr. Mackenzie had a successful day, killing five salmon, which turned the scale as follows—29 lb., 25 lb., 20 lb., 18 lb., and 14 lb. On Sprouston, the Hon. John Bright and Mr. James Brunles, C.E., London, fished the lower dub water, but got nothing. On Floors upper water, Mr. Clapham, of Broomhouse, killed four salmon—20 lb., 18 lb., 12 lb., and 9 lb. respectively; and Mr. Digby Cayley, on Rutherford water, killed seven fish, all about 23 lb. On the lower stretches fair good sport has also been got. On Learmonth water, Major Macpherson got one fish, 20 lb.; and Mr. Irvine, at Tweed Mill, one of 23 lb. On the Wellington cast, at Coldstream, Mr. Rutherford got one of 23 lb.; and Mr. Irvine, on the same water, one of 28 lb. Mr. Laing, on Birgham water, killed four fish—17 lb., 16½ lb., 8 lb., and 9 lb. respectively; Sir J. Marjoribanks, on Lees water, one of 14 lb.; and on the same water, Captain Spencer, two—7 lb. and 27 lb.; and in Learmonth water, Major Collingwood killed a brace—17 lb. and 18 lb. respectively; Major Macalpine, two salmon; and Captain Pemberton, one salmon. Mr. James Scott, at Wellington cast, got one of 16 lb.; and Mr. Irvine, at Tweed Mill could, got one of 20 lb. This is all that has been done, both rivers again being in flood. On Sunday the Tweedometer at Kelso Bridge registered a flood of fully seven feet, and as the angling season closes on Wednesday, the fishing for salmon may practically be said to be over, as the waters will not subside enough so as to allow of angling before the legal time for plying rod and line expires for the year 1881.—*Edinburgh Courier*.

Whitadder.

During the past few weeks anglers on this river have landed and also detected large numbers of sea trout affected by the fungus which in recent years has been so prevalent amongst salmon in the Tweed. It is considered that fully one-half of the fish are diseased, and many are lying dead in the river. Some have been taken out with parts of the nose eaten away, and when cut up they emit a most offensive smell. The fish appear to have come into the river with the fungus upon them, as new run fish have been taken in a diseased condition, and many of them are so enfeebled by it as to be unable to ascend the weirs, and consequently congregate in pools and die. It is feared that, in addition to the incalculable havoc which these Norwegian trouts commit in the river in the devouring of fresh-water trout, they have also infected the latter with the disease. One day lately an angler on the Whitadder landed a yellow trout weighing 4 lb., and on examination it was found to be seriously affected by the fungus.—*Scotsman*.

Wye and Derwent (Derbyshire).

Last Saturday morning, we had a most beautiful woodland water on the Derwent, until we had another very heavy storm of rain and hail in the afternoon, which quite disturbed both rivers again on Sunday and Monday. The bottom-fishers did well in the morning part, with both worms and maggots; and some fine baskets of fish were landed; one gentleman having seven brace of nice grayling, besides a good quantity of roach, dace and three perch, every fish being killed with the little cockspur worm, in the sandy-bottom swims, close to the rough streams, and were killed in the Derwent below Cromford, both on Tuesday and Wednesday. Some good baskets have been made off both the Darley Dale Club water and the Whatstandwell length, chiefly with stream fishing in the Nottingham style. This kind of fishing is a very deadly way for taking large grayling at this time of the year. The weather up to to-day (Thursday) has been more like summer than winter, when a very great deal of rain fell from the south, which has disturbed both rivers again. We have had no fly-fishing this week worth recording, as both rivers have been too high and only in condition for successful grayling fly-fishing. If no more rain falls, it will take the Derwent till the latter end of next week, over the

higher lengths, and the Wye till Tuesday before there is even a chance of fly-fishing. Weather very unsettled. The bottom fishers ought to do well in the Derwent next week.—G. J. EATON.

Yore (Yorkshire).

There has been no angling worthy of mention in this district since Saturday, when a tremendous gale of wind and rain accompanied by thunder and lightning swept over the valley of the Yore and Wharfe, causing both rivers to come down in flood. Previous to that, I heard of a gentleman from Stockton-on-Tees, killing a nice dish of grayling at Tanfield, using a small red worm as a bait. Nothing has been done with fly for some time, what we require now is a touch of frost, and a few bright days, the grayling would then rise freely to the fly.—FRANCIS M. WALBRAN.

PROSECUTION OF LONDON ANGLERS FOR POACHING.**BIGGLESWADE DIVISION PETTY SESSIONS.**

Wednesday, Nov. 23.

Present: Sir John Burgoyne (in the chair), and Mr. C. S. Lindsell, with the Clerk, Mr. T. J. Hooper.

POACHING BY LONDONERS.

Albert Flanagan, Hampstead, and Arthur Sergeant, Kentish Town, were charged with unlawfully taking fish from a stream at Morhanger on Nov. 13.

James Clark, gamekeeper, stated that on Sunday morning he saw two men fishing in the river Ivel, and in the act of landing a pike. Mr. Browning held the fishing in that water. Flanagan gave him his address civilly, but Sergeant gave him a false address and used abusive language.

Defendants said they were under the impression that the water was open to the public. They were sorry to find that they had trespassed, and promised not to repeat the offence. Sergeant made several statements about the keeper, which the latter denied.

Flanagan was fined 20s. or fourteen days, and Sergeant 40s. or one month's hard labour. Sergeant said he should go to gaol.

CAUCASIAN FISH.

On the steamer which took me from Taman to Kertch was a cargo of fish for the Kertch Bazaar, caught in the lake between Taman and Tumerük. They were for the most part carp—huge fellows, weighing from 25 to 30 lb.; and one of the fishermen told me that they were frequently caught up to 40 lb. There were sturgeon from the north of the Kuban said to be caught in snares, something after the fashion of our ordinary rabbit-snares, as they routed with their noses, pig-like, at the bottom of the stream. There were, too, the hideous “Tom” (Tilurus), the largest, I believe, of Caucasian fresh-water fish. This whiskered fiend plays the part of the pike in the Caucasian lakes, and feeds on all other fish. The ugliness of the “Tom” has led the inventive mind of the Russian moujik to create all sorts of legends regarding this fish, such as his laying hold of the limbs of horses and cattle, as they crossed the fords near which he was lying, and even of his seizing and thereby drowning a man under similar circumstances. They tell, too, of his growing to vast proportions. One Russian colonel, whose home is in the Red Forest, claiming and being commonly reported to have shot one with his rifle while basking in the Kuban river, where it passes through the Crasnoi Lais, which weighed over 200 lb. I fear this sounds very much like fisherman's weight.—“Sport in the Crimea and Caucasus,” by Clive P. Wolley, F.R.G.S.

SALMON DISEASE IN THE EARN.—The fungoid disease which recently appeared among salmon in the river Earn has now spread to an unusual extent, and large numbers of dead fish are daily found lying along its bank. Strong healthy fish are now and again seen, but the numbers of others affected is very large, and many are in such a weak state that though touched with a piece of stick from the bank will hardly move, while some, which at other times would readily clear the dykes and barriers, fall helplessly back into the shallow waters. The dead salmon have in several instances been carefully examined by experienced anglers, who, however, cannot arrive at any definite conclusion as to the cause of the disease. It may still be interesting to state that in consequences of the low state of the river during the past two seasons, the fish were huddled together at its mouth, not being able to ascend to the spawning beds on the upper reaches, except in limited numbers, and many are therefore of opinion that the disease has originated from the fish not enjoying their natural period in fresh water. The malady, it is believed, is being further developed owing to the present overstocked state of the river, which is swarming with fish to an extent seldom or even seen before. The theory advanced by a few anglers that the disease is caused by artificial manures being washed into the river during the late heavy rains will hardly bear investigation, as less of these materials have lately been used for agricultural purposes than in former wet seasons when no disease was observable. The origin of the disease, it will thus be seen, is far from being traced, and on that account no remedy can be applied to the evil till some scientific authority or other has solved the problem of its cause.—*Scotsman*.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

ANSWERS TO CORRESPONDENTS.

CLUB ANGLER.—We must refer you to the letters of "A Thames Fisherman" for information about the Old River.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

COARSE-FISH CULTURE.

SIR,—It was with considerable satisfaction that I perused your suggestions at the dinner of the recent FISHING GAZETTE tournament, respecting the artificial propagation of our national coarse fish, or, to follow the designation of our continental confreres, the summer spawners.

But, sir, I must admit that it is with feelings of disappointment I notice the comparative apathy among your correspondents, with but one or two exceptions, on this important subject. I had hoped to have seen your valuable suggestions taken up by some of our friends in the provinces, who have a substantial interest (or ought to have) in the success of the movement. Surely there cannot be a doubt in their minds as to the expediency of the line of action you advocate. I think, sir, we have both of us seen, and unfortunately too often, many of our lovely rivers and streams entirely depleted of fish life—a life that brings food to the people as well as sport to the angler—then, in the light of national economy, there ought not to be a doubt as to the immediate action of the pisciculturist, by whose aid the water courses in question can be restocked.

Perhaps others may feel that the artificial propagation of our coarse fishes is not practicable, but I would assure them there is no more difficulty in artificially raising the fecundated ova of the roach, the perch, the pike, the bream, &c., than there is with the salmon or the trout. It has been my pleasure to study the systems adopted in the German and French schools of pisciculture, and to enjoy an interchange of correspondence with the leading culturists of these nations, as well as with America, and have already commenced practical operations to carry the same into effect. The position it was my privilege to occupy at the recent Fisheries Exhibition, at Norwich, taught me many useful lessons, one of the most important being the very unsatisfactory condition, as a nation, we hold, regarding the science of pisciculture in comparison with the noble works of other countries. It therefore behoves us to take action in order that this may be remedied in the future, so that when the great International Exhibition of 1883 is held, our hands may be strengthened, our minds improved, and we may be enabled to hold our own among the scientists of the world in this particular department. It has been said that in unity there is strength. I would, therefore, strongly support your suggestion as to the formation of an association, but let its objects embrace the extension of the knowledge of fish-culture in all its branches, it might then assist in restocking our depleted rivers with good fishes.

Such an association, if formed, would be enabled to advise district conservators, fishing associations, &c., in all matters of a practical character. Before making grants of young fry, preliminary investigations should be made as to the natural food of the waters in question, the rearing of aquatic plants, and any improvements to the spawning grounds, if considered desirable. I need hardly remind you, sir, that entire rivers are liable to be depopulated, and valuable species of fish lost, through the growth of some pernicious weed, or other cause detrimental to the fish indigenous to the waters. If observations were made in the temperatures of the rivers, the association would be enabled with far greater certainty, having these statistics before them, to advise as to the breeding grounds and habits of the fish with reference thereto. Meetings of the members would periodically be held, papers read and discussed, and a general advancement made in the science. I regret having to differ from your views as to the exclusion of salmonidæ from the hatcheries, but the association would require assistance from all classes interested in fish-culture, and, as we know, there are many noblemen and gentlemen that hatch off large quantities of anadromous fish, that I fear would not be induced to join the ranks if salmon and trout were excluded from the operations of the society. It must be admitted that we have in this country thousands of acres of inland waters that would, under skilful cultivation, insure a food supply for our nation, rich and productive in the extreme, and may the day not be far distant when our depopulated rivers, streams, and water-courses teem with life for the nourishment of our fellow creatures. We should, therefore, with no half-heartedness, look the question in the face, but consider how we can contribute to the amelioration of mankind by assisting to feed our cities with a wholesome and plentiful food. The field of usefulness open to the society is very extensive, and it would be difficult to calculate the immense benefits to the nation that must arise if the society's organisation is complete and founded on broad, national principles, and which can be made not only self-supporting, but even lucrative in character.

Why should not we be as successful in deep-sea pisciculture as our Transatlantic brethren, who find no difficulty in artificially hatching the ova of sea-fish. It may be of interest to some of your readers to know that through the kindness of the Great Eastern Railway Company, in granting me the use of the sea water from their depositing tanks, I hope this winter to be enabled to make some experiments in hatching the eggs of the cod-fish, and am promised by several smack owners assistance in bringing the live fish to harbour for the purpose of being "stripped." I am now perfecting some hatching boxes which require special care in their construction on account of the specific gravity of the ova being so much lighter than that of water. The eggs being now adherent in their formation, every care must be exercised to prevent their clogging, the water therefore cannot be too pure for the experiments.

In studying the submarine works of the Great Architect of the universe would it not redound to our national credit to be able to tell, with some amount of accuracy, the nature of the spawning beds of our trawl and drift fishes, of their ova, of their embryo, of their food, of their spawning beds and habits generally; and after having unravelled some of the mysteries of nature, then, for the benefit of humanity, bring into practice the results of our labours. To the association whose claims on the public sympathy you have so nobly advocated would I delegate the grand work before us that in the social economy of our nation would play a part all conspicuous for its good, so that in after years may the pisciculturist be indeed denominated a "Benefactor populi."—I am, &c.,

W. OLDHAM CHAMBERS.

Lowestoft, November 21.

COARSE-FISH CULTURE.

SIR,—I should be much obliged if you would kindly send me the name and address of "A Thames Fisherman," whose recent letters to the FISHING GAZETTE have been so full of interest.

I am very glad to see you are setting on foot a movement for the culture of coarse fish—it is sadly wanted—and shall be happy to attend the proposed meeting.—I am, &c.,

ARTHUR KING.

ro, De Crespigny Park, Denmark Hill, Nov. 26.
[It is not our custom to give the addresses of our correspondents, but "A Thames Fisherman" is sure to see this letter, and can give his address if he thinks it desirable to do so.—ED.]

SIR,—There can be no doubt at all as to the desirability of coarse-fish culture. The available fishing ponds near the centres of industry in England are steadily year by year decreasing in productiveness, and if the sport is to be numerically increased as time goes, as in recent years, something must be done for their recuperation. It is really idle to assert that the rod has little or no influence over the prolificacy of a fishing water. In the very nature of things, where tons and tons of fish are annually taken by fair fishing, and no corresponding increase is added, there must be a falling off. And it is a fact that there is no yearly increase at all corresponding to the decimation caused by angling. Increased navigation and the (of late years, especially) violent floods have destroyed the chance of reproduction in many fishes by washing away the ova. Pike and perch especially suffer, and not only from the evils mentioned. All the cyprinidæ, including the leuciscini, are spawn-eaters. Roach are especially voracious, and as they are, in respect of the insect world, omnivorous, they, by their superior agility and spawn-eating propensities, are amongst the worst enemies of the perch and pike and trout fishermen. Naturally, however, these fish do not eat fry. If, therefore, fry can be turned in at intervals, and in large quantities, in suitable localities, the good to the coarse-fish angler would become incalculable.

The *modus operandi* of coarse-fish artificial impregnation is, however but, ill understood, though there are no difficulties of an insuperable nature in the way. Of course such experienced and intelligent operators as Mr. Oldham Chambers are not numerous, and it is quite necessary that if an association formed for the cultivation of coarse fish be expected to prosper and produce good fruit there should be properly skilled labour. As a rule, the transport of the eggs of most coarse fishes is almost impossible, unless they be in a far advanced state of incubation; but the parent fishes might be sent anywhere, and with safety, when it is considered they present indications of speedy spawning.

If every angler subscribed his mite, however small, I am sure the funds for the purpose of founding such a very desirable institution would be ample. With the editor's permission I hope to give my more elaborated ideas on this subject elsewhere.—I am, &c.,

J. HARRINGTON KEENE.

PRESERVED WATERS ON THE OUSE.—PRESERVATION OF THE RIVERS AT PULBOROUGH.

SIR,—I see that you have inserted a notice relative to the preserved waters at Watford in the last number of your excellent and widely-circulated FISHING GAZETTE.

I am sure you would confer a very great benefit on some two thousand members of fishing clubs if you would kindly state in your next number that the fishing in the Ouse, in the parishes of Paxton, Diddington, and the two Offords, is now closed and preserved strictly.

Notice boards have been put up, and the keepers have received orders to obtain the address of the persons fishing and trespassing on the above portion of the river Ouse. The riparian owners are Lord E. Gordon, Arthur Thornhill, Esq., and Geo. Jismy, Esq., and the owners of Buckden Mills, and John Linton, Esq. Information, also, that the use of a path by men, boys and horses, for the purpose of barge navigation does not give the public a right to fish from such a path, would be very useful, and that the fishing rights of the above lords of the manors and riparian owners are clear and unquestionable. I wish to save members of fishing clubs the annoyance and expense of useless journeys—or the useless expense of litigation. I believe that the fishing also from Buckden Mills to Brampton is also closed.

I have also heard it stated, on indisputable authority, that the fishing in the vicinity of Pulborough Sussex, is now closed. There is no public path by the rivers there; and I just leave to the imagination of your readers the feelings of the land holders and land owners in that neighbourhood at the arrival at Pulborough station last summer of, upon one occasion, 300 anglers, and upon another occasion 500 anglers by special train!—I am, &c.,

ARMIGEE.

[We hope it is not correct that the Pulborough waters are to be closed to London club anglers. If so, it is another finger pointing to what we suggested last week—viz., that the London angling clubs will be compelled to rent waters of their own, and stock them too. There are thousands of miles of canal and other waters which can easily be utilised, and which before long must be so utilised. If London waits much longer, more wide-awake provincial towns will secure the fishing, as is being done now.—ED.]

BEDFORD ANGLING CLUB.

SIR,—I must decline any further controversy in your columns with L. B., more especially as I note from your article on poaching by anglers in other waters that you understand the position of this matter. If L. B. feels a desire to test the rights at Clapham, he has simply to fish there, and give his correct name and address to either of our keepers. I promise him a better opportunity to dispute the deed of grant to this club than by making complaints in the FISHING GAZETTE.

L. B.'s further statements as to the exclusion of visitors and strangers from this club show an utter ignorance of facts.—I am, &c.,

E. BICKNELL,

Hon. Sec. Bedford Angling Club.

Ashburnham Road, Bedford, Nov. 28.

CLUB ANGLERS AND PRESERVED WATERS AT WATFORD, AND A WORD ABOUT THE BEDFORD CLUB.

SIR,—I have no more sympathy with anglers who persist in fishing at places where they are not entitled to fish, than I have with anglers who do their utmost to preserve the fishing for a privileged few; but your correspondent who writes under the above heading has made a suggestion which is hardly practicable. He advises the London clubs, instead of spending so much on prizes, to hire water of their own. I ask him, Where is suitable water, within reasonable distance of London or the railway station you journey to, to be obtained? Take

it that all proprietors of eligible waters were willing to let, and clubs were willing to rent, not one club in ten would be able to obtain an eligible piece of water. Then, as in the Bedford Club cited by your correspondent, selfishness steps in, and those who get the waters do preserve with a vengeance. There are some pieces of water, that, should a club be possessed of, there may be some excuse for preserving it entirely to themselves; but I fail to see how any excuse can be found for the Bedford Club refusing to grant day tickets to any but members' friends, or generally to make the endeavour to keep the fishing entirely to themselves. The temperate letter of your correspondent on the Watford matter, affords a lesson to Mr. Bicknell, the secretary of the Bedford Club. This gentleman severely criticises the notes of L. B. in your journal, who had charged Mr. Bicknell with acting in an undignified manner in asserting the rights of the society of which he (Mr. Bicknell) is secretary. I think the admissions of Mr. Bicknell in your issue of that week, go to show that L. B. was in the right. What would Mr. Bicknell and the members of the Bedford Angling Society say, were some other gentleman, or body of gentlemen, to attempt to overbid them for the whole or any part of their water? If it is a mere question of money, any one would have a right to do so.

Now, I should be sorry to be a fomentor of strife, so I make an earnest appeal to the Bedford Club—not on behalf of London working-men anglers altogether, because they trouble Bedford very little; but on behalf of all anglers, wherever they live, whether rich or poor, members of clubs or not—to do their best to promote angling among all classes, by making their water as free as they possibly can. Make a charge, because the water must be efficiently watched; but not a prohibitory charge. Favour, if you can, the poorer class of working men and lads, so that, instead of becoming poachers or sympathisers with poachers, they may become your most zealous watchers and river keepers. Why not endeavour to share with others the immense benefits, physical and moral, that attend upon the angler? Would it not become you more than selfishly keeping all the pleasure to yourselves? You have a fine stretch of water that fair angling can never appreciably injure, or I should not make this appeal. Put away the spirit of selfishness, and extend the hand of friendship to all true and honest anglers. Remember two things: that those who live farthest from the water are most intense in their love of the sport, and that selfishness is a double-edged sword.—I am, &c.,

A. J. MARRIOTT.

Member of the Waltonians, London.

BONES IN HEAD OF PERCH.

SIR,—I am very much obliged to Mr. Frank Gosden for his specimens of "brain-ivory" from the head of the perch. I must look a little more carefully for these bones myself. I recollect Mr. Buckland wrote a very interesting article in *Land and Water* on the subject of brain-ivory some year or two ago. Has Mr. G. seen it? If not, I will look it up and send the number to him.

THE BIG PERCH.

"*Esox Lucius*" asks me for my experience anent the size of perch. I think it has been given very sufficiently already. I never saw a perch (*perca fluviatilis*) over 4 lb., and I am morally certain that the 10½ lb. gentleman which has exercised our minds so much was a sea perch—a totally different animal. For goodness sake, Mr. Davies, don't let this chimera of a fish haunt me in my dreams any longer. Do take our Editor's suggestion and send it up to the office of the paper.—I am, &c.,

J. H. KEENE.

[Will Mr. Keene please return the chub jaw he had for inspection, the owner wants it?—ED.]

TACKLE LOST AT EEL-PIE ISLAND.

SIR,—Will you kindly insert the following:—

Fishing at Eel-pie Island, Twickenham, on Sunday, I left my rod, bag, and one top joint. As others were fishing, they possibly picked them up, not knowing to whom they belonged.—I am, &c.,

W. HOWELL,

Cornwall House, Acton.

Member of Acton and Ealing Angling Society.

TACKLE FOUND.

SIR,—Will you kindly insert the following words:—

FOUND!

On Sunday last, while travelling from Cheshunt, a bag of fishing tackle, which also contains a Pulborough and Amberley ticket, signed by Mr. Thomas Howe. The owner can have it by giving a description of the contents to the landlord of the address below.—I am, &c.,

W. EYLES.

Bull and Bell, Ropemaker Street, Finsbury.

"WHY ARE THE ANGLERS SO SHY OF CARP?"

SIR,—This is a most excellent question you ask, Mr. Editor. I do not mean with regard to taking them, but with regard to dressing them. You say, "By the way, carp are good eating if properly cooked, and that Her Majesty the Queen eats them frequently." I quite coincide with your remark, and must say that carp, dressed as the Jews only can, in my opinion, dress them, are delicious; but then the expense of doing so is too great for the class of folk by whom these fish are most plentifully taken. There are many ways of dressing these fish, by numerous authors, but most of them wind up by stating that the stock in which it is stewed is the best portion. Here is one method given by Couch, vol. iv., page 7, in which the fish is not wholly thrown away. "Good stock and port wine, to disguise its native taste, and overcome its soft watery inanity." If any of your correspondents could give us a simple and cheap mode of dressing the same, it would be a great boon to many of the poorer classes here, where many carp are bred, but cared little for by anglers, except for preserving. I like them very gently stewed, in small fillets, in but little liquor, and eat them as eels, which they nearest resemble, with parsley, butter, and various sauces, and vinegar.—I am, &c.,

FRANK GOSDEN,

Exeter.

FOOT'S CRAY NOTES.

SIR,—Enclosed is a copy of a letter received from Loch Lomond—very satisfactory, so far as it goes.—I am, &c.,

CHAS. C. CAPEL.

Cray Fishery, Foot's Cray, Kent.

(A COPY.)

"Rossdhu, Luss, Dumbartonshire,

"Nov. 15, 1881.

"DEAR SIR,—I regret extremely that you should have come so far for nothing. I gave the watchers strict orders to let me know when trout were

seen in sufficient numbers in the streams; and I let you know at once when they did. From what you tell me, I will take means to ascertain if the watchers have not been doing their duty, but I have confidence in the men. I am not able now to look after matters as I once did; but I have seen these pools black with trout at the spawning season.

"Again expressing my regret at your disappointment.

"I am,

"Yours faithfully,

(Signed)

"WILLIAM COLQUHOUN."

ELSTREE RESERVOIR.

SIR,—Could you let me know, through your paper, the fare to Elstree Reservoir, also the prices per day for jack and roach fishing?—I am, &c.,

JACK TRACE.

[The distance is only a few miles. We do not know the fare. Bottom-fishing tickets 1s., and jack 2s. 6d. per day, we think.—ED.]

CLUB REPORTS.

AMICABLE BROTHERS.

The society was saved from a blank by Mr. J. Robinson, sen., weighing-in roach and dace from the river Stort, which won him a prize, and finished the 28th season of the society, which has been remarkable for the scarcity of fish weighed-in, although some of the veteran anglers of the club have tried their utmost to get them. Some of them have been out on several occasions, and have only got a fish or two, when in former years they have got a score of pounds at a time. The annual supper will take place in the club room on Monday, December 12th, and the distribution of prizes to take place on the following Wednesday. All members who have kindly promised prizes, and have not sent them in, will oblige by forwarding them as soon as possible.—J. WORLEDGE.

Nov. 29.

ANGLERS' BENEVOLENT SOCIETY.

Since the last meeting I beg to acknowledge, with thanks, the receipt of ros. 6d. annual subscription from H. Brockwell, and a handsome painting by Greville Fennell, Esq., presented by that gentleman towards the funds of the society. Last year he very generously presented a pair of paintings, which realised a very substantial item in our income. See annual report published in the *FISHING GAZETTE* of September 3rd last.—R. GHURNEY, sec.

Nov. 30.

BRIGHTON ANGLERS ASSOCIATION.

The third anniversary dinner took place at the head-quarters, Victoria Hotel, Queen's Road, about sixty took of a capital dinner. The chairman of the evening, Thomas Stanton Hillman, Esq., a large landowner on the river Ouse. He complimented the society as to its respectability, and will be pleased to meet them on his land at any time. Mr. Gandling spoke as to the secretary and accounts, the secretary, Mr. Anscombe, returned thanks. The "Visitor's" was given by Mr. Power, and Frank W. Smeed, of the Metropolitan Anglers, responded, and spoke in high terms of the Brighton Angling Society, such kindness he never had before met with. The singing by Mr. Keats, Bennett, Power, and Sharp was up to the mark, accompanied by the society's own band. No fishing, ail flooded.—GROUNDBAIT.

BRUNSWICK.

This newly formed society met on Wednesday evening at host Keeble's Brunswick Arms, Brunswick Street, Stamford Street, S.E. At the conclusion of the business the health of the visitors was proposed, coupled with the name of Mr. Gardner, of the South Belgravia, who most ably responded. There were some capital songs rendered by Messrs. Keeble, Booth, Gardner, Jamieson, Booth, Morris, &c., the latter being given in Welsh. After spending a very pleasant evening the proceedings concluded with "*Auld Langsyne*."—*ESOX LUCIUS*.

November 30.

CITY OF LONDON ANGLING SOCIETY.

Three of our members visited Amberley on Sunday, but returned without a fish. Several others fished the Lea, only one, Mr. Mortimer, weighing in a handful of roach from St. Margaret's, saving the club from a blank, and winning a half-guinea prize, given by Mr. Fowler. He also took an eel about half pound, with gentles rather unusual at this time of the year.—CAS.

GOOD INTENT SOCIETY.

The members of this club finished their months' competition last Sunday, the result of the winners being in rotation; Smart, Richards, Horms, Cox, Haines, Maybury, Bell, Murphy, Baker, Robinson, Bates, G. Robinson, &c. Our worthy treasurer, Mr. Roberts, has given his usual surloin of beef to the members to be fished for, the winner to have a handsome silver plated goblet given him all pegged-down to be fished for on the 11th inst. at Boxmoor. Ten other prizes to be added.—R. MURPHY.

December 1, 1881.

GRESHAM ANGLING SOCIETY.

The meeting of this society on the 24th ult. (the largest angling association in the metropolis) proved the greatest gathering of the season, for their fine room at the City of London Tavern in Bishopsgate Street, was crowded to overflowing. The great attraction of the evening was a contribution, by Mr. J. P. Wheeldon, of *Bell's Life*, on the science of angling, and which proved to be an eloquent and lucid exposition of the charms and beauties of the gentle craft, cleverly interspersed with many original thoughts on the scientific aspect of angling, such as could only come from one so fully versed in all its lore and mystery. It is hoped Mr. Wheeldon will consent to the publication of his essay, which will assuredly form not the least valuable feature in the society's transactions for the year. A spirited debate followed the reading of the paper, in which Dr. Brunton, Mr. Jardine, Mr. Frost, Mr. Crumplen, Mr. S. C. Harding, and others took part, and the proceedings closed with an exceptionally hearty vote of thanks to Mr. Wheeldon, and also to Mr. S. C. Harding, who occupied the chair. It was announced that the society had secured the water known as the small river Lea, near Waltham, for the exclusive use of its members, the necessary plank-

bridges, notice-boards, &c., being now in the course of erection. To-morrow the society has a special musical evening, when the old Waltonian music will be revived; Mr. Harding, Mr. Winterbottom, Mr. Reynoldson, and other members having kindly volunteered their services.

This society had a musical evening on Thursday last, which was very largely attended, Mr. T. Crumpley, their hon. secretary, taking the chair by special request. The old Waltonian airs, with other ancient angling ditties, were splendidly rendered and greatly appreciated by the overflowing audience which had assembled. Mr. Reynolds gave an artistic performance on the flute (encored), admirably accompanied by Mr. Winterbottom, Mr. Francis Austin, Mr. Harding, Mr. Young, Mr. Cartwright, Mr. Neville, Mr. Parker, Mr. Aveling. Mr. Harding and other members also sang, recitations being given by Mr. S. C. Harding and Captain Crossley, which were greatly appreciated. The "Old Waltonian," and other angling airs, were greatly admired, and it was clear, by general opinion and the applause so freely given, that the grand old compositions that stirred the soul of "Father Izaak," and gave, to some slight extent, vitality to his immortal work, were far in advance of many modern airs dealing with similar topics. The meeting, which was very successful (saying nothing for the Gresham), terminated, after very hearty thanks to the chairman, with the National Anthem. Nearly all the representative men of the angling world were present.

ISAAK WALTON.

The half-yearly distribution of special prizes took place on Wednesday, Nov. 30th, 1881. To celebrate the event, the members indulged in a supper, which was put on the table by our host in a very first-class manner. After the supper the prizes were presented by the president, Mr. G. P. Rolt, to the successful competitors, after which the members and friends spent the remainder of the evening in harmony. There were some capital songs sung by the President, Major Twohey, G. Edwards, J. Bye, B. Crook, A. Soar, J. Wyatt, G. Riches, H. Butt, G. Manning and J. Ashton. On the same evening Mr. J. W. Morgan had a splendid show of fish, the particulars of which were as follows:—1 Chub, 4 lb. 1 oz.; 1 ditto, 3 lb. 1 oz.; 1 ditto, 2 lb. 1 oz.; 1 ditto, 1 lb. 4 oz.; 1 roach, 1 lb. 3 oz.; 1 ditto, 1 lb.; 1 ditto, 15 oz.; 2 ditto, 1 lb.; 2 dace, 15½ oz.; 1 perch, 7 oz.; total weight, 15 lb. 15½ oz. Three special prizes, given by Messrs. H. Butt, B. Crook and W. Clarke, will be fished for on Dec. 11th, all fish to weigh; members to choose their own fishing water; no competitor to leave London before 5 a.m. on the day of the competition.

Dec. 1.

NORTH-WESTERN ANGLING CLUB.

The 29th half-yearly supper of the North-Western Angling Club took place on Thursday 29th inst. Chairman, Mr. Leo Bonvoisin, vice-chairman, Mr. W. Aldis. Letters of apology were read from Messrs. Marsden, P. Geen, T. Hood, and T. Morgan. The worthy host, Mr. Wetenhall, provided a very sumptuous repast, consisting of everything in season, and which was done ample justice to. The toasts of the evening were:—"The Queen and Royal Family"; "W.C.A.L. and P.A.," replied to by Mr. Marshall; "The Club," responded to by the secretary, who gave a brief account of the receipts and expenditure of the past half-year, and informed the members, much to their satisfaction, that the club would commence the new half-year with £30 in hand; "The Treasurer," responded to by Mr. Wetenhall, who afterwards distributed the prizes that had been won during the past half-year—jack prizes being taken by Messrs. Grinaley, Hilier, and Underwood: roach prizes being taken by Messrs. Stead, Patchin, and Foreman; perch prize by Mr. Wynn; "All fish," Messrs. Stead, Smart, Underwood, and Marshall; Gross weight, Messrs. Aldis, W. Roxbee, Grinaley, Lancaster jun., A. F. Smith, Greenwood, Billinger, and Wynn; Dace prize, Mr. Harris. The value of the prizes varied in value from 10s. 6d. to 30s. After the distribution, about forty-five prizes were offered for the ensuing half-year, and a very enjoyable evening was brought to a close by a vote of thanks to the chairman and vice.—F. HILL, sec.

Nov. 28.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

Several members of the above society were out on Sunday last, but met with little sport, owing to the severe weather. Messrs. Lucy, jun., and Burke, weighing roach and dace from the Thames. The first half yearly supper will take place on Monday next, December 5, at 8.30.—THOS. WM. LUCY.

ORIGINAL ALEXANDRA.

We had nearly the whole of our members out on Sunday last, but there was not a single fish taken. We fish for eight prizes on Sunday next at Burnt Mill, (peg down), namely:—A silver watch, a gold ring, two pair of pictures, forty-two pieces of china, a looking glass, a silver cup, and a dinner service.—E. DYMOND, sec.

SECOND SURREY PISCATORS.

During the time the wind and rain prevailed on Sunday evening last I sought refuge in the headquarters of the above society, held at the Queen's Head, in Brandon Street, Lock's Fields, Walworth. There were a few members present, and several of them bore evidence of having weathered the storm during the day, in fact, they had been courting "Father Thames," but to no purpose. "The Ancient Pater" was in the power of "King Boreas," and so they had to return to their cosy headquarters, where, preferring the ale indoors to the hail outside, they enjoyed themselves. This is a working man's club, and has not been established a great while, but with a few more good working members it will soon be able to hold its own with other societies in the neighbourhood. Mr. S. Houghton, the landlord, is a great lover of the rod, and has been for years, and I dare say he is well known among "Ye ancient members" of the Hoxton Brothers, he having been the landlord of the house in which that society first say light, and he has now in his possession the first book used by that society for the names and subscriptions of the members. There is a vast difference in the size of the book used for the same purpose by Mr. R. Ghurney at the present time. Gentlemen desirous of joining this society can do so by applying to the secretary on Sunday or Wednesday evenings, between 9 and 11. This society is enrolled on the Central Association's Books.—PIXIE.

November 30.

SIR HUGH MYDDLETON ANGLING SOCIETY.

Only three of the members ventured out on the 26th ult., the last day of the roach competition for a silver lever watch. The above-mentioned members went to the Upper Thames and found the water over the bank and running

into the meadows, with a continual downpour of rain and blowing half a gale. The idea of getting fish was out of the question. Still, we tried some of the eddies where we could reach them, but without success; so we gave it up, hoping for better luck next time. Mr. T. B. Duncan proved the winner with 21 lb. of roach.—J. CABORN, sec.

UNITED BROTHERS' SOCIETY.

The competition among the old members that I gave notice of last week was postponed, as we did not think the weather or water was exactly the thing. Should the weather hold fine til Sunday, the whole of the members of the above society will fish a pegged-down match for a series of handsome prizes given by members. Water to be decided on next Saturday night the 3rd of December.—WILLIAM BELTON.

December 1, 1881.

WALWORTH WALTONIANS.

A competition took place on the 29th at Rye House among eleven of the members of this society for the following prizes: 1st, a set of tankards, given by Mr. South; 2nd, a box of cigars, a pipe, and ½ lb. of tobacco, given by Mr. W. Taylor; 3rd, half-dozen bottles of wine, given by Mr. Blake. The result is as follows: Mr. Fieullade landed the first prize with one fish, Mr. Piolaine the second with one fish, and Mr. C. Beale the third with one fish. The next competition will take place on December 18th for the following prizes: Box of cigars, given by Mr. Towers; 10s. 6d. by Mr. Delahaye, and two gallons of gin by a member—the winner of the gin to have it before Christmas.—PIXIE.

Dec. 1.

THE PISCATORIAL SOCIETY.

THERE was a very large attendance of members and visitors at the Club Room, Ashley's Hotel, Covent Garden, on Monday evening last. Dr. Brunton occupied the chair, and as soon as the ordinary business was over, called upon Mr. T. R. Sachs to read his paper on "Jack and Jack-fishing." Mr. Sachs, on rising, was received with great applause, and after giving the Latin name of the fish, proceeded to state the reasons of the name of jack, and why it was called a pike. He then exhibited "the Union Jack," of 24 lb., which had been unitedly caught by the late Mr. H. L. Rolfe and himself, and afterwards described the different kinds and styles of fishing. He considered spinning as the most scientific way, strongly deprecating the use of the dead gorge, and then showed flights of hooks and traces, including the dead gorge, with hooks so arranged as to fly out when seized by a pike. He then touched on their spawning time, voracity, etc., thereby concluding a most interesting paper, which was frequently applauded. A discussion then followed, in which Messrs. W. B. Adlington, James Pattison, David Goodger, Thomas Huggett, and others took part. Dr. Brunton exhibited a nice take of grayling, caught with the fly at Winchester. The largest fish weighed 2 lb. Votes of thanks were heartily given to Mr. T. R. Sachs and the chairman. Mr. Edwin Sachs will read the next paper on Monday, the 12th December, having the title of "Reminiscences of the Eastern Archipelago," illustrated with specimens of fishing tackle and other curiosities which he has collected together from his late voyage extending over a period of three years.

CLUB AND OTHER JOTTINGS.

By L. B.

I AM right glad to see our editor most heartily endorsing in last week's number of the FISHING GAZETTE my remarks about the advisability of the London clubs joining to rent, preserve, and stock waters in the neighbourhood of London. It is indeed an old favourite idea of mine, and one to which I have repeatedly given expression, both in speaking and writing. Take a good map of London and its immediate neighbouring counties—say within a radius of from 30 to 40 miles. Now try to count the scores of miles of rivers, canals, streams, reservoirs, ponds, &c., such a circle would take in, nearly all capable of sustaining an almost practically unlimited amount of fish life.

If only as a trial, the whole of the clubmen of London, whose numbers (at least those affiliated to the Central Association) we will put down at 5000, would unite, and subscribe say 2s. 6d. a year, or a fraction over a halfpenny a week, it would give a sum of £625, more than enough to rent, restock where necessary, half-a-dozen separate fisheries, and to pay a competent person entirely employed in looking after each. Of course, I am prepared to hear it objected that many of the waters I speak of have been so ill-treated that it would be a doubtful privilege to be allowed to fish them; but to those who know what the abolition of netting, trimmering, night-lining, and all unfair practices, the strict enforcing of a close time, scientific restocking, and, if absolutely necessary, a whole season's rest—to those, I say, who know the value of these, combined with the wonderful prolificness of the fish themselves, such objections will have little, if any, weight.

I have made up the above estimate roughly, and being desirous of not devoting too much space in these notes to any one subject at the expense of others, have made my remarks as brief as possible; but I feel that the matter is one of vital importance to the club anglers, and one which I sincerely hope my brother rodsters will, with the permission of the editor, express their opinion freely upon in the columns of the FISHING GAZETTE, the only paper devoted entirely to angling interests.

The 29th half-yearly supper of the North-Western Angling Club took place on Thursday evening, 24th ult., 50 members and friends sitting down to do justice to the capital catering of host Wetenhall.

Mr. L. Bonvoisin occupied the chair, Mr. W. Aldis facing him in the vice. For further particulars see the indefatigable secretary's report in present number.

From Hurley a few good roach have been had, and one piscator captured, ledgering with a lob worm, two fine eels (6 lb. 5 oz.).

The West Central Association No. 1 District visit was paid to the Prince of Wales Angling Society on Monday evening, Mr. Lee in the chair, Mr. Pearce in the vice. It was a complete success, thirteen clubs being numerously represented, and the spacious room crowded. Due notice will be given of the next visit.

The next monthly meeting of the United London Anglers Central Committee will take place on Monday next at the Bald-Faced Stag, Worship Square, Finsbury, Mr. S. Morgan in the chair.

Our old friend *Punch* this week contains some capital rhyming lines anent the Thames Rights Defence Association's recent victory at Maidenhead, in which Sir Roger Palmer came off second best.

The patient angler is above all a contemplative man, and he does not, or, at least, he should not, exclusively indulge in this pleasant habit merely when the fish are off the feed, or he has eaten all his grub up, or the tobacco is all smoked, or the beer is—but no. Let us take it for granted that the bump of pensiveness and meditation is, as it should be in every true disciple of Izaak Walton, fairly developed. What, I say, must be the feelings of such on entering any London angling club-room, or, better still, a room where, as recently at the Grecian Theatre, the Westminster Aquarium, or the Norwich Exhibition, the walls are covered with specimen of preserved fish. Each defunct scaly one generally rejoicing in sundry shining coats of varnish seemingly swimming about in space within the narrow limits of his glass-fronted hutch, each hutch the exact counterpart of the other—black with gold edging, glass sides, glass front; wooden back, top and bottom; inside back painted some shade of grey or lavender; bottom, sand or fine gravel, with three or four—generally three—tufts of grass; stiff and spiky these last, putting one in mind of nothing so much as the bayonets or the piled arms of a squad of infantry. Well, I am of opinion the aforesaid anglers would vote that the time had arrived when enterprising taxidermists should seriously try and introduce something “new” in the way of making our piscatorial trophies beautiful for ever, an opinion to which I think the readers of the *GAZETTE* will add—“So say all of us.”

Haslett, of Chertsey, writes me this (Thursday) morning:—I was out Mr. Allen last Saturday, and we espied the jack-float one of my customers had lost the previous week. We seized the float and end of line, but the strain was too great, and the fish, which was still on, succeeded in breaking the gimp. It was a good jack, and had been on nearly a week. On Saturday we could not fish, though we started to, the water rose so fast and came down so thick. It is now, however, improving, and by Sunday, if we have no rain, it will be right for big roach ledgering, with a chance for bream as well. I can put you on the track of a good jack or two, if you have gimp strong enough to hold him—for my part, I hate gimp. Fishing with Mr. Allen the other day, lost three good fish through the gimp breaking; I much prefer good gut.

OBSERVATIONS ON THE SALMON OF THE PACIFIC.

By DAVID S. JORDAN AND CHAS. H. GILBERT.

(Continued from page 548.)

LITTLE blue-backs of every size down to 6 inches are also found in the Upper Columbia in the fall, with their organs of generation fully developed. Nineteen-twentieths of these young fish are males, and some of them have the hooked jaws and red colour of the old males.

The average weight of the quinnat in the Columbia, in the spring, is 22 lb.; in the Sacramento about 16 lb. Individuals weighing from 40 to 60 lb. are frequently found in both rivers, and some as high as 80 lb. are reported. It is questioned whether these large fishes are: (a) Those which, of the same age, have grown more rapidly; (b) those which are older but have, for some reason, failed to spawn; or (c) those who have survived one or more spawning seasons.

All of these origins may be possible in individual cases; we are, however, of the opinion that the majority of these large fish are those which have hitherto run in the fall and so may have survived the spawning season previous.

Those fish which enter the rivers in the spring, continue their ascent

until death or the spawning season overtakes them. Probably none of them ever return to the ocean, and a large proportion fail to spawn. They are known to ascend the Sacramento as far as the base of Mount Shasta, or to its extreme head-waters, about four hundred miles. In the Columbia they are known to ascend as far as the Bitter Root mountains, and as far as the Spokane Falls, and their extreme limit is not known. This is a distance of six to eight hundred miles.

At these great distances, when the fish have reached the spawning grounds, besides the usual changes of the breeding season, their bodies are covered with bruises, on which patches of white fungus develop. The fins become mutilated, their eyes are often injured or destroyed; parasitic worms gather in their gills, they become extremely emaciated, their flesh becomes white from the loss of the oil, and as soon as the spawning act is accomplished, and sometimes before, all of them die. The ascent of the Cascades and the Dalles probably causes the injury or death of a great many salmon.

When the salmon enter the river they refuse bait, and their stomachs are always found empty and contracted. In the rivers they do not feed, and when they reach the spawning grounds their stomachs, pyloric cæca and all, are said to be no larger than one's finger. They will sometimes take the fly, or a hook baited with salmon roe, in the clear waters of the upper tributaries, but there is no other evidence known to us that they feed when there. Only the quinnat and blue-back (then called red fish) have been found in the fall at any great distance from the sea.

The spawning season is probably about the same for all the species. It varies for all in different rivers and in different parts of the same river, and doubtless extends from July to December.

The manner of spawning is probably similar for all the species, but we have no data for any except the quinnat. In this species the fish pair off, with tail and snout, excavates a broad, shallow “nest” in the gravelly bed of the stream, in rapid water, at a depth of 1 to 4 feet, the female deposits her eggs in it, and after the exclusion of the milt they cover them with stones and gravel. They then float down the stream tail foremost. A great majority of them die. In the head-waters of the large streams all die, unquestionably. In the small streams, and near the sea, an unknown percentage probably survive. The young hatch in about sixty days, and most of them return to the ocean during the high water or the spring.

The salmon of all kinds in the spring are silvery, spotted, or not according to the species, and with the mouth about equally symmetrical in both sexes.

As the spawning season approaches the female loses her silvery colour, becomes more slimy, the scales on the back partly sink into the skin, and flesh changes from salmon red and becomes variously paler, from the loss of the oil; the degree of paleness varying much with individuals and inhabitants of different rivers.

In the lower Sacramento the flesh of the quinnat in either spring or fall is rarely pale. In the Columbia, a few with pale flesh are sometimes taken in spring, and a good many in the fall. In Frazer's River the fall run of the quinnat is nearly worthless for canning purposes, because so many are white meated. In the spring very few are white meated, but the number increases toward fall, when there is every variation, some having red streaks running through them, others being red towards the head, and pale towards the tail. The red and pale ones cannot be distinguished externally, and the colour is dependent neither on age nor sex. There is said to be no difference in the taste, but there is no market for canned salmon not of the conventional orange colour.

THE CARRIAGE OF FISH.—Mr. J. L. Sayer, of Lower Thames Street, publishes a copy of a sale account which he returned to a consigner. It was in respect of twenty-eight boxes of good herrings sent from Oban, which fetched 10s. per box—£14. The expenses were as follows:—Use of boxes, £1 8s.; carriage (2 tons 16 cwt.), £11 11s. 2d.; porterage, &c., £1 8s.; commission 13s. 10d.; total, £15 1s.; that is, the expenses were £1 1s. more than the fish brought. Mr. Sayer says:—“It is no wonder than fisherman complain of the price they get returned to them. The sooner the railway companies carry fish at about the same as they do potatoes, the better for the public. From Scotland they bring potatoes for 30s. per ton, but for sprats and herrings they charge 74s. per ton. The public can see who stops the fish from coming to London.”—*City Press*.

Mrs. F. Y. BROCKAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

ANGLING.
Now ready, third Edition.
THE ANGLER'S INSTRUCTOR.
By WM. BAILEY.

A book on the best modes of Angling in English Rivers, Lakes and Ponds, and on the habits of the fish, besides all the latest practical hints on many things that have not up to now been made public, to be had of W. Bailey, 170, Kirke White Street, Nottingham. By post, 2s. 9d.

Now ready, price 7d.

CASSELL'S FAMILY MAGAZINE FOR DECEMBER,

forming the

FIRST PART of a NEW VOLUME,

In which the following, amongst numerous other NEW FEATURES, will appear:—

- 1 One of the most novel and attractive characteristics of the New Volume will be
THE FAMILY PARLIAMENT,
which will be opened for the friendly discussion of Topics of importance and interest in the Home Circle. Amongst the subjects for Debate will be:—
HOME LIFE *versus* PUBLIC LIFE FOR GIRLS.
ARE PUBLIC EXAMINATIONS BENEFICIAL TO YOUNG PEOPLE?
ARE EARLY MARRIAGES UNTHRIFTY?
 &c., &c., &c.
- 2 The order and method of Debate are explained in the December Part.
UNDER THE CRUST:
Sketches of North-Country Characters.
- 3 GIRL LIFE (Passages in). By a Woman.
- 4 MEN OF COMMERCE.
- 5 NO PROOF. New Serial Story. By the Author of "Horace McLean."
- 6 RALPH RAE BURN'S TRUSTEESHIP. New Serial Story. By J. BERWICK HAWOOD, Author of "Paul Knox, Pitman."
- 7 THE FAMILY DOCTOR
Will continue his Popular Papers on the Preservation of Health and Cure of Disease amongst Adults and Children.
- 8 COUNTRY NOOKS AND CITY CORNERS for Holiday Travellers. Illustrated.
- 9 SHORT COMPLETE STORIES
By Popular Authors.
- 10 HOME MUSIC
Will still form an attractive feature. The Prize Song will appear in an early issue; and occasionally high-class Pianoforte Pieces will be introduced.
- 11 HOME WORK FOR READY HANDS.
- 12 DAINTY SNACKS AND HOMELY DISHES FOR THE FAMILY TABLE.
- 13 FLOWERS AND FRUIT:
Gardening Papers (including Window Gardening) for every Month.
- 14 "A HAPPY HOME WELL ORDERED."

** Order CASSELL'S FAMILY MAGAZINE for DECEMBER, now ready, price 7d., commencing the New VOLUME for 1882.

The Fishing Gazette.

SATURDAY, DECEMBER 10, 1881.

PIKE AND JACK.*

THE distinction between the two appellations is that a jack becomes a pike when it weighs 3 or 4 lb. In ancient angling books and in heraldry, the pike is also called a luce, and

* A paper read by T. R. Sachs, on November 28, 1881, at the rooms of the Piscatorial Society, Ashley's Hotel, Henrietta Street, Covent Garden.

the younger species pickrells. I have never been able to gather why the former name has been disused for the comparatively modern one of jack. The most artistic and killing way is spinning for these fish. Among my friends, I note Mr. James Forbes, of Chertsey, Mr. Edward Lukyn, of Sunbury, Mr. Robert Barker and Mr. Lemann, of the P.S. as being accomplished in the art; and there is no doubt that a neat and dexterous hand will cover more water and catch more fish than by other modes of angling, providing there are not too many weeds in the way; in that case, it is better to use a pike fly, a bunch of feathers to imitate a wild duckling, with some triangle hooks attached. With such an imitation I have seen large pike caught, the method being to use a double-handed trout or grilse rod from a boat, casting in all directions among the weeds, and moving the fly as a flapper would swim. Of spinning flights of hooks, I prefer the Francis, and a four triangle with a return hook to keep the bent tail in proper position. I have also found it advantageous to slip on an extra triangle at the tail after the flight has been baited, it is more killing; most artificial baits have a triangle at the tail end, for that reason. Of spinning leads I prefer the *Field*, as, from the shape, it prevents the line from kinking; another excellent lead is the FISHING GAZETTE lead, which having a spring fastening, enables it to be attached to the line, and detached without trouble or delay. Of artificial baits I prefer the American spoon with a red tassel. There is also another effective Gregory bait, the "Clipper," a fish with a red tassel at the tail, the tail of the bait being cleverly bent for spinning. There is also a secret spring bait in my possession which is in the shape of a fish and the hooks only fly out when seized by the fish. I regret I cannot persuade Mr. Gregory to undertake the making of similar spinning baits. The interior being rather complicated, they cannot be made for an angler's price. The first time I used a Francis flight of hooks, was at Godfrey's, Thorney Broad, West Drayton, a few years back. Having paid my shilling for permission to angle, and bought some gudgeons, I fortunately hooked a good fish, which ran into the weeds, and, as these were rather thick, I broke my much-used line, in the endeavour to withdraw the pike. Very vexed, I then put up a float and live bait, and soon had a run, my float vanishing among the weeds; in the end, as I could not extricate my tackle, I broke again some foot or so above the float, and, to add to my mortification, my property was bobbing about in all directions. Being anxious to secure the fish, I removed all the weak portion of my reel line, and secured another unbaited Francis on to it, with the intention of catching the runaway float and line with the fish thereon, when some gentlemen passed me, two of whom were members of the P.S., and going to dine at the house. I promised to follow, and stopped the boy, who was carrying the empty refreshment basket, telling him of my mishap and promising a shilling to stay and assist me. At the second cast I caught the line, and hooked the float, and, by gentle handling, I gradually got Pikey out on to the shallows, the boy, having removed his shoes and stockings, going in and fetching him out, with my first Francis flight hanging out of his jaws, which he brought to me, with the exclamation, "What a baby!" On taking the fish to the house, and placing same on the dining-table, much surprise was expressed. It was weighed there and then with a Salter's balance, and was 9½ lb., Mr. Godfrey remarking that such a fish had not been caught in his waters for 30 years past. I went on spinning again in the afternoon, and caught several jack. At last, Godfrey came to me and said, "I think, sir, you have had enough for your shilling. I don't know who you are, but I don't want gentlemen like you to come catching all the jack out of the river." He was told afterwards who I was—an hon. sec. of the P.S.—and apologised. I had the specimen cased by Cooper, and, after a time, made Godfrey happy by presenting it to him. It now ornaments his dining-room, and, in return, he has made me a life member of his fishing at Thorney Broad. I know several waters where snap fishing or live-baiting is of little use. There is the Stour at Wimborne. I have taken over a hundred pounds in weight of pike there in two days by spinning; I tried live bait, but it was slow work; my largest was 18 lb., I gave this fish to my friend, and our family doctor, whose wife told me that her cook had sliced it à la codfish, and salted the pieces, which being broiled for breakfast were delicious. There is a famous water well known to Messrs. Goodger, Pratt, Lemann, R. Barker, self and others. Mr. Goodger is clever with snap-tackle, and holds his own with any other angler in this style of fishing. He has brought many a fine pike to grass, and does not eschew this or any other scientific amusement he so well understands. Mr. R. Barker brought a sackful of pike from this water a few years since, all caught spinning. Mr. Pratt, Mr. Lemann and I, fished the same water, Mr. Lemann with a Gregory bait from the bank, Mr. Pratt and I, from a boat. We had grand sport that day, our largest 20 lb., 18 lb. and 15 lb. One day I took our late friend H. L. Rolfe to another

water, and here is his own account of same as it appeared in print at the time:—

(From *Land and Water*, February 1875.)

"THE UNION JACK!"

Allow me to relate an incident that happened to me last week, with a dear friend of mine, Mr. T. R. Sachs, about thirty miles from town. I shall not say where it was, as my old friend Francis Francis has given me the tip. "Keep good fishing to yourself." "Once say where you have been and your friend will have a bushel basket full of letters asking permission." We had very fair sport up to 4 p.m., the largest fish scaling 10½ lb., the total weight nearly 60 lb. I was about to give in, but my companion, who is an ardent fisherman, said, "We have still half-an-hour to the good; have another try old fellow!" "Very well," was my reply; "Hand me a bait." I was much amused when he handed me a thing as long as your finger. "What is the use of that with my tackle?" "It is all we have left," my friend said. "If you give me three I'll have a bit of fun to wind up with. I was fishing with a live bait snap, the tackle consists of two triangles and one single hook. I put three small roach, one on each triangle and one on the single hook, hooking them all under the back fin. I dangled them in the water to see how they looked; it was quite charming to watch their antics. I felt sure that if Alderman Pike was in the neighbourhood he could not refuse such a dainty dish. A slight cast of twenty yards, and flop went the lot into the water, and then out of sight went my float. "You've a run," exclaimed my friend. "All right," I replied, "let the beggar go; I must light my pipe and have a drop of whiskey; if he takes the lot of my hooks he must be a whacker." A minute after my friend had just put on a new bait, and made a cast within ten yards of me. He instantly had a run; he struck his fish, and, by the bend of his rod, I saw he was a whopper. Now comes the fun. I was too interested in the result of his capture to think of my own. His fish was running across my line, so I raised my rod to let him pass under it. After a very masterly piece of rodmanship he managed to bring him near the boat. At the first glance I had of him, I said, "It is a twenty pounder; be careful, give him the butt, but do not be too hard upon him." How the beggar ploughed through the water, making it spray up from the line, and the music of the reel was beautiful. All of a sudden, after one of his maddening rushes, I found my rod nearly overboard. I seized it and tautened my line, thinking my fish had felt the hooks and made way. Now, my brother anglers! laugh at the fun. As I struck my fish, my float bobbed up near my friend's. Of course I began to bully him to keep clear of me, and he returned the compliment with, "You know I've a good fish on, get out of my way." Out of courtesy, I bore hard on my fish, but the devil a bit could I separate them. No, they were like the Siamese twins. At last the murder came out. Master Johnny neared the boat, and, to our great surprise, we found we had both hooked the same fish! He had taken my bait first, and actually gorged my snap tackle. Then he took my friend's who struck him in the upper part of the mouth. It took but a minute to land him, a beauty of 24 lb. My kind friend Frank Buckland has cast it for me, and I intend to paint and keep it in my studio as a memento of as jolly a day's sport as ever I had in all my life.—H. L. ROLFE.

I must add to that narrative, that the late Mr. Buckland took two casts of the pike. Mr. Rolfe painted one. It was placed in a glazed case, as our 35 lb. one is. We took it down and presented same to the proprietor of the lake; had another day's fishing and a choice eatable present in return to take home with us. The fish weighed 23½ lb., and allowing half a pound for waste. The case is labelled 24 lb. Another member of the P.S. had the good luck to catch a pike near Maidstone, weighing 35 lb., and another from the Colne of 34½ lb. These fish were at the Norwich Fishery Exhibition, and labelled 36 lb. and 37 lb. each, thus putting on 3½ lb. for waste, which is rather questionable. The present Duke of Wellington uses a live bait without injuring the fish. The bait is secured into a light kind of harness, on which is a loose triangle of hooks, this enables the fish to swim about freely. I think if the fishing-tackle makers were to make such live bait tackle they would have a good sale.

[Most certainly they would. If Mr. Sachs will get us a sample, we will get some house to make and sell it, if it is effective.—Ed.]

Trolling with dead bait is the ancient way of catching pike, and, on a cold day, the walking and throwing exercise tends to keep you warm. I remember an instance at the River Wey, near Weybridge. Self and friend were jack-fishing. I went first with a live bait, there being too many obstructions for spinning; my friend followed with a dead gorge. He soon had a run, and landed a pike of 16 lb., remarking that he preferred some one to go first with a live bait, as it stirred the pike up to take his gorge. In the same water I once saw a pike caught on an eel line. The eel had swallowed the hook, and pike had swallowed the eel; but the eel, not liking his new quarters, popped out again through the pike's gills. So both were dragged out together. Once, in the same water, I was fishing for perch with a small gudgeon, a small jack took my bait, and, as I was lifting it out of the stream, he wriggled off and fell in again. At the same time, my bait fell after him, when the little fellow seized the gudgeon and bolted. Another time, one of my daughters was fishing with me at Streat-

ley, and hooked a pike of 8 lb. with snap tackle. After some play, she brought him near the punt, when the fish extended his jaws so wide, and eyed her so ferociously, that she called out "Oh, my!" dropped her rod in fright, and the fish got off. However, we caught him again the next day. Paternostering for pike requires some skill, and is occasionally more productive than other modes of fishing in deep waters. I remember being out with the late Charles Keene, of Weybridge, and had the luck to catch eight in succession with a three single hook paternoster. I then had hold of a nine-pounder, and he was most curiously hooked in the top of his head. When close to the punt, and the net placed under the fish, he gave a last struggle, broke through the rotten mesh and got away, my puntsman, with great disgust, throwing the landing-net after him. In deep waters, I found a leger very useful; and, with a threadled bait, very attractive for large pike; but none of these are so scientific as spinning.

Mr. Patterson, son, and self, returned on Saturday last from a celebrated lake, where pike of 20 lb. and 30 lb. are known to be. We fished for two and a half days, with the expectation of placing some fine specimens on the table this evening, but the tempestuous and wet weather caused the water to thicken so much as to prevent much success. We kept at work all the time, and I never experienced such a dose of wet and wind before. In pike-fishing, it is all luck who gets the largest, for frequently the inexperienced angler gets the best fish, while the acknowledged artist in the art is least rewarded.

Patience, however, forsakes him not, his motto being "Persevere and Win."

FISH CULTURE IN AMERICA.

REPORT OF THE MINNESOTA FISH COMMISSIONERS.

THE following extracts are from the report of Messrs. Daniel Cameron, William W. Sweeney and Robert Ormsby Sweeney fish commissioners to the State of Minnesota, to the Governor, for the years 1879 and 1880. [When shall we have such an interesting report of similar proceedings in this country?—ED. FISHING GAZETTE.]

As the season of 1878 drew to a close we found ourselves embarrassed with our riches, for our hatching house was full to overflowing with eggs and young fish still carrying the sac, and those just beginning to eat. To relieve the crowding in the troughs, as the little fellows of the California fry began to feed heartily, and to give them the benefit of more and larger water, we allowed them to pass out into the pond immediately in front of the hatchery.

The weather continued pleasant and very favourable, and the salmon to grow and flourish as they had done in previous seasons when turned out; but on January 1, 1879, there came a change. The mercury fell to 20° below zero, and on the second to 25° below. This sudden and extreme cold seemed to chill and benumb them so that they did not take their feed well, and great numbers perished from its effects. However, as the weather moderated, a majority of them seemed to recuperate, and we thought we were safe in hoping they had passed all danger; but we were destined to be disappointed, for on February 13, the mercury again fell to 20° below zero, on the 14th to 22° below, 15th to 10° below, and on the 16th it had moderated to 12° below zero. The effect of all this severe and continued cold upon the young fish was disastrous in the extreme. They died by the thousands, and although we took many of them back into the hatchery, the shock was too great, and we were compelled to witness the fruits of all our great labour and care daily diminishing, without being able to arrest the mortality.

Of the survivors who withstood the terrible ordeal of cold, and yet appeared to be remarkably vigorous and healthy fish, we were able to distribute, by actual count, into the different waters of the state, forty-one thousand.

Of the land-locked salmon fry hatched from the sixty-five thousand eggs received from the United States Fish Commission from Grand Lake stream, we were enabled to raise and distribute fifty-three thousand, five hundred vigorous and healthy fish.

Of the salmon trout eggs bought of Dr. Pratt, Elgin, Illinois, we raised and distributed into our different lakes nineteen thousand six hundred and fifty; and of the white-fish eggs purchased of the same gentleman, which we held until they began hatching and then introduced into the waters to the numbers of two hundred thousand; we also made the endeavour to keep some of the fry of the white-fish in the hatchery and teach them to take artificial food, as our friend, Supt. Walsher, of the Wisconsin commission, succeeded in doing; but, notwithstanding all care and precaution, at the end of ten or twelve weeks, none survived.

We are still hoping to raise the young fry from our native "wall

eyed pike" for distribution, but up to this time we have not successfully accomplished it. In the last days of April and beginning of May, the pike in the ponds were spawning, being nearly through by the fourth. We watched the manner of spawning, which is to throw the eggs, scattering them over and so completely covering the bottom of the pond that it looked as if sowed with white mustard seed, the eggs being but little larger and same colour. We had placed brush in the ponds in the same manner as in the perch ponds, but the pike avoided the sticks and branches, preferring to throw their spawn upon the clean sand without any care or nesting.

Superintendent Watkins took some of the spawn from the females, which is delivered readily and free, in the same manner as the brook trout, fertilising it with milt from the males, without any difficulty. The fertilised eggs were put into the troughs in the hatchery, but in less than a week all died. All the eggs in the pond also ceased to develop, and in a little while perished; the only assignable reason seems to be the coldness of the spring water. We have planted one hundred and seventy "wall-eyed pike," averaging three pounds each, in our lakes, among others Lake Minnetonka, where, singular to relate, this fish has never heretofore been known.

Our pond of perch keep healthy and vigorous, and use the brush-wood branches about which they wrap their spawn in wreaths and festoons, like cobwebs in dusty corners. Some of the mother-fish appeared to watch anxiously for the safety of their eggs, for they linger about them for hours, motionless, and seem to be on guard for days after it is demonstrated to us the eggs cannot hatch. The temperature for perch eggs evidently must be much higher.

The brook trout at both Red Wing and Willowbrook have been healthy and prolific, and from them we have raised and distributed two hundred and sixty-one thousand by actual count. Besides these, many thousands were washed out in the stream at Red Wing by the severe storm or tornado of June 9. All the lower part of the premises were flooded, badly damaged, and ponds and fish were swept away. The same thing happened, but to a less disastrous extent, last summer (1878). Again on July 3 another storm severely injured the premises at Red Wing, nor did we entirely escape the effects of the storm at Willowbrook. The high, sandy bluff back of the ponds where the C., M. and St. P. R. R. Co. were excavating was so washed by the tempest that an avalanche or land slide of hundreds of cubic yards plunged down, and pressing against the soft and springy earth between the foot of the bluff and the ponds, caused it to burst through one of them, snapping and twisting eight inch square timbers like straw.

Fortunately the loss of fish was but few in number, as follows: Seventeen "wall-eyed pike," two pickerel and one Lake Superior trout. Although the number was small, the fish were the largest specimens we had in the ponds and attracted much attention by their graceful movements, size and beauty.

The damage done by this accident took several weeks and much labour to repair and make all secure as possible against such dangers in the future. All that terrible night Superintendent Watkins and his assistants worked at the ponds, clearing the screens and sluices, preventing their damming up and washing around the bulkheads, otherwise the mischief might have been more disastrous. After surveying the washed-out roads, gulleys, and general devastation everywhere about the country, we felt very thankful that the damage was no greater.

There was another heavy storm on July 10, but no harm done at Willowbrook. On December 26, another occurrence of a rather curious kind will complete the chapter of 1879's happenings. The superintendent, in order to get water of a low temperature for the white-fish eggs, was intending to use an iron siphon pipe to draw from one of the coldest ponds for the jars where the eggs were to be placed, and for this purpose had caused a trench to be dug in the sandy embankments on the lower side of the ponds in which to bury the pipes. As darkness came on the digging was stopped when within a foot of the water level of the pond, intending to continue the excavation and lay the pipe next morning, but had not calculated what the frost might do in the night, and was more than a little surprised to find in the morning that the earth had frozen and arched up into a bridge two feet thick and under which was washed a gully through the sandy bank nearly wide and deep enough to drive a cart. The water and fish from three ponds had escaped; the gates in the sluices being old, were unable to withstand the enormous pressure of the water behind them when the frost emptied the first one. By this break we lost about two thousand Lake Superior trout and about twelve hundred brook trout yearlings. Some of the latter which remained in the stream we afterwards recovered.

During the year we have made several valuable and essential improvements to the efficiency of the hatchery and ponds.

The advisability of bringing more water into the ponds being

apparent to the commissioners, they sought and got, through the courtesy of James Stinson, Esq., permission to bring water through a flume twelve hundred feet long, from a spring stream upon his land, which lies adjacent to the hatchery. The additional volume of water is very, apparently, beneficial in keeping the ponds entirely free from ice, even in the coldest weather, as well as affording a supply of insect food for the small fry just beginning to feed naturally, as well as the larger fish. Some protection to the grand spring being found necessary to keep out leaves and dirt as well as to prevent accidents, we have built a low, wide, spreading roof, summer-house fashion, over it, with a high board guard or curb, also seats where visitors can sit in the cool shadow, a pleasant resting place which gives much satisfaction to the hundreds of visitors who every month examine the establishment. After considering the cost of buying sour milk for food, and the expense of keeping cows, it was determined to purchase two cows, which has proved to be an economical investment.

We have also built an inexpensive shed or addition to the shed or stable. The most pretentious improvement, however, is a low frame building for workshop, feed kitchen and waiting room. It is 15 by 30, and cost 150 dols. It is immediately opposite and a few yards only from the hatching house, so that the men can readily warm themselves when they find it necessary, when chilled working in the hatchery in winter time.

We secured by purchase from the Baytown Trout Brook Company two hundred and forty-nine pounds of young, healthy brook trout, deeming it advisable, as the price was very reasonable. From the lot we secured fifty thousand spawn, almost an equivalent to our purchase money.

Early in February we received a communication from our neighbouring fish commissioner of Iowa, and much esteemed friend, Hon. B. F. Shaw, inviting us to join in calling a convention of Western fish culturists and commissioners, for consultation and consideration of the Western interests of fish matters generally. We agreed cordially with Mr. Shaw as to the importance of the Western interests, and his object of having them looked after. The result was that we were fortunate enough to get Hon. Fred Mather, Assistant United States Fish Commissioner, interested, as he always is in anything pertaining to fish culture, and a call was issued. The meeting was held in Chicago, at the Palmer House, and was attended by many gentlemen from different states, all interested in fish hatching and fish catching.

An association was formed called The Central Fish-Cultural Association. Many interesting and instructive papers were read and discussions had during the two days the association was in session. Among the papers read was one by the chairman of the Minnesota commission in the shape of a brief, but earnest, plea for the systematic attempt at least of stocking our Western rivers with fish by the United States Commission. With a trusting hand we launched this little waif upon the tide of opportunity, hoping some happy breeze of luck or favour would waft it swiftly to the consummation wished. The association is to meet annually, and much good is anticipated will result to our Western fish cultural interests therefrom.

At the beginning of the season of 1880 we again found our hatchway swarming with life. Every available inch of room in the troughs and boxes were filled either with eggs or fry, and as the weather was cold and rigorous, and remembering the effects of exposing young fry to the extreme temperature of our severe winter weather, we kept them in the troughs, intending to hold them as long as possible before turning them into the ponds.

The white-fish eggs that we have heretofore manipulated seemed to hatch too rapidly for our season. Naturally the eggs lie in the cold water of the lakes all winter, hatching in the spring-time when the ice melts, and microscopic insect life awakens to feed them. But, in spring water, at the lowest temperature we can get it from the ponds, it is so much warmer than the lake water, that the period of gestation is greatly shortened, and the precocious white-fish are hatched long before any indications of spring are apparent, and we are necessitated to plant the fry under the ice which may be from two to four feet thick. To make the hatching of the young white-fish conform to the season and appear as they naturally should in the early days when the sun's warmth brings forth the animalculæ in abundance and upon which they are thought to feed at first (when older their sustenance is much more substantial), we have been placing the well developed eggs into the lakes, scattering them as nearly as possible over such localities of bottom and depth as the fish themselves in their native waters would select.

We have asked the counsel of the eminent ichthyologist and esteemed friend, Dr. Sterling, of Ohio, who assures us it has been done successfully within his observation, and we have reason to believe it will prove as successful in Minnesota as in Ohio. A number of small dead white-fish have been found on the shores

of lakes where we have planted them. The largest specimen we have seen was six inches in length, showing that they have made good progress, and are growing.

There have recently appeared in Lake Elmo some small white-fish, one of which we have in alcohol. But curious enough, none have been put into that lake by the commissioners. The nearest water where they have been placed is White Bear Lake, about five miles away. There are several small lakes intervening, however; and it is conjectured there is a subterranean communication between, and which is apparently, at least, demonstrated by a well that has been dugged a mile or so from Lake Elmo towards White Bear, and under which runs a deep and rapid stream toward the former.

Further, the conformation of the earth's surface between the lakes, shows that at some remote time there has been a continuous body of water stretching from one to the other.

Diligent inquiry fails to find any one who has until recently seen such fish in the lakes where now they are very abundant. So we are quite willing to claim them as planted white-fish until other-ways accounted for.

In the beginning of February some of the California salmon began to show something wrong with them and began to die in the pond rapidly where we had put some of them to ease the crowded troughs, and to give others room, we constructed two large tanks inside the hatching house, three feet deep, three feet wide, and twelve feet long, into which were transferred many others from the still greatly crowded troughs. February 17 Superintendent Watkins reports: "California salmon have been acting badly for two weeks, and a great many outside, and to-day they begin to go in the hatching house. Think the trouble outside is from cold, and inside from overcrowding." "March 2: Nearly all the salmon dead; am satisfied the trouble was all from overcrowding. The gills seemed to be affected and muddy water kills them almost instantly."

Of the survivors we distributed about twenty-five thousand, and have still on hand fifty thousand good healthy fish for next year's distribution.

We have been able to distribute brook trout into the streams throughout the southern part of the state, where lakes are few or none, very liberally, also in the middle and to some of the upper portion of the state where the trout have never been known to be before. We have most encouraging reports of their doing well wherever placed, and of their attaining considerable growth.

This year we hear of parties from Minneapolis who have enjoyed good fishing in the Vermilion river and neighbouring streams.

We hope eventually to so stock the streams in Dakota county that citizens from both St. Paul and Minneapolis can, without losing but a few hours from business, drive out and enjoy the pleasure of casting a fly and hooking a trout at the same time, in season.

We have not known of any one catching, or at least identifying, the land-stocked salmon; the difference in appearance not being so striking as to impress one other than perfectly familiar with both kinds, and it is quite possible some of those seen and caught are of this variety.

The lake trout, of which we have been planting for the last two years, are doing finely in the ponds at Willowbrook; and although we have not heard of any being caught in the lakes, he is such a hardy and audacious fellow we think he will undoubtedly thrive.

We had a very large one at Willowbrook, presented us by Mrs. Rubbles, of McGregor. In the same pond were two large pickerel; it was a sight to be enjoyed to see the wholesome awe with which the pickerel regarded the least movement of the trout. Whenever the trout moved or seemed to have his attention directed toward the pickerel (although the same size, about twenty-five inches long) they would dart around the pond with incredible rapidity and unaffected terror. We never saw the trout give chase, but he had a bold look which undoubtedly shook the little courage of the pickerels and put them to flight.

From the 2000 eggs of the Californian mountain trout (*salmo iridea*), sent to us by the United States Fish Commission; we have now about 1200 vigorous troutlets, and from their hardy and lively appearance think they will make a valuable addition to our streams.

We have a lot of one hundred half breed, or hybrids, by fertilising the brook trout spawn with California salmon milt; the result is the most beautiful and active fish. They are all large and vigorous, and their wondrous quickness and astonishing leaps in the air as they dart flashing about when food is thrown to them, startles as well as delights the spectator. If they will fight for life with the anglers as they do with each other for the scattered morsels of food, they will prove *par excellence* the sportsman's fish.

As was hoped for and suggested last year at the meeting of the

Central Fish-Cultural Association, the United States Commissioner Baird has directed attention to a systematic plan of stocking the Mississippi river with salmon. The immediate details and prosecution are in the hands of Major T. B. Fergusson, his able assistant. After inquiries for eligible places on the Mississippi and its tributaries, Major Fergusson, sent two of his experts to examine and select the most suitable site from the number recommended to their notice. After examining many beautiful and excellent places, we were much gratified by the decision that Willowbrook, our state hatchery, was by far the best place they had seen. They immediately began preparations to handle the eggs, which were soon to arrive from California. It was a pleasure to us to aid and assist and facilitate the preparations of Messrs. Ellis and Sauerhoff, and soon we enjoyed the sight of nearly a million of young salmon fry in vigorous development in the various troughs at Willowbrook. The troughs in use and constructed by the United States Commission are in the open air and unsheltered from the intense cold which has been so unexpected and continuous from early fall this season. It was impossible to give them room inside the hatching house this year, but next we hope to have a shelter to protect them more from the cold. Important duties called Messrs. Sauerhoff and Ellis away, and we have undertaken to put the fish into the Mississippi and a tributary of St. Croix as Major Fergusson desires, thus liberating as soon as practicable within our borders nearly a million of these fish. Let us trust and hope this is but the beginning of what will be a grand and successful work that will benefit the whole valley of the Father of Waters.

Another good thing has come to us this year, and for which we have been trying for several seasons past. We have at last received a lot of small carp. The much talked of and highly esteemed German carp, reached us through the courtesy of Professor Baird and Major Fergusson in the beginning of October. There were 507 of them, and we have upon the orders of United States Commissioner Baird, already distributed 120 of them to applicants in our own and other states. There is such a demand for these fish that we shall have to deal them out very sparingly until we can have breeders of our own, and then, of course, the distribution will be more liberal when we have plenty of the fry. It must be understood the carp are not to be put into ponds with other fish, not even minnows, as they are utterly defenceless, and it is simply a waste of time and carp to attempt to introduce them into lakes where other fish are already, but when put into shallow, weedy lakes, where no other fish abide, they do well, and multiply abundantly.

TOTAL DISTRIBUTED IN 1879.

Brook trout	261,000
California salmon	41,000
Land-locked salmon	53,500
Lake Superior trout	19,650
White fish	200,000
Wall-eyed pike	170
	575,320

TOTAL DISTRIBUTED IN 1880.

Brook trout	222,000
California salmon	23,400
Land-locked salmon	18,000
Lake Superior trout	29,800
White-fish	200,000
Wall-eyed pike	64
German carp	120
California salmon, for United States Commissioner	200,000

Total distribution in two years . . . 1,288,704

FISH ON HAND AT STATE HATCHERY, WILLOW BROOK.

Breeding trout (<i>salmo fontinalis</i>)	10,000
Troutlets (<i>salmo fontinalis</i>)	5,000
Calis, mountain trout (<i>S. iridia</i>)	1,900
California salmon and brook trout, hybrids	100
Land-locked salmon (Schoodic salmon)	100
Lake Superior trout (<i>S. Nymacush</i>)	5,000
Wall-eyed pike	200
Yellow perch	300
German carp	387
California salmon, yearlings, for distribution coming year	50,000
	72,987

To accommodate the large number of fish we have in the ponds at Willowbrook, we have re-arranged the divisions so as to make the water flow from side to side, back and forth through each separate pond, so that every part of them is moved by the current, preventing dead water and its evil effects. The whole series of ponds, particularly where the breeders are kept, have been so im-

proved at considerable expenditure of lumber, time and labour, but the great advantages of this change are very obvious. We have, by making an extension to the hatching house, increased its capacity very greatly, so that there will be less danger of overcrowding in the future.

We have also built a large and suitable pond for our German carp, and in which we hope to see them make themselves at home and increase and multiply rapidly, for the demand for them is wonderful, and the praises bestowed upon their excellence is but little short of extravagant.

There is great complaint by many citizens against obstructing dams which prevent the going up of fish in the streams, so that those living above such obstructions are entirely deprived of their right and pleasure of catching fish. The millers and dam owners seem determined not to construct fishways until they are compelled so to do. They take no heed of notices sent by the commissioners, and as the law now stands, it seems to be easily evaded, and it also calls upon the Fish Commissioners to do a great deal of work, burdensome at any time, and under any circumstances would involve great personal labour and expense of time and money, but in the absence of any provision to pay for such duties, it is hardly to be expected they will be performed. The law may and should be so changed that the county attorneys should bring suit when necessary, upon complaint of any one, instead of the Fish Commissioners.

Should such a bill reach you for your approval, I hope your signature will not be withheld, for something needs to be done that will allay the growing dissatisfaction of those interested."

NOTES FROM THE RIVER-SIDE.

THE EFFECTS OF A FLOOD.

THE subsidence of a flood at this time of the year brings the perch on the feed, and finds them in their holes and suitable eddies. There is, to my notion, no prettier fishing than that of angling for perch, and if, as one of the oldest Thames fishermen said last week, there is plenty of them in the river, in spite of the cry which has been raised on their scarcity, the anglers will soon be amongst them. It is remarkable how rapidly the river rose after the rainfall. In a very little time the indicators registered an increase of five feet—covering the towing-paths and making immense pools of the adjacent meadows. I often think on these occasions the sight of water, when standing on the top of Chertsey Bridge, is a most extraordinary one; and then one's mind begins to revert on the probable migration of the fish out of the natural bounds of the river, proved and strengthened as that idea is by the shoals of roach seen priming in the waters beyond. I once remarked to the venerable George Hone, of Walton-on-Thames, "What about the monster jack, whose home is in the Sale?" and this remark was made when the floods were out. He replied, "God knows, he may be miles away, but he'll come back again;" and if it is true that the same fish was there only a short time ago, his reply was a correct one. It is not unnatural that the fish, with an extended range of water, should roam from their common haunts, and the great fear in these cases is that, unless they are looked after, the smaller fish may be left in shallow land, where the water still remains, for some time after the flood has subsided. And here comes in the work of the various preservation societies, to drag and recover the stray fish. Hence it is we find in the different annual reports the quantities that have been recovered from such places and out of the ditches as well. Here are the figures of the Maidenhead, Cookham and Bray Thames Angling Association last year: "134 jack, 109 perch, and 453 roach, exclusive of chub and tench," and in the "Blue Book" of the Thames Angling Preservation Society in one place alone "something like six thousand." At the time I am writing the water has made a good turn, but is much out of condition. The water is still lying in the meadows, and the professional fishermen are hopeful of getting amongst the fish shortly. The roach anglers, and especially those who plod on the shore, will be the first to make a score, as, in clouded water, the fish will range beside the banks. All jack anglers have for some time been waiting for a run of water before wetting their lines in the Thames, and it is now hoped some of them will be on the move and catch fish to their hearts' content. I met a friend in St. Paul's Churchyard last week, and, chatting about fishing in private waters, he said, "When the jack are on the feed, give me Old Father Thames for sport," and I believe he is right. My friend, Mr. Sachs, appears to believe in spinning as the legitimate method of catching jack, and he is not far wrong. In private waters, the practice of live baiting is the common one. The friend I have just been referring to told me he was out fishing in some private water, using this ordinary and killing bait without any result, when he determined on getting into the boat to try the effect of a quiet

spin, and the result was, he got plenty of good fish, which perfectly astonished the keeper, who had previously told him all the anglers that had been lately had gone away with empty creels, and he had come to the conclusion the lake had been literally fished out. It is now a matter of speculation as to when the next flood will come, and whether angling will be interrupted by a series of floods this winter. The season of Christmas will soon be here, when both anglers and fishermen are hoping to be on the river—the former for the purposes of sport, and the latter not only to give sport, but to enable them to provide for seasonable necessities, whether in the shape of a Christmas entertainment or to raise the means for paying their quarter's rents, both of which are necessary for that especial period of the year. It is a great drawback to the Thames fishermen, when their best weeks' fishing comes, and when their best patrons support them, to be prevented, by the continuance of floods, from fishing. And yet it is no uncommon thing at this time of the year. In the month of November there is always a great desire for a flood, to bring on both jack and perch fishing; but, unfortunately, it is not unfrequently the case, when the flood has come and done its work, just as the water has got into splendid condition, and angling engagements are thick and three deep—telegrams flying in all directions for stated days—another flood creeps in, and for weeks the river is suffering from frequent runs of water. But let me not discourage either the angler or the fisherman—for I feel just as much for one as I do for the other—so it may be just the reverse this season. We may have some good Christmas fishing; and I hope there will be, with all my heart.

HOTEL CHARGES.

In reference to a paragraph written some months ago, under the above heading, some one has foolishly sent an anonymous letter to Mr. G. H. Thurston, of the Chertsey Bridge Hotel, indicating his house as the one referred to. Mr. Thurston has invited me to inspect his books at that time, and I have pleasure in stating his charges, while bearing no comparison to the total mentioned in that paragraph, *are most moderate*. I have always been assured that Mr. Thurston has studiously catered for his brother anglers, and is deserving of their support. It is a pity that persons should lend their hands to write under the cloak of an anonymous term, for, to my notion, nothing is more objectionable. B.

SPECIAL NOTICE.

IN consequence of Mr. R. B. Marston having become a member of the Publishing Firm of Sampson Low, Marston, Searle and Rivington, the "FISHING GAZETTE" has been transferred to and is now the property of the Firm. Mr. R. B. Marston will continue to edit it, and it may be mentioned that during the two years that he has had the management of it the sale has increased by two thousand copies. Under the auspices of the Firm the increase will doubtless be even more rapid.

PUBLISHING OFFICE: 12 and 13, FETTER LANE, LONDON, E.C.

EAST ANGLIAN PISCATORIAL SOCIETY.

THE monthly meeting of the above society was held on Tuesday evening last, at the club house (the Great Eastern Wine Vaults). There was a thin attendance of members, and a vote of censure was passed upon those gentlemen who had failed to put in an appearance since prize fishing had ceased.

Upon the motion of Mr. William Hinsbey, and seconded by Mr. George Cubitt, it was unanimously resolved:—"That all members who are in arrears of payment of subscriptions shall at the next general meeting pay such arrears, and failing this, be expelled the club, such notice to be given them ten days prior to the meeting by the secretary."

Mr. Springfield also suggested that no other members be admitted until after the next general meeting. This suggestion to be laid before the Committee at their next meeting, with a view to limiting the number of members belonging to the club.

The Secretary also announced that owing to the members not responding to the wish of the last meeting, the Annual Dinner had been a failure.—ALFRED PALMER, hon. sec.

St. Stephen's Gate.

GREGORY'S SPINNING BAITS. "The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by him the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean line, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

THE ILLUSTRATED DOUBLE CHRISTMAS NUMBER

OF THE

"Fishing Gazette"

WHICH WILL BE PUBLISHED ON SATURDAY, DEC. 17.

will contain, among other special features, the

PRIZE ESSAY

By Sir JAMES R. G. MAITLAND, Bart., on

THE SALMON DISEASE,

ITS CAUSES, NATURE, AND POSSIBLE REMEDIES,

Which won the £10 prize given by the Editor of the FISHING GAZETTE for the best Essay on the subject at the Norwich Fisheries Exhibition.

**In consequence this number will have a large additional sale amongst the Scotch Nobility and Proprietors of Salmon Fisheries, and a large additional number will be printed.

This Number will also be sent to about 600 Fishing Tackle Makers, Boat Makers, &c., &c., as well as to 200 Newspapers for notice, and to many other influential quarters.

Advertisements to appear in this Number must reach the Office by 6 o'clock p.m. on WEDNESDAY, December 14, addressed to

THE MANAGER,

"Fishing Gazette,"

12 and 13, FETTER LANE, E.C.

RIVER REPORTS.

Thames (Goring).

Water now very high and thick. No fishing for some time to come. The prospects look bad for this week. It will take three or four days to get the water in good order for jack and perch. Water will be in good order for roach about Monday, if it keeps fine. Nothing has been done here this week, no one having been out.—JOHN RUSH.

Thames (Kingston.)

The river has risen and got thick to-day. Thursday, Friday, Saturday and Sunday, last week, it was good for all-round fishing. Prospects at present rising; should no more rain come, good for Saturday and Sunday. I have been out twice—one day from ten till two: two jack, best about 6 lb., next 4 lb., and a few nice perch; to-day: run three jack, broke twice. John has been getting some dace, but no bream. You can see plenty priming all round the punt. The bank-fishers have got some fine roach with the worm, and a private boat got a nice lot of fine roach. Saw two fine trout close on shore, to shun the stream.—JOHN JOHNSON.

Thames (Richmond).

The heavy rain that fell on Tuesday night has coloured the water again, and it has risen a foot. The river was in capital order on Monday, Tuesday and Wednesday, when there were a few punts out, and some very good bream were taken by Mr. Brain and myself; Messrs. Mansell and Wheeler have also been out. Should we get no more rain by Sunday the river will be in capital condition again.

Thames (Twickenham).

Wind, south-west; a little frost this evening, but the weather has been quite like summer for some time past. We have not been doing much since I last wrote, through the heavy land water, but I am pleased to say we have commenced again. Yesterday and to-day also we have got some fine roach and dace, averaging about six dozen to each punt; and, should the rain keep off, we shall expect to have some large takes by the time this is in print, as the water will have run off, and the fish ought to be found in abundance.—ALFRED PERRIN.

N.B.—I beg to inform members of fishing clubs that my reduced charges have commenced, and shall be pleased to communicate with any members in reference to the same.

Thames (Walton).

Water still high, and, after last night's heavy rains, likely to rise. Still thick, and running out very fast. Not very good prospects of fishing, except perchance some perch or jack. South-west to west winds; occasional rains. No fishing whatever, and no one been down to try.—HENRY G. WOOD.

Ancholme.

Owing to the continuance of the exceptionally fine weather, an improvement has taken place in the angling. The waters are all that the most particular can desire. The fish are taking very kindly to the worm, but no large pike, that I am aware of, have been as yet secured, though a few runs have been had. The commissioners might make a good thing of the angling if they would only cater with spirit for support. The introduction of other varieties of fish is sadly needed. £50 was, I think taken last season from Sheffield anglers alone, and it is only fair that a portion of the profits should be spent in adding to the stock. Carp, tench, blass bass, &c., would thrive here, and add considerably to the sport. At present, our stock fish is the bream, whose edible properties are at a discount.—THOMAS FOX.

Dove.

There is little to report this week. Grayling will hardly look at the fly. A few have been caught with the maggot and cockspur on the bottom, but that is all. The weather alone is the cause. There are thousands of fish in the river, but they will not rise while the atmosphere continues as it is now—more like June than December. I may mention, as illustrating the present mildness of the elements, that a blackcap warbler was shot on Monday last at Norton, in Derbyshire. This is one of our summer migratory birds. Messrs. Foster, of Ashbourne, informs me that a few pike have during the last day or two fallen victims to the Colorado and Excelsior artificial baits, but grayling have been almost entirely conspicuous by their absence from the angler's basket. The Dove has been running high all the week, and is so at the time of writing (Thursday), but should there be no more rain it should be in good order for coarse-fishing by Saturday.—THE SPODGER.

Exe (Exeter).

It cannot always be expected to report good sport every week, and this week the elements have again been against us, and to-day when it was expected, after the beautiful sunset and the splendid view we had of the moon's eclipse, that those few who intended to try for pike would have had a good time of it; but, alas, it was a wet one, and no mistake, for it came pelting down, and all those who intended to venture felt loath to leave the comfortable hearth to wander by the waterside for a very possible empty creel; but nothing venture nothing have. So a few started, and after a few hours' toiling and finding the water began to trickle down their necks and even into their boots, they made for more comfortable quarters, there to remain until Boreas and Pluvius had had their revenge satisfied, which at the present seems very unsatisfactory. The river is exceedingly high and very dirty, and no doubt will remain so during the next few days, even supposing it should clear up forthwith. The takes during the week have been of the most meagre description, and very few pike have been taken since my last. The roach fishermen up stream have done pretty well, and many have been of good size (over 3 lb.). Carp are seen in large quantities in the canal, and very fine they are, but very cunning, and excite great interest in this locality. Salmon and trout are numerous, and no doubt will be greatly helped, by the heavy freshets we are having, in reaching in considerable numbers the upper waters, although they are not required by many so far up, they preferring trout-fishing to salmon at any time. Herring are exceedingly fine at Exmouth and moderately plentiful. Crabs abound and are both good and cheap, but they are from Cornwall, and are chiefly females.—FRANK GOSDEN.

Ilfracombe (N. Devon).

There have been no heavy takes of fish to report this week. On Friday the weather was a little finer than it had been for some days, so that all boats were out, and their catches varied from three maize down to half maize. One boat brought in a fine cod that was caught in the nets while drifting. Saturday's catches of fish were near the same as Friday's. It is probable their catches would have been more, but owing to the sudden change of the weather they had to get their nets in as quick as possible and make their way towards the port. Soon after they got in it blew a gale from the S.W. On Sunday evening a few boats were out. The best boat brought in four maize; others came in with two maize, and on Monday, bad weather; only two or three boats out; their catches were very slack. On Tuesday several boats went out to drive for the low water. While they were out the wind began to freshen, until it blew a gale. After an hour and a half's beating to windward they managed to get in the roads and bring up. One of the little crafts split her mainsail, and it was with great difficulty the crew brought her in. Wednesday, weather very bad; blowing very strong from W.N.W., with a heavy sea; boats unable to go out. Thursday morning, one boat out. They got 400 herrings. Evening, several boats gone out, as the wind has moderated a great deal. There have been three fine conger caught from off the jetty with hand lines.—E. COMER.

Lea (Rye House).

The water is very thick, and it is not fit for fishing now; it will be by Sunday if there is no more rain. The wind is south-west. On Sunday, Mr. Decoster took a nice chub, 3 lb., and some roach.—WM. COWELL.

Lea (Ware).

Since last Sunday we have had some very heavy rains, in consequence of which the water has not been fishable until to-day. It has fined down nicely. Very hard frost last night, and continuing. Wind S.W. There should be some good bags on Sunday next. Some very nice roach were taken last Sunday at the Boom, also some very good dace, but I have heard of nothing since, excepting three jack.—VON LEEFE.

Medway (Tonbridge).

The rain of Monday somewhat stirred the water up again, but it is now going down nicely, and in the absence of rain will be in condition for angling by Sunday. No doubt jack will be on the feed, and roach may be secured with a well scoured worm. Those who prefer the sport should try the back streams for chub and dace.—YE MEDWAY WATER RAT.

Ouse (Littleport).

Water very uncertain—one hour a nice colour, but as soon as the rush of water comes down it goes thick, so that we cannot get above two or three hours' fishing per day. There might be some good fishing with a light ledger, but no one seems to care about turning out. The following are the best catches:—

December 2: Mr. Hy. Lee, Cambridge, 10 lb. roach; Mr. Wm. Purchas, 8 lb. roach, in four hours. December 4: had a turn myself with light ledger for about two hours, got nine roach and one dace, going 5½ lb. the lot. December 5: Mr. Slatter, Littleport, 9 lb. roach and perch.—CHARLES SOUTH.

Thorney Broad (West Drayton).

The water is at present thick, but, if we get no more rain, the water will be all right by the end of the week, when there is every prospect of getting some good takes of roach, chub, jack, &c. Mr. W. Browning, 1 chub 2½ lb., and 2 fine trout, which he returned to the water. Mr. W. Hawkins, 1 jack 4 lb. 9 oz. on roach tackle. Mr. S. Browning, 1 chub 2 lb. 9 oz. Two gentlemen on Wednesday had a few roach.—E. GODFREY.

Trent (Alrewas).

The river has been unfishable the greater part of the last fortnight, and anglers have met with but poor success. A few good chub were taken on Monday, three of them weighing 9 lb.; the same anglers also getting a few roach with, I believe, worms for bait. The river has been too much discoloured for pike fishing, and our anglers have only been doing but little in the reservoirs and lakes. Mr. Robert Mann had a nice brace of fish from Earlswood on Tuesday, but the majority out on the same day met with no satisfactory results as regards either quantity or quality. I start early in the morning to join a friend at Wolverhampton, to fish the "reputed" best water in the Midlands; the result, satisfactory or otherwise, I will report next week. River to-day again rising, and much discoloured from the heavy rain which fell in the Midlands on Tuesday, and angling in the river is at a standstill.—JAMES GREGORY.

Trent (Nottingham).

The water in the early part of the week was in capital order for bottom fishing; but some of our anglers have been somewhat puzzled to know why the fish would not feed, and the rodsters in all the best lengths on the Trent have failed to do any good. I will venture to give them a hint or two, at this time of the year, when the weather is always expected to be uncertain as regards fishing with a rod. The best thing I can recommend is that anglers should carry a small thermometer in their pockets and by occasionally dropping it in the water they would soon discover the cause why the fish would not bite. This sort of thing is a frequent occurrence during the winter months, and it only wants carefully watching and there is not a doubt that the anglers who are fond of winter fishing would get on much better. To commence fishing when the temperature is low, to my thinking, is a mistake, because the fish are then perhaps in nearly a torpid state, and will refuse to take any bait, however tempting it may be. Then, towards the middle of the day, your small thermometer will tell you what to do; it is simply a waste of time to attempt to capture fish when there is no possible chance of persuading them to feed. These few hints I give for our brother anglers on the Trent, who have, as I have stated above, failed in some of the best waters to do any good. Pike fishing in some of our best waters has not been good, though one of fifteen pounds was taken at Weston with a live bait. The keeper says he is satisfied there are plenty of all sorts of fish in his water but most of the anglers seem to have no idea how to capture them; my reply was that I thought keepers ought to be practical anglers themselves, so that they might be able to give instructions to visitors. The water at the time of writing has now fined to something like the form for chub and pike fishing, and the weather being cold and nights frosty, the anglers cannot do better than go after these two fish.—W. BAILEY.

Trent (Newark).

The water has been high and discoloured most of the week, although not in very bad trim for a little worm-fishing. To-day an extra foot or so of water came down, but did not alter the colour much. To-night the river is rather high, and a bit of colour in it, but it is mending fast, and in a few more days will be in fairish condition for most kinds of winter fishing. We have had a few frosty nights, which should soon set the jack and chub on the feed. A few roach, &c., have been had these last few days with cockspur worms for bait, but not in very large quantities. The water was not in bad condition for worm-fishing, but somehow or other the fish would not feed. When the weather is at all frosty, and the water clear, I don't care for worms as a bait. I have done better, under those circumstances, with a bit of white paste. If the present favourable condition of things should continue, I think anglers who have a few gentles will find them to be the best bait for roach and dace. A handful or two of bread and bran, mixed together as a ground bait, will be about the best plan to adopt. The best swim for roach and dace just now would be a quiet, slow swim, about five or six feet deep, and a sandy bottom. Pike and chub fishers will have to wait a few days before they can hope to meet with much success in the main river; the weather is so very changeable that it is difficult to tell what will be the best plan to adopt, but anglers should come prepared for anything.

THURSDAY NIGHT.—Prospects pretty favourable, all things considered.—THE TRENT OTTER.

Wye and Derwent (Derbyshire).

Since my last report there have been some dishes of fish killed with the bottom on most parts of the Derwent; with both maggots and small cockspur and brandling worms, the maggots killing the greater quantity of coarse fish, such as roach, dace and a few small-sized chub, and the worms doing the most execution amongst both grayling and perch. On Thursday morning we had a sharp frost, which has brought both grayling and pike better on the feed, as I have just seen a basket of 7 brace of good-sized grayling that have been killed off of the Darley Dale water, below Darley Bridge, with small brandlings for bait. There has been very little done on the Wye during the past week with the fly, owing to the river being very high and out of condition for fly-fishing. If we only get some good, sharp, frosty nights and fine weather, we ought to have some first-class grayling fly-fishing up to Christmas on the Wye, as we have a good quantity of grayling in the Wye and in the Chatsworth fishery this season. The killing flies for both rivers are furnace and dyed hackle flies; these fine flies will kill grayling on any river where they abound, up to Christmas, weather and water permitting.—GEORGE JAMES EATON.

Yore (Yorkshire).

Everything during the past week has been in favour of the grayling fishermen, who have had what our American cousins usually designate "a fine time." Some excellent dishes have been caught with both fly and worm, the best that has come under my notice being 12 brace of grayling, 8½ lb., taken on Monday, by R. Colbeck, of Tanfield. The weather is remarkably open for the time of year, and there seems to be every prospect of our having a green Christmas.—FRANCIS M. WILBRAN.

THE EEL SETS ON THE NORFOLK RIVERS.

WE are glad to find that the view which we and Mr. G. C. Davies took respecting the alleged damage done by the eel-sets is fully borne out by the investigations of the committee. The following extract is from the *Norwich Argus*:—

"It has been demonstrated beyond doubt that eel-sets do not catch other fish, and that they do not prevent any members of the finny tribe from reaching the Broads at time of a 'salt.' It will be recollected that Mr. G. C. Davies stood alone in his view of the matter but in order to test the whole thing a committee were appointed to make inquiry, comprising Mr. Davies, Mr. Chamberlin, and Mr. Greene. The first-mentioned gentleman spent a night among the eel-sets, saw them taken up, and only discovered two or three ruffes among the eels. On returning to Horning Ferry, a number of other owners of eel-sets were there to meet him and show their produce of the night's work. There were no other fish but eels. As supplementing this conclusive evidence, the sales accounts of the fishermen have been produced, and show that only eels were sold. It is worthy of note that the nets, which were said to have stopped fish from going to the Broads, had all been swept away by the strong ebb tide of Saturday night, so that they could not have caused the results said to have been witnessed on the following Monday. Eel-sets are not the enemy of the angler; on the contrary, they are his friend, for they catch the greatest destroyer of the spawn of other fish known, and were it not that nets were used a great diminution would soon be found in the angler's sport. Eels go with the stream, and nets are useless at flood-tides, so they cannot obstruct fish in going to the Broads. We are glad that the matter has been cleared up, but we think great credit is due to Mr. Davies for the courage and patience he has displayed, and perhaps some day he will publish his experience, not only on this question, but also with regard to the devouring capacity of eels in respect of the spawn of other fish.

We think it might be well for the preservation societies to keep an eye on the produce of the eel-sets during the spawning season, it is during the march, if one may use the expression, of the great armies of fish to the spawning beds, that the nets *might* do damage by hindering them.

ANGLERS' RIGHTS DEFENCE ASSOCIATIONS.

WE beg to draw the special attention of our readers to the letter from Mr. Francis Francis, which appears in our correspondence columns, and also to the advertisement of the Thames Rights Defence Association, which also appears in our columns this week. We shall be most happy to acknowledge any contributions to the funds of this important Society; an angler who does not support it ought never to have any sport when fishing the Thames, and we hope he will not.

There is a similar movement on foot at Nottingham for the protection of anglers' rights; we give a condensed report, from the *Nottingham Guardian*, of a great meeting of Nottingham club anglers.

Our motto, in defending our rights, must be "*suaviter in modo, fortiter in re.*"

On December 6 a large meeting of the members of the different angling associations in Nottingham was held at the Assembly Rooms, Low Pavement, for the purpose of taking into consideration the right of the anglers residing in Nottingham to fish in the Trent. M. H. Coxon (president of the Anglers' Association) occupied the chair, and was supported by Councillor Hugh Browne, Mr. B. H. Cockayne, solicitor; Mr. W. Bailey, Mr. J. Jackson, Mr. S. Cook, Mr. Clarke (secretary), Mr. H. Benson and Mr. Barnes. The Chairman remarked that they were met to consider an important subject connected with the rights of the fishermen of that town. That meeting had more particularly been called in consequence of the conviction of two anglers, named Collishaw and Walker, by the magistrates at the Shire Hall. Notice of appeal was given against the conviction, and it expired upon the 17th inst. As they were no doubt aware, the defendants in the case were fishing from a punt in the Wilford Fishery, and it became a question as to whether such fishery was private or belonged in part to the burgesses of Nottingham. He might say that the association believed that they had a strong case as against the lord of the manor, Mr. Markham Clifton, and if the case was taken to the Court of Queen's Bench they would have substantial support from several quarters. He read a communication which he had received from Mr. W. Bailey, stating that he had fished during the last 30 or 40 years in the Trent between Clifton Grove and Trent Bridge, including the part in which the Collishaw and Walker were angling, on both sides of the river, without being interfered with. In conclusion, the chairman remarked that it was for that meeting to say what action should be pursued in the matter. (Applause.) Mr. Collishaw, Mr. Bishop, and Mr. Roper briefly addressed the meeting, each stating that for a number of years they had fished in the particular part of the river at the spot where Collishaw and Walker were caught angling, and afterwards prosecuted, without any molestation until recently. Mr. B. H. Cockayne followed, and read a voluntary letter which he received from Mr. Hugh Brown, bearing upon the matter, which they had assembled to discuss. In the communication Mr. Brown quoted the opinion of Mr. Patchitt (the county magistrates' clerk), which he expressed in a case in which several years ago some persons were prosecuted for fishing against the Trent Baths, and came on for hearing before the county magistrates, Mr. Patchitt stating that the right of fishing had been exercised by the public from time immemorial. Mr. Brown also mentioned another case in which a keeper and his son were convicted for assaulting a fisherman and taking away his fish in the same locality, and he certainly thought that the conviction in the recent case would be quashed if it was taken to the Court of Queen's Bench. Mr. Cockayne also referred to the action of Mr.

Cropper in the matter, and read a report of the proceedings touching upon the subject when it was brought forward by Mr. Cropper at the meeting of the town council in October. Mr. Cockayne, continuing, remarked that he has been authorised by Councillor Worth to express his sympathy with the association, and the pleasure which it would give him to render them any assistance. He had also conversed with many influential gentlemen who were willing to give their support, and wished the question to be fought out. (Hear, hear.) He had represented the matter to the Town Clerk as one affecting the inhabitants of the town, but he could not see his way to take it up in the interests of the public, and it therefore remained to them to carry it to the end, which he was informed was the intention of the executive. He had taken the opinion of counsel, and believing they had really a good case, he hoped the members of the Angling Association would give Collishaw their support in carrying the matter to an end. (Applause.) Councillor H. Browne, who in the meantime had entered the room and was well received, next addressed the meeting, remarking that he supposed he was addressing anglers, who, until about twenty years ago, fished where they pleased up and down the Trent, but since that time the results of proceedings before the magistrates had been that whereas once they had the Trent as their river, at the present time they could hardly cast a line anywhere in it. Twenty-five years ago it was an open question whether the public might not have rights of fishery in any river navigable or not. Lord Campbell, he thought not quite rightly, with a view to Magna Charta, held that the public would not have a right in a river not navigable. Then there came another distinction. There was an allusion in one case that where the public had a right of fishery the river must not only be navigable but tidal. Let them remember that it was only an allusion, but when the Commissioners for salmon with regard to the river Ribble afterwards met they prepared an elaborate judgment and took up the chance word tidal, and said the public should not go any further than the tide went, therefore it was not to be wondered at that the landowners, with that decision in their favour, acted upon it and said, "The public have no right; it all belongs to us." This was natural on the one side, but on the other they had a long series of cases beginning with Magna Charta and continuing down to latter judgments, especially that of Lord Cockburn, that the tide had nothing to do with the question. If that question had not been decided disputes would constantly have arisen as to how far the tide came up, and where their right of fishing began. There was every reason for contending against the decision, which was considered as settled by the Salmon Conservators, and acting upon Lord Cockburn's suggestion. He advised them to proceed with the present case and defend any other which might be brought by any landowner. Then as to the method of doing it. Let them apply to the Fishing Associations which had been formed at London, Sheffield and Worcester, and other places, for assistance, and not be divided in the matter. The town had an active Corporation, and he (Mr. Browne) was proud to be the chairman of the Public Rights Committee, but they must have them at their backs; and if he felt that it was a question of two shillings, as in the question which he had cited, he would give up representing them. Let them have a decided expression of opinion in the matter. He was willing—and he spoke on behalf of the bulk of the members of the Corporation—to take the matter up, provided they were supported and urged on. They ought to be united in the question, call upon other Corporations to assist them, and appeal to Parliament, and finally have the matter settled. (Applause.) Mr. Wilkinson followed, and proposed "That a public subscription as a defence fund should be immediately started in such a manner as the Executive thought fit, and prosecute the appeal to its final issue." He remarked that all they had to do was to collect as large a sum as possible, and if any amount was wanting in the end it had been guaranteed. (Applause.) The meeting afterwards concluded with votes of thanks to Mr. Browne, Mr. Cockayne, and the Chairman and officers connected with the Association.

HORTON'S CREEK.

No. II.

WHEN writing of this forest-grown closely matted, Horton's Creek, as a sample of an American forest trout-stream, we did not imagine that in a few months its waters would run out unchafed and unweaved, without anything to dam its progress until it emptied into the Pine Lake; but the demands of commerce were awaking the echoes of this quiet valley. This forest growth of timber was wanted; the axe of the woodman was already ringing in the forest glades; along this stream were clumps of hemlock whose bark was wanted in the tanneries of Milwaukee and Chicago; whose branches and trunks would cut up to make ties for the iron road to enable the screaming horse to push his way across the treeless prairies of the far west, and to the savannahs of the south; thus bringing to our pushing city, the wealth of cotton from the sunny south and the golden grain from the great west to this immense granary of the world. The trees must come down and the bark be stripped; this could be easily transported in waggons to the lake, but the hemlock ties must be floated down stream. To do this the creek must be chopped out and cleared of the thousands of fallen trees and brush. This was an undertaking; but a few of the red sons of the forest—of the tribes of the Chippewas and Ottawas, rejoicing in such names as, Nah-a-quom, O-gagh-me-ga-do, Louis Wim-a-gonce, Peter Skip-er-gosh, James Wash-er-ghe-dic—contracted to clear the creek sufficient to float down the ties and posts.

One of these Indians would jump into a dug out (canoe), and get out into mid-stream; he would chop out a log, fasten a rope to it and throw it to his companions to haul up. With some pulling and tugging they got them on to the banks of the creek. Just fancy a band of labourers working, with such names as these; how would an English foreman twist his mouth to give any one of them orders? But these Indians, working almost by signs, silently chopped out this creek until the last log was moved, and the work progressed sufficiently to run the ties already in the river mixed up

into a big jamb. Such was the state of this famous trout stream when we reached the place in mid-July; but trout were on the feed, and running a log jamb only added spice to the fishing; so we determined to take the fishing skiff, haul it up through the riffles, and do some fishing above the log bridge. So, putting on our long boots, we took the line across our shoulder and waded in to tow the boat. Phew! but it was hot work! We tilt the beam at 175 lb., yet the surging of the boat in the rapid current brought us up standing, and often forced us down stream again; but sticking at it overcomes the greatest difficulties, so we at last pulled our boat into the quiet waters above the bridge and began fishing; the river is full of ties, and we must force our way through them. Trout were there in plenty; we just drop a line into a small space in the ties, instantly we feel the jerk, and a slight turn of the wrist hooks a fine fellow—this just whets the appetite as we drop him into our fish well, but we cannot stay here. A half-mile of logs are moving, and unless we want to get hemmed in and carried down stream, we must pitch into some hard work. Plying pole and boat-hook we scramble through the water, sometimes on logs, sometimes along the river edge at every available opening, until at last we reach open water. Here we pause for a breathing spell.

Our intention has been to explore this stream. There had come to us in past summers strange stories of this noisy brook: that in its upper reaches it widened out into small glassy lake-like openings; that little creeks and springs came tumbling into it so cold that you could scarcely keep the water in your mouth; that up near the head were springs away down in deep holes, and the water rippled on the surface, like the boiling of a pot, from these many springs; that in these spring-holes trout lay by the hundred, and no one could induce them to bite, neither fly, worm, fin, or bait of any kind. We therefore determined to explore this creek, and see for ourselves the truth of these vague reports of the Indians. We had a hard day's work before us, but both of us were fishermen, and vigorous enough for anything; so to work we went. Whoever said there was no trout in this brook knew nothing of it, for no sooner did our boat strike a log than away went two or three. As I paddled or poled along up stream, my friend Alonzo would occasionally drop a line into a likely-looking hole, then out came a good-sized trout. We passed on, over sand bars, across which the bottom of our boat rubbed; another moment we would be over a deep hole out of which trout scurried; these holes seemed to have no bottom, the black peaty mud giving way to our pole for six or eight feet. Along up through green vistas of alder and spruces until the creek narrows and islands form on its surface, springs of cold water came tumbling in; we jump ashore and push up into the forest a hundred yards or so and find small trout in these little creeks in good numbers. We push on until we reach the pools; there are three of them, large holes deep and dark, where the bubbling waters have washed out the soft earth; on the surface you can see the water as it rises, breaking into ripples. Looking down into them the bottom seems covered with dark forms, which we can imagine are trout. Elated and jubilant we put our best bait on small hooks; we gently sink them, they turn to it for a moment, but there is no responsive jerk. They sink down to the bottom again. We try the best flies in our well-stocked book; the same result. The brightest worm, the handsomest fin, and that most killing of all baits—the trout's gizzard; but all with the same results. We determined to wait until the sun was sinking and the shadows fell over these pools; but we waited in vain. No trout could we take. To see what quantity of trout were in the pools my friend drove his rod down into the holes. His startling cry, "Just look at them; there must be hundreds of them." What a sight! We question if ever such a sight will come to our eyes again. They were going in all directions. But what a nuisance—not one of them would bite.

The shadows are deepening. We have already stayed too long, and have a long way to go, and through a jamb of ties that may take hours to get through. So, hastily skimming over the shallow portions of the stream, we make for deeper water and for the trout. My friend is an expert in handling these peculiar boats, so he generously gives me the bow while he takes the boat hook. As we strike the current I drop into the holes on either side me, while we drift along, and once in a while strike and bring in a nice one; sometimes bringing a big fellow around for him to lift into the boat, while he evidently enjoys seeing me catch them.

A sharp push for the ties, some hard pulling and tugging enables us to break up the jamb and make a rush for the bridge. We pull our boat up on the bank and tramp for home just as they were lighting the lamps and were wondering what had become of us. We were tired and hungry, for we had eaten nothing for thirteen hours. While the family were examining our basket of trout, we ate supper. Another year will bring great changes in this creek. Though the trees and brush had been cut out they

did not stay so—the stormy winds, the heavy snows, the vernal equinox, had all done their work, and done it well. The trees are again lying across the creek, and will soon dam up its waters. The havoc of one winter's storm will fell so many trees, that it is difficult and expensive to clear them out; if they are left alone they form a splendid hiding-place for the trout. As we last saw it, the condition was hopeful, and we expect to enjoy many days of fine trouting on this "beau ideal" of an angler's trout-stream.

W. DAVID TOMLIN.

Chicago, U.S.A., November, 1881.

CLUB AND OTHER JOTTINGS.

By L. B.

THE monthly meeting of the United London Anglers' Central Committee was held at the Bald Faced Stag, Worship Square, Finsbury, on Monday evening last, under the presidency of Mr. Samuel Morgan. After the reading and confirming of the minutes of the previous meeting, the secretary, Mr. R. Ghurney, laid on the table some important letters from the authorities of the London and North-Western, and the Midland Railways, the gist of which was that as a further guarantee against the misuse of privilege cards by persons travelling to stations to which cheap tickets are issued, they would not in future be issued unless the angler also produced, at time of booking, his fishing tackle. The last-named company also suggesting that a clause to that effect should in future be embodied among the instructions printed on the back of each privilege card. This fact cannot be too widely known; as such knowledge will, no doubt, prevent much annoyance to anglers who have been in the habit of keeping their rods, &c., at some favourite and frequently fished resort. I may state *en passant*, that the case of these last had been duly laid before the companies previous to their arriving at this final decision, so there is nothing for it but to comply with good grace to what they deem a precaution necessary to protect their interest.

The next matter brought forward was the reading, passing, and distribution of the half-yearly balance sheet, from May 2nd to Nov. 7th. Among the principal items of interest, I note that there have been four new societies enrolled, that the total number of privilege tickets issued is 1168. The cash balance in bank and in hand amounting to £112 1s. Among the items of "Expenditure" are the following connected with the "River Lea Department," which every lover of Old Isaac's sedgy river—nay, every true angler—will say is money well spent, "Watching river, fence months, £8 19s. 9½d. Police constables, 12 nights each at Waltham and Tottenham, £6 3s. 6d. (I believe the water was drawn down during this time). Successful prosecutions at Stratford, Waltham, and Ware, £6 7s. Reward to constables, Ware and Waltham, £2 2s. Police constable watching river at St. Margaret's and Clapton, £1 10s., total £25 2s. 3d.

A proposition was also made and carried, that the secretary do again write to Mr. Seton, respectfully requesting, agreeably to a promise made last season, he would sanction this association again netting the East London Waterworks at Tottenham, with a view of enriching the public portions of the river Lea with the fish so procured.

Mr. Murphy then made some remarks about the necessity of secretaries of angling societies guarding against enrolling members who had left other clubs as defaulters.

The subject of London angling clubs renting suitable waters for the use of their members was then brought forward by Mr. Theobald, of the Great Northern Brothers, who referred to the recent correspondence in the FISHING GAZETTE. As it was somewhat late in the evening, this gentleman, upon the suggestion of Mr. L. Bonvoisin,—who said this was perhaps the most important subject ever brought on for discussion in that room, and one which would have his hearty sympathy and support—agreed to give notice of motion, and to have it thoroughly ventilated on the next monthly meeting night. After transacting the routine business, Mr. Ghurney called the roll, the meeting terminating with the usual vote of thanks to the chairman.

On Sunday week, fishing one of the ballast holes at Staines, commonly known as "Staines Gulleys," in a perfect hurricane of rain and wind, Mr. Defour, of the Savoy Brothers Angling Society, managed to capture a handsome carp (6 lb.), which has been duly forwarded to Mr. Cooper to be done justice to.

On Wednesday evening next, 14th, a special complimentary visit will be paid to the King's Cross United Angling Society, Prince Albert, Wharfedale Road, Kings Cross. Mr. L. Bonvoisin has promised to take the chair. The house is barely five minutes' walk from the Metropolitan Railway Station, and handy for both busses and trains, so piscators from all quarters will have no excuse for not mustering in goodly number. Possibly, if a little bird that has whispered to me speaks true, this may be the first public opportunity of communicating to the London anglers the eagerly hoped for extension of a great boon—but I must not anticipate.

At the recent half-yearly supper of the North-Western Angling Club, a handsome white cane German-silver-mounted roach rod, with a suitable inscription, was presented to Mr. Robert Marshall in recognition of the able manner in which he had discharged the duties of chairman during the past twelve months.

At an important special meeting of the Committee of the Thames Rights' Defence Association, held at Messrs. Crump and Son's offices, 26, Philpot Lane, E.C., on Monday morning last, it was decided that appeals to all interested should be inserted in the form

of an advertisement in the sporting, daily, and a number of country papers in those counties through which the Thames flows, asking for funds to continue defending, and, if necessary, asserting the public rights to the free use of the river. Other important steps concerning the immediate future action of the Association were also discussed and decided upon.

On Monday evening, after the Central Committee meeting a gentleman asked me whether two of the Committee's Lea bailiffs, who had recently, in the execution of their duty, overhauled his basket to satisfy themselves whether his fish were undersized or not, were justified in appropriating the contents of a flask of whisky, which they could scarcely have mistaken for an undersized fish. As he was a consenting—or at least a non-protesting—party and they had a long walk before them, and it was a cold day, it didn't so much matter. "Only, on another occasion," added he, "they might claim it as one of the rights of bailiffship—then how should he act?" Well, I referred him to head-bailiff Ghurney, who is an authority—I don't mean on I. whisky—but on bailiffship, its responsibilities, and privileges.

I alluded some time since to the Chairman of the Richmond Piscatorial Society having been seen at Holroyd's, selecting a rod which, I understood, was for presentation to a prince. The presentation came off this week; and I am breaking no confidence in saying that it was a present from one Royal head to another; in fact, it was from the ruler of the T. A. P. S. to the ruler of the W. C. A. L. and P. A. S., and if they are not kings amongst men—at least angling men—I don't know who are! This fine specimen of the tackle maker's skill, was a barbel rod; and when readers learn it was mounted in solid silver, they may rest satisfied that the acumen and skill of the chairman of the R. P. S. was well rewarded by the way in which his order was executed. All good fellows will rejoice at the kindness of Mr. Spreckley, who could mark his sense for a good day's barrelling with such a trophy; and that our old friend and fellow-worker, Mr. Geen, will appreciate and value the gift—not for its silver mounts and ivory stops—but for the kindness of one who has endeared himself to every "Thames Angler."

THE THAMES RIGHTS DEFENCE ASSOCIATION.

SIR,—May I venture to inform the public—at least, those few millions of it which are interested in preserving the rights of the people from wholesale annexation and plunder—that, however public-spirited the chairman, treasurer, secretary, solicitor, and council of an association may be, there is a point at which their public spirit begins to fail them, and that is when the public won't put their hands in their pockets and subscribe sixpence to assist the expenses incurred in their own behalf. We give our time and our trouble and thought freely, without any pay or any prospect of pay; nay, we even subscribe according to our fortunes out of the fullness or otherwise of our purses. Is it too much to ask those who do nothing at all, and who don't give a minute to this matter, to send us any trifle of superfluous cash which they may be able to afford? When I started this association, it was on the promise of considerable support from the outside. Many people promised us handsome subscriptions if such an association was started. It was started, and when these persons were applied to fully half of them never responded. One gentleman, who nobly promised us fifty or a hundred pounds, never even answered any of our applications. Should my eloquence move him now, may I say how very pleased our treasurer, Mr. W. A. Crump, of 10, Philpot Lane, or our secretary, Mr. J. M. R. Francis, of 11, Old Jewry Chambers, City, would be to receive a cheque upon any prominent London or provincial bankers for that pleasant three figures, or other like documents for lesser sums from other parties. If this is to be carried to a conclusion, we must have money, and much money; for I am told that the riparians are ready to spend large sums to effect their purpose of shutting up the Thames. It will be a long and toilsome job for us, but this we don't shrink from a bit. For my own part, I am fond of a good fight, and am never so happy as when I am in hot water; but then, on the other hand, I am never so unhappy as when my banker's account grows smaller by degrees and beautifully less. So, to all whom it may concern, please weigh-in without loss of time.

FRANCIS FRANCIS, chairman.

MR. AND MRS. GERMAN REED'S ENTERTAINMENT.—Messrs. Alfred Reed and Corney Grain, having completed their fifth year of joint management of this popular entertainment, have renewed their tenancy of St. George's Hall, Langham Place, for a term of years. Great improvements have been made during the autumn; the stage has been rebuilt and lowered, a green-room provided for the artists, and the arrangements before and behind the scenes have been improved. The performance comprises the operetta *Ages Ago*, written by Mr. W. S. Gilbert, and composed by Mr. Frederic Clay, who has rewritten portions of the music, and added an entirely new duet for the tenor and soprano. The cast includes Miss Edith Brandon, Miss Fanny Holland, Messrs. Alfred Reed and Corney Grain, and Mr. North Home, who will make his first appearance as a member of this company.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40, Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invite Noblemen and Gentlemen to try his standard FLIES for the present season. No flies seen or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

THE LARGE DORSAL FIN OF THE GRAYLING.

SIR,—With regard to the enquiry of Mr. J. Harrington Keene as to the purpose of the large dorsal fin of the grayling, possibly its development may be explained in the following manner:—A lateral compression of the body, in conjunction with a lengthening of the vertical and a shortening of the longitudinal axis, we find in fishes moving comparatively slowly through the water and able to remain, as it were, suspended in it.

If a lengthening of the dorsal fin of a fish is a substituted compression of the body and lengthening of the vertical axis, the convenience of such a lengthening is obvious in a mid-water feeder, and the presence of such a dorsal fin shows the habits of the fish. And if the vertical length is made up half of body and half of fin, it may account for the movements of the grayling not being, perhaps, properly described as comparatively slow.—I am, &c. H. M. P.

LISTS OF FLIES.

SIR,—Allow me through your columns sincerely to thank Mr. Balderston for his kind response to my request to him to publish his tables of results of flies, which I have perused with much interest and pleasure, and to assure him that I should have expressed my thanks before now, but have been weekly awaiting his promised tables of Comparative Results, intending to have thanked him for both together.

I hope we may yet have them; and if you, Mr. Editor, can find space, I can answer for a number of your subscribers in this locality that they will not find Mr. B.'s remarks too voluminous, as he seems to fear.

From your footnote to Mr. B.'s tables, Mr. Editor, I conclude you do not incline to Pennell's theory of flies; but I observe, nevertheless, that in Mr. B.'s tables, Pennell's flies outdistance many standard patterns, notably the Palmer. I admit, however, that the data in their case are scanty compared with the others, indicating that for Mr. B. their "selective attraction," as he happily phrases it, is but low.

I am led to make the above remarks from having made my best bag of this season with Pennell's green and brown, in gin-clear water in July, beating, moreover, an older hand than myself, who was using a selection of ordinary flies. It seems to me, therefore, that the system, if not infallible, does not quite deserve the ridicule bestowed on it in some quarters. I should be greatly interested to hear Mr. B.'s opinion, or your own.—I am, &c., W. T. S.

FISHING AT DORKING.—A QUERY FOR MR. JARDINE.

SIR,—I have from time to time gleaned so many valuable hints from your excellent paper, and have so often noticed the kindly way in which questions on fishing matters have been answered by your correspondents, that I venture to ask a question or two. Is there any fishing to be had in the river Mole, at or within a reasonable distance of Dorking? What kind of fish are to be found there? May I ask one other question—are not all the largest pike female fish? I believe the males are always much smaller. Certainly in the spawning season, from all I have observed, and from what I can gather from others, the males are often not half the size of the females. If this is so, it accords well with a law which appears to be very general amongst birds and butterflies, and other scaly-winged insects. Perhaps, sir, if my question on this matter, is not outside the range of subjects discussed in your pages, and if it is not already settled beyond dispute, you will kindly allow it to appear.—I am, &c., 33, Harley Street, W., Cavendish Square. ARTHUR HENSMAN.

[There is good fishing at Dorking, and permission or day tickets can, we believe, be had of some of the millers. Perhaps some reader who knows the locality will kindly give us details.—ED.]

READINGS IN ANGLING CLUBS.

SIR,—An excellent article under this heading appears in your issue of Saturday last, but to one passage I must certainly take exception, because it conveys an erroneous impression to the mind.

It is stated that the Piscatorial Society was the first angling society to introduce the reading of papers at their weekly meetings, which readings relapsed for a time, but have lately been revived. Will our friend B. give us the date and subject of the last paper read before that society previous to his so-called revival?—which latter, by the way, was the act of an individual member, not that of the society, as he seems to think. So far as my information goes (I am open to correction), no paper, in the proper sense of the term, had been read before that society for the last twenty years, and it was only after the Gresham introduced the reading of papers at their meetings that the Piscatorials made an effort again. So long as this is fairly understood, I do not complain; but it is not clear from his article that this was so, and I think B. might have stated the fact.

Most admirable papers have also been read before the Manchester Society for some time past, and to them the credit is due of doing steadily what should never have been neglected by the metropolitan body.

I ask you, sir, to admit these comments in no spirit of rivalry, save that honest and wholesome rivalry which consists in doing our utmost for the common cause; but I am jealous of the fair fame of the Gresham, which, I trust, will yet lead the way in further reforms and innovations, to which it may not be policy at present to refer.—I am, &c., T. CRUMPLEN.

11, Albert Street, Regent's Park, N.W., Dec. 6, 1881.

THE INTERNATIONAL FISHERIES EXHIBITION, 1883.

SIR,—In your paper of October 13th, I noticed the announcement of the great International Exhibition and the list of names of the presidents, etc., and among them the names of two of the M.P.'s for my county of Cornwall. But what I wish, Mr. Editor, is to draw your attention, and, through the medium of your powerful paper, that of the general public, to the state of some of our otherwise beautiful rivers, which are polluted and made barren by the refuse sent into them by the mines. Nothing can live in them, fish or fowl. Some of them literally stink as they roll heavily along, laden with the thousands upon thousands of tons of stuff, saturated with arsenic and copper, liberated from the tin in the burning houses; others are loaded with the slimes of copper and lead,

and at flood times they overflow, and then woe to the beautiful grass in the meadows—nothing will grow again, where that takes place, for years, and nothing lives in it.

Now, Mr. Editor, I would suggest that a prize or prizes be offered, at the Exhibition, for the best practical essay and the means to be adopted, and proved there and then, to prevent the mischief, or to purify the water before leaving the mines, or before it enters the leats or feeders of the rivers. If the Exhibition accomplished this only it would, in my mind, be a great success. I should say that the prize should not be of less value than 200 guineas. I don't see much use in showing a lot of fine things to capture fish with, if there is nothing, scarcely, shown how to cultivate and preserve them from all their enemies—birds, beasts, or reptiles, and the filth that is wantonly thrown into the rivers of our county. If it is worth while for the Wycombe Association to make such stir about their little bit of water, it surely must be a national affair when miles upon miles of the rivers in Cornwall are daily polluted in the manner they are. It always seems to me a hard case that a landowner, on granting a sett, perhaps at the head of a river, should be able to do so, and not consult any of the landowners further down the stream, who will be sure to feel the baneful effects, nor help to make up any losses thereby, or scarce anything. Take a case. South Caradon mine, one of the richest copper mines in Cornwall, is situated at nearly the head of the river Seaton, which empties itself into the sea about two miles to the eastward of the Looe, and which, some years ago, swarmed with trout and grilse, and was a noted salmon-spawning river, but now there is not one in all its length of fourteen miles. I believe the mine just sends a few men one day in a year, in another lord's right, to repair it; but the party that work the mine never, to my knowledge, have contributed a penny, although, by the published reports, they have received more than forty thousand pounds in dues from that mine. Is it not monstrous, Mr. Editor? Why I, as a private person, if I were to throw any deleterious matter in a river, I should be called to account for it. There are many other rivers in Cornwall as bad, if not worse—the Loyhner, for instance, I think is worse if anything. Commissioners have been down, and I don't know what, but they have done nothing that is practical. What we want is something practical, something that will clean the water. I could write you more about our rivers, but my space is at an end, and, perhaps, your patience.—I am, &c., A CORNISH ANGLER.

EARTH WORMS.

SIR,—I am extremely obliged to your correspondent, Frank Gosden, Esq., of Exeter, for his remarks on my letter in reference to earth worms; but since I wrote I have experimented on some 3 dozen "lobs" and "cockspurs" and from the dilapidated appearance these tail ends now present, I decidedly incline to your opinion that they do not regain their original forms, though we are distinctly told by one or two celebrated naturalists that such is the case. In Goldsmith's "Animated Nature," vol. 2, pp. 561 and 561r, he says: "Spalanzani and others have tried several experiments upon the earth worm, many of which succeeded; every earthworm, however, did not retain the vivacious principle with the same obstinacy; some, when cut in two, were entirely destroyed; others survived only in the nobler part, and while the head was living, the tail entirely perished. But what was most surprising of all, in some, particularly the red-headed earth worm, both extremities survived the operation; the head produced a tail, with the anus, the intestines, the annular muscle, and the prickly beards; the tail part, on the other hand, was seen to shoot forth the nobler organs, and in less than the space of three months sent forth a head, a heart, with all the apparatus and organs of generation." From close observation, I am in a position to say that not a single tail end succeeded in penetrating the mould in which they were placed; under these circumstances how could they possibly obtain nourishment sufficient to enable them to perform the astounding feat mentioned above? Hoping to see something more conclusive in your much looked for review.—I am, &c., MARK ANTONY.

Dec. 5.

THE PROPAGATION OF COARSE FISH.

SIR,—Your proposal to form a society for the propagation of coarse fish is one of the grandest that has been mooted for the benefit of anglers during the last few years.

One thing I sincerely trust you will do, and that is, eschew the cultivation of either salmon or trout, or any of those aristocratic fishes which require a good deal of expense to capture, and for which club anglers do not care to angle whilst there is a prospect of being able to obtain a goodly basket of lubberly, bream, or shiny roach. Some will say: "But if you make trout, &c., more common in our rivers and streams, it will repay for people of tightened means to try for them." I do not think it will. Working men, who have not too much money, would rather secure a 20 lb. bag of perch or roach, than throw a fantastic fly all day for one or two small trout. The tackle for fly-fishing is also too expensive to be freely indulged in. You want a rod or two of perfect make, lines of the very best, and a countless hoard of costly flies. I hope, therefore, this will be exclusively a "Coarse Fish Cultivation Society"; at any rate at the commencement, until its funds have reached a considerable amount and the society has taken root and stands firm on its basis.

I cannot agree with those who would exclude the carp from being cultivated, for, although he's wary and exceeding cunning, yet he does afford great sport when once hooked, and makes a courageous tussle for existence; therefore, carp, by all means.

Another matter of great interest and curiosity will be the introduction of black bass; and, if they are not too bellicose in their nature in attacking such good-natured fish as roach, &c., no doubt they will be welcomed by the angling public.

Also, sir, respecting that 'ere German manager; it is very gratifying to learn you acquiesce in Mr. Keene's hope that a man be found, who can do the work, in this country. We shall like him all the better. Please don't forget to give us a long warning of the coming meeting which you propose to hold, and then no doubt you'll see a mighty array of rod holders.

And, now, sir, will you let us know whether it is intended to float this enterprise by opening a subscription list, or by enrolling members, who will have the option of withdrawing fry and ova to the amount of their subscription?

If all anglers assist in as ready-hearted a manner as "A Thames Fisherman,"—whose intelligent letters, by the way, are very well worth reading—by sending their contribution, however small, and by shaking off all lethargy and indifference—thereby showing a little public spirit, for which many of them are, unfortunately, not characterised—there is no reason why the society should not have an income of £1000 a year.—I am, &c., HENRY GREENWAY.

The Firs, Cricklewood, Dec. 5, 1881.

LOST TACKLE ON EEL-PIE ISLAND.

SIR,—On behalf of Mr. Anderson, sole proprietor of the Eel-pie Island, I beg to say there was no person fishing from his island when this tackle was lost; but there were several persons fishing from the adjoining island, which is the property of Mr. Grant-Duff, M.P.—I am, &c., ALFRED PERRIN.

CLUB REPORTS.

ANGLERS' PRIDE.

The members of the above club fished for three valuable prizes at Boxmoor on Sunday last, given respectively by Mr. Clarke, Mr. Watkins, and Mr. Haines with the following result:—T. Fiddes, 1st; F. Nash, 2nd; H. Scutt, 3rd. H. Mallett, D. Dodson, W. Hayes, and W. Ferry weighing in the order named. All members are requested to attend on Wednesday next to select a place to fish for the Christmas prizes.—T. MARSHALL, sec.

December 6.

BEDFORD ANGLING CLUB.

I do not wish to press further controversy on Mr. Bicknell, but, in justice to myself, beg once more to state that I never gave an opinion as to the legality or otherwise of fishing from Mr. Mann's fields at Clapham. Mr. Bicknell is very inconsistent in suggesting to me, that, because I have been the means of making public the calling of ugly names and stoning business, the advisability of my going down and getting summoned. He knows as well as I do that any person desirous of thoroughly testing the case would in all probability have to appeal against the local magistrate's decision, and to get the case transferred, and finally decided, to a superior court, necessitating the expenditure of a large sum of money and the loss of much valuable time, which the comparatively limited interest felt in this particular water by the London anglers would scarcely justify. Concerning the closing paragraph of Mr. Bicknell's letter to the effect that my statements as to the exclusion of visitors and strangers from this club show an utter ignorance of facts, I feel sure Mr. B. will, if he refers to my original notes, find that I did not quite say that; but that the refusal to issue day tickets, upon payment, to well-conducted anglers and the charging of double annual subscriptions to non-residents, must practically have the effect of excluding visitors and strangers, particularly the poorer ones, is self-evident.—LEO. BONVOISIN.

Dec. 8.

BERMONDSEY BROTHERS.

The Bermondsey Brothers had their half-yearly supper on Tuesday night, the 6th inst., at their club-house, Alscot Arms, Alscot Road, Bermondsey, about fifty sat down to supper. Mr. W. F. Herbert in the chair. Mr. W. Mills, vice. First toast, proposed by Mr. Penington, "Prosperity to the Bermondsey Brothers Angling Club," with health of the secretary and officers, Mr. W. Allen seconded. After a few songs Mr. Frost proposed the second toast, "Prosperity to the London Angling Central Committee," with health of Mr. Ghurney and officers. Mr. Allen, as delegate, responded for that association. Mrs. Benningfield, Mrs. Allen and Mrs. Mitchell sang some excellent songs in capital style. Mr. Hulse then proposed the health of the worthy host, Mr. Sargent. Mr. Sargent replied in a very felicitous speech. The rest of the evening was enlivened by songs and recitations from members and friends. A vote of thanks to the chairman and vice-chairman, and to Mr. Benningfield, who presided at the piano, concluded a very enjoyable evening.—WILLIAM ALLEN, sec.

Dec. 7, 1881.

BRIGHTON ANGLING ASSOCIATION.

Some of the members went to Berwick during the week, but the water was in a very bad state for fishing. Mr. Flating took four bream, the others did not do much, the largest bream weighed 3 lb., and were brought home alive, and are to be seen in the Brighton Aquarium, the other rivers are all flooded, and if any more rain it will not fine down by Christmas. The installation of new officers for the year 1882 took place on Monday last.—GROUND BAIT.

THE BRUNSWICK PISCATORIAL SOCIETY.

The business meetings of this society take place on Wednesday evenings, at eight o'clock, at the Brunswick Arms, Brunswick Street, Stamford Street, S.E., not on Thursdays, as has been erroneously published, and on Sundays, at the same time, for the purposes of weighing-in fish, etc. Last Sunday, Mr. Wm. Booth weighed-in dace from the Thames. On Wednesday last, after the enrollment of some new members, it was proposed, seconded, and carried that a vote of congratulation be recorded to our brother member and pianist, Mr. Wm. Allsop, on his narrow escape from death, being knocked down by a cab. After which, Messrs. Allsop and Chrysilian presiding at the piano, some good songs were given by Messrs. W. Worth, W. Booth, Moore, Chrysilian, Reynolds, Keeble, Dent, etc.; duets by Messrs. Walker and Keeble, concluding with "Auld Lang Syne."—ESOX LUCIUS.

CADOGAN ANGLING SOCIETY.

On Wednesday week, a splendid show of fish from the Colne, by Messrs. Goodger and Pike. Mr. Goodger, with 10½ lb. of roach, several of them going 1 lb. each; 3 lb. of fine dace, the largest 9 oz.; 2 lb. of perch; also one jack, 6 lb. 8 oz., in first-rate condition. Mr. Pike, 8 lb. 12 oz. of roach, the largest going 1½ lb.; 5 lb. of fine dace, the largest 7 oz.; and 2½ lb. of perch, the largest 14 oz. The total weight of fish shown being nearly 39 lb. All members are requested to attend on Thursday next, to arrange prizes, &c.—W. R.

CONVIVIAL ANGLING SOCIETY.

Only a few members were out on Sunday but there was a very fine show of roach, perch and dace, and one fine jack, weighing five pounds, from the Lea. Our half-yearly dinner will take place on Tuesday, Dec. 13.—W. EYLES.

DUKE OF CORNWALL.

The Duke of Cornwall anglers were saved a blank on Sunday by Messrs. Aldridge and Flanagan, the former with a very nice jack scaling 6 lb., and the latter with roach. The third half yearly supper and distribution of prizes took place on Tuesday, and was a great success. Mr. J. Robinson was in the chair, and Mr. Hillman in the vice. A very pleasant evening was spent, in the course of which a goodly number of prizes were promised for the rest of the season.—J. HECKFORD.

EDMONTON AND TOTTENHAM ANGLING SOCIETY.

The scarcity of fish in this club is as noticeable as the rest of the clubs, nothing having been done for some time past, with the exception of two or three pretty good jack of about 7 lb., Mr. Jones showing a very pretty fish of 9 lb., on Sunday last. We go out for prizes next Sunday; roving commission given by Mr. Holdsworth Lowin Chambers. A very exciting contest is taking place between Mr. Jones and Mr. Lowin for a new guinea hat for the largest jake of jack.—G. STEPHENS.

GRESHAM ANGLING SOCIETY.

The members of this society met as usual on Thursday, and passed a very enjoyable evening, although the attendance was not so large as on many former occasions. The chair was ably occupied by Dr. Defreiz. The hon. secretary stated that all the arrangements connected with the water rented by the society were now complete, and some prizes over and above those named in the society's list, would be fished for on January 2nd next. Mr. Bryant had taken a jack there on Saturday last of 3½ lb., and the secretary some fair-sized roach, but the latter were returned to the water. A jack of 17 lb., taken by Mr. Ellis, from the Lea, had been weighed-in during the week. On Thursday next the meeting will only be of a formal character, strictly limited to matters of business, but on Thursday the 23rd inst., there will be a general discussion, chiefly on jack tackle, several distinguished anglers having undertaken to bring their tackle by way of illustration. Dr. Brunton presented the society with an excellent water-colour drawing of two roach, beautifully rendered by a lady artist, for which himself and the painter were very cordially thanked. Dr. Brunton mentioned incidentally that the roach depicted were in the possession of the Piscatorial Society, and suggested that this would indicate the harmony that should prevail between two such important societies, both having the same end in view, a remark that was strongly endorsed by Mr. Crumplen, and heartily applauded by the assembly. Messrs. H. W. Towse (secretary, International Fisheries Exhibition, 1883), J. Callaghan, H. Day and W. F. Jones were balloted for and elected. A number of new candidates were proposed, some of them eminent in the angling world, notably Mr. W. B. Adlington, who was present and warmly welcomed. Mr. Crumplen's paper on the "Causes of the Diminution of Fish in the River Thames," was distributed to the members, and Mr. Bentley's on "Pain in Fishes" will shortly appear. The proceedings closed with a very cordial vote of thanks to Dr. Defreiz for presiding on the occasion.

HAMPSTEAD ANGLING SOCIETY.

The members of this society fished at Bourne End on Sunday for the following prizes:—A fishing rod given by Mr. Dillon, fishing-tackle maker, Victoria Road, K.T., three money prizes by the club, and one by Mr. George Henry, member. As they were all for gross weight, the prizes were all won, though the takcs were not much. The rod was won by Mr. C. Messenger, the others by Mr. Woodward, W. Messenger, Chiel, and Hawker. The two men prosecuted at Biggleswade last week for poaching, are not members of our club, though they live this way.—J. H. HAYWARD, Sec.

IZAACK WALTON ANGLING SOCIETY.

There were very few fish on the trays on Sunday last, although several members were out. Mr. G. Bliss had some good roach from the Thames, and Mr. T. Ward had a show of very handsome dace from the Lea. I also wish to remind the members that there are three special prizes on Sunday next to be completed for.

Dec. 8.

JOVIAL ANGLERS.

On the 4th inst., the competition for the box for fishing implements presented by Mr. H. Howard, fisherman, took place, Mr. Steade proving the winner with 3 lb. 12 oz.; Mr. Clarke being next, with 1 lb. 14 oz.; Mr. Jeffrey next, with 1 lb. 2 oz., all dace. Messrs. Newell, Greene, Kollmann, Marsham, Bugelar, also took part, but the fish proved very shy. On Sunday week, the 20th inst., there will be a competition for a new rod, 100 yards of line, and winch, presented by Mr. E. Brown, for bank anglers belonging to the club, to be fished for anywhere between Richmond Bridge and Oxford.—H. W. PLATT.

Dec. 5.

KINGS CROSS UNITED ANGLING SOCIETY.

A complimentary visit will take place at the club house of the above society, the Prince Albert, Wharfedale Road, King's Cross, on Wednesday next, the 14th inst. Mr. Bonvoisin has consented to preside on the occasion. The members have been doing their utmost to persuade some of the scaly denizens of the various metropolitan waters to change their quarters, but up to the present their well-meant efforts have not met with much reward.—G. TREADWELL, sec.

Dec. 8.

LITTLE INDEPENDENT ANGLING SOCIETY.

Last week we were only saved from a blank with a small take of roach by Mr. Humphreys; and this week we give you particulars as under:—Mr. Grey, a pretty show of roach and dace, 5½ lb.; Mr. Scott, a nice roach, 1 lb.; Mr. Petrie, roach, dace and gudgeon; Mr. Hurwood, perch. We have a series of prizes in had to be fished for and to be distributed to the winners before Christmas.—W. BROWN, hon. sec.

NORTH-WESTERN ANGLING CLUB.

Our shows for the past week have not been great. Mr. Grindley, jack from the Welsh Harp; Messrs. Marshall, Stead and, Weaver, roach and dace from the Thames; and Mr. Patching, roach from Boxmoor.—F. HILL, sec.

NORWICH PISCATORIAL SOCIETY.

The Walnut Tree Shades, Norwich, was the scene of one of the most successful and brilliant gatherings of the "wielders of the rod" which has ever taken place in the eastern counties, when, on Thursday evening last, the members of the above society, with their friends, assembled to celebrate their annual dinner. The enlargement of the society's club-room has now supplied the only want which hitherto existed in this fine old city house—long a rendezvous for the Norfolk disciples of old Isaak—that of the means of accommodating an assembly on so large a scale. We have before us a copy of the programme—a handsomely displayed piece of work by a local firm—and observe that the chair was occupied by Charles Daniels, Esq., president of the society. This gentleman was faced by the Rev. W. H. Matthews, B.D., chairman of the society. There were also present Mr. Alderman Newman, Mr. Councillor Matthews, Mr. Thirkettle (Members of School Board); Mr. W. G. Capon, hon. secretary; and Messrs. Edwards, Earl, Butler, Turner, Thompson, Chadwick, Midland, Olivant, Day, W. Page, G. Cubitt, Sim, Harvey, Loveday, Otty, Hart, Skinner, Knight, Cubitt, Greenfield, Wright,

Holmes, G. Daniels, Roberts, Parker, Howitt, Wills, Waythe, Brown, Bassingthwaite, Youngs, Murrell, Hinsby, McWright, Gill, Provart, Whorton, Mace, Williams, H. C. Townshend, F. F. Bradly, R. Bradly, Geo. Corbyn, etc., etc., the four last gentlemen acting as stewards, and adding much to the success of the dinner. The toast list, besides the usual loyal and patriotic toasts, embraced those of the "Corporation of Norwich," responded to by Mr. Alderman Newman, Mr. Councillor Matthews, and ex-Councillor Thirkettle; the "Yare and Bure Preservation Societies," which met with able respondents in Messrs. Provart and Howitt; the "Norwich Piscatorial Society," replied to in eloquent terms by the popular hon. secretary, Mr. W. G. Capon; "the Visitors," to which Messrs. Geo. Daniels and Midland suitably responded, etc., etc. The evening's proceedings were much enhanced by admirably rendered songs and recitations by Messrs. F. J. Knight, F. F. Bradly, Midland, G. Corbyn, J. D. Turner, etc., and some nice selections by the band of the Norwich Philharmonic Club. The National Anthem, played by the band, brought to a close what will be a pleasant reminiscence for a long time to come to many of the Norwich anglers.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

The first-half-yearly supper of the above society took place on Monday last, when over thirty members and their friends sat down to a most substantial repast provided by the treasurer, Mr. T. Morris. Mr. Obbard in the chair; Mr. Bartlett, vice. After the removal of the cloth, the chairman distributed the prizes to the various winners, amongst whom were Messrs. Neagus (2), Lucy, jun. (2), J. Drew (2); J. Longman, S. Gorsuch, and several others were recipients of one prize each. After the above distribution, the chairman announced several valuable prizes for the remainder of the season. The rest of the evening was spent in some excellent harmony, and the songs by Messrs. Gorsuch, Roberts, Obbard, Ormond, and others, aided by Mr. Gorsuch, sen., on the violin, and the recitations by Mr. Bartlett, called forth ecstasies. Amongst the friends we noticed Mr. F. Williams, Great Queen Street; Mr. Rimer, secretary to the Buckland Angling Society, Mr. Bostle-mann, treasurer of the Reform, &c. The trays were not overburdened this week with fish, Mr. Neagus saving the society from a blank, with roach from the Stort.—T. W. LUCY, sec.

THE ORIGINAL ALEXANDRA SOCIETY OF ANGLERS.

We had a pegged down match, on Sunday last, at Burnt Mill, but I am sorry the roach were off the feed. Mr. Morton took the first; Mr. Atkinson, second; Mr. E. Dymond, third; Mr. H. Hussy, jun., fourth; Mr. W. High, fifth; Mr. E. Brockett, sixth; Mr. E. Hewett, seventh; and the best of the prizes were not taken. Our Monday concerts are proving a great success.—E. DYMOND, sec., pro tem.

PECKHAM BROTHERS.

On the 4th I visited this society, which is held at Mr. Reid's, the Prince Albert, East Surrey Grove, Peckham. It has been established about two years, and is in a flourishing condition. The accommodations here are very comfortable. In addition to the club-room, they have a billiard-room and a comfortable parlour for visitors and general conversation. It was here I met Mr. W. Matthews, the secretary, who informed me that a few of the members were out. "Will you stop a short time?" "Yes," I replied, and I sat down close to an elderly gentleman who evidently was barred from going out fishing through an accident to his left hand, which was in a sling. In the course of conversation I learned that Mr. Wood (I think that was the gentleman's name) was an old friend of Mr. G. Arnold, or, as he was better known in the prime days of Mr. W. Matthews, of silver trout fame, "The General." "Do you know him?" Considering that he was the party that I first fished Brentford Canal with, over 20 years ago—myself and a friend walking from Oxford Street to Brentford overnight for that purpose—and also being with him at the creation of "the silver trout hole" at Sunbury by Mr. Clarke, who commemorated it by putting myself and about a dozen more in the river, I stated that I thought I might claim a slight knowledge of "The General," and also of Mr. Antony. "Well, now, I should like to see both of them; but they do not go far from home now, I suppose? If you see them at any time give them my respects, will you." At this moment Mr. Page and a brother member arrived from Shepperton. The former had a jack about 3 lb., and the latter had the misfortune to have a breakaway with a stump of a tree, brick wall—it was impossible to say which, but it was with something larger than a bleak. Speaking of bleak, Mr. Matthews showed me two that he had caught with a hook at Ditton seven weeks ago. He gave them to Mr. Birch, of the Wellington, in Camden Grove, who has kept them in a globe ever since. They are as frisky now as ever they were, taking flies as soon as they are put in the water. Now, considering that bleak are such delicate fish when hooked, I consider that they are a novelty to live all that time in confinement and the heat of a public-house. What do

you think, brother readers? I also had a pleasant chat with Mr. Carter, a gentleman who belonged to the North-Western some ten years ago—one whom Time had treated kindly, but left his mark with that which makes old age honourable. We chatted about R. Lealand, sen. and jun., J. Harding, Salmon, Job, and other members of that society, of whom Mr. S. M., or "Plummet," stated "that they knew the Welsh Harp as well as a cabman knew the Strand." Time brought the Act of Parliament into force, and also an end to as pleasant an evening as it has been my lot to spend for some time.—PRIXE.

Dec. 6.

PRINCE OF WALES ANGLING SOCIETY. IMPORTANT NOTICE.

By the kind permission of Mr. Osmond, the visiting officer of No. 1. district of the West Central Association of London and Provincial Angling Societies, a complimentary visit will be paid to the Princess of Wales Angling Society, at their club house, the Prince of Wales, Great Barlow Street, High Street, Marylebone, W., on Thursday evening next, Dec. 15th, at nine o'clock when it is hoped a good muster will rally round, and give this young society a jolly good bumper. Those who attend will be highly amused, as several great favourites have promised their services.—F. ROBSON, sec.

ROYAL PISCATORIALS.

There was a very nice show of jack exhibited in this society on the 4th, about 50 lb. falling to the credit of Mr. T. Hughes, the largest fish turning the scale at 10 lb. and the smallest 7 lb.—PRIXE.

Dec. 6.

UNITED BROTHERS.

The members of the above society fished a pegged-down match at Chertsey on Sunday the 4th, but not one fish was taken among the whole lot. The old members will fish their postponed match on Sunday next, the 11th, weather and water permitting.—WILLIAM BELTON.

Dec. 6th, 1881.

WEST CENTRAL ANGLING SOCIETY.

The second quarterly match this season took place on Sunday last, Dec. 4, at Taplow, the following members being the winners:—Mr. T. Wood, 1st; Mr. W. White, 2nd; Mr. F. Beard, 3rd; Mr. W. Wilcockson, 4th; Mr. Wood and Mr. White being nearly a dead heat. The weights were small, as is generally the case in matches, but all the prizes were won. The monthly prize for January is a handsome writing desk for the largest jack, given by Mr. Summers.—R. I. BEARD, jun., sec.

December 5,

CONVICTION FOR TAKING UNDERSIZED FISH FROM THE RIVER LEA.

At the Magistrates' Court, Ware, on Tuesday, December 6, Henry Trees was summoned by R. Ghurney, fishery bailiff, of the River Lea Conservancy, under Clause II., Section T. of the Fishery Bye-Laws for unlawfully taking a fish from the river undersize, to wit, a pike or jack 8½ ins. G. Corble, Esq., clerk to the Lea Conservancy, attended to prosecute. Mr. High and G. Stevens, fishery bailiffs, gave evidence that on Sunday, November 20, they were on duty at St. Margaret's, they found the defendant on the garden of the Lock, in possession of a pike, measuring 8½ inches, they demanded his address. Mr. High had cautioned him some time months previous. The magistrates considered the case clearly proved, and fined the defendant 10s. and costs.—R. GHURNEY.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaits, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

TO THE QUEEN, THE ROYAL FAMILIES OF ENGLAND AND FRANCE.

JAMES GARDNER,
Animal, Bird, and Fish Preserver,
HOOF AND HORN MOUNTER,
FURRIER AND PLUMASSIER.

ANGLING.

Now ready, third Edition.

THE ANGLER'S INSTRUCTOR.

By WM. BAILEY.

A book on the best modes of Angling in English Rivers, Lakes and Ponds, and on the habits of the fish, besides all the latest practical hints on many things that have not up to now been made public, to be had of W. Bailey, 170, Kirke White Street, Nottingham. By post, 2s. 9d.]

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 137, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. T. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, or, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 183, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.

The Fishing Gazette.

SATURDAY, DECEMBER 17, 1881.

CHRISTMAS ON THE THAMES.

CHRISTMAS time is generally regarded by jack and perch-anglers as the best period of the season for fishing, and many a piscator selects it as a time set apart specially by him for angling purposes, yet it scarcely appears right to leave the festivities of home to spend Christmas on the river. But, it may be, that many of those that do it, have not the home influences to attract them to their own firesides; no large family connections, and no absolute "keeping" of Christmas maintained.

Then one can understand the practice of their favourite sport at such a time, and enjoying the Christmas with perhaps a fisherman and his family for whom he has a friendly regard. I have been in that position myself, and therefore I can speak practically on the subject. My home was like an ordinary home at such a time, because one's friends lived at a very great distance. Besides, I was a single man with no prospects of a matrimonial alliance, as I had not up to that time thought of marriage—my brother had that issue before him, and went away at Christmas to discuss his turkey or goose with his young lady; my mother and sister preferred a quiet Christmas to themselves, and there was no objection to my going from home to have two or three days' Thames fishing, and spending the Christmas nights at the comfortable fireside of my old fisherman, which I did right merrily. The snug little cottage was on the river's bank, and near to the best jack-fishing ground on the Thames. At that time the railway communication was not so close as it is now. Anglers were about one where there are fifty now; and the number of fishermen was nothing nearly so great, and more of the type of the old school. I have spent many a happy Christmas on the river, and bagged many a good fish at that particular season. On the edge of the deep close to the fisherman's cottage, I have picked out many a handsome perch, and my memory has the glorious recollection of many a good day. It is fair to assume, then, that whilst others are nobly enjoying themselves with their wives and families at home, there are those who, from peculiar circumstances, can enjoy the holiday just as well on the Thames. I am a married man now, and would not leave my family at Christmas for all the fishing in the world, even if I had a chance to equal my friend Mr. Jardine, in the capture of a much larger pike than he possesses. I expect the professional fisherman is rather pleased than otherwise if he has the chance of piloting a good-hearted customer on Christmas Day, as it may enable him, when the day's fishing is over, to have the wherewith to provide more bountifully for his family at home, or, as it used to be in my case, to supply the best and prime portions of the evening spread. If the angler, on the one hand, is in full enjoyment of the day, and, on the other hand, it is his good pleasure to make the fisherman's home happy afterwards, it must indeed, be doubly gratifying to his feelings. It was so in my case, and we did not retire to rest very early at night. I think it used to be the small hours of the morning. Twenty-five years has been marked by strange alterations, such as time will naturally make—the freshness of youth and almost boyhood was then visible—but now it has got into the sere and yellow leaf; yet one may hope in the possession of the same feelings and the same desire to make people happy. The river at Christmas has now another generation upon it—the fisherman I used to go out with is still alive, and his boys of twenty-five years ago are men in the same profession, with homes of their own. The anglers are, for the greater part, new people, for nearly all of the old ones of my recollection have wetted their last line, or given up fishing nearly altogether; and increased railway accommodation has so augmented the number of anglers the river is not like it used to be for the quiet enjoyment of Christmas on the river. I am, perhaps, one of the oldest contributors to the FISHING GAZETTE, and therefore, at this particular time, it will be no presumption on my part to wish all its readers a very happy and joyous Christmas. If I have unwittingly offended any one, in correspondence or otherwise, I must ask their forgiveness—I certainly have had no desire to be unfriendly with any one; and, with the close of another year, I hope all will be forgotten, and we shall commence the new year, if spared, with "peace and good will." I cannot, however, conclude without sincerely wishing the new proprietors of the FISHING GAZETTE a happy and prosperous future and tendering my heartfelt thanks to Mr. R. B. Marston for all his kindness and courtesy in the past. B.

TROUT AND GRAYLING FISHING IN THE DOVE.

By R. B. MARSTON.

(Continued from page 514)

THE proper way to fish the water of the Dove which one gets the privilege of fishing free by staying at Mr. Prince's hotel, the Izaak Walton, is to walk down from the hotel to the road, go through the gate just above the bridge, and, keeping well away from the water, cross the meadow to the point where the Dove and Mainfold join. Then get into the water and carefully fish every feeding place of trout, or grayling swim. The rod I generally use now for fishing "up-stream" is one which I bought a year or two ago of Mudford, of Tiverton. It cost only a guinea, and is one of the best rods I ever used. Length eleven feet, in three joints; the butt is ash, the second joint greenheart, and the top lancewood. It tapers gradually from the point where the rod is grasped just above the winch, is too stiff to have the least double action about it, and yet has the springiness of steel.

For hard work there is no rod like a stiff one, it will throw as well or better than a limber one in a calm or with the wind, and against the wind is the only rod that will throw at all. In my opinion, a well made hickory or greenheart rod, with ash butt, and lancewood or jungle-cane top, is greatly to be preferred to the finest and most expensive split-cane rod. Blue mahoe wood is recommended by some rod makers, but it, like the glued-up cane rod has a great want of pluck and backbone. If cane is used at all, it should be whole, and of that almost solid kind used in making Thames trout spinning rods. The line I prefer is a fine hard eight-plait silk, waterproofed; or the American braided silk line, as made by Messrs. Carswell, of Glasgow. In consequence of inferior imitations these braided line have got a bad name, but if you can get the real thing, with the waterproofing on it properly dried and seasoned, you will be satisfied. The Manchester Cotton Spinning Company are, I am glad to say, now making silk lines, and I trust they will continue to do so. Silk is unquestionably by far the best material of which a line can be made; cotton is too light a material, and requires the very greatest care to prevent its rotting. A new "dressed" cotton line seems heavy and solid, but this is simply because it is covered with the india-rubber dressing; when this wears off, the line becomes light and limp and most vexatious to throw with. This is not the case with silk. If you take a hard-plaited undressed silk line and soak it, it shrinks and gets stiffer, and will cast with a refreshing straightness and spring; if you dress it with a good smooth waterproofing these most desirable advantages are enhanced. Some anglers use a line of plaited horsehair, or horsehair and silk plaited together, but these ancient affairs are rapidly going out of fashion, just as the hair cast is now only used by prejudiced anglers who find all manner of fancied advantages in it. I have tried every kind of line, and am certain that the best for trout fishing is an eight-plait smoothly waterproofed silk, not quite so thick as an ordinary hair pin, and of a sombre colour. I prefer them of even size throughout, and confine the taper to the gut cast. The gut-cast I make thus: length three yards; the first half of lengths of fine round whole gut, each strand becoming finer; to the finest of these I fasten a yard and a half of gossamer drawn gut, which may be obtained, in lengths of three yards, for the very small price of eightpence, of Mr. Bulmer, 62, Wandsworth Road, London. Before I saw Mr. Bulmer's advertisement in the GAZETTE I frequently paid a shilling and eighteenpence for lines not so fine. The best colour to dye a gut line is a pale smoky blue, and Mr. Bulmer gets this tint very nicely. Drawn gut is more expensive than whole gut, because it very soon wears out, and the only advantage it has is the inestimable one of superior fineness. The best way to fasten your gut-cast to the winch-line is to keep a piece of fairly stout gut spliced on to the end of the winch-line, and knot your casting-line to it with the water knot—the knot usually used for fastening gut strands together. I never use loops on the gut line, and the two dropper flies are secured in that best and neatest way, viz., by making a double knot at the end of the three-inch gut of the dropper, and passing it between a "water knot" before it is pulled tight. There is no danger with this plan, provided the angler does not leave ends on the water knots to pull open to change his flies; drawn gut will not stand this—I simply cut the gut close to the knot on each side of the dropper, tie a fresh knot, and so change my flies. When one has to pay ten or twenty pounds on the expenses of a fishing trip, it is very false economy to waste time unnecessarily for the sake of saving a few inches of gut. I have seen anglers waste half an hour or more in trying to recover a gut-cast from some unapproachable branch, perhaps when the fish were rising well all round; it is only excusable when the fish are not feeding, and even then the recovered collar is never trustworthy—the process of getting it down generally frays it or strains the knots. If I get fast I give a gentle pull in the direction of least resistance; if this is ineffectual I pull hard straight from the hand, to avoid straining the rod, and rig up a fresh collar. I can always trust my winch line not to break before the gut does, but it would never do to submit a hair or a hair and silk winch-line to such a test. The best winch for fly-fishing is one made of ebonite or bronzed brass, with a *silent* slight check action just sufficient to prevent overrunning. A loud-clicking check-winch is an abomination—you might just as well take an alarm with you to warn anglers that you are just ahead of them, and that if they want to fish undisturbed water they had better cross the hill and get ahead of you. I have no objection to other anglers using them. There is no objection to a multiplying winch if you once get a good one. I have used one old favourite for nearly fifteen years, and never yet lost a fish from any fault on its part; but the difficulty is to get a good one, mine was given to me by an angler who had read in some book that the writer's advice to all who had multipliers was to "give them away!" But a multiplier is unnecessary if you have a deep narrow plain winch with plenty of line on it, it will then wind-in sufficiently fast for most emergencies. Having thus, for the benefit of beginners in fly-fishing, described

what I have from long experience in every kind of trout stream found to be the most generally useful rod and tackle, I will now endeavour to describe what I have found the best way of using them on a small trout and grayling stream, and I call any stream small which can, like this upper portion of Dove, be easily waded across every now and then.

Entering the smaller stream, then, as described in a previous article, under the natural bower of branches, we come at once on a very pretty pool, divided by a clump of trees forming a little island in the centre. The stream on the right side is not of much account when the water is low, but its sister on the left is the very model of a trout cover. After rushing in impetuously from the long stream above, the water rests a little here, and eddies gently under the steep bank in a small semicircular bay formed by floods out of the soft earth. There must be trout here, in such a splendid feeding-place, with dead and living root cover in abundance. The eyes search carefully the clear still water, and suddenly become riveted to one spot; there, within two yards of you, is the monarch of the pool! a lusty, lazy three-quarter pounder, quietly sailing about, now rising gently to examine some floating speck, now resting almost motionless; he is absolutely looking at you, and you feel that he is already making up his mind to bolt like a dart into his cover. But no, the friendly bush screens you, and when he turns you gently stoop down and draw back to prepare for the battle and lay your plans for his capture. To throw your flies over him, would be just as effective as throwing your hat; the only chance is to get your flies well into the stream above him, and so manoeuvre them that one shall come within a foot of him. Letting out just sufficient line, you throw down stream, and hold the rod-point under water to soak the gut well; then, watching how the leaves and bits of stick work down, with the lightest jerk you lift the flies from the water, and with a quick wrist-motion, with the spring of the rod only, you send them to the desired spot, so that nothing but the gut collar and the top joint of the rod are to be seen by our unsuspecting friend. The flies fall into the current, the rod-point is moved gently to the left, and your little yellow dun—the middle fly—is sailing straight towards the quarry. In another second the rod-point is instinctively forced back and the tackle strained almost to the breaking point in your endeavour to turn his first rush, which, as you had rightly calculated, is to the roots deep down under the head of the little island. Checked within a foot of home! But not an instant must be lost, and before he has done shaking himself and showing you his lovely golden sides and white belly, you put on all you dare and force him with the current down the pool and down the next stream and out into the Manifold. Once out of his own pool he is all at sea and getting too exhausted to look for cover—a few faint rushes, and the little landing net is slipped deep into the water and brought up under him. After breaking his neck—for 'tis cruel work to let such a noble fellow gasp his life out—you splash through to the bank, light a pipe, and rest a bit. There is more sport in killing a trout out of a difficult place like this, with trees all over and round you and roots on every side, than in killing one twice the size in an open pool or stream. Before creeling him, you take a long grass stalk, bend it into a loop, pass it down his throat, give it a turn, and, generally speaking, if he has been dining recently, you will get plenty of evidence as to the nature of his repast; and your *post mortem* examination gives you the clue to the killing shade of fly.

The water above this pool is shallow stream, and except at dusk, when the fish drop down or run up from their holts to feed, it is useless to fish it. Passing this, then, we come to the corner of the field where the river makes a sharp right-angle turn round another island. Getting down from the high bank you step from a ledge of almost solid gravel as far as you can into the stream, and wade over to the middle, where there is an old tree stump stuck fast and directly under which the water rapidly deepens. I always caught or rose a fish at the end of the left-hand stream, and from the nature of the place you are compelled to throw down stream. The feeding place is in the slack water under the bushes on your left, and at the end of the straight run where the stream has silted the gravel up into a shallow and then gently ripples over it into a blue-looking narrow channel. I got into a nice fix here, for, after hooking a fish, in my excitement I forgot the deep drop just under me, and found I was going down over my fishing-boots. I instinctively leaned forward and grasped the tree stump, but the foothold was gradually giving way, and a snag caught under my waistcoat and regularly hung me up, with one hand engaged with the rod and the other grasping the stump. I soon found the water rising to within an inch of the top of my waders. There was nothing for it but to place the rod between two boughs and get free, which, after some minutes' desperate exertion, I managed to do. As I expected—the fish was gone. If I am not tiring my readers, I must reserve the rest of the lovely pools and streams for another article.

(To be continued.)

THE AVON AT FORDINGBRIDGE.

IBRESLEY.

THE AVON AT RINGWOOD (EVENING).

"AUTUMNAL LEAVES." *

"EVERYBODY knows Mr. Heath's fascinating books about ferns and forests," says one of our author's reviewers; and hence it will be needless for us to do more than indicate the especial features of the handsome new volume now before us. But first let us say that several of Mr. Heath's illustrations (with three of which we have been favoured for reproduction in this number of the FISHING GAZETTE) as well as part of the forest itinerary described in "Autumnal Leaves" have an especial interest (as we shall presently show) for our angling readers.

The especial object—the *raison d'être*—of "Autumnal Leaves" is suggested by its title. The exquisitely beautiful tinting of dying foliage—the "blossoming," as it has been very appropriately called, of autumn—has often been admired; but never before, so far as we know, has any writer attempted to, as Mr. Heath phrases it, "stereotype the beautiful but transient features of the season of autumn." Such a work, however, is a fitting task for the writer of "Sylvan Spring" and "The Fern World;" and here, in twelve exquisitely coloured plates, we have figures—which, in the best and most successful sense, are "nature-printed," and which look like natural leaves gummed on to paper—of more than 250 autumnal leaves and leaflets. Then there are some very beautiful page and vignette drawings, eighteen in all, by Mr. Frederick G. Short, of New Forest scenery, together with a series of initial-letter leaf designs by the author accompanying the second portion of the volume. The cover is also designed by the author, and the book—most tastefully and beautifully bound by Burn and Co.—is very novel and striking—autumn leaves, life-size, being printed upon it in colours. Altogether, then, it will be seen that Mr. Heath's newest volume is one of the handsomest books of the season, and is just the sort of book that an angler, who must, by instinct and training, be a lover of nature, would wish to present as a gift to his fiancée or sister, or, if he be married, with "other fish to fry," to his wife or daughters.

But for anglers there will be in "Autumnal Leaves," as we have said, an especial attraction, not merely in the author's descriptions, but in his illustrations of the River Avon. For your genuine angler there is always a fascination even in the sight of a river, and perhaps the next best thing to the actual water is a pretty picture of water. In "Autumnal Leaves" we have a description of the Avon Valley from Ringwood, by way of Ibbsley, to Fordingbridge. One of the little pictures, "On the Avon at Ringwood (evening)," is very pretty. Ringwood is the headquarters of Avon anglers. One can almost hear the splash of the trout as they (we are sure) are competing with the depicted swifts for the Avon flies, which are skimming the quiet surface of the stream. Here the river has the peculiarity in winter of forming ground ice. But it is its autumn aspect we are looking at and thinking of now, and the "Shades of Evening" remind one of the eels which ordinarily "bite" better then than during the daytime. There is, however, a day roving and feeding eel in the Avon, called the "Sniggle" (*Anguilla mediostrois*), which differs from its more common congener (*acutirostris*) in its slender form, and elongated under jaw as well as in the "day-feeding" peculiarity aforesaid.

Anglers, we are sure, will look with pleasure at the little vignette we reproduce of Ibbsley, on the Avon, up stream from Ringwood. We must not stop to quote Mr. Heath's sketch (though our readers would, we think, like it), from Ibbsley Bridge, of the river the water meadows, and the weir; but surely, if we may trust—and we honestly can—his descriptions, this little village ought to be a veritable paradise for the angler. Says Mr. Heath:—"The prettily-thatched cottages of this charming little village straggle picturesquely along the roadway on the same side as the church, their yellow-washed brick walls being almost hidden by ivy and other trailers, whilst the little front gardens, bordered by wooden railings, are bright with coloured blossoms—yellow and pink, and scarlet and crimson—windows peeping out from the deep cosy shelter of their amply-sufficient eaves. Near the hedge stand three enormous elms, which crown a sloping grassy bank that leads down to the water's edge."

Eels must have been very abundant in the Avon in William the Conqueror's day, for we learn from Domesday Book that the mills in the Avon valley paid rent in eels as well as in money. Ibbsley (Tibeslei) Mill, for instance, paid ten shillings in money and 700 eels as rent; Burgate (Borgate) ten shillings and 1000 eels; and Charford (Cerdeford) fifteen shillings and 1250 eels.

Going on up the Avon, we come to Fordingbridge, of the river at which place we also reproduce one of Mr. Heath's enticing pictures. Trout, grayling, pike, perch, roach and carp, are to be caught in the Avon at Fordingbridge, and though the fishing is all, or nearly all, preserved, permission can occasionally be obtained from Sir E. Halse and Mr. Coventry, the landowners.

* "Autumnal Leaves." By FRANCIS GEORGE HEATH. Author of "Sylvan Spring," "The Fern World," &c. London: Sampson Low, Marston, Searle and Rivington.

We strongly advise Avon anglers to take Mr. Heath's book with them, and follow at the due time and season his up-stream itinerary, from Ringwood to Fordingbridge, along the Avon Valley; or, if they would like to buy it and give it to sweetheart or friend, they may be assured that they would find some difficulty in obtaining a handsomer or more elegant gift in the book way.

ESSAY ON THE SALMON DISEASE.

ITS NATURE, CAUSES, AND POSSIBLE REMEDIES.

By SIR JAMES R. GIBSON-MAITLAND, Bart., Craigend, Stirling.

[We have now the pleasure to present our readers with a copy of the Essay on the Salmon Disease, which won the FISHING GAZETTE Prize of £10 at the National Fisheries Exhibition at Norwich. The jurors spoke very highly indeed of this Essay, and we are very glad to have been the means of bringing out such useful knowledge on so important a subject. The idea of giving a prize arose in conversation with the late Frank Buckland, and he was to have assisted us in the matter, but his illness and death prevented it.—ED.]

THE nature of the disease which has recently prevailed among the salmon in the Tweed, Eden, and other rivers in England and Scotland, its causes, and possible remedies, will, I think, be best discussed by taking the Report of Messrs. Buckland, Walpole, and Young, and examining what is therein set forth, and supplying, so far as possible, the missing links from my own personal experience, chiefly obtained in carrying out extensive experiments with migratory and non-migratory salmonidæ.

The Parliamentary inquiry concerning the salmon disease was carried out at a considerable expense to the country, but the information elicited forms a very tangled web; and before a clear view of the facts now known can be obtained, the great mass of the evidence, consisting as it does of personal opinions and hearsay, must be thrown on one side.

The Commissioners have drawn up a short report, detailing the chief points brought before them, and regretting they were unable to arrive at any definite conclusion as to the cause or remedy.

Some of their conclusions, as we shall subsequently show, are controvertible; others can be admitted only with grave qualifications; so that they have furnished a very slight basis on which to formulate a theory.

The mass of evidence appended to the Report, and on which the latter is grounded, is of very unequal value. The range of observation, as well as the time bestowed on the research, has varied greatly among the different witnesses. The testimony of persons unaccustomed to habits of scientific thought is liable to be coloured by conclusions they have already formed on insufficient foundation; their evidence of facts may be valid, but their deductions are always unsound. Others, again, who are competent investigators, are in some cases biassed by preconceived and favourite theories which they are unwilling to abandon.

Great care is thus necessitated in the rejection as well as in the selection of portions of the evidence. No theory yet advanced, either of the disease itself or of its epidemical outbreak, is sufficient to meet all the known co-existent conditions of its appearance, and I shall in this essay try to lay a foundation of observed fact on which a theory may be built that will harmonise the diversified and seemingly contradictory circumstances under which the disease presents itself.

It is evident that no essay which merely embodies the substance of the Report can afford any satisfactory treatment of the subject; nor would a digest of the results of popular observations and letters to the daily press since the publication of the Report be of service. They are so frequently inadequate in detail, and misleading in tendency, that they serve too often only farther to increase the obscurity surrounding the question.

Any contribution to prove of real value, must be added by those who, with ample opportunities of thorough investigation, can bring a previous scientific education and devote much time to the investigation. We propose—

- I. Briefly to describe the appearance of the disease.
- II. To summarise the invariable conditions under which it appears.
- III. To examine the various statements promulgated.
- IV. To state our own views on the cause of the outbreak, based on our own experience, and to endeavour to show that they account for the phenomena.
- V. And finally to suggest remedies.

I. DIAGNOSIS.

The appearance of the disease when epidemic is chiefly remarkable for patches of fungus, *Saprolegnia ferox*, but there are

earlier symptoms in isolated cases which seem to have escaped the Commission, as I cannot find any mention of them in the evidence.

The first indication we have in the beginning of the season when in handling a, to all appearance, healthy fish is, that the scales feel dry and harsh to the touch; there is, in fact, an absence of the usual slime. The next symptom is, in the case of a male fish, on its being held up by the gills some liquefied milt in a very watery state flows from the fish; then the indurated spot, sometimes discoloured, appears between the pectoral fins; ulceration of the mouth and gill cover is frequently present, and a dark congested spot involves one or more of the gills; the fungus sometimes precedes, sometimes follows the ulceration of the mouth and gill covers; the fish frequently becomes blind, and in many cases show symptoms of acute suffering; the breathing becomes more rapid, and during the later stages of the disease spasmodic movements of the operculum are noted. I have found respiration as rapid as 104 per minute, and a spasmodic movement occurring once in thirty respirations twelve hours before death. The application of bay salt seems to occasion great pain; the fish, when not too weak, lies between the stream and the pool. Female fish, unless egg-bound, are seldom attacked with fungus at the beginning of the season.

II. CONDITIONS UNDER WHICH IT APPEARS.

The only successful method I have yet discovered to produce the salmon disease is as follows:—

Take a few hundred large male fish, confine them in a deep pond where they have no opportunity of shedding their milt, starve them for a couple of months, when about two-thirds will die of salmon disease.

Take an equal number of hen fish, treat them in the same way, and the loss will probably be under 1 per cent. From this I think we may safely assume that the salmon disease can exist, and originate independently of the fungus, which in many of the sporadic cases is undoubtedly an aftergrowth.

Saprolegnia ferax is one of those fungi which propagate either by seed or cells. The cell is in diameter many times larger than the seed, and is probably always present at all times in all water; but there is this difference between the two modes of propagation—the cell is much more particular as to the soil on which it can root than the infinitesimal seed. Wherever there is dead fish matter in water, the fungus is sure to grow, but unless some scrape or sore form a suitable nidus, I very much doubt if it would grow from the cell on the back of a living fish.

It is probable that the oospores are fertilised by the actual penetration of the male spore, and in this fertilisation the secret of the epidemic probably lies. I mean, I consider the zoospore the cause of epidemic, the resting-spore the cause of the aftergrowth in the sporadic form of the disease, and the probable source of the centres of infection from which the epidemic spreads. The highest authorities consider the resting spores of the fungus are equally present in pure and in impure water; but my own experience is, that they do not germinate with equal facility in all water. Many fungi other than the *Saprolegnia ferax* hover banefully round salmon life from the egg to the grave.

First, the *algæ* and common *Saprolegnia* which attack the live egg; then the byssus, with a dead ovum as a *point d'appui*, piercing all surrounding eggs with its sharp-pointed hair-like threads; then the mucus destroying the fins of the hapless alevin; then the green frog-spittle netting the young fry by hundreds when the pools are low in summer; and, lastly, the salmon disease, with its long tail of commissions and reports. Well might Mr. Livingstone Stone say there was no word in the fish-breeders' vocabulary so connected with loss and devastation, there is nothing so insidious as fungus.

The local conditions under which fish are affected are very diversified, and we must not suppose that, because certain rivers are scheduled by the Commissioners as infected and others are stated in the evidence to be free, the disease has not existed from all time, and does not exist now, in all salmon rivers. This very season I have netted and destroyed salmon with the *Saprolegnia ferax* in one of our rivers whose watershed nestles a chain of the finest lochs in Scotland, and which, according to the evidence of the report of the Commission, has hitherto been free from disease.

I do not attach much weight to any theory based on the absence of disease in some rivers, and the presence of it in others; all we can feel certain of is that there are many where it has not assumed an epidemic form.

There is, however no satisfactory evidence of *Saprolegnia ferax* being found in other than fresh water; but it seems to affect the waters of America equally with Europe.

I think we may conclude with the Commission that the disease

has always existed, and has occasionally before now been epidemic.

III. STATEMENTS AND THEORIES.

We will now consider several statements made in the Report in the order of their occurrence:—

"The salmon affected by the disease bears a very different aspect from a fish unaffected by it."

We deny the universality of this assertion. The disease occurs in two forms, one self-originating and individual, the other external and epidemic. The statement is only accurate when applied to the latter, and even as regards the epidemic disease, the description following, commencing, "The scales are covered more or less by patches of fungus," on p. 5, down to "suffocation," line fourteen, p. 6, is not sufficiently precise, considering the twenty or thirty diseases of, and causes of death to, the *Salmonidæ* well-known to pisciculturists.

Mr. Livingstone Stone, in his "Domesticated Trout," gives twenty-three, which I will enumerate and explain where necessary.

1. Fungus on the egg (not byssus).—Its effect is to suck out the vitality of the embryo, and cause the production of a sickly fish.

2. Partial suffocation of the embryo.—This is generally the effect of sediment in the water, and it is in this way pollution causes the least seen and the greatest injury to our salmon stock.

3. Strangulation in hatching.

4. Blue swelling of the yolk sac.—Generally the result of want of vitality in the alevin.

5. Deformity at birth.—Caused by sediment clogging the shell.

6. Fungus on surface of the body.

7. Constitutional weakness.—Principally due to imperfect impregnation of the eggs. The vitality or energy of the milt is impaired if the cock-fish be kept an unusual time off the spawning-redds.

As constitutional weakness would undoubtedly form a predisposing cause to the salmon disease, I here mention two experiments.

First Experiment.—On the 24th November, 1879, about two ounces of milt was taken from a salmon early in the afternoon, being expressed into a glass jar which was kept uncorked all night in the watcher's cottage, and brought to me next morning with a crumpled piece of paper roughly stuffed in its mouth. The temperature of the air in the morning being below 20° Fahr., the cold had thickened the milt, and, before I could use it, it was thawed out with spring water. I then hybridised some trout eggs with the following result: An embryo formed in about 80 per cent., of the eggs; in 10 per cent. the formation stopped after the appearance of the embryotic line: the rest eyed, but in 20 per cent. the system of the yolk sac circulation failed to develop, the blood appearing in red patches, and in some cases the black eye spots were replaced by red dots. Out of the remaining 50 per cent., one-third died in the act or shortly after hatching. And I have now, sixteen months after the experiment, barely 10 per cent. of dwarf hybrids.

As I have been perfectly successful in all former experiments in hybridisation, the result is clearly due to the vitality of the milt having been impaired.

Second Experiment.—This one, though not in itself so important, has a more direct bearing on the question at issue. On the 14th of December, 1880, I had occasion to strip two lots of fish of different ages. The ova in both cases was just ripe, but the older males had shed a portion of their milt; the eggs were kept separate, and eyed in different hatching-houses. The impregnation obtained with the milt of the younger males was almost perfect, the loss being less than 7 per thousand; but with the older males, although the actual percentage of impregnation was probably as good, or nearly as good, fully 7 per cent. ceased to develop between the formation of the embryotic line and the formation of the second ring of the pupil of the eye. The obvious deduction being, that the vitality of the produce of fish kept long off their spawning redds is seriously impaired, for the number of delicate embryos that survive must bear a direct ratio to those of the same lot that prematurely succumb.

8. Emaciation.—This, in the case of young fry, is probably caused by the absence of suitable food suspended in the water, and is only the result of Mr. Livingstone Stone's next heading.

9. Starvation.

The next six causes of death are all of them closely connected with one or other of the external symptoms of the salmon disease.

10. Ulcers on the head.

11. Animal parasites.—Of these I only know three which attack externally. One shaped like a small worm about 1-80th

of an inch in length and 1-200th of an inch in diameter. Fungus generally grows over the surface infected by these parasites. There is also a small circular parasite which attacks young fish, but does not cause a fungoid growth. A third is described by Stone as having the appearance of small bunches of a jelly-like matter. This may possibly be a fungus. Salt is a cure for these three. I have also noticed several internal parasites, especially in trout from Loch Ard, a small lake on the borders of Perthshire, draining into the Forth.

12. Fin disease.—Generally caused in the first instance by injury to the fin. Fungus freely grows on this. In very young fry the pectoral and dorsal are usually affected.

13. Black ophthalmia.—This disease is common, but not contagious. It attacks all ages.

14. Irritation of the optic nerve.—Probably caused by strong light and absence of shade.

15. Inflammation of the gills.—Most common with *Salmo Fontinalis*. Deep water is probably the only remedy.

16. Black gill fever.—Supposed by some pisciculturists to be contagious; it is very rapid and very fatal.

17. Fatty degeneration of the vitals.

18. Spotted rash.—I never had an opportunity of observing either of the above diseases.

19. Strangulation by food.

20. Cannibalism.

21. Over-heating.—I do not think the temperature of water ever rises in Great Britain too high for *Salmonidæ*.

22. Suffocation.—This is possible in summer in an overcrowded pool, but I do not think it likely to occur unless the free oxygen in the water be diminished by pollution.

23. Paralysis.—I have never known this attack other than very young fry.

In addition to the above may be enumerated the diseases incident to the spawning season:—

1. Induration of the neck of the ovary.

2. Penetration of water into the ovary.—This renders the eggs incapable of fertilisation, and frequently causes inflammation.

3. Retention of milt.—This is always accompanied by inflammation of the milt sac. It is fatal, the fish frequently dying even before getting fungussy.

4. The sporadic salmon disease.

5. The epidemic disease *Saprolegnia ferax*.

Besides the above, many fish die from the effect of accident, hook, or spear, which would in most instances become covered with fungus before death. It thus becomes absolutely necessary to distinguish carefully the precise evidence regarding fish undoubtedly infected with the disease, from the loose statements of a number of fungussy fish being in the water.

Returning to our Report, we find on page 6 "the internal viscera of diseased fish do not in general materially differ from the internal viscera of undiseased fish in a similar stage of existence, though in some cases the livers of diseased fish are pale, and break down easily under the finger."

This may be admitted where the disease is epidemic, but where it is sporadic and self-originating must be denied *in toto*, as, besides the induration between the pectoral fins as before mentioned, the liver is scisted, blotched, discoloured, and frequently congested in parts.

As regards the symptoms affecting live fish, I have watched a number of cases, from the fish first appearing loggy and out of sorts, to death, from two to eight days afterwards.

In a sporadic case the first suspicion of the disease is raised by the position of the fish, and the particular part of the water it betakes itself to. Instead of lying in a pool when not on the spawning redd, the fish seeks a deep steady current, from which I infer the blood to be deficiently oxygenised.

In from one to four days blotches of fungus appear, and the movement of the gills becomes more rapid. If the fish is now taken out and exposed to a solution of salt and water it will exhibit signs of the most acute agony, writhing and dashing itself against the sides of the tub. Similar symptoms exhibit themselves on the fish being rubbed with salt and returned to the pool. The fish generally dies after this treatment, and the fungus always.

In the epidemic form the fungus itself forms the first symptom. As spring advances the disease runs its course with much greater rapidity. I have known a fish die within forty-eight hours of the first attack. The fish turned belly upwards six hours before death, and the inspirations rose to 104 per minute. One of the spots to the side showed red flesh, but I was unable to ascertain whether from an ulcer or from the flesh having been rubbed off. In some of my water the disease became epidemic several times in 1879, but in each case the epidemic disappeared, *i.e.*, no fresh case was seen, after the application of a few hundredweight of bay salt, and some fish slightest affected actually recovered.

The above experiments were conducted with large trout. I have frequently known fungus on the fins, quite distinct from the salmon disease.

I do not agree with Mr. Erasmus Wilson's statement, that the parts most affected were those most distant from the centre of circulation. I freely admit that the fins are a more favourable ground to cultivate fungus upon than the skin of the fish, but a spot is almost always present above and slightly behind the pectoral fin.

It is not generally known that many *algæ* are, up to a certain stage of growth, absolutely harmless to fish life in water, and it becomes an important point for inquiry under what condition fungi becomes dangerous: and I think Mr. J. P. Moore has covered the ground of this inquiry, perhaps unintentionally (see extract of the Report, page 9, line thirty-eight):—"Either zoospores or resting spores germinate, though the latter are undoubtedly intended to play the principal part and serve to carry over the specie from one season to another. The disease is known as *Saprolegnia ferax*. Wherever there are wounds, or whenever the circulation is weak from any cause, and the nutrition consequently slow, the attack is most likely to begin."

Very true for the sporadic cases; now for the epidemic. Zoospores and resting spores both germinate, but the former has an immense numeric superiority over the latter, and that alone would seem to make it more likely to be the cause of the disease in its epidemic form. The zoospore, moreover, is bisexual; the germination of its seed depends upon the penetration of an impregnation by the male spore. It requires, before it can fructify, direct contact with one of the most fragile and delicate substances in nature; and I believe the action of the bay salt in the last-mentioned experiment was to destroy the fertilising power of the male spore, for the salt must have borne an almost homœopathic proportion to the vast quantity of water in which it was diluted, and it is natural to suppose that the most delicate factor of the disease was the first, if not the only one, to succumb to its influence.

Personally, I believe that although the club-shaped egg-spores are continually developing, the conditions—aquatic, atmospheric, thermal, and solar—under which these fungus eggs are generally fertilised, are rare indeed; and that when favourable conditions of water, air, heat, and light co-exist, an epidemic, of greater or less severity, will always appear in every water where the sporadic form of the disease exists in a sufficient degree to form centres of infection.

I will now consider the addendum to the Report of the salmon disease by the late Mr. Frank Buckland, which is signed by Mr. Buckland alone, and not by the other two Commissioners. Under eight heads he classes the causes to which the disease and its spread have been attributed in the evidence received by the Commission.

1. POLLUTIONS.

Although the salmon disease appears unconnected with pollution, yet its effect is to render unsuitable the lower spawning beds, and probably to weaken the embryo and fry in many portions of the river.

2. LOWNESS OF WATER, &c.

Lowness of water caused by excessive land drainage is a factor, in so far as, in some seasons, it will keep the fish longer off their spawning beds; and the older cock-fish, which seem more susceptible to the disease than any other, will, especially if weakened by having to remain long in fresh water before they shed their milt, become very liable to disease, and this applies in a less degree to the Forth district, although mitigated by the water sent down from Loch Vennachar.

3. EFFECTS OF FROST AND SNOW.

Frost and snow undoubtedly predispose to disease by causing the retention of the fish in the lower waters.

4. OVERSTOCKING.

The evidence of overstocking seems to be confined to the south-west of Scotland, and I am afraid was only put forward in the mistaken interests of the net fishers. The statement at the end of this paragraph, page 20:—"In confirmation of the fact that overcrowding of fish will produce fungus growth, it is important to note that (as all breeders of salmon by artificial means know only too well), when the young salmonidæ have attained a certain growth, if they are too crowded in the hatching troughs, they at first breathe with difficulty, and ultimately die, with the gills propped widely open by a growth of fungus."

I do not know what is considered overcrowding by all breeders of salmon, but I do know that twenty thousand fry can be kept in a box 6 feet by 9 inches by 1 foot 7 inches for three months and a half after hatching, with an average temperature of the

water of 45° Fahr., its depth being five inches, and the quantity of water passed through being two gallons per minute.

Fry die from dirt and from starvation, but not from overcrowding. Of course, the secret lies in so large a quantity of fish preventing any dirt lying at the bottom of the box and fouling the water.

5. OBSTRUCTION BY WEIRS.

This favours both forms of the disease—sporadic, by keeping the males off the spawning redds; epidemic, by collecting the lean and ill-favoured kelts, so that they can hardly by any means escape infection if it exists at all.

6. DEAD FISH.

Dead and dying fish tend to spread the disease in an obvious manner, and should of course be removed.

7. INJURIES INFLICTED BY FIGHTING OR BY ANGLERS.

These would subject the fish to the ordinary action of the resting spores of the *Saprolegnia ferax*, but could in no case be said to form an epidemic.

8. BIRDS.

[Crows and rooks eat freely of diseased fish, but I do not think any danger need be anticipated from this source.

IV. STATEMENT OF MY OWN VIEWS.

The result of my own experience of the disease is, that it appears in a twofold character. One, isolated and of no commercial importance, present more or less every season in every spawning stream. The other, of serious importance, uncertain in its extent, widespread in some waters, officially unknown in others; probably the murrain among fish frequently mentioned by old Scotch writers.

The principal thing in common to the two forms being the *Saprolegnia ferax*, a fungus, a-sexual, and bi-sexual, and whose malignity may possibly be measured by its mode of propagation.

We find in nature the proportion of unfertilised eggs in salmonidæ to be very great, and it is probable that the fertilisation of a complicated fungus like the *Saprolegnia ferax* is, under ordinary circumstances, infinitesimally small.

I therefore unhesitatingly attribute the late outbreak of the salmon disease to the co-existence of a large number of sporadic cases with the subtle conditions favourable to the bi-sexual propagation of the *Saprolegnia ferax*.

V. THE REMEDIES.

The remedies to be suggested are obvious. They are few, simple, and sufficient; they require no great expense; but I am afraid, in the eyes of our salmon legislators, they have one great and grievous drawback, containing as they do the virtual admission that our much vaunted salmon legislation, which has stripped the upper proprietors of their rights and of privileges exercised from time immemorial, is in a great measure responsible for the late virulent outbreak of the salmon disease. I admit it has multiplied stake-nets on shore, and has added bag-nets to stake-nets, until the gravid salmon which escapes these engines is debarred from entering even the brackish water of the estuary; until the finest part of the spawning season is already far advanced, and any impediment—be it caused by frost and snow or by weir and low water—finds the male fish overpressed by a vital fluid they cannot discharge to the zoosperms, to which the very slightest admixture of water is death; while every day of delay weakens the muscles and emaciates the fish, the re-absorbing power of the glands becomes less, and the milt passes from the consistency of butter to cream, and from cream to milk, and from milk to an abominable watery white fluid, incapable of supporting life.

The zoosperms die and decompose; the induration between the pectoral fins commences; the mouth ulcer follows; and the dry skin, itself a suitable nidus for fungus; blotch after blotch appears, and here and there a bleeding sore on the operculum; the gills congest, and the breathing becomes rapid; and the fish, if not long ere this a prey to the poachers' gaff or the landing net of the river watcher, lies on its back spasmodically breathing its last in any still pool where the current of the stream may have cast it. It has died, but its work of destruction is not over. The egg-spores thrown up by its fungus sides burst, filling the water with myriads of active spores, capable of generating on any living surface within the water, and with resting spores, endowed with such vitality that neither heat nor cold prevent their germinating wherever a wound or sore presents a suitable ground for their fatal mycellium.

The first remedy I would suggest is, to forbid by law any bag-net to be added to a stake-net; I see no reason why both should not be legal separately, though I much fear, until our

rivers are barren of salmon, it will be difficult to persuade the Legislature that together they are destructive to the food of the country, and prevent what is now the luxury of the rich becoming the common sustenance of the poor.* I would empower Fishery Boards to legalise the capture of all kelts, especially male kelts, after an early date, always having in view the probability of the kelts reaching the tidal water before they have eaten their heads off in the matter of smolts.

The second remedy I would suggest, and it is a very efficacious one, is to empower Boards to obtain loans for the purpose of spawning and artificially hatching the ova of any large quantity of salmon which may be detained from reaching their natural redds by caulds in conjunction with the lowness of the water. The spawned fish would turn seawards, and be for a much shorter time under the range of infection.

Obstructions in the sea should be reduced, that salmon are not made later year by year; obstructions in the river should be utilised to increase the stock of salmon and decrease the number of days foul fish are in fresh water.

THE POTOSI CIGARS.

A SAMPLE-BOX of Potosi cigars, made from tobacco grown at Potosi, St. Thomas, has been sent us by Messrs. Gaspard, Bell and Co., agents for the manufacturers, Messrs Thompson and Weitzmann, of Kingston, Jamaica. At first we did not quite take to the somewhat peculiar flavour of Jamaica tobacco, which is quite distinct from that of the Havannah or the Manilla tobacco. Perhaps we were unfortunate enough to get hold of the wretched Dutch tobacco which has been sold in this country as Jamaica tobacco. However that may be, certain it is that the cigars manufactured by Messrs. Thompson and Weitzmann are vastly superior; indeed, at the price, they are the best cigars in the market. We do not say they equal in flavour the best Havannah, but one hardly expects that at the price—while they are in every way better than the ordinary foreign cigar sold at the same price. The flavour grows on one gradually, and we think any smoker who gets a genuine Potosi will acknowledge he cannot get an equally good cigar of any other kind at the price.

THE INFLUENCE OF ARTIFICIAL CULTURE ON THE SPAWNING-TIME OF TROUT.

IN that capital little paper, the *German Fishing Gazette*, we see a communication from Herr Müller-Tschischdorf, which deserves general notice. Mr. M. is one of the foremost pisciculturists in Germany. Here is a translation of what he says:—

"This year the spawning of the trout in my brooks here (in Silesia) has occupied fully five weeks. It becomes more apparent year by year that the artificial culture has brought about a change. Before I began putting in artificially bred young trout, the spawning time was divided into two periods: part of the fish spawned generally at the beginning of October, occupying from 9 to 10 days; then the rest spawned, earlier or later according to the temperature. If frost set in early, they soon spawned; but if the weather continued mild, the spawning occupied a long time. The first to spawn were brighter in colour, and had more of a reddish tint; while the others were darker, and the white parts appeared blacker.† Now we find the fish come up to spawn in one body, and this last season, again every day for five weeks fish could be seen on the spawning-beds. A consequence of this has been that fish which spawned last have used the same spawning-beds as those which spawned earlier. That the spawn first deposited is thus lost, there can be no doubt; this, however, cannot be avoided. On the whole, this change is advantageous; for if, during the first period of the former spawning time, a flood occurred, then as a rule all the eggs were lost. The eggs of the second period were open to a like fate. Now, if we get a flood in the first part of the five weeks, it only carries part of the eggs away, and as soon as the flood subsides other trout come up and spawn."

* It ought to be mentioned that the late Mr. Buckland, and Mr. Archibald Young, in their report of 1871 on the effect of recent legislation on the Salmon Fisheries in Scotland, make the following recommendation with regard to fixed nets on page 34 of the Report:—7th. That no stake or bag nets should be allowed within half a mile of the mouth of any river, and that in certain cases they should be removed to a distance of two miles; that no fixed engines should be permitted between the mouths of rivers that fall into the sea close together; that some restriction should be put upon the number of stake and bag nets along a certain stretch of coast; that the junction of stake and bag nets should be prohibited; that the present position and number of fixed engines should be officially registered; and that no further additions to their number should be allowed."

† This sounds like a bull, but any one who has seen trout out of condition will know it is perfectly correct—the whites appear as though sprinkled with black specks.—ED. F. G.

THE CRUCIAN CARP.

A SPLENDID BOOK ON FISHES.

OF the preceding volumes in this magnificent work on natural history, we have spoken very highly. We have now the pleasure to introduce to our readers the fifth volume, from which the publishers have lent us a few specimens of the very fine and very numerous illustrations. The first part of this volume is devoted to Fishes, and is by Professor H. G. Seeley, F.R.S., F.G.S., &c. Then follow divisions devoted to the *Invertebrata* (animals without backbones), with an introduction by the Editor; the *Mollusca*, by H. Woodward, F.R.S., &c. (octopus, squid, cuttlefish, nautilus, shell-fish of all kinds, snails, oyster); the *Tunicata*, by H. Woodward ("sea squirts," and other ascidians); the *Molluscoida*, by Agnes Crane (the mantle-breathing bivalves, *Branchiopoda*, and the moss animals, *Bryozoa*). The *Insecta*, with introduction by W. S. Dallas, F.R.S.; divided into the *Coleoptera*, by H. W. Bates, F.L.S. (beetles), and the *Hymenoptera*, by W. S. Dallas, F.L.S. (wasps, bees, ants, &c.)

The section on fishes, by Professor Seeley, will naturally be of most interest to anglers. It comprises about 150 pages, and has some 100 illustrations of fishes, most of them being exceptionally good. As a work of reference on fishes, this part will be found invaluable to students, and the general reader cannot fail to find much matter of great interest respecting the piscine inhabitants of the world's fresh and salt water. We confess we are a little disappointed that in a scientific description like this of the life and habits of fish, very scanty notice is taken of the important question of the various spawning times, the nature of the spawn, whether adhesive or non-adhesive; the places preferred by various fish for its deposit, &c. There are also some palpable errors; for instance, of the grayling, it states that "it reaches a length of ten inches." We have caught them nearly twice this length. Of the pike it is gravely recorded that "this fish is well known to travel over land, and annual migrations of the fish have been recorded. They come in the spring in great shoals out of the Isle of Ely into the River Cam." Some old college chum must have been making fun of Professor Seeley. We cannot help thinking the Professor must have meant to refer to the eel, though even in the case of this snake-like fish, there is no really trustworthy evidence that it travels over land. Elvers, or young eels, will swarm up a wet floodgate to get to the water above; but we have always considered the stories of eels leaving the water in search of frogs and slugs, and bean and pea fields, as unauthenticated. If you catch an eel, and let him go free on the grass he will make very fair progression away from you, but a pike simply flops about and gasps, like any other "fish out of water." Here is another statement that will amuse our pike-fishing friends: "The pike often sleeps, or remains in an unconscious state, in quiet parts of rivers. When thus dozing, it may be taken with a kind of noose"! fortunately, poachers can also be taken before a magistrate. It is ungracious, perhaps, to take notice of such little slips as these, which will, doubtless, be corrected in a second edition. As a whole, Professor Seeley's work is well and most carefully done, and we think if Messrs. Cassell were to issue his "Pisces" as a separate work, with a few corrections, it would, with its attractive illustrations, have a large sale. A good index should be added. With regard to the illustrations we give from the work, they will speak for themselves, we think. The only fault we can find is that in the picture of the pike the artist has made the skin marks of the lower of the two fish too much to resemble large scales. On a future occasion we shall hope to quote some of Professor Seeley's curious and interesting facts relating to the natural history of the rarer sea fish, the wonderful sea-horse, the walking or climbing fish, the sea scorpion, the sea devil, the octopus, the squirter, &c.

The sections devoted to the molluscs, shell-fish, insects, beetles, wasps, bees, &c., are particularly well done. It would be difficult to find a volume of more permanent value than this, and as a present it could not fail to be acceptable to any one who is a follower of old Izaak. How he would have revelled in such a book.

THE SPORTSMAN'S EXHIBITION.

We have much pleasure in calling the attention of our readers to the approaching Sportsman's Exhibition, which will be held at the Agricultural Hall, Islington, in February next. On our outer sheet will be found a detailed list of the Patrons and classification of the Exhibition. It will be seen that it comprises the names of the leading aristocracy and gentry of the United Kingdom, and we trust we are committing no breach of confidence in stating that it is confidently anticipated that His Royal Highness the Prince of Wales will accept the post of President and Patron. Under such auspices, and with such an excellent prospectus, we have no doubt that this Exhibition will be an unqualified success.

A YULE-TIDE FRAGMENT.

A YARN IN THE HIGHLANDS.

BY THE "TRENT OTTER."

"A PENNY for your thoughts!" The abruptness of this remark startled me from the midst of a deep reverie; and I glanced at my companion, who had been sitting on the opposite side of the fireplace. He was just then drawing up his long limbs that had been stretched across the hearth; and had seized the poker, preparatory to giving the fire a vicious thrust or two by way of emphasis to his remark. The speaker, a fine-looking man in the very prime of life, and your humble servant, were on a visit to an old friend of his, in the land of cakes, heather, and glorious sport, bonnie Scotland; and on this particular night we were seated in a small but comfortably furnished room, that had been assigned to us as our sitting-room and private sanctum during our stay. On a sideboard, by the window, three or four fishing-rods stood, while on the table in the centre of the apartment, tackle, and the various appliances peculiar to a jack-fisherman, were scattered, plainly showing the chief object of the visit. We had been repairing and arranging some of the said tackle, in readiness for the morrow, and were then gazing dreamily into the fire, watching the fantastic shapes conjured up in the fitful flames, and indulging in a fit of deep abstraction, when, "A penny for your thoughts, old man!" suddenly startled me. "Well," I answered, "I don't know whether the penny would be a very profitable investment or not, if laid out in the article just asked for; but I am sadly afraid it would be a dead loss to the purchaser. However, I was thinking that the sport of these last two days was hardly good enough, considering what we had expected; and as we have only two more days to stop, unless something else turns up, it will be a grievous disappointment. I cannot help thinking that, that old sinner, Archie MacTavish, has been leading us astray. I believe he knows very well where there are some good fish, only he takes us in an opposite direction, and then pretends to be so sorry, because we cannot get hold of a good one or two." "Well, to tell you the truth," answered my companion, "my thoughts were running in the same direction; eight fish in two days, and the biggest not quite 6 lb. Tell you what, old man, we shall have to try and get the blind side of Mr. Archibald MacTavish; but how? that is the question we shall have to consider, and that quickly." This said Archie MacTavish was the keeper on the estate owned by the friend of my companion, and was a fine sturdy old Highlander—tall, and broadly built, still strong and active, though his hair was silvered with the frosts of nearly threescore winters; in fact, to look at, he was a grand picture of a Scotch keeper. But he had one very serious drawback, as a sort of a set-off to his looks; he was a gruff, surly old piece of goods, whose rugged face never relaxed into a smile. Up to then, although we cracked our best jokes, and told our queerest tales, he looked upon us with no degree of favour. Indeed, only about an hour or so before, I had overheard him, in a sort of confidential communication to one of the house-servants, describe us as a couple of Sassenach fellows, who had no business catching his pike; whatever he might mean by that outlandish Scotch term I do not know. It boots not state the exact locale where we were having our sport. I should very much like to mention the place, and give a description of the surrounding scenery, but I am forbidden to name it; and so it is enough to say that the mansion is situated in the midst of a scene of natural beauty, within easy walk of a grand river and loch; and the estate itself is dotted over with some splendid sheets of water, connected with each other by a small stream. We were given to understand before coming that we could get any quantity of live baits; but the keeper said he had tried, but could get none for either love or money, and his master, on turning us over into his hands, gave him the injunction that he was to find us the very best sport he could, an order which, up to then, he had totally disregarded. On stepping out with him that morning, a proposition that we should go in the opposite direction to the one taken the previous morning, was instantly negatived by that surly old retainer, with the remark, "that it was nae gude gangin' that way, for we shoed catch naething but poonders"—a remark tendered in the very broadest of Scotch; and he forthwith strode off, and we had nothing else to do but to follow him, and trust to our own experience, and the result was, as my friend has said, eight small fish in two days. And now, I think, my readers have got at the bottom of our very serious meditations, which were giving us just then some little difficulty to get over satisfactorily. At last my friend sprang to his feet, and the light of a sudden inspiration shone in his eyes, as he exclaimed, "I have it! the simplest thing in the world, the only wonder is that I did not think of it before; give me my portmanteau," from an inner recess of which article he produced two glass bottles marked "whiskey." "This is the stuff," he added, "to smoothe the way up here in the

north. Let's make a real strong whiskey toddy, and get that gruff old block of ice up here, and see if we cannot thaw him a bit." The necessary articles were soon forthcoming from the kitchen, and a grand bowl of punch was soon steaming on the table. While my friend was giving it the finishing stroke, in the shape of a good stirring, I went in search of Archie. I soon found and inveigled him up into our sanctum on the pretence of looking at some grand salmon flies. The toddy was introduced there and then, and under its influence the rough old Celt gradually thawed, and in a short time we became the best friends imaginable, and passed some hours in roaring style, finishing up about two in the morning with "Auld Lang Syne;" and the end of it was, that after we had once got him to come out of his shell, he became the very king of good fellows, and gave us some fine sport the next day. For on stepping out the next morning he had two or three dozen fine live baits in a big can, which he informed us he had been able to procure after a lot of trouble after our previous day's sport, a remark which, it is hardly necessary for me to say, we did not believe, although we did not tell him so. Some grand bits of jack-water we fished that day, and at night, when we went home, we carried with us a dozen fine fish, one brace of which together bumped the scale at something considerably over 40 lb. A grand bag of pike and a day's sport that only falls to the lot of ordinary mortals about once in a lifetime in these degenerating days, to say nothing of the splendid scenery and the bracing weather we had enjoyed. Although it was the day before Christmas Eve, and so far up in the north, there had not been sufficient frost to bind the pools with an icy chain, but just enough to sharpen the appetites of the pike, and make them take a bait as though they meant it, even then, so late in the year. The scenery of the surrounding country was grand, and I wished I could have been there in the very height of its autumnal beauty, and seen it in all its glory, with its long stretches of wavy moorland covered with dark green heather, spotted with purple bells, and the tall bracken, whose feathery arms swayed slowly to and fro in the heather-scented breeze; whilst here and there a hillock, under which nestled a stretch of green sward, inviting the sportsman to rest awhile and eat his mid-day lunch, and admire the blended landscape of colour, all growing brown and golden under the burning gaze of the autumn sun; while far away, on the one hand, he could just see the valley with its river and lochs, Scotland's glory and Scotland's pride; while, on the other hand, almost hidden by the horizon, were the rugged summits and fir-clad slopes of the Highland line. A beautiful picture, but alas, a fancy one; for rude Boreas, with its winter storms, had changed the scene, swept the purple bells from the heather—the trees stood up gaunt and leafless, like ghostly sentinels, and the landscape was covered with a light mantle of snow. Changed it was, but beautiful still, even in its winter garb; but ah! how I should like to see it in the glory I have just now faintly tried to portray. And the water! could an angler, cooped up for weeks in our modern Babylon with nothing to see but seemingly endless rows of bricks and mortar, and nothing to hear but the ceaseless roll of wheels, be suddenly transported to its banks, and listen to the silvery music of the little stream as it so pleasantly ripples along, pausing every now and then for a quiet swirl under some big bush or round the trunk of some fallen tree, pausing for a moment, and then to skip away with a laugh and a dance over some brilliant shallows till it is lost in the broader expanse of a large pool with its deep and quiet waters; to reappear again further on, to ripple along, and again get lost in another of those pools for which that estate is so famous—could our London working-man angler see this, a sweet contentment would steal over his piscatorial soul, for it is a very angler's Paradise. But hold, I shall soon be treading on forbidden ground, and giving a clue to the locality; and so I will only say that, in the whole course of my piscatorial wanderings, I never saw a series of jack-waters to beat them. And then, what historical associations do these Scotch localities call to mind, for after we had left our kind host, and had paused for a few minutes in our journey south, under the very shadow of Ben Lomond, and looked at the quiet scene down the glen and across the waters of that famous loch, and up to the summit of that giant mountain. I could not help saying to my companion, "Can this be the place of which the poet wrote:—

"Proudly our pibroch has thrilled through Glen Awe,
And Bannochur's groans to our slogan replied;
Glen Luss and Rosdhu are smoking in ruin,
And the pride of Loch Lomond lies dead by her side."

(I have quoted from memory, and I am not sure about the spelling.) But this is a sad digression. And now to our fishing. As we had had such splendid sport the day before, we did not care the next morning whether we went out or not. But after breakfast, Archie informed us that there was one grand pike pool we had not tried, and so we determined to have an hour or two in it. As we were going, we noticed a change in the weather.

The sky became overcast, and we had only just got settled to our fishing, and landed a brace of good jack, when it began to snow heavily. We stuck to it for another hour or so, and landed another brace of jack, but nothing so big as on the previous day; and then we determined to make tracks for home, and spend the intervening hours of our stay by examining our host's splendid collection of trophies of the chase, and other natural curiosities, which he had collected, during a long life, from many climes.

"Christmas Eve," said our host, with a sigh, as we sat, an hour or two after the events just narrated, in one of the grand old rooms of that mansion. "'Tis many a long year, and many a Christmas day has come and gone, since accident led my wandering footsteps to this locality, to live here, and, I hope, to die here. I suppose," added the old man, "it is hardly necessary for me to tell you that all these trophies, specimens of stuffed animals and fish, and other curiosities, that you see hung around and scattered about the room, have each and all a special history, the relating of which would occupy many hours. This"—and he pointed to a long scar that extended from his temple to his chin—"was done by that brute, when alive," and he indicated a glass case that contained the head of a magnificent Bengal tiger. "You see that fish,"—and as he spoke he pointed to a case containing a splendid specimen of a preserved pike—"I value that case above anything in the house, for that fish brought me my fortune and my bonny wife. Nearly fifty years have flown away since that fish swam free in its native lake, and I, a man young and strong, with knapsack on back and staff in hand, tramped this way, on pleasure bent. Ah! I shall never forget my first impressions on standing outside yonder by the old fir-trees, and looking at the beautiful scenes that spread on every hand, a living panorama. Through the foliage of the trees I could see this mansion, and the expanse of waters that glittered in the August sunshine, while away on the right thin spirals of blue smoke rose slowly into the air from a cluster of thatched stone cottages that formed the village from which this house takes its name; while, in a light boat, floating dreamily along on the bosom of the sheet of water to the left of the house, sat a young girl in a very pensive attitude. All this I saw, and it formed a picture that I have never forgotten; but suddenly the little boat struck against some hidden object, and the next moment its occupant was in the water struggling for dear life: to dash up, to fling off my knapsack and coat, and plunge in, was but the work of a few seconds, and in another few seconds I brought the dripping damsel safe to shore. This was the beginning of a friendship that soon ripened into love; and from that date I was happy, wandering about where I liked with my rod, with none to say me nay. In the lake, from which I had rescued my future bride, lived a big pike, that up to then had baffled all attempts to capture him. When I learned the existence of this gentleman, I determined to have him if he existed. For a long time I was unsuccessful. My most enticing baits were taken time after time, and every time I went home I was met with the remark, "Have you got him?" A peal of silvery laughter from my fair tormentor always followed the shake of the head with which I answered the query. One day she made a rash bet, so very confident had she become that the big pike was not to be taken; for, in answer to a query of mine: "What will you bet me that I don't catch him in a fortnight?" she said, "I will stake my life against half-a-dozen of the best kid gloves, so confident am I that you will never catch him." "Done," said I, and sealed the bargain in a moment. From that very hour, I felt that that fish was my standing disgrace, and spared no pains in order to circumvent him. It matters not the exact methods I tried, but it will suffice to say, that in a week from the date of the bet, during a very favourable afternoon, I hooked him, and, after a very anxious half-hour or so, succeeded in landing him, and bore him home in triumph. You should have seen the girl's look of blank amazement when I proudly exhibited him and claimed my bet; he weighed thirty-two pounds; and there he is. I might tell you," added the old laird, "that the young lady's father was a widower, and she was his only child; and one of his ancestors had mortgaged the estate to a fearful extent. During his lifetime he had by strict economy paid all off but one debt of five thousand pounds. And, as I had a considerable sum lying idle, as soon as his daughter and I were engaged I insisted on paying it off and clearing the estate. I am an Englishman, but I promised my father-in-law to take his name, and at his death carry on the old traditions of the family, and become a Highland Laird; but alas!" added the old laird, in a sorrowful voice, as he wiped away a tear, that trickled slowly down his furrowed cheek, "I am the last of the race; my gentle wife has, these many years, been laid at rest in the family vault. And my son, our only boy, he was ambitious, and longed for the life of a soldier, and now he lies under the shadow of that grim old Russian fortress, Sebastopol, and a cross marks the spot where he and thousands of his countrymen fought and fell. And as for me, I feel that my time is drawing near; long since I have passed the

allotted span of life, those three score years and ten that are meted out to the strongest of us; and now I only wait for the call to join my loved ones." Such was the yarn we heard that Christmas Eve, from the lips of that old Highland laird; but time, that waits for no man, now reminded us that, if we wished to catch the express, we must bid our kind host good-bye, for the carriage had come round. And, the best of our spoil packed away with our tackle and ourselves, we were soon on the road to the station, and in another hour or so were speeding south as fast as the iron monster could take us, leaving behind some good friends, and taking with us some pleasant recollections of glorious sport and beautiful scenes in the Scotch Highlands. And the last that I saw and heard of my friend, as I left the train, and left him to go on a little further, was his jolly face out of the carriage window, and his resonant voice, as he shouted out a sort of a parting benediction: "Remember, the next time you are in difficulties with a Scotch keeper, don't forget the whiskey."

A CHEAP ROACH ROD.

MR. H. BOOTH, fishing-tackle maker of 88, Prospect Street, Hull, has sent us one of his five-joint bamboo roach-rods, twelve feet in length, with upright rings, winch fittings, &c. He tells us that his advertisement in the GAZETTE has procured him customers for this rod from all parts of the country, some anglers, having bought one, have written for others for friends. It is well worth the money; a strong light useful rod, exactly suited for roach-fishing or general bottom fishing. Mr. Booth gives a good bag with it, and sends it carriage free and strongly packed to any part of the country for four shillings and eight pence. It would be a capital Christmas present for a young disciple of Izaak. We can recommend it, as being all it pretends to be.

ANOTHER USEFUL CHRISTMAS PRESENT.

Messrs Eyre and Spottiswoode have sent us their "Landseer" colour-box, No. 304. We forget the exact price of this, but it is rs. 3d. or rs. 6d., and is by far the best paint-box in the market for the money. It contains, in a neat tin box, twelve "moist" colours, a tube of Chinese white, a tube of sepia, and three brushes; it would be cheap at five shillings.

CONVICTION FOR POACHING AT OXFORD.

JAMES BEESLEY, waterman, was summoned for illegal fishing, on the 20th ult., during prohibited hours, and he was further charged with taking fish under the proper size. Mr. J. J. Bickerton appeared for the prosecution, and Mr. Dudley for the defence. Sergeant Keene said he was on duty in Hythe Bridge Street at four o'clock on the morning of the 26th November, and saw the defendant with two other men, in a punt. They landed at the defendant's house in the Fisher Row. He immediately went to them; but when he got near they rushed away, and defendant ran into his house and bolted the door. The boat was wet, and there was a quantity of grass in it. He searched the punt, and found some fish alive in the well, and one outside. There were also some stones with a hole through them, and he believed they were used for fish nets. He found nine jack, two chub, sixteen roach, and two barbel, but he did not know the size of them. The defendant came out of his house and asked him what authority he had to search the punt, and the witness said he considered he had an authority, as a constable, to search it, when defendant came in at that time in the morning. Cross-examined: The punt might have come from Wolvercote. He could not tell how long the fish had been out of the river. William Venables, water bailiff, said he saw the fish that were taken on this occasion, at the police station. He measured them, and found one jack 11 inches and one 9 inches long, and a barbel 9 inches. He saw the stones, and they would be used to put on a net to keep it to the ground. Cross-examined: He had kept fish in punts for several days, and it was a common practice among fishermen. The small fish might have been used for stocking ponds. By the Bench: It was not usual for punts to return at four o'clock in the morning. There was no doubt that the fish were taken in a flue net, and that was illegal in the Thames. The magistrates retired, and, on their return, the Mayor said that taking into consideration the circumstances of the case, they thought the charge had been proved, and the defendant would be fined 40s., and 8s. costs, in each case.

WANTED, by the 'TRENT OTTER,' a situation as Keeper to a private fishery, or as Water Bailiff to a Board of Conservators, or a Fishery District; the former preferred; for further particulars apply to the editor of the FISHING GAZETTE."

A SPECIAL Morning Performance of the Spectacular Fairy Opera, "Black Crook," and the Grand Ballets will be given at the Alhambra, on Boxing-day, Monday, December 26th. It is announced that this is the only Morning Performance that can be given of the "Black Crook."

NORFOLK.

WITHIN two weeks of Christmas, much to our delight, we are once again in the midst of good roach and dace fishing. Apparently a touch from the magic wand of some wizard, and here we are, surrounded by as good baskets of roach as ever we set eyes on in the height of the season. And to-day, as I write, may be seen trudging off, as if for dear life, anglers, with as much eagerness as if it were July or August. Thanks to the glorious weather, we anglers may yet finish up the year in proper style.

I have this week seen no fewer than ten different catches of pike, perch, roach and dace. Of the former, I saw some very nice fish, taken by Mr. R. Palmer and E. F. Holley, Esq. (of the E.A.P.S.), at Boston Ponds, and they informed me that the waters were literally alive with fish, but so overgrown with weeds that it was impossible to work it fairly.

Through the kindness of George Kinder, Esq., of Bowthorpe Hall, I myself fished his private waters, and was rewarded by nine handsome jack, the largest weighing 8½ lb. My friend of the E.A.P.S. again visited Homersfield, on the Waveney, and was again lucky in securing a heavy creel of fine perch. Splendid sport, he assured me, he had, and I could quite endorse his remarks, as I think they are as game as any perch hereabouts. As to roach, I had the pleasure of seeing 200, which were taken in a few hours last Sunday by a gentleman from Norwich, near the "Walpole Reed Bushes," between Buckenham and Brundall; and also another lot, taken on Saturday, by E. F. Holley, Esq., near the spot at Brundall which is now being put in order for the great fishing station.

The prettiest lot, certainly, were a dish of roach and dace, which were taken by Mr. Howard, of New Catton, on the River Wensum, at the back of the New Mills, the roach averaging upwards of ½ lb. each, and the dace were every one as large as an ordinary-sized white herring. Quite a picture was this lot, and decidedly a credit to the catcher. The back river is a difficult river to fish, and one must be well acquainted with its waters to ensure any amount of sport. Friend Howard has promised me a day with him before long, and I shall be most happy to embrace the opportunity.

A deal of controversy has been going on relative to eel sets on the Bure, Ant, &c.; but, I am happy to say, we have no cause to bother ourselves about the matter with respect to the River Yare, for not a single net is to be found from Norwich to Yarmouth. The last one, which was down somewhere between Reedham and Yarmouth, having been removed within the last few weeks.

At the recent meeting of the committee of Y.P.S., held at the Bell Hotel, a committee was appointed to inquire into the matter, consisting of Mr. C. G. Davies, Mr. A. J. N. Chamberlin, and Mr. C. J. Greene. Mr. Davies, who at the meeting, stood alone in supporting the eel-catchers, passed an entire night amongst the eel-sets, saw them hauled, but failed to discover any other fish than eels, with the exception of a few ruffs.

Inspecting the eel-sets which were put down the same night at Horning Ferry, not a solitary fish had found its way into them, only those for which they were intended. From this it may be clearly gathered that eel-sets are not the enemies the angler has taken them to be; but, on the contrary, from the showing of Mr. Davies, who is no mean authority, they are more friends, as eels are known to destroy more spawn than any other fish that swims. Mr. Davies is to be congratulated upon the pains he has taken in order to bring the matter to a satisfactory issue.

The dinner of the Norwich Piscatorial Society was held on Thursday evening last, a report of which will be found elsewhere.

The new fishing and boating station at Brundall is being rapidly pushed forward, and will, if the weather permits, be finished by the commencement of next season. I hear that, in addition to this, another piece of land has been purchased adjacent to it for the purpose of forming gun-clubs similar to those held at the Welsh Harp, Hendon, and other such places. ANGLER.

[We hear some big jack have been taken recently at Higham Sound—one of 22 lbs.; how they were taken we did not hear.—ED.]

STRANGE BUT TRUE.—It was the depth of winter. We were travelling in a railway carriage, she was a splendid woman, and had such a pretty little foot, "Rub my foot," said she, pushing her dainty little well-booted foot right out before me, "it won't dirty your hands, it is Young's Sable." "Who is Young's Sable?" said I. "Why! blacking, of course." Young's Sable Blacking requires no brushing, it may be applied with the bare hand, does not stain the hands or clothing, and gives an instantaneous polish equal to patent leather." And I did rub her foot. And I always use Young's Sable Blacking, so does my wife, so do my fourteen children, and the mother of those children is that very lady who travelled with me on that bitter winter day.

ROACH-FISHING IN THE WARWICKSHIRE AVON.

ON a lovely Saturday morning in August I made arrangement to go for three days to Bidford, a very pretty village on the banks of the Avon, to try my hand at my favourite pastime, roach-fishing. Having booked by the 6.40 train from Birmingham I arrived at Salford Priors, the nearest station to Bidford, at 8.30; and after an extremely pleasant walk of about a mile and a quarter I arrived at my destination. After looking about for apartments for some time I was recommended to stay at the Pleasure Boat Inn, kept by a very respectable lady, Mrs. Hendley; and I must confess that during my sojourn at her establishment she did all in her power to make me comfortable. Having refreshed the inner man, I shouldered my rod and basket, and on leaving the Inn I turned to the right, went a short distance up the village, walked over the bridge which crosses the Avon at this point; passing through the gate I took up my stand at the end of the osier-bed, opposite the back of the Boat Inn. The swim at this part of the river is a very good one, being about 7 feet deep, and a very gentle current. After plumbing the depth, I threw in some ground bait, bran and bread, and commenced fishing close on the bottom with my favourite bait, paste. After one or two swims down I managed to get the fish together, and perceiving a slight bite I struck and found myself fast in a good fish, which, after a good fight, I landed, and which proved to be a roach of a pound weight, and fishing on, with varying success, I managed to land several more good fish, all roach.

Throwing in some ground bait, I commenced fishing with paste, and after trying this bait for some time and finding they would not look at it, I then tried stewed wheat, and the first swim down succeeded in hooking a splendid fish, which, after a deal of careful play on a very fine horse-hair line, I safely landed, and which proved to be a roach in magnificent condition—weight, 1 lb. 10½ oz. After catching a few more roach in the same swim, I tried another pitch in a bend of the river just above, and, fishing over the water-lilies, which here are very numerous, I succeeded in adding a few more fish to my bag. I then went back to the Boat Inn and had my tea, and in the evening I went as far as the “Long Swim” in a boat kindly lent me for the occasion, and, having caught a few small roach, my second day’s angling came to a pleasant termination. On the Monday morning, I was out of bed very early, and having gathered my fishing tackle and baits into the basket, and throwing my rod and gear over my shoulder and defying the elements—for it was pouring in torrents with rain—I went down the village until I came to a passage which runs by the side of the gasworks. Having traversed this, I came out at the bottom of the gardens got over the stile, and walking down the meadow about a hundred yards, I commenced fishing at half-past three in a very steady swim this side of the long osier-bed and here I succeeded in getting a splendid lot of roach, many of them weighing from ½ to ¾ lb. each, the baits were paste and stewed wheat.

Lovers of perch-fishing should try the basin at the other end of the osiers near to the old lock, as one Saturday evening, about four years ago, I caught a splendid lot of perch in this hole close to the side, when the roach were dead off the feed; there are also a few small pike in the basin. After gathering up my fishing paraphernalia, I went a little lower down the same meadow and commenced to fish the swim opposite a part of the river known as the “Sweep’s Hole.” In this spot I took four roach that averaged a pound each, besides a quantity of small fish. I then went a short distance lower down, and fished two swims opposite the long osier-bed, from which I obtained some capital roach. Darkness coming on, I wended my way back to the village, having thoroughly enjoyed my first day’s sport. On the morning of the second day (Sunday) I commenced fishing at four o’clock, at a part of the river known to the natives as the Long Swim, which is situated at the bottom of the third meadow from the bridge, and on the same side of the river as the swims I fished on Saturday, and with Marl Cliff, an old-fashioned little village at the back. Here I caught one bream weighing 2 lb., and several very fine roach, including one that turned the scale at a fraction over a pound. Bait—stewed wheat as paste—did not seem to suit the palates of the finny tribe this morning. I then went to breakfast, and after partaking of that meal, I wended my way through the village, round by the church, and across the fields by a public path, to a nice quiet spot on the river, situated just above the mill at Graage, about a mile from Bidford.

I then went lower down the river, until I nearly came to the end of the osier-bed, then stooping down, I passed through a small gap in the osiers, and found myself in a very nice spot; indeed, there being a piece of ground about two yards square upon which I could stand, and in front of me was a splendid stretch of the Avon about six or seven feet deep, just the place to find good roach at this time of year. After ground-baiting, I placed a small piece of paste on my hook, and about the third swim down, I succeeded in hooking a decent fish, which, when landed, proved to be a roach of half a pound. After fishing for some time with the results of a very decent lot of fish, I quietly strolled back to the Inn, and partook of a hearty breakfast. Having satisfied my hunger, and thoroughly dried my overcoat, I again shouldered my basket, passed over the bridge, and commenced fishing in the Avon, opposite Day’s Mansion, and having caught a few roach, I then started for the “long swim,” from which I got a few good fish. Still wandering down the river, I tried another pitch, a very quiet little spot in the next meadow opposite the gate on the other side of the water, from this swim I took sixteen roach with stewed wheat; all of the fish were from three to four ounces each. The fish having gone off the feed at this place, I wended my way under the Cleeve Hills, and having passed through a most lovely walk, one portion being a complete bower of trees, I came out at Cleeve Mill, and crossing the narrow foot bridge, which here spans the weir, I went down the

meadows on the opposite side of the river, and on a small piece of land which projects I placed my basket, and sitting down commenced to fish my last swim for that day. After trying for some time with paste, and to no purpose, I then tried wheat, but that not getting the fish into the creel, I next tried the cockspur worm, and with that bait I succeeded in getting a capital lot of roach, and also a very few nice perch. I then packed up my traps, and strolled up the fields to the Bell, at Salford Priors, and having had a crust of bread and cheese, washed down by a bottle of Bass’s bitter, I had a quiet chat to the charming hostess until the train was nearly due.

THE WANERING ANGLER.

CORRESPONDENCE.

We do not hold ourselves responsible for opinions expressed by our Correspondents.]

THE OLD RIVER—HOW TO GET THERE, AND HOW TO FISH IT FROM BANK OR PUNT.

BY A THAMES FISHERMAN.

SIR,—In my letter under this heading I only succeeded in describing to you the first half mile of this splendid reach of fishing water. If you will kindly fancy yourself on board once more, I will try to take you over the remaining mile.

Possibly, Mr. Editor, I may some day have the pleasure of actually seeing you step into my punt, and as we—your readers—have recently been informed that Mrs. Editor occasionally accompanies you and I takes her part in the enjoyment of angling, I shall hope to see her with you. I can just fancy myself handing her in. Handing the ladies in and out is one of our old customs and privileges for which I am a great stickler; and I think I ought, I am not so slippery shod or fingered as you London gents; I have my semi-sea legs on, and my hands are water-roughed and sure of grip. You may not know it, sir, but so long as Mrs. Editor does me the honour to remain in my punt, I am the responsible party—your chief duty will be to see you do not miss a bite; you must trust me to pay her all those little attentions necessary for her comfort, and to enable her to whack you by ever so many fish. The ladies—bless them—know all this by intuition. It is only a short time since I had a young married couple out with me jack-fishing; the husband got a run, hooked a fish, and before I could get the net out he lifted a four-pounder bang in betwixt and between the lady’s legs, where it commenced to flop over and over with the triangle hooks hanging from its mouth. There was a scream, a jump, and I think just a trifle of fainting; at any rate, she fell over. Which way, did you ask? Why, the way ninety-nine out of every hundred would; towards the captain, to be sure, the man most unlikely to be knocked overboard with the shock. Bring Mrs. Editor with you, sir; but don’t pull your jack out as that young man did, or I will not be answerable for the consequences.

Immediately after leaving Mr., Mrs. and Master Phillips’s barbel swim, we shall reach the high perpendicular bank which has withstood, as best it could, the headlong rush of the angry floods for longer than my memory serves. The winter’s frosts following fast upon the autumn rains have materially assisted the determined and almost successful efforts of the river to get at the railway. A few more years and the small portion of meadow still intervening will have disappeared from Bucks and been carried over to the Berks side, there to aid in the formation of an island, which already rears its head sufficiently to act as a breakwater, much to the satisfaction of a number of jack and perch which make the tail and inner side their home. No doubt this filching habit of Father Thames is not quite so satisfactory to the loser of the land as to the shoals of fish which are thereby fed and provided with new haunts. The increasing twirling and twisting, moving and removing, and the shoals, deeps, rapids, and lay-byes thereby formed, is just what Nature intended Thames fish to enjoy. Make as many deeps by the aid of dredging machines as you may, and as soon as the dredging ceases the fish will desert them for one of Nature’s making; straighten the river, shear and concrete its banks, fill in the lay-byes, and each and all of those works will most assuredly hasten on the day when the artificial propagation of fish shall become imperative, and when men more enterprising and energetic will be chosen to fill the places of those who are now merely playing at fish preservation. I say this, Mr. Editor, with the respect which is due to a few gentlemen who are noble exceptions to the rule, and who deserve our lasting thanks, for labouring to do their best according to their lights and the means placed at their disposal. Were the truth told—why may it not?—the anglers are the men directly responsible. Where are their hundred and fifty societies? Where their amalgamated associations? Indeed, where are the ten thousand London anglers? Are they, or are they not, the constituency which our preservation societies represent?

I have stated that this is the best one-and-a-half mile’s fishing the Thames can boast of; I would add that it requires more protection than any other; and now let me challenge any man to say that he knows, of his own knowledge, that it has been visited by a river-keeper during the past twelve months. Have the Windsor and Eton Preservation Society, who profess to preserve this water, a single river-keeper in their employ? Some one, no doubt, will say “Yes, so-and-so is paid five or ten pounds per annum.” Take it from me, all you whom it may concern, that it would be better that such moneys had never been subscribed. I don’t doubt, for one moment, but that the gentlemen who form the working committee of this society are

actuated with the best intentions; but good intentions are a poor return for hard cash. Poaching goes on here, but who remembers a poacher being captured? Let me be just, I remember seeing one caught, and I think it worth your trouble to read how it was done. It happened about ten years since, at this season of the year, on a Sunday morning. I was making for my punt which I had left the previous night. As I travelled up I noticed two bank-anglers walking in front; they suddenly stopped and hid themselves behind a bush, in such a manner as left no doubt in my mind they were watching some one. Behind a tree close in their rear I pulled up to wait for the explanation. Round the corner came a punt, and lying at full length along the well, with head and shoulders hanging down level with the water, was H—, a notorious thief and poacher. First a jack and then a barbel was cleverly snared, and afterwards two more jack were snatched in. Just then the punt caught the stream and travelled too fast for his work. He rose, took the pole, and pushed her into the ditch close to the spot where the two anglers were secreted. They waited until he came on land, and then one of them stood directly in front of him, and asked, "What sport?" The wary poacher smelt a rat, and, as he answered, "Not a fish," he drew from his pocket a quart glass bottle, which he firmly gripped by the neck. "I saw you take several, and in an illegal manner," came, in a stern firm voice, from the man who barred the road. The poacher, with an oath, threatened that he would dash his brains out, if he did not stand aside, and with this he made a step forward with his arm uplifted, and the bottle reached within an inch of his opponent's nose. "For God's sake, Geen, let him alone, he will do you a mischief, come away," was the advice of Angler No. 2. One step backwards went the plucky little fellow, and I thought it was all over. I was mistaken. He only wanted to free his mouth and nostrils from the too close vicinity of the aforesaid bottle, that he might be able to say, "Page, stand by, but don't interfere, unless I call for help;" and then he said to H—, from whom his eye had not wandered, "Will you or will you not hand me over the fish and snare?" The answer was another series of oaths, and that he would see him—first; and, at the same time, he advanced a step, and the bottle once again touched his opponent, who never moved a muscle. H— appeared stupefied at such passive yet successful resistance. Here was a man, scarcely more than half his own weight, who had not as yet condescended to raise his hands to ward off the threatened blows. It was inexplicable to me, until I noticed the self-satisfied gleam of the proud eye. I then felt that there was no need of assistance, the bully had most assuredly fallen in with a trained boxer. After this slight hesitation, H— seized the man with his disengaged hand, and fairly forced him round out of his way; in doing so, he had to partially turn himself, and, as one of his legs was about to pass over the other, lo! they both flew from under him, and he was sprawling on his back. Quick as lightning No. 2 angler seized the bottle, and as he hurled it into the river became a changed man. Up to this time he had been dodging round and round the combatants with a bundle of rods, in such a manner as left a doubt in my mind as to whether he fancied he was forming a ring, or was merely on the look out for a favourable opportunity to charge in aid of his comrade. Now, he had dropped the rods, and was rubbing his hands in delightful anticipation of what would follow. In an instant H— was upon his legs again, and as I saw his ferocious bloodthirsty look, I made a step or two forward in my fear lest he had armed himself from his pocket, with a worse and more cowardly weapon than a bottle. No, it was with clenched fist that he made an attempt at a running blow; but its oncoming had been seen by the intended victim, and cleverly the brute's impetuosity was utilised to bring him once more violently to the ground. He rose, and blindly rushed at, and closed with, his man, but he was soon to discover that he could not strive at close quarters. Vainly he attempted to thrust his antagonist to arm's length with his left that he might strike with his right, but each and every struggle tended to perfect the grip of his lithesome wrestling opponent. Once I saw the little fellow weigh him and let him gently back upon his legs, as I have seen professional wrestlers do. He was evidently satisfied, for almost instantly H— was turning a summersault, and as he came down on his back upon the frozen ground the wrestler fell on him with a dull, squashy thud, which plainly said it's all over. I was due at my punt, and as I made a slight circuit to avoid the three men I saw H—, lamb-like, submitting to have his poaching pockets rifled of the barbel and jack. Had H— confined his attention to fish I don't think he would have gone to jail. Possibly the encounter I have described disgusted him—at any rate he took a fancy for fowl, and was discovered early one morning by an inquisitive constable with a full sack. On being questioned as to its contents, he said it was firewood, and on an inspection being made the constable was satisfied. The sack was shouldered and off he walked, and clean off he would have got, had not one of the ten dead ducks which were at the bottom given a most unmistakable quack, quack.

The shallow round the high bank will be sure to afford sport to the summer chub-fisher who knows how to work. I have taken numbers by throwing in a handful of soaked bread, which on reaching the water will break up and swirl round in the little eddies formed by the sandy clay lumps which have fallen from the bank. The bread will put the fish on the alert for the more substantial piece which should follow the hook. The pollard at the bottom, which is growing out a little above the ordinary level of the river, hangs over a capital bank swim. Slide down some eight feet, and you will be landed on a miniature platform with a good seat formed by the roots of the tree, there is just sufficient space to stow your lumber, do away with two or three joints of your long rod and you will then be able to catch fish of all kinds directly under your feet. Don't be in a hurry to leave this spot; sit quietly, smoke a pipe, look well about, and, tell me, did

you ever fish a snugger, prettier swim in all your life; don't sleep, for at any moment the frightened fish may return and walk off with your tackle.

I have stated that the tail and inner side of the island is the home of a number of jack and perch. I may, without fear of exaggeration, say that the quiet water extending from this spot to the next bend—about 400 yards—is the best piece of public jack-water within twenty miles of here, and has without doubt produced more large fish than any other.

Had I space I would tell you something of the monsters that have been taken, and a little about a brace that will some day be caught, I hope, fairly, with the hook, and not by that poaching one-arm man's crook.

There are a number good bank swims on each side between this and the ditch, where the water flows gently enough for the laziest of roach, and where the most fastidious of Lea or Thames fishermen may suit themselves.

I must say a word or two about the tricks that are played with the said ditch. As I am writing, the river is rushing by in full flood, and by the time this is in print more probably it will have slightly subsided, and the fish that have headed up the ditch will be at the mercy of a set of vagabonds, the ringleader of which is the one-arm man; they will most assuredly lay their flue net first across the mouth, and having gone up some distance, will, with a long pole, drive the fish down into it. The net will then be refixed higher up, and another length will be similarly treated. Should they be as successful as on many previous occasions, a two-bushel bag will be required for the perch alone. What say you to this, sir? Are the W. and E. P. S. preserving this reach of water?—another pen broken; bother the poachers and preservation societies.

Its seldom that elms consent to have their roots washed by Father Thames; the clump before us on our left has done so for many scores of years and cast its grateful shade in summer, and welcome shelter in winter, over the fortunate anglers who have fished the two pitches known as the Elms Swim. If there be amongst the readers of this letter a brother working man who is undecided where to travel for his to-morrow's hoped-for sport, let him straightway make arrangements with his mate to come here. No matter that the water be high, I promise dry foothold and a quiet corner for the floats. Don't forget your worms, as you may fairly expect a few good perch with your day's take. Are you afraid of ghosts? if so, don't come, for as sure as spirits are permitted to revisit the scenes which they loved faithfully while in the flesh, so surely will old Mortimer's spirit hover about these trees. A few months since you might have had the pleasure of meeting the most extraordinary enthusiast that ever lived. Here he fished in his prime, a tall stalwart man; twenty years made no difference in him, he continued to fish his favourite swims with the best of tackle; another twenty years passed and the hale hearty man still did the journey from Putney to Wraybury for a day's fishing. Why need I speak of the journey? it was nothing to him at sixty, he said nothing of it ten years later, but some of us who knew and respected him fancied his tackle not so fine and his rod not so long and taper as it used to be. Another ten years saw him a constant visitor in all weathers; the last time I saw the grand old man of eighty years was as he stood close by here up to his knees in snow, anxiously watching the float, which I had noticed grew larger year by year. Yes, old Mortimer is dead, and the Elms Swim is "To be Let."

Now, sir, for the fly rod—I am told you have one which you wield most gracefully. Before us are the rapid shallows that reach past Captain Gill's park; what a grand day you would have if only a few of the many trout should condescend to rise at your fly? they won't, so you must be content with the chub and dace, any number of which you may deceive on a propitious day in July or August. It is rumoured that the T.A.P.S. intend to keep a sharp eye on the fly-fishers next season, so mind your sizes, sir. There are a few second-rate swims in the park, and two others of the same description in the osier-bed below. On the opposite side is the meadow adjoining Old Windsor Lock, where several good bank swims can be found, but I would advise anglers not to visit them in winter, as a flush of water makes them unfishable. Stretching across the river, just above the lock, is the foundation of the old weir; should you desire to take a barbel in July—they are scarcely worth taking then—bait well with greaves twelve yards up stream, about two-thirds of the way across, and you will soon be amongst them; most probably you will find your take varied with other fish. The deep hole at the back of the lock I have written of in a previous letter.

I must now thank you for giving me so much space for my rough-and-ready description of the Old River, or Fleet.

May I trespass on your kindness, while I answer one who claims to be a brother professional, Mr. J. Harrington Keene?

I am gratified to learn that he has derived considerable amusement, combined with instruction, by the perusal of my letters. In reference to the one headed "The Great Curse of our Calling," he says:—"His complaint would certainly be a remarkably proper one if it were founded on anything more than isolated instances. I assert they do not occur more than once or twice per year." Let me ask J. H. K. how many times per year it must occur before my complaint becomes a proper one? Twice, I say, is more than sufficient. Immediately after admitting that it occurs once or twice per year, he writes:—"Your correspondent has put an imaginary grievance into charmingly terse prose." What consistency, to be sure, from a trained critic.

Of my letter, "Bell Weir to Old Windsor Lock," he complains that he has tried hard and cannot find some of the pitches, and he asks, "Where is the good barbel swim near the road from Staines to Old

Windsor? Very vague this." I admit that is vague, but I deny it to be my description, which was as follows:—"We must not forget the second good barbel swim as we pass the sharp turn in the river, where, at flood time, it rushes against and over the road from Staines to Old Windsor." As this is the only spot where the river and road actually meet until we get to the Bells, I thought the description sufficient; but if you will grant me the same space per swim as you granted J. H. K. to describe the bones in a perch's head, I will be more particular.

I desire to thank him for his courtesy in refraining from criticising my last letter until I had completed the stretch of water. I know that he is entitled to speak with considerable authority of the old river, as here the greater portion of his brief—very brief—existence as a professional fisherman was passed. He may be as severe as he likes with my writings, and I shall have no cause of complaint, so long as he may be consistent, and refrains from the worst of critics' faults, and the least to be excused, that of misquoting.

Come, brother Keene, be as candid as you are clever—with the pen, not the pole—and admit that, as a professional fisherman, you never wore the varnish off that new pine punt you purchased, and

"When—are—you—coming—to—bed—father?" That's the wife, sir, so good night.—I am, &c., A THAMES FISHERMAN.

MESSRS. THORNHILL'S NOVELTIES.

MESSRS. THORNHILL and CO. have got a magician on their premises. There is an immense iron room, with a big trap-door on the top. When the firm want to bring out a novelty, the partners put their heads together, and, shortly afterwards, an order is sent forth that certain articles of furniture, or use, or ornament, are to be delivered up to the magician. Then may be witnessed a curious scene (but only by those who are privileged to stand in their nightshirts on the roof of the house at exactly 1 a.m. every new noonday). Desks, garden chairs, ladders, cockatoos, umbrellas, seals, cats, toll-gates, ships—in fact, everything that can be got hold of—is thrown down the iron trap-door. As soon as the last one disappears, the trap-door is shut, and then commences the most awful row ever heard by mortal ears; and the Christmas "waits" are not a patch on it. The magician is at his work, and by twelve the next day the "Novelties" are ready. A little trap-door in the bottom of the cage is opened, and, first, a miniature toll-gate appears, beautifully made, with lamp, house, and bar, the whole forming a most elegant smoking companion. The cumbersome garden-chair has been transformed into a most dainty penholder, the ladder into a pipe-rack, the seal into a claret jug, and so on. A few of Messrs. T. and Co.'s novelties will be found in their advertisement in our columns. We say a few, because, if we are not quite correct in our account of their manufacture, we must explain that it comes of examining Messrs. T. and Co.'s new catalogue at dead of night in our editorial den. Perfect silence reigned for a short interval—the printers' "devils" and their masters were having tea. We looked at the hundreds of illustrations, trying to trace back each charming "idea" to its cause; each novelty to its origin; then commenced a fearful din. The whole building began to tremble, iron-shod feet clattered up and down iron-faced stairs; under us, over us, all around us, was the steady grind of the printing presses, the monotonous noise of machinery in motion; we gradually got into a dazed state. Bang goes the door, in rushes a "devil." "Please can we have the rest of the 'copy'?" This reminds us we have to write a notice of Messrs. Thornhill's "Presents." We can only say as we did last year, and as the *World*, *Field*, *Queen*, and all other papers say, go to Thornhill and Co. if you want something really new and really good. You can suit your purse as to price, and choose from many hundreds of articles from a shilling to hundreds of pounds in value.

At our suggestion Messrs. Thornhill have brought out a cheap edition (at 15s.), of "The Fishing Gazette Knife," which they call at the *Marston Knife*. Having designed it, we will simply quote what others say of its qualities.

Land and Water, says:—"The *Marston Knife* will form an excellent companion to the angler. It contains just what the angler requires at the riverside—a capital strong cutting blade, a good scissors, corkscrew, disgorging file, three-inch measure, and screw driver. It is neither bulky nor over heavy, and reflects much credit on the designer and on the manufacturers."

The *Field*, says:—"There is only one thing wanting—a small screw-vice for holding hooks—of the workmanship, it is enough to say that it comes from Thornhill's."

The Steroscopic Company have, as usual with them at Christmas time, prepared a treat of novelties for their customers—and they are legion—a few of which will be found detailed in our advertising columns, under the designation of "Our Guinea Box."

RIVER REPORTS.

MID-THAMES.

"My business in this state
Made me looker-on."

—SHAKESPEARE.

I have to report that I am still a "looker-on," mid mud, and that the thin silvery streak of summer Thames is no more; but in its place, a swollen, perturbed, moving excrescence of unfishable water. The continuous rains have dispelled, I fear, all hopes of a jolly Christmas, externally, for the piscator on the bosom of Old Father Thames. The frosts of the past few days brought hope, but the thaw of yesterday and to-day plainly said, "after me, the deluge." Roach and perch, with worms as bait, may be caught in the eddies and quiet corners, where the wicked jack cease from troubling and the weary small fry are at rest. At Henley, on Tuesday, Potter, in Marsh Pool, took five pretty jack, and Mr. T. Jeston a good basket of jack and perch. W. Parrott has been busy in the low-lying districts of Remenham, near Henley, collecting the contents of the ditches and returning to the river, 300 small perch being thus had and consigned on Tuesday last. At Hurley Mr. R. J. Birch, a piscator of ten years, on a recent occasion, from a hole, got 60 fish (half roach and perch), the last roach going 1½ lb. This is a little birch which would prove a rod to many a complete angler. Thursday Evening.—River high and coloured, and in many districts unapproachable; but *nil desperandum* should ever be an angler's motto.—MARLOW BUZZ.

Thames (Goring).

Water now in very good order for all-round fishing. It rained here on Wednesday night very hard, and I am afraid if we have much more rain it will make the water come down thick again. The prospects at present look bad for this week, unless we get a change in the weather. Some good roach was taken here on Monday last, fourteen roach going 9 lb., and one jack, 3 lb., with the worm.—JOHN RUSH.

Thames (Kingston).

The river has been rising and falling all the week, and the rain keeps freshening it up. The bank fishers have had the best of it lately—some good roach and dace from the banks, and here and there a good perch.—JOHN JOHNSON.

Thames (Richmond).

The river is now got to a very good state of affairs again, the water not being too high, and a very good colour. Since my last report, we had a fair mixture of weather that has put the anglers off as well as the fish. The bank anglers have been doing well during the week, in fact, they caught more off the bank than have been caught in the punts, but I fully expect to have to report some good takes of bream and roach next week. There have been six punts out during the week, but have met with little success, as the weather has been so changeable; in fact, it has been wretched, the rain we had to-day will not do any harm, as the river is getting lower every hour now.—JOHN BUSHELL, fisherman.

Thames (Windsor).

Water has gone down considerably, but is still very much discoloured. Very few anglers out, but some nice roach and perch have been had from the lock cuts, but few in number. The best bag for the week I know of is seven barbel, taken by Mr. Keep, of Down Place.—B. R. BAMBRIDGE.

Ancholme.

Reports to hand concerning this stream are very meagre, in fact no one seems to care about winter fishing. I have, therefore, considerable difficulty in making up a report. If, however, coarse fish notes are at a discount, I am happy to report most favourably respecting my forte—the trout. I have seen a fine lot of fish on the spawning beds of the stream I am stocking, and hope to take therefrom, as well as from my own ponds, a good store of eggs, which I shall be most happy to supply at a rate which will contrast agreeably (to the purchaser) with any in the market. Our trout are rather late, but for fine qualities cannot be surpassed. The larger ones cut as pink as salmon, and the waters are very favourable to their growth. I have some about three years old that weigh nearly 3 lb. I shall be glad to send list of prices, free on application, to intending purchasers.—THOMAS FORD.

Dove.

The weather has been very changeable this week; and as the Christmas holidays are close at hand, and people are what is known as "finishing up," we have not had a great number of rodsters out. Those who have visited the river have succeeded better than of late, inasmuch as grayling and pike have been nicely on the feed. We have at last had severe frosts, and there can be no doubt that these have had the effect of sharpening the piscine appetite considerably. I hear that Mr. Charles Wild caught six brace of grayling near Rochester with the needle fly, and some nice dishes have fallen victims to the cockspur worm and maggot. Notwithstanding the fact that the river has been running very high and thick, the coarse fishers generally have done well, and I fancy all kinds of sport will prove remunerative during the holidays if the weather continues as at present.—THE SLODGER.

Ilfracombe (N. Devon).

The fishing this week has been very slack owing to the unsettled state of the weather. A few boats have gone out drifting, and their catches have averaged

about half-maize of herrings each boat. A few fine cod and ling have been caught with ground lines. On Wednesday a conger, weighing about 50 lb., was brought in by one of the fishermen. There has been a quantity of nets lost and damaged this season; one man lost twenty, another ten, and several three and four. Thursday, weather moderate; several boats out this afternoon drifting; they have just come in with a maize of herrings in each boat, and a few whiting.—E. COMER.

Lea (Rye House).

Water has cleared down and is in good order for fishing. Mr. Moss took a small jack on Sunday and a few roach on Monday. The weather is very cold and frosty; the wind N.W.—WM. COWELL.

Lea (Ware).

Once again this water here is in rattling good order, and the late fresh has swept the bottom very much. The Boom is a treat now, but there has been nothing done this week. So far "nobody down." Through your valuable GAZETTE I should like to make known that I am about to get up a benefit for Harry Page here, who is known to the angling fraternity at large.—VON LEEFE.

Medway (Tonbridge).

The river is fishing down nicely, and if we are favoured with fine weather till Sunday no doubt roach will be on the feed. A well scoured worm will be about the best bait, but if any one has a few wasp grubs preserved, *a la* the FISHING GAZETTE recipe, no doubt they would prove attractive. Now is the time for anglers fond of pike-fishing. With the wind right and a nice dace all should be well.—YE MEDWAY WATER RAT.

Onse (Littleport).

Water in very good condition, but running very rapidly, owing to the recent heavy rains. It is very cold here now, and the frosts have knocked the roach off the feed. Still, I think if an angler would sit down patiently to light ledgering it would pay, for what few fish are taking are of good quality. No one is turning out now, however, so I have not much to report. The following are the only anglers who have had a turn:—Messrs. J. Heald, W. L. Shipton, and G. Smith, Cambridge, December 8th, 9 lb. roach. Had a run myself yesterday and got a dozen roach in two hours, going 4½ lb. the lot. Mr. J. Hulford, Ely, also had a turn for an hour, and got six roach and perch, going 3 lb.—largest roach 1 lb. 2 oz., largest perch 14 oz.—CHARLES SOUTH.

Trent (Nottingham).

Some of our anglers could not understand why the fish have nearly altogether refused to take both worms and maggots, it was doubtless owing to water in the early part of the week, having gone down to almost summer height; and become quite clear. When this is the case during any of the cold winter months, they should not be surprised at the fish refusing the two baits mentioned, it always has been so through my experience in Trent fishing besides the cold misty weather was much against the successful use of either worms or maggots, though it just happened to suit the chub-fishers with scratching and pith and brains; for, I believe, it is now well understood among our rodsters that chub are often found to bite best in misty weather, so long as there is no frost with it, and the first two days in the present week proved that what I have stated was quite true, as several anglers lost no time in preparing their scratching, and at once started down the river to fish some of their noted winter places, and, I might say, have succeeded in capturing better baskets of chub than other rodsters have done up to the present time, some of them going 3 and 4 lb. each. It is always a difficult matter to fish for chub on a misty day, the line, once getting wet has not a chance of getting dry again that day; consequently, if the anglers would only take the precaution before they start to rub the line twenty yards up with a little palm oil, they would find that it not only resisted the water, but the line would run much freer, and the rodster, in winter, should not forget this whenever a running line is required. As regards pike, I believe that a misty day will make but little difference to their feeding, so long as, as I have stated in chub fishing, there is no frost. On one occasion, although the anglers could scarcely see their float, the jack bit freely, but I did not see one that exceeded 10 lb. Anglers, under the present state of things, might venture to leave their worms and maggots at home and go after the pike and chub, and if pith and brains can be procured, they will find it the most killing bait for chub, and jack will be best tempted with a livebait, dace in preference. Water still low and clear, and the backwater and still parts of the river will be found the most likely place to find the jack at this season of the year.—W. BAILEY.

Trent (Newark).

The water has been in fair condition for general winter fishing most of the week, but the weather has been dead against the angler. The latter part of last week we had some very sharp frosts, to be succeeded on Sunday by a thaw, followed by a drizzling rain. Rain during the day and frosts at night have been the order of things down here this last day or two, and the wind one day has been south-west while on the next it has been plump north. This curious combination of circumstances between the weather and wind has had the effect of putting the fish off feed, for, as far as I can learn, nothing of any importance has been done—a few odd roach, chub and pike have been had, but nothing worth reporting. For my own part, I have nothing to report, except a 5-lb. jack, taken with a sprat on the "Fishing Gazette spinner and tackle"—a capital concern to spin a natural bait is the "Fishing Gazette spinner," although I have heard some anglers declare that they do not like it; but I believe it is because they don't know how to use it. I have no difficulty in making a bait spin splendidly with it. To-night (Thursday) the water is coming on a bit, with some colour in it, and, as we have had a nice lot of rain, I am sadly afraid we shall have another heavy and thick water; and so anglers had better be prepared to find the water thick and high by Saturday. It is still raining as I pen these lines. A very fine dog otter was shot last Saturday afternoon in the Muskham Fishery, near Newark, by, I believe, Mason, the keeper; it weighed 24½ lb., and has gone to be preserved, so I hear. I was not in that locality last Saturday, or perhaps a charge of No. 6 might have been lodged in the carcase of the

THE TRENT OTTER,

Wye and Derwent (Derbyshire).

We have had very changeable weather since my last report, viz., snow, rain, foggy, and sharp frosts; in fact, the grounds and roads are one sheet of ice this morning (Thursday) and very dangerous it is travelling; both rivers are a little discolouring this morning from the rain and snow which fell yesterday. Sport during the week up to Wednesday, with both top and bottom, has not middling, and only small baskets have been the order of the day off of both rivers. The best taken that has come to my notice was a

basket of four brace of nice grayling that were killed last Monday on the Derwent close to Whatstandwell, with the furnace and dyed hackle flies. The bottom fishers have lured a few fish, chiefly out of the deeps, with both worms and gentles. One angler having a splendid perch of over 2 lb. weight, besides a few grayling and roach; all these fish were killed in the Derwent below Cromford Bridge, and fell victims to cockspur worms. The changeable weather is the sole cause of the fish not feeding better than they are now doing. Pike have been doing very little during the past week, at either live bait or by trolling. There has been a good quantity of wild fowl, such as ducks, widgeons and teal, seen on both the Wye and Derwent during the last couple of days.—GEORGE JAMES EATON.

CLUB AND OTHER JOTTINGS.

By L. B.

THE great item of interest this week undoubtedly is the granting of an extension of the cheap travelling concession by the Great Eastern Railway Company to the members of the three Central Associations. The following letter from the General Manager to Mr. T. Hoole, the secretary of the Association, will explain what the new concession consists of.

[COPY.]

Great Eastern Railway,
General Manager's Office,
Liverpool Street,
December 8, 1881.

DEAR SIR,—With reference to the interview I had with a deputation from various angling societies on the 20th of October last, I have submitted the question raised on that occasion to the directors, and am instructed to inform you that on and after 1st January, 1882, 1st, 2nd, and 3rd class single fare return tickets will be issued to the members of the

United London Anglers Society,
The West Central Association of London Angling Clubs,
The Central Association of London Clubs,

on production of their cards of membership.
From Liverpool Street, Bishopsgate, Bethnal Green, Stratford, to all stations between Ponders End, Buntingford, Ware, and Shelford, inclusive, and all stations between Loughton and Ongar inclusive.

Hackney Downs, Angel Road, to all stations between Ponders End, Buntingford, Ware, and Shelford inclusive.

The tickets will be available for the same period as ordinary return tickets.—

Yours faithfully,

(Signed) W. M. BIRT,
Per G. STREUDWICK.

Mr. T. Hoole,
West Central Angling Association,
Mortlake, S.W.

The committee of the Anglers' Benevolent met, on Friday last, at the new Foresters' Hall, Clerkenwell Road. Mr. L. Bonvoisin in the chair. The balance sheet of the last half-year was read and passed, and will be printed and distributed in a few days. A sad case of a necessitous member was brought before the meeting, which voted a sum £3 for his relief.

Sir Roger Palmer has caused his name to be removed from the list of vice-presidents of the Maidenhead, Cookham and Bray, Thames Angling Preservation Association. This is as it should be. Holding such a position was entirely at variance with the claims to the exclusive fishery rights recently set up by Sir Roger.

Speaking of Thames riparians, and their so-called rights, I cull the following from a scrap book and diary which belonged to the late Harry Crystal, a well-known and successful angler.

"Right of fishing in the Thames.—Several months since Mr. Parsons, of Abingdon, was summoned before the Oxfordshire magistrates, by the Rev. W. Harcourt, for fishing in the Thames, at Nuneham, in water to which he was said to have a private right of fishing. The defendant pleaded that the river was navigable, and that the right of fishing was in the public. The solicitor for the prosecution was not in a position to prove Mr. Harcourt's claim, and accordingly withdrew the case. On the Saturday before last, it again came on under a new summons, but, after a long discussion, was dismissed, as Mr. Henley, M.P., stated the question was too high, a one for the magistrates to decide. It is said that Mr. Harcourt will carry the case to a superior court."

From the type, I should judge the above to be a cutting from the *Field*, while a written memoranda shows that it dates back to March, 1867. Seeing the present relations between Thames riparians and the public, all such precedents are just now likely to prove of considerable interest.

I have this week had an opportunity of perusing the paper, "Apparent diminution of fish in the Thames, with some remedial suggestions," recently read by Mr. Crumplen at a meeting of the Gresham Angling Society. Fortunately for the fish and fishermen, Mr. Crumplen has not striven to discover and spring upon us some new source of destruction—our old foes, pollution, swans, steam launches, increased navigation, &c., are those Mr. C. strives, and successfully, to show up in all their naked hideousness. There are one or two of the less important parts, or which I should like to have asked a question; but, on the whole, Mr. C.'s paper will be pronounced excellent, eminently practical, and particularly free from the pedantic and egotistical vein peculiar to many good readers and writers.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Faddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 188, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 27, Lombard-market, Battersea, S.W.
Mrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.

The Fishing Gazette.

SATURDAY, DECEMBER 24, 1881.

THE MOOR AND THE LOCH.*

ONE of the most pleasant books on sport with rod and gun ever written is "The Moor and the Loch," by John Colquhoun. Doubtless many of our readers have long been well acquainted

* "The Moor and the Loch," containing minute instructions in all Highland sport. By John Colquhoun, in 2 vols. Fifth edition—enlarged. William Blackwood and Sons, Edinburgh and London.

with it, and it must be known by reputation to all of them; those who have read it already will be able to endorse what we say of it, and those who do not know it will be induced, we hope, to speedily make its acquaintance. The first volume and part of the second are devoted to deer stalking, wild goat stalking, roe hunting, seal shooting, winged game shooting, &c. In fact, this part of the work is a perfect mirror of the whole range of sport in the Highlands, on mountain, moor and forest. The natural history of all the animal life the sportsman comes in contact with—game or vermin, from the deer to the water-rat, from the eagle to the water-ouzel—is here described by one who is a born sportsman and naturalist, and whose experiences range over nearly three quarters of a century.

In reading Mr. Colquhoun's book you soon forget almost that you are reading; it seems rather as though you were listening to a friend recounting his varied experiences, interspersing his narrative with anecdotes and good stories, and all the while giving you, in the pleasantest way, his knowledge of the wild inhabitants of his dearly-loved Highlands.

But it is to the last half of the last volume that our readers will turn with the deepest interest, the part devoted to angling. Salmon-fishing is just over for this season, trout-fishing is just beginning to be thought about again by those of us who fish our early streams. If the weather is mild, the trout of the North Devon streams will be getting into condition in a few weeks' time, and the February red, blue-upright, and blue dun, will be sent on their deadly errand again over the stickles and pools of the lovely Lynns, Barle, Exe, and other moor streams. It is to that most charming of all modern novels, "Lorna Doone," that we are indebted for our introduction to the trout streams of North Devon. If any one who sees these lines is looking for something to read these long winter evenings, let them take "Lorna Doone" one evening and "Colquhoun" the next, in rotation, until they are finished; they will not easily match these two books in their respective fields—romance and sport—in the whole range of literature. Both writers are masters in the art of describing nature naturally. Mr. Blackmore is an angler, and we shall refer to this pleasant fact in a notice, which will appear next week, of his latest novel, "Christowell; a Dartmoor Tale."

But to return to the "Moor and Loch." Listen to this, ye anglers; hear what an accomplished master in all the branches of Scottish field sports says of angling:—

"I shall hope to be pardoned if I claim for fishing the appellation of a science. I have never considered it, like shooting, a mere art. At all events, it has certainly not yet been brought to perfection; and the more able the angler, the more willingly will he admit, that not a season passes without his acquiring fresh secrets which he is not over-solicitous to tell. If a man fancies he can jump into proficiency after a season or two to practice, he is vastly mistaken; it is not a few fishing excursions now and then that form the adept, but the heedful experience of years."

Our author advises the angler who is looking for sport in a district new to him to obtain the help of some local guide; we quite agree with him that this is necessary if his quarry is salmon, because in every salmon river there are many likely looking pools and runs in which salmon never remain, and which, of course, it is waste of time to fish. The trout-fisher, however, needs no guide but his own knowledge of the habits of trout and the proper places to expect to find them in. To him a "local" is generally a nuisance, though, of course, now and then one comes across a man whose knowledge is useful and whose presence is agreeable.

ADVANTAGES OF BEING ABLE TO MAKE LONG CASTS.

It is always an advantage to have the power of making very long casts with the fly; even on a small trout stream you will frequently meet with places which can only be successfully fished by a long line, and, of course, these places are less fished than easier water. On large streams, such as the Eden and Coquet; often the sole chance of getting a creel of trout lies in the possession of this great advantage. Salmon and trout keep their own places in a stream, and if you can get your line out a yard or two farther than the majority of anglers can, you will get your reward. Mr. Colquhoun says:—

"If equal in other respects, a man who has the power of throwing a very long line has the same advantage over a less gifted friend, in this particular, that a far-killing gun has over an inferior one, both in the same skilful hands. I should therefore advise every aspirant to excellence in salmon-fishing to attain this knack in the greatest possible perfection."

FLIES TO BE SUITED TO THE NATURE OF THE WATER.

"Large rivers require a large rather than a gaudy fly, which must decrease in size as the river narrows. Rapid brawling streams, on the contrary, take a gaudy fly rather than a large one. There are many Highland burns where salmon and sea-trout ascend in numbers in the autumn. These being generally shallow and rapid, a large fly would frighten as many as it would attract. If you fish with a small

fly of sober colour in such troubled water, it might not catch their sight. Streams of this kind are in best order when tumbling over stock and stone, and something like the colour of London porter. The reason why a large fly of sombre hue is preferred for a stately river, arises from the depth and clearness of the water. A large fly is required to catch the attention of the fish at the bottom, while gay colours will be apt to alarm them as they come up, when the water is so clear.

"When a large river is also rapid, as in the higher parts of the Tay, the fly may be proportionably bright. The size of the stream is an excellent criterion for that of the hook; and you may see every village urchin fishing for the spring trout in Tweed, with a hook double the size of that which he uses in Gala, or any of the other tributaries, for the very same purpose; the favourite fly in both cases being a woodcock wing, hare's ear body, tied with blue thread."

We should like to quote more of our author's instructions in the use of flies, but must refer our readers to his work. They will find innumerable hints, the outcome of long experience, and all worth remembering.

SPINNING FOR SALMON.

We confess when we first read Mr. Colquhoun's book we were somewhat surprised at finding such an aristocratic salmon-angler describing and recommending the use of spinning baits, worms, shrimps, parr-tail, &c., for the capture of the lordly fish; but since then we have discovered that both in Scotland, Ireland and England, more fish fall victims to these under-water styles of fishing than are ever taken by the fly. We do not think we are wrong in estimating the number of salmon killed each season with the fly, as but perhaps one third of the whole number killed by rod and line. In a river in which salmon rise to the fly freely, worms, spinning baits, &c., should be prohibited; there is not the slightest doubt they greatly spoil the fly-fishing—fish which are frequently harassed by spinning and worm fishing become timid and shy. In rivers in which the fish do not take the fly well of course there is no objection to the use of other lures, and undoubtedly the most scientific and sportsmanlike of these is the natural spinning bait. The best method of using this bait is, in our author's opinion, the Thames style, which he considers far more killing and effective than any other. "Even a moderate performer with a Thames spinning rod would excel the most skilful Highland parr or minnow fisher." He recommends young herring as a spinning bait, as, from their shining qualities, they form a most enticing bait for salmon. Bleak, dace, gudgeon and loach can also be used with advantage, selecting a dark bait for a bright day, and *vice versa*.

WHY DO SALMON TAKE A BAIT IN FRESH WATER.

That the salmon will take a worm freely in fresh water has always been a mystery to us. Did any one ever find food of any kind in the stomach of a salmon which had been twenty-four hours in fresh water? We have tried for years past to find a single well-authenticated case of salmon having been caught in fresh water and found to have in its stomach any food except the remains of its last meal in salt water. We made inquiries in all parts of Great Britain, in Germany, France, Sweden, and America, and the answer in every case was a decided negative, except in one solitary instance. A Devonshire clergyman, who knew we were wanting information on the point, informed us that a river keeper on the Barle had informed him that he one day found an old kelt dead in a pool on the above river; it had evidently only just died, and in its throat was a small trout, and in its stomach the half-digested remains of another. This fish had been prevented by the lowness of the water from going to the sea, it was evidently a thoroughly starved fish; and we are inclined to the opinion that it killed itself by attempting to digest food before it had recovered in the salt water. When paying a visit once to the late Mr. Frank Buckland, to examine some diseased salmon, we asked him what his opinion was, and he at once said he did not believe that salmon fed at all in fresh water, and the popular error that salmon destroy trout arose, perhaps, from some similar case to the one quoted above, where an imprisoned fish had been driven by hunger to devour trout. How salmon are able to exist so long without food in fresh water is explained by his grand discovery that they are provided by nature with organs for secreting fat, and that when they are in salt water they accumulate a rich store of fat, on which they exist when in fresh water, just as the camel carries with it a store of water for its sustenance in the desert. Why, then, we ask, does the salmon take the fly, the spinning bait, and, above all, the worm? Ask your fishmonger if, amongst the thousands of salmon he has received from our British and Irish rivers, the Rhine, &c., he ever found food in them. His answer would be "nothing." Our view of this curious matter is this: in the sea the salmon feeds voraciously, as is shown by its extremely rapid increase of weight; it feeds on the fry of sea-fish of all kinds, on shrimps and on lug-worms; in fact, its whole life in salt water is devoted to dashing after the bright rainbow-coloured herring fry, picking the shrimps from the sand, and feasting on young crabs and lug-worms. When impelled by the reproductive

instinct to seek the fresh water and ascend to the spawning beds, it ceases to feed; the very fact that trout exist in salmon rivers proves, we think, that it ceases to feed. Take the Tweed, for instance, many thousands of splendid fish ascend this river every season. Would there be a trout left if these powerful invaders turned on their weaker brethren? What chance would the trout in Sproston Dub have, if the hundreds of salmon which this fine pool often contains were to turn on them, as pike would do in a similar case? Salmon never chase trout except to frighten the impudent little thieves off the salmon spawning-beds. We have frequently caught trout in a pool in which we could see many fine salmon and trout swimming peacefully in close company, and have caught trout in such places, in the very spot, and within a second or two, of where a salmon has belled up. But, although the salmon does not feed in fresh water, its old habit, acquired in salt water, of dashing at a bait, impels it to dash at the salmon-fly or spinning-bait, which reminds it of some shining or lively sea bait; but how about the worm? Perhaps, here again, it is the sight of an old friend, and memory of a well-known smell, that will account for its being so greedily taken. The appearance and smell of the bait calls into action the movements necessary to secure the object, and this impulse is not from a desire for food, but from force of habit. But we are digressing, and our only excuse is the great interest of this vexed question as to what a salmon takes a salmon-fly, or other bait, for, when all the evidence obtainable goes to show it does not do it from any craving for food. We should much like to hear our author's views on the question, such an enthusiastic naturalist and salmon-angler, must have often considered the matter. The theory sometimes advanced, of extremely rapid digestion, will not hold water, and the theory that directly a fish is hooked, it disgorges the contents of its stomach, is equally absurd—fish are frequently so "lock-jawed" by the hooks on a spinning flight, that no food could be disgorged. We mentioned this question, as to why the salmon takes a bait, at a dinner party at which several salmon-anglers were present. One gentleman, who had caught sixty salmon in his own river that season, laughed at the idea that salmon do not feed in rivers, and said he was convinced they killed trout; he admitted he had never seen one chase a trout, and confessed he had never examined the contents of a fish's stomach, but was certain his cook would substantiate his views. The matter was referred to the kitchen, and the answer was "plenty of food in trout, but never the slightest trace in any of the many salmon she remembered cleaning."

Mr. Colquhoun gives detailed instructions in the use of the worm, which he considers a most deadly bait, as it is taken when the fish refuses every other lure. We have no space to refer more fully to this invaluable work, but as an index of what the angler may expect, will content ourselves with giving an epitome of the contents of the chapters on angling.

SALMON ANGLING.

Fishing a science—Salmon-angling the deer-stalking of the streams—Management of the fish the real test of skill—Kinds of flies required on various waters—Spinning with parr—Minnow bait—Worm-fishing for salmon—Trouting the germ of salmon-fishing—Boat-fishing for salmon—Races with salmon on the Dee—Net-murder—Artificial propagation of salmon.

AUTUMN ANGLING ON THE LYON.

Low water—The shoemaker's prophecy—"Whaur's the salmon?"—The Bellman's fish—An apology for a late dinner—"Nothing but twigs!"—Every river has its local peculiarities.

OCTOBER ON THE STINCHAR.

The Ducket-wheel—An enormous fish—Stoning him—The uncertainty of salmon-flies—A twenty-three pounder—A big fish on a slight line—"Bring a lantern!"—"I hae him noo!"—The finest fish of the season—A five hour's run.

LOCH SALMON-FISHING.

"Only a trouter!"—Early experiences—Throwing a long line—Disadvantages of preserved waters—Analogies of loch-fishing—loch-feeders—Salmon in Loch Awe—Trolling on small lochs—Boat fly-fishing—Size and colour of salmon-flies—Flies for the Falloch—The effects of wind.

SPINNING FOR THE SALMO-FEROX.

Haunts of the salmo-ferox—Level shores—Steep rocky banks—Spawny depths when loch is large or discoloured—When small and clear—Baits suitable for both moods of water—September baits—Five days' spinning on Loch Awe—The Sutherland feroxes—The phantom minnow.

RIVER-TROUTING.

Spinning on the Tweed—Spinning and trouting rules—Choice of flies—Still deeps—The circle—Dragging the cast—Small black summer fly—The river Almond—The May fly—The river Ale—A hint to the young angler—Unruffled deeps—A curl on the water—Small minnow, a killing bait—Places where trout harbour—Wind—Lennie burn—Burn trout—Frogs—Imprisoned trout and eels—Their jail habits.

THE MOOR BURN.

In ordinary trim—When small—Linns—Eddies—On level ground—The Balnaguard burn in Perthshire—Overgrown burn trout—Sea trout in autumn—Spates—Caprice of white trout—A greedy angler.

LOCH TROUT AND OTHER FISHING.

Best time to fish different lochs—Flies—Pike, an advantage in many lochs—A ravenous hue—Fly-fishing—Sea trout—Weeds—The minnow tackle—Boat-trolling—Spinning for pike—The gorge troll—Eels—Perch—Mountain tarns—The weedy loch.

FISHING ON SALT-WATER LOCHS.

The sea loch—Spinning for sea trout—The long line—The hand-line—The white feather—Sea loch-fishing—"Cuddies"—Trawling porpoises—Spearing—Oyster beds—A thrilling episode.

A RAID ON SUTHERLAND.

Changes—Harry Munro—A Caithness laird's inquisitiveness—Lochs Slam, Craggie, and Layghal—The salmo-feroxes of Loch Assynt—Hector Gordon.

FRAGMENTS.

Winter sport—The arts of birds—The pea-hen and her bantam chicks—Aquatic adders—Perch and chub—Fen terms.

Is not this an enticing bill of fare? The author's name, and the fact of the work being now in its fifth edition, are guarantees that the articles are carefully done. In conclusion, we venture to make a suggestion to Mr. Colquhoun and his publishers, and we are certain that twelve out of any dozen trout and salmon anglers will endorse it heartily: it is, that the two hundred and sixty pages of the "Moor and Loch," which are devoted to angling, should be published separately, as a five shilling, or at most, seven shilling and sixpenny book. The matter is already in type, even if it is in stereo the pagination alone requires altering—a very easy matter. With a short preface, and a good index, the book thus formed would at once find a ready and lasting sale amongst enthusiasts who cannot well afford the price of the bulky two volumes, of which the angling portion is only a fourth.

CORNISH "WRECKERS."

COMMUNICATED BY CAPTAIN HEATH (R.V.)

ON a dark, rainy, and windy night, in the month of September, 1879, about ten o'clock, the cry went through the little out-of-the-way village of Lizard, situated within half a mile of the most southerly point of land in the kingdom, that a ship was ashore. There are two grand lighthouses and a powerful foghorn on the Lizard Point, so the weather must have been thick indeed. Every available man in the village—some only partly dressed—at once started at his fastest pace for the scene of the disaster (a Cornish congregation has been known, before now, to melt away far more rapidly than they assembled in the church, under similar circumstances). Every available man, we say, intent only on "wrecking," left his home, or the public house, as the case might have been (we are relating what happened in a civilised country, and only two years ago). The cliffs over the scene of the disaster were soon reached by the foremost of the runners, when it was ascertained that a large steamer (the *Brest*, owned by the Cunard Company, as it afterwards turned out), was on the rocks. She was bound from Havre to Liverpool with cargo and passengers, more than 140 lives being on board. There was a nasty sea, no moon, and rain, and inky darkness; just the sort of night for the deeds of violence and plunder these "wreckers" have been credited with from time immemorial. The rocket men were called out, and were in readiness, the lifeboat men also, and the lifeboat at Cadgwith was launched; but the "wreckers" were before them. One fine old "wrecker," a man of determined aspect, although upwards of 60 years of age—an old man-of-war's-man, straight as a dart, spite of his services, 17 years in the navy, 10 in the coast-guard, and now fallen from his high estate to become a fisherman, guide and "wrecker,"—this old sinner, with the help of three other sinners, succeeded in launching his little boat, and, in spite of the sea that was on and the darkness, made for the scene of plunder. They found the vessel with her nose on the rocks, her stern under water, her decks as sloping as the roof of a house, and nearly a hundred and fifty human beings wild with terror—some drowned, some drowning. These hereditary "wreckers," false to all their ancient traditions, as soon as they heard (for they could not see) this mass of misery, forgot all about their "plunder," and turned to and tried to save as much of the unprofitable cargo as possible. After hauling on board eleven men and women (they, with the crew of four "wreckers" making fifteen in the little boat) expected momentarily that their small craft would founder. But they put off from the wreck, and in safety reached Landewed-nerk Church cove—a place more like a crack in the stupendous cliffs than a decent landing place—and, after landing their contraband cargo, they thought there might be more "plunder" of the

same kind left, and so they rowed out in the darkness again to the wreck. This time, as the sea was increasing, they could only take nine, and they could not get back to Church Cove for the same reason, but they managed to land this boatload at Cadgwith, about two miles down the coast. Still hankering after "plunder" they returned again to the charge, but this time could only get hold of two. The Cadgwith lifeboat and other boats had meanwhile saved all those remaining alive, but there were, alas! lost on this dark night, twenty-four lives, including some infants. The old reprobate of a "wrecker" had thus succeeded in saving twenty-four lives in his little boat in his three trips, besides a baby, which, he says, he did not think it worth while to count. Somebody did, however, for the poor mother taken to Cadgwith in the lifeboat, found next day that her baby, whom she supposed drowned had been taken to Lizard in the boat of the old "wrecker," and it was restored to her after its clothes had been carefully dried by the women of Lizard. John Curgenwin, the aforementioned old "wrecker," not content with his "plunder" of the night (the booty having been all secured before dawn) must needs prowl about the wreck still, and as she was still on the rocks offered to try and save the passengers' luggage, no doubt with an eye, as before, to "plunder;" but here judgement overtook him, for, as a case was being hoisted over the side, it slipped and crushed off the tops of one of his fingers. He then had to go ashore and give up all hope. He was not, however, suffered to go without "acknowledgment" for some weeks later there was presented to him, through the respected clergyman of the parish, as a reward for saving twenty-five lives (but according to his account, only twenty-four, for the baby he did not count), the loss of his fingertop, and for saving and taking to the slip the ship's No. 2, quarterboat, the magnificent sum of ten shillings for himself, and ten other shillings for the damage to his boat. Verily, human life on the Cornish coast is held at a very low estimate (about 5d. per head); but verily, also, the good old breed of Cornish "wreckers," exist only in history. The men of the present day (who represent them), being so weak as to listen to the prayers of women, and the cries of drowning children snatched hastily out of their first sleep, instead of boldly plundering, as in the good olden time.

* * If any readers of the FISHING GAZETTE, would like to express their feelings, and we are sure they would, in any shape, towards the hero of the foregoing story, they will find that he is still alive, and that a letter addressed to the village where he lives would easily find him.

1881:

A LOOK BACK AND A LOOK FORWARD.

By L.B.

PERHAPS in the absence of any item of interest this week, it may not be altogether out of place if I utilise the space kindly placed at my disposal by our editor, in taking a few retrospective glances at a few events of interest which have taken place during the fast expiring year, and anticipating a few of those likely to engross the attention of piscators generally during the one we are about to enter piscatorially, as far as our rivers are concerned. To Londoners, 1881 has been the worst year we have had for a long time, owing to the long continued frost which kept the river bound in icy fetters for days—nay, weeks at a time. Terrible snow storms, and perfect hurricanes of wind, the majority of our rivers were totally unfishable from early in January till the middle of March, nor did the opening day of the general fishing season—the 16th of June, usher in a much better state of things; low bright rivers—naturally resulting in the fish being "dead off," and everywhere on the Thames, Lea, and elsewhere, small baskets or positive blanks have been the almost unbroken rule; and now, with little more than ten weeks left before the close of the season, the prospects look anything but bright, for even a passable wind-up. The sharp frost and good pushes of water necessary to kill and sweep away the bulk of vegetable and minute insects which have, undisturbed during the late summer and autumn, increased apace, have until the last week or two been entirely absent. There is one consolation, however, viz: that owing to the absence of floods, the spawning season of '81, was one of the best ever known.

The year 1881 saw the commencement of an agitation in favour of amendments to the Freshwater Fisheries Act; followed by a large meeting of anglers of all classes, and from all parts, at the "Society of Arts Room," John Street, Adelphi. A meeting which was singularly unanimous and enthusiastic—a meeting held with the double object of passing certain resolutions as to the substance of the proposed amendments, and to express strong disapproval of the Bill introduced in the House of Commons, by Mr. Stuart Wortley, M.P., to legalise rod-and-line fishing during the

close season; the opposition to which was so marked and strongly expressed, that Mr. Stuart Wortley yielding to the views of an overwhelming majority, ultimately withdrew it.

I am afraid space will prevent my doing little else than merely mentioning the committee formed to consider the best means of decreasing the annoyance and risks to Thames anglers, oarsmen, and others, caused by the reckless driving of steam-launches on the river, and the meeting subsequently held in connection with same at Willis's Rooms.

The vast increase among the members of London angling clubs during the present year, is also a matter of great importance, as it is bound to make itself felt as a principal factor in deciding leading questions of the future.

The starting of the "Thames Rights Defence Association."

The inauguration of bait and fly-casting tournaments in this country.

The granting of further cheap travelling concessions to the members of the London angling societies by the various railway companies. All these, and many more works undertaken for the protection and furtherance of angling interests, will prevent the stigma of "barren" being attached to '81.

My perspective glance, which must be of the briefest, includes the future of our Thames Angling Preservation Societies; for while gladly admitting the great and useful work done by our river preservation societies, we cannot close our eyes to a few facts in connection with them. First, there undoubtedly is vast room for improvement, both in their internal constitution and their working. When the Thames Conservancy delegate—as they practically do—to any association, the duty of protecting anglers' interests, on any stretch of the river, the unmistakable duty of that association to itself and the public, is, so far as it possibly can, to make its executive committee a thoroughly representative one (this is what I mean by internal constitution). To go at length into details of what may be considered shortcomings in working, would require greater space than I can, in conscience, hope the editor would place at my disposal.

But there are two or three reforms which claim urgency over all others, and must be undertaken if the said societies are desirous of continuing to retain the confidence of the angling public. The system of partially-paid keepers for instance, as has been repeatedly pointed out, is a thoroughly worthless one; and all the money thus expended in dribbles, if not positively in all cases wasted, could be much better utilised in employing two or three competent men as wholly-paid keepers. It seems little short of marvellous that a system self-condemned by its almost entire absence of results in the past, and the opinion of Thames anglers generally, should have been so long maintained. Again, Preservation Societies must understand clearly that anglers will not subscribe funds to be wantonly wasted, as in a recent case this year, in trout-stocking experiments.

Then there is the all-important question of the rapid decrease of jack and perch. It is undeniable that thousands of the former—mostly immature fish—are annually killed by the trailers in June and July. The Preservation Societies, urged by an unmistakable expression of public opinion, are now unitedly using their best endeavours with the Conservancy to get these two months closed for pike fishing. How far the decrease of this bold sporting fish might have been prevented had they made a serious endeavour in the same direction years ago, is a fair matter for speculation; however, "better late than never."

To London club anglers, and indeed to anglers generally, there is no doubt the vital question of interest in the immediate future, is to secure waters and to preserve the same for the use of members. The West Central and East Central Association, have resolved to hold a joint meeting, to which representatives from the third or Central Association, are to be invited, when this and other important questions, including coarse-fish propagation, and the proposed amendments to the Mundella Act, will be thoroughly discussed and carefully considered; and the outcome of which will, let us hope, be the adopting of some important active measures.

ON THE CAUSES OF THE APPARENT DIMINUTION OF FISH IN THE RIVER THAMES; WITH REMEDIAL SUGGESTIONS.

By THOMAS CRUMPLEN, HON. SEC., GRESHAM ANGLING SOCIETY, &c.

(Paper read before the Society.)

FROM all time our grand historic Thames has been known as a good fish-producing river; and only a little over a century since, salmon, trout, roach, dace, eels, flounders, and other fish, could be caught in abundance at London Bridge, whilst hundreds of professional fishermen earned their livelihood in the heart of the city, by the very proximity of its waters. There were, for

example, well-known swims for the rodster off Bankside, the Temple, Somerset House, and the Savoy; this was also the case down to a much later period. In the time when railways and privilege tickets were alike unknown, the faithful followers of Izaak in any part of the metropolis had but to walk to the river's bank, to stand at least the chance of a fair day's sport, and that with tackle of a much rougher type than is now at the command of even the humblest angler.

Whatever may be said for or against the good old days in other matters, there can be no doubt of their reality so far as angling is concerned, and no less doubt that, for the present at least, they have passed away. It will now be my purpose to put before you, what I think are the causes that have brought about so marked a change; to suggest, where possible, remedies; to ask you to discuss them; and see if the Gresham Angling Society cannot do something, however small, to restore the prestige of dear old Father Thames. Time was, when he kept his children clean, provided them with wholesome food, gave them a good bed, and looked after them until they were able to take care of themselves, but he does not do so now. Father Thames does not stand alone in this; and in dealing with him, I am but dealing with him in his patriarchal capacity, taking him really as the representative of every stream in the country to which anglers resort.

I take it to be admitted that fish are gradually diminishing in numbers; if it be not so, then is there no need for fence months, and other protective measures now so properly resorted to. Bear in mind therefore, two important facts. Fish were formerly abundant in that part of the river running through the metropolis,—there are still fish there—but for the most part they may be said to have disappeared. In the upper waters of the same river they are not so numerous as they used to be—in some cases not so large; and are being gradually overtaken by the fate which befell their metropolitan confrères, some two generations ago. Now I venture to affirm that the very conditions that have practically exterminated the fish in the London waters, are, in a degree, precisely those now operating in the more sylvan portions of the river. What I may call the fisheries of Old London, succumbed only as docks, factories, and gasworks multiplied; the noxious refuse from which was turned into the Thames—there to mingle with the sewage of a great city, the whole being stirred up and battered by the iron or copper bottomed steamboats, which at the same time appeared upon the scene. Moreover, nets were in constant operation, and the baser sort of the population probably but too ready to make use of them. What wonder, then, that fish disappeared from such a water; or will disappear from any water where such conditions prevail.

I put it, therefore, that these, or similar causes are now in operation, in a minor degree in the non-tidal waters of the Thames, and just in proportion as these causes increase, so will our stock of fish inevitably diminish. It has been repeatedly stated the vast increase of late years in the number of anglers, is sufficient alone to account for the diminution of fish, but I venture to assert that if our river be properly cared for, its quantity of fish would never be seriously affected by any fair rod-and-line angling. It should also be borne in mind that, just as anglers multiply, so do fish become more wary; and, that although we have more anglers, each has, as a rule, a lesser proportionate take than formerly, of which the roach fishermen of the Lea are certainly well aware.

These are days of board schools, and even the fish are being educated. The constant taking of small fry, coupled with other circumstances, has left a few wary old fish, who have occasionally, perhaps, felt the hook, and become more cunning in consequence. In accordance with the instinct implanted in them by the Creator, this faculty is to some extent transmitted, and I believe, within given limits, each succeeding race of fish will become more difficult to catch.

The only remedy for this (save finer tackle), is to increase our stock by every available means, and I do not think this is as yet sufficiently thought of, so far as the commoner coarse fish are concerned. It is well known that a trout of 1lb. will deposit eggs sufficient to produce 1,000 more, a jack of 28lb., nearly 300,000, a perch of 3lb., about 150,000, and a roach of 1lb., over 15,000.

Therefore if the spawn and young of fish could only be properly protected from year to year, there can be no question that as fish multiply in a far greater ratio than the fishermen, we might have abundant sport at least down to the time when Macaulay's New Zealander surveys the ruins of the metropolis from London Bridge, and finds a fishing rod and Gresham angling ticket among the wreck! The increase in the number of anglers can do no possible harm, so long as they do not take the small fish, and I trust that the day is not far distant, when all the London clubs will follow our example, and abolish gross-weight competitions, as they now exist. Perch for example, are certainly decreasing in the Thames, and they are not caught by any means of so large a size as formerly. The perch is "bold biter," and any one who

has fished much in the Thames, will know what quantities of small perch are occasionally caught. The youthful angler, perhaps, does not like to part with them; they are not returned, as they should be, to the water, and the stock suffers in consequence. I hope during the next session of Parliament, we shall be able to improve upon the Mundella Act, and get our fence months a little more adapted to the fish, so that perch and jack may be better protected; and, with respect to all fish, let us have one legal standard of sizes for taking, from Oxford to London Bridge. It certainly seems inconsistent that it should be unlawful to take a perch of less than 8 inches one side of the City Stone at Staines, but quite lawful to take one of 6 inches on the other!

Another cause tending to diminish the number of fish, are the numerous mills that now exist. I am far from saying that a mill is injurious in itself; but mills, I am told, discharge in many cases a certain amount of poisonous matter into the river, highly prejudicial to the fish. Many chemical substances now used in manufactures, were formerly unknown, and the refuse from the mills, is consequent different from what it used to be. Paper mills, using immense quantities of caustic potash and chloride of lime, are notoriously objectionable. Mr. Keene, in last week's number of the *FISHING GAZETTE*, instances two streams, the little Gade, and the Wraybury section of the Colne, which have deteriorated greatly from this cause, water from both of which, directly or indirectly, finds its way to the Thames.

An old angling friend told me from experience, and it is confirmed by others, that fish do not live so long now in the well of a punt as they formerly would, and he, in consequence, contrived a perforated box to let down from the boat, which he found to preserve them alive much longer. The reason seems to be, that the well only receives the surface water, which, holding in suspension the noxious products from mills, the drainage from chemical manures used on the land, and other sources, does not thoroughly commingle with the purer water below; and in this surface water fish cannot live.

Artificial manures on land adjoining the river, into which alkalis, always deleterious to fish, are largely employed, has certainly a great deal to answer for, and although chemical science, and mechanical skill may do much to neutralise their effects, a good River Pollution Bill is perhaps the only remedy that will insure their being properly applied.

Another, and more serious evil in the upper Thames is the prevalence of steam-launches, which, if they do not altogether mar the sylvan beauty of our glorious river, will in time denude it of its fish. The wash from these vessels is such as to disperse and spoil vast quantities of spawn, and Mr. Wheeldon has stated that the young fry are frequently dashed lifeless on the shore. I scarcely know what remedy to suggest for this, short of their entire abolition in the non-tidal waters, but being, as they are, used almost exclusively for pleasure parties, the matter might perhaps be compromised by allowing them to run at a regulated speed, during the months of August, September and October, so that they should not interfere with the chief spawning season. The next enemies the poor fish have to contend with in their struggle for existence, are the swans. I do not put these in the same category as steam-launches, because they certainly are somewhat picturesque, and supply the Corporation of London with a time-honoured excuse for a day's outing every year. At the same time, the swans undoubtedly devour large quantities of spawn, and are by no mean the friends of the angler. I would not get rid of the swans, of which about one hundred are distributed between Richmond Bridge and Staines, but I think some arrangement might be made for them to be fed frequently during the spawning seasons, which, if judiciously done, would almost nullify their destructiveness.

Another important matter to be considered is the fact that some fish feed upon others, and if natural conditions are materially interfered with, we may be in danger of lessening our stock of particular species from this cause alone. In the Thames, trout, jack, perch and chub do their share of this work, but they are all desirable fish to foster, and I trust will long be abundant in the river. We all know what a quantity of fish, jack and perch consume, and, not only so, but in many cases will devour a fish almost as large as themselves. I abominate netting—another great source of mischief—but if tolerated at all it should only be in the hands of a responsible committee; although, if permissible, I think some few old jack, too wary to be caught, might be safely transferred to an aquarium, to the delight of myriads of roach and dace, who would otherwise provide them with a meal.

There is also reason to believe that many fish are not taken in the Thames of so great a weight as formerly. A few escape, because too wary for the angler; more of them probably never attain maturity; others get an insufficient supply of food, owing to the conditions by which they are surrounded.

Such are a few of the most important causes leading to a diminution of fish in the river. A new source of danger has lately

appeared in the shape of floods, which undoubtedly scatter and do much harm to certain classes of fish, but on these and other points which I trust will crop up during the discussion, time will not now permit me to dilate.

What I am anxious to impress upon you more particularly is this—that the sewage, docks, factories, gasworks and steamboats which destroyed the fisheries of Old London, have their modern counterparts in the shape of sewage, mills, chemical manures, and steam-launches, which, unless prompt measures are taken, will infallibly perform the same work for us in the waters of the upper Thames. I know the Thames Angling Preservation Society, and the other preservation societies too, are doing good service; and I also know that Mr. Forbes and other public-spirited individuals are doing their best to cultivate and replenish our stock of fish, for which, all honour to them. In conclusion I would say:—In treating this subject, let us follow as much as possible in the footsteps of nature; let us impose no needless artificial barriers to the stream; let us keep our river from pollution; let our preservation societies combine, and take not merely a police, but a scientific view of their duties; let the angling clubs of London forego the capture of small fish, and act like men in the true Waltonian spirit; then is there yet time to arrest the destruction going on, and to restore a strong and healthy progeny to dear old Father Thames.

T. C.

AMICABLE BROTHERS ANGLING SOCIETY.

THE twenty-eight annual supper took place on Monday, December 18th, when forty-four members and friends sat down. Mr. Medcalf, who occupied the chair in most able and courteous manner, was faced by Mr. W. Breasley in the vice. After the good cheer was disposed with, harmony reigned supreme. The National Anthem was sung by the whole of the company, accompanied by Mr. Henwood on the pianoforte. The prizes given during the evening were:—Mr. Medcalf, value 15s., first pegged-down match; Mr. Meas, value 15s.; Mr. J. Robinson, jun., 10s. 6d.; Mr. J. Hunt, value 15s.; Mr. Clarke, 10s. 6d.; Mr. W. Breasley, 10s. 6d.; Mr. Patrick, 10s. 6d.; Mr. Squire, 10s. 6d.; Mr. C. Robinson, jun., 10s. 6d.; Mr. J. Robinson, sen., a length of doeskin for trousers; Mr. Farebrother, silver watch; Mr. W. Say, 10s. 6d.; Mr. Henwood, £1 1s. Mr. Clarke, 10s. 6d.; Mr. Meas, £1 1s.; Mr. Larkman, 15s.; Mr. Arnold, 12s.; Mr. A. Plumstead, 10s. 6d.; Mr. Marshall, 15s.; Mr. Moir, 10s. 6d.; Mr. Shury, 10s. 6d.; Mr. Carrington, 15s.; Mr. Gabb, 10s.; Mr. Abbott, gold ring; Mr. Lewis, work-box; Mr. Sinclair, pair of decanters and a meerscham pipe; Mr. Harding, 10s. 6d.—Wednesday night, December 14th, distribution of prizes. Mr. Farebrother in the chair. Mr. Medcalf, as trustee, discharged his duty by handing over to the different winners their prizes: Mr. Wool, gross weight of perch, tea service; Mr. Medcalf, heaviest weight of jack, pair of lustres; Mr. Moir, heaviest weight of bream, cruet stand; Mr. G. Carrington, heaviest weight of perch, set of tea trays; Mr. F. Harding, heaviest weight of dace, a gold ring; Mr. Medcalf, a pair of lustres, for the heaviest one roach; Mr. Hood, the heaviest take in one day; Mr. Harding, three prizes; Mr. A. Plumstead, three; Mr. F. Plumstead, two; Mr. Pedley, two; Mr. F. Arnold, two; Mr. Shury, two; Mr. Sinclair, two; Mr. Moir, two; Mr. Patrick, two; Mr. Abbott, two; Mr. Breasley, one; Mr. T. Lake, one; Mr. C. Robinson, jun., one; Mr. J. Robinson, sen., one; Mr. Squire, one; Mr. Wortledge, one. Mr. F. Plumstead gave a prize value 10s. 6d., Mr. W. Lake one value 10s. 6d., Mr. Rory O'More a fishing umbrella. A vote of thanks was given to the chairman, which finished the season. So I now conclude with wishing my brother anglers a merry Christmas and a happy and prosperous new year, with plenty of good sport.—T. WORTLEDGE.

LOB WORMS.—In consequence of the difficulty experienced by London anglers in procuring lob-worms, Mr. Gillett, fishing tackle maker, of No. 40 Fetter Lane, has arranged to keep a constant supply; also of other worms and gentles, &c.—ADVT.

GREGORY'S SPINNING BAITS. "The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by him the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

Mrs. F. Y. BROCKAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand, Flies made to pattern. Lessons in fly making given.—[ADVT.]

RIVER REPORTS.

MID-THAMES.

I have been trying to find an appropriate Shakesperian quotation for the occupation of mine which seems gone, and so far have not succeeded. I have little doubt the immortal William has got it about his clothes, but on the pinch I have not been able to find it, so I shall read up stiffly and let my gentle readers have a full "gill" next year. The river is more than bank high, and in fact is "over the hills and far away." Fishing is a thing to dream of just now on the Thames, and real sportsmen had better stay at home and "mend their tackling." A frost has suddenly set in, and the water so far to-day is stationary, so that bank anglers and eddy enthusiasts may have a chance for their Bank holiday. I wish all my gentle and FISHING GAZETTE readers a jolly and fishy Christmas, and more particularly wish them, that "good digestion may wait on appetite, and health on both." Its hard when you have got the health and the appetite and not the grub, as is the case with MARLOW BUZZ.

Thames (Goring).

We have got a very high flood now; it is going down, but very slowly. There will be no fishing this week. Prospects at present look better; a few days will soon get the water down again.—JOHN RUSH.

Thames (Kingston).

The river is high and a bad colour, and the stream so great that punt-fishing is almost out of the question, except in a few spaces. I have not been out for ten or twelve days. Most of the towing paths are under water. The best of the bank fishers cannot find but a few fish—four or five in as many hours. The continued rain up in the west country will stop us for three or four days. If it should be fine for that time jack, perch, and chub will be got at.—JOHN JOHNSON.

Thames (Walton).

The water is very thick, full of floating rubbish, and very high and still rising. There is every appearance of a frost to-night. If the water subsides there will be a chance for jack-fishing and perch. The weather has been simply awful; rain, heavy gales, and cold; changed to-night, very fine and wind dropped. Nothing done whatever.—H. E. WOOD.

Thames (Richmond).

The river is now bank high, and the water very thick. I little thought while writing the report last week that the rain would have continued so long. By Saturday morning the river bore the appearance of mustard. There has not been a punt out here during the week, simply because there were very few fish to be caught; in fact, the bank angler has the best of it now, as the fish keep close to the shore and under the banks for shelter from the heavy stream that is running down. There is a change in the weather, and should it last over Christmas day we shall be able to have a start on Monday, as the water will not take long to run away, providing the weather only holds fine. I hear from Teddington that the fishermen there have had a good time of it with the lampins, for, as these fish are only caught at flood time, it is an ill wind that blows no one any good.—JOHN BUSHNELL.

Thames (Twickenham).

I am sorry to say we have not done anything for some time now, and I am afraid it will be some time before we shall be at work again. The water is out all over the place. It is simply dangerous for an inexperienced person to attempt to cross the river. Wishing my patrons the compliments of the season.—ALFRED PERRIN.

Achnolme.

The approach of Christmas has turned the attention of anglers from the water to the land, consequently, but little has again been done; moreover, the weather has been uncongenial and wet, more favourable to bronchial affections and rheumatics, and, consequently, to the doctor than angler.—THOMAS FORD.

Chertsey.

Haslett, the well-known fisherman, reports the capture of a handsome jack, 15 lb. Fishing with Mr. Allen for about three hours, and had not the tackle proved again and again untrustworthy, he adds there would have been a really good take to record.

Dove.

This may be described as almost a blank week—the dark before the dawn—for things generally mend on our river when Christmas comes. There have been very few rodsters on either the higher or lower lengths of the water, and I don't think they would have done a vast deal had they gone out, for the river has been full of snow broth, and this has prevented the fish from feeding with any degree of freedom. When this nasty broth goes I fancy pike and grayling will be found well on the feed. The bleach net fraternity still maintain great activity in the high waters. One gentleman cleaching grayling was beautifully dropped upon by the night-watchers this week, and he will be dealt with in the usual manner. The "find" was made in the water below Dovedale. I fancy coarse fish will be best on at the Maggot during the holidays. They rarely take the worm in a very low temperature of our river.—THE SPLODGER.

Medway (Tonbridge).

The river is still very muddy, but in the absence of rain some of the pens below the town may be fishable for roach by Monday.—YE MEDWAY WATER RAT.

Ouse (Littleport).

Water very high and thick. No chance whatever for the angler now for the next few days; but I hope when the water clears we shall be able to get some very good fishing on the flats. There have been no anglers down since my last report; but I had a nice little turn for a couple of hours on the 16th, before the water came down thick, and got 8½ lb. roach and bream; largest roach, 19 oz.; largest bream, 2 lb. 3 oz. The bream was quite a novelty, as I never saw one near that size taken here in December.—CHARLES SOUTH.

Trent (Alrewas).

Nothing doing in this locality. The river has not been fishable for a week, and very little probability of any angling during the forthcoming holidays. River reported to-day (Thursday) thick, and all over the meadows—will take a week's fine weather before in anything like condition for pike and chub. While the water remains discoloured worms will be found the most killing bait for all-round angling.—JAMES GREGORY.

Trent (Newark).

We have had a very heavy flood all the week, miles of meadow land has been submerged; and nothing has been done in the way of sport; to-day (Thursday) the water is slowly going down, but has not yet got within the banks; prospects look very bad for the Christmas holidays. The banks, after the water has left them, will be very bad and uncomfortable for the bank angler; but the genuine anglers motto is "nil desperandum," and so possibly he may manage to get a roach or two out of some quiet corner, with worms for bait, for I am sadly afraid that will be about the extent of the sport this Christmas, at least, as regards the Lower Trent.—THE TRENT OTTER.

Trent (Nottingham).

With the exception of Friday and Saturday in last week, when the water was in good condition for both worm and maggots, there is very little to report in the way of angling. The water, however, on the days mentioned was all right, but the weather was wet and cold, so that only a few rodsters were out. Those, however, who went up the river, succeeded far better than was expected under such unfavourable circumstances, and I believe those who visited the Burton and Willington waters brought down some capital fish; one angler had, among other fish, twelve roach that averaged a pound each, whilst another had twenty dace that weighed together 10 lb., which was considered a very pretty sample. A few jack were caught in the upper waters at Shardlow and Sawley, but none of the fish caught exceeded 5 lb., the live bait doing the work. After that heavy rain came on, which lasted several hours, and on Sunday morning the water came down very thick and altogether unfishable. Rain continued to fall, which caused the river to overflow its banks, and at the time of writing (Thursday night) there is a little flood on the river, and some of the meadows are under water. The river is going down rapidly, and as the weather seems settled and inclined to be frosty, we hope to have the water all right again for Christmas.—W. BAILEY.

Wye and Derwent (Derbyshire).

We had a regular thaw last Friday, which took away the keen frost, and several of the old hands, grayling bottom fishers, availed themselves of a day's bottom fishing in different parts of the Derwent, and I am pleased to say that some handsome baskets of coarse fish and grayling were killed with both worms and gentles. The best basket was five brace of grayling and three and a half brace of roach and dace. We had a great deal of both rain and snow the latter end of last week, which caused both rivers to have floods on them on Monday. The cleach-net party killed a few fish on the Derwent during the time the river was in flood. Both on Wednesday and Thursday a few anglers were out on the Derwent trying their skill with the bottom, and were rewarded with a few brace of grayling and coarse fish. The best dish was killed on the Darley Dale water on Thursday with cockspur worms, viz., six brace of grayling and one large dace. Both rivers are a very great deal too high for fly-fishing at present, in fact, I really do not think that the Derwent will be fit for successful fly-fishing any more this year. It will take the Wye a few days to run down before it is fit for fly-fishing. Several anglers have been out trying for pike, but I can't hear of any being taken worth recording.—GEORGE JAMES EATON.

PISCATORIAL SOCIETY.

The weekly meeting on Monday, the 12th inst., at Ashley's Hotel, Henrietta Street, Covent Garden, was principally devoted to the contribution of a paper on "The Reminiscences of the East Indian Archipelago," by Mr. Edwin Sachs. Mr. W. B. Adlington was unanimously voted to the chair, and was supported by about fifty members. Mr. Thomas Huggate weighed in 3 lb. 14 oz. of roach, the largest fish 1 lb. 7 oz., 2 lb. 6 oz. of dace, the largest 1½ lb., and a jack of 3 lb. 11 oz. There were no fewer than seven new members elected. The chairman then called upon Mr. Edwin Sachs to give his paper on the above subject, and which partook more of the character of an illustrated and deeply interesting lecture, which occupied one hour and a half in its delivery. The lecturer, after describing the reason he went out, and how his travels, ostensibly to last six months, eventually spread over four years, warned his hearers not to take tackle for sea fishing if they went out in steamers, fishing from them being impossible. He described methods of fishing in Ceylon, in Sumatra, from so-called "catamarans," and tackle used, and explained methods of fishing in the interior of Java and Sumatra, exhibiting models of boats used, with some very interesting articles of fishermen's clothing; lines made from the fibre of the flowering aloe, and reels; cast nets, the same pattern as used in England, only lighter and larger, and with chain in place of bullets; and heel baskets and creels. Also a large variety of Sumatran arms of great rarity, including a creese 172 years old. Humorous description of inmates of reader's hut in Sumatran forest. Live snapping tortoises, snakes, flying bats, civet cats, mountain goats, herons, &c. He also described blow tubes and the feats performed with them, and showed a curious implement by means of which the natives procured fire before the introduction of matches, consisting of a buffalo-horn tube with a piston, fire being produced by compression of air. Besides these, the speaker exhibited a large quantity of native implements and ornaments, idols and weapons from such obscure places as Wias and Pogy Islands, west coast of Sumatra, and concluded with a description of a new species of viviparous fish discovered by him in the island of Biliton. At the conclusion of the lecture a hearty vote of thanks was accorded to Mr. Edwin Sachs, the only regret being, from the great trouble he had taken in preparing the lecture and the very valuable and practical information it contained, there were not more present. Mr. Edwin Sachs evidenced great aptitude as a lecturer and his pleasing delivery and the popular manner in which he treated the subject frequently secured him the warm approval of his hearers. A cordial vote of thanks to Mr. Adlington terminated a very enjoyable and instructive evening.

WEST CENTRAL ASSOCIATION OF LONDON AND PROVINCIAL ANGLING SOCIETIES.

COARSE FISH CULTURE, &c.

THE last delegates' meeting of this association for 1881 was held on Friday, the 16th inst., and was of more than ordinary interest. The president of the association, Mr. Geen, Mr. Clench, of the Richmond Piscatorial Society, and Mr. Marston, of the FISHING GAZETTE, were among those present. Mr. Bonvoisin, and Mr. Beckett occupied the chair and vice-chair respectively. The hon. sec. opened the business of the evening by reading the minutes of the meeting held on the 18th ult., which were confirmed without comment. He then announced that the interview by a deputation of the joint committees of the N. L. A. C. and W. C. A. with the manager of the Great Eastern Railway, on the 20th October, last, had resulted in the company giving further concessions. The following letter will explain what such concessions are—

Great Eastern Railway, General Manager's Office,
Liverpool Street, December, 1881.

DEAR SIR,—With reference to the interview I had with a deputation from various angling societies on the 20th October last, I have submitted the question raised on that occasion to the directors, and am instructed to inform you that on and after 1st January, 1882, 1st, 2nd, and 3rd class single fare return tickets will be issued to the members of the—

United London Anglers Society ;

The West Central Association of London Angling Clubs ;

The Central Association of London Clubs ; on production of their cards of membership.

From Liverpool Street, Bishopsgate, Bethnal Green, Stratford, to all stations between Ponders End, Buntingford, Ware and Shelford, inclusive, and all stations between Loughton and Ongar, inclusive. Hackney Downs, Angel Road, to all stations between Ponders End Buntingford, Ware and Shelford, inclusive.

The tickets will be available for the same period as ordinary return tickets.—Yours faithfully,

(Signed)

W. M. BIRT, per G. Strudwick.

Mr. J. Hoole, West Central Angling Association.

A hearty vote of thanks to the Great Eastern Railway was then recorded, in anticipation of which the hon. sec. had already written to Mr. Birt.

The Chairman, in introducing Mr. Marston to the meeting, said that a conference had been held earlier in the evening, at which Mr. Marston, Mr. Greville Fennell, Mr. Geen, Mr. Clench, Mr. Hoole, and himself had been present, relative to a scheme for the propagation and cultivation of coarse fish, which had been sketched out by Mr. Marston, but, as that gentleman was present, he would leave him to inform the meeting what it was proposed should be done for the benefit of the angling fraternity.—Mr. Marston, who was very cordially received, in a very able speech treated the question of the decrease of coarse fish in the various rivers of this country in a very masterly manner. In his opinion, this was only to be rectified by the anglers themselves continuing and carrying out some scheme of fish-cultivation, and more efficiently preserving the water. For the purpose of discussing this question, it was proposed to hold a meeting at the Society of Arts, early in the coming year. He concluded by calling on those who had the interests of angling at heart to join and support any scheme which would further the object in view—viz., the increase of coarse fish in our rivers.—Mr. Geen, president of the W. C. A., briefly stated that he could speak from experience as to the depletion of the Thames, and that, at the rate it was going on, unless something was done, and that very shortly, there would be no fish whatever to catch. In his opinion the scheme sketched out by Mr. Marston was a reasonable one, and he thought that if the anglers would contribute £100 per annum, it would enable it to be carried into effect.—On Mr. Geen resuming his seat, the Chairman introduced Mr. Clench to the meeting, when that gentleman urged all the London societies to support the proposed scheme, and do their utmost to ensure its success. He then read a resolution passed by the Richmond Piscatorial Society, and urged all the societies to pass a similar resolution. Each of these gentlemen condemned the association for allowing individual societies to rent waters which they might have secured, and then practically kept them open (which they would have been) to the members of societies enrolled with the association.—Mr. Murphy, although agreeing with these gentlemen, said that although some waters had been secured by individual societies, that was much better than if they had got into the hands of some private individuals.—Mr. Crumple, the hon. sec. of the Gresham Angling Society, who have rented some erstwhile public waters, urged that such waters had, in the first place, been brought to their notice by some gentlemen of the U. L. A. C. He concluded by saying that if any scheme was started for the cultivation of coarse fish, the Gresham would not be found wanting in support to such a movement, and his only hope was that it would be an entire success. After some

further discussion, in which the vice-chairman, Mr. Field, and the representative of the Portsmouth Waltonians joined, the following resolution was carried unanimously :—

“That a joint committee of the U. L. A. C. and W. C. A. be held on the first Friday in January, to arrange details to be laid before a special meeting of delegates, to be held on the third Friday in the same month.”

The case of Messrs. Bidgood and Clayton, of the Queen's Angling Society, which has occupied the attention of the delegates and committee since August last, was, at the last meeting of the committee, finally decided. The decision has only been arrived at after a long and patient hearing of the whole matter. At the last meeting, the majority of the members of the Queen's Angling Society were present by direction.—The Chairman, in very forcible language, stated that the whole affair, from beginning to end, was a most disgraceful one ; in fact, one that warranted a severe vote of censure being passed on the Queen's Angling Society. The decision arrived at by the committee was that the tickets held by Messrs. Bidgood, Clayton, Wood and Walford should be cancelled. Upon this being put to the meeting it was unanimously confirmed. On the roll being called, the following societies were represented : Acton and Ealing, Bostonian, Bloomsbury Brothers, Beresford, City of London, Cambridge Friendly, Duke of Norfolk, Duke of Cornwall, First Surrey, Golden Barbel, Good Intent, Gresham, Hammersmith Club, Hammersmith United, Hampstead, King's Cross United, North-Western, Prince of Wales, Princess of Wales, Portsmouth Waltonians, Queen's, Richmond Piscatorials, Savoy, Brothers, South London, South Belgravia, Trafalgar, United Brothers, Waltonians, and Mr. Gurney, representing the N. L. A. C.

A cordial vote of thanks to the chair and vice-chair brought one of the most interesting meetings of the year to a close.

GABRIEL TREADWELL.

SPORT FOR ALL.

FISHING is the panacea for all ills. Trouble, worry, difficulties, even ill-health, may for a time be forgotten and banished by this fascinating and all-engrossing pursuit. For very-much-married men nothing affords so much relief, as angling ; and who shall bid the poor sat-upon Benedict despair, when he may exchange the domestic battlefield with all its attendant joys and miseries, for the sunlit meadows, and the deep slowly running stream, with its store of silver beauties only waiting to be transferred to his creel.

Some people are very intolerant fishermen, and will only admit, as orthodox, the pursuit of certain fish in a certain way. With all due respect to this body of piscatorial exclusives, good fun may be obtained, and plenty of sport shown, by all kinds of fish caught in a legitimate way. Fly-fishing must of course always bear away the palm, but where salmon and trout are not known, and coarse fish are plentiful, no lover of angling need lack occupation.

One great mistake is made by those who systematically sneer at the all-round fisherman.

These immaculate gentlemen only see one side of the question, and most likely have been roused into their virtuous indignation by the sight of a pot-hunter fishing in very thick water, with a very thick line, with a very large lob-worm for trout, or throwing out a sugar-loaf at the end of a cable, with an impaled roach for bait, waiting for the signal to haul the unwary pike ashore by main force.

These instances, I am afraid, are common enough, and are certainly calculated to excite feelings of disgust in the minds of those fair anglers who like to see the struggle more equal, and who like to give the fish at all events an occasional chance of liberty. I can imagine no finer sport than roach-fishing with a single-hair line with one clevil of boiled wheat for bait, in any place where “big uns” are wont to congregate ; an outsider cannot appreciate the delicacy of touch, and the perfect co-operation of eye and wrist, required before the angler can be called a proficient in this department. Then, again, when the freshwater shark is hungry, let us not murder him offhand for the sake of our “gross weight” at the end of the day ! Let us minister to his appetite in the most artistic fashion. Let us arm ourselves with a single-handed fly-rod (with a shorter stiffer top joint), eighty yards of fine prepared trout line, a gut trace, and a very small spoon bait, attached to six inches of the finest gimp. Now let us spin carefully every foot of likely water, and if we are rewarded with the mighty rush of a ten-pounder, there will be plenty of excitement, and a vast amount of skill and patience brought into play, before we administer the *coup de grace* to our struggling captive. There is more pleasure and satisfaction in such a victory, than the gross-weight gentlemen ever “dreams of in his philosophy,” and a brace of fish taken by the fine system will afford more real sport than a puntload secured by main strength.

I maintain, then, that good sport may be had with all kinds of freshwater fish, bearing in mind that the strength and size of the tackle should be proportioned to the size of the fish angled for. Trout may be caught under some conditions with the most primitive appliances, but who cares to drag this well-bred little gentleman from his native element by means of a clothes prop, a yard of string, and a hook to match! Rather let us wait until the floods disappear, and the brooks are running bright again; then with a delicate quill gnat, or a tiny blue upright on the finest drawn gut, let us (carefully keeping out of sight) cast our lures lightly upstream so that they fall like gossamer upon the ripples; and ah! how deliciously that gentle tug thrills through us, as we politely intimate to our game little opponent, that he cannot have all his own way. Good anglers are generally good fellows in every sense of the word, and, wherever we may wander in search of sport, we are sure to meet with some genial souls by the river side, who are ready to compare notes with us; and in the evening as, weary with our long day, we recline in our arm chair, discussing our toddy and "a burnt offering," tales of wonderful days long ago spring up, and, as we become confidential, the weight and size of some of our past catches insensibly seem to increase.

Well, may all brethren of the rod love sport for sport's sake, and that the pot may be always a secondary consideration is the earnest wish of

QUILL GNAT.

NOTICES OF BOOKS, &c.

THE HOWIETOWN PISCICULTURAL ESTABLISHMENT AT STIRLING.

WE have received from Mr. J. R. Guy, the secretary of the above fishery, the second edition of his "Pamphlet on Stocking," a most interesting little work, which we cordially recommend to the notice of all who are interested in the culture of fish; we believe it can be had post free simply by applying for it. Mr. Guy makes some strong charges of neglect, ignorance and carelessness against the Stormontfield pisciculturists. He says the water used to hatch the ova in is not good, though good water could easily be had; that the hatching boxes are badly arranged and exposed to frost; that the rearing ponds for the fry are everything they should not be; and, finally, that the young fish are starved, getting only 4 lb. of liver a day, instead of 1000 lb., which would only be a fair amount if the statement is true that the Stormontfield fishery annually yields 300,000 young salmon to the river Tay. As he pointedly remarks, if this vast quantity of salmon is placed in the Tay every year, how is it that the salmon-fishing shows so little improvement? If Mr. Guy's strictures are well grounded, we should say the reason is not far to seek—the poor little beggars are too weakly to exist, and soon die in the main river, or, if they ever reach the sea, have too deeply-rooted a remembrance of their starved infancy to return to such a foster mother!

We will select from the pamphlet a few remarks which are likely to be useful.

"We have brought artificial impregnation to such perfection that probably less than 200 eggs will be barren out of a gallon of about 40,000."

* * * * *

"In from six to eight weeks the embryo is sufficiently developed to enable the eggs to be handled with impunity, and they can be packed in trays on damp swansdown, and forwarded all over the world."

* * * * *

"It is by no means easy to construct a hatching-house absolutely frost-proof, and it is advisable to excavate and build the greater part of the house underground. The expense, of course, varies according to the nature of the ground, and the distance spring water has to be conducted, but £1000 per million ova may be taken as a fair estimate."

* * * * *

CARRIAGE OF FRY.

"Fry will not bear much handling. It has been found advisable, to suit those who require large quantities, to offer them in lots of about 15,000, as these can be easily estimated from the hatching boxes, and a large allowance left for mishaps *en route*. Another advantage is that this number can be sent safely in a forty-gallon tank, except for very long journeys, or in warm weather, when a supplementary small tank requires to be added. . . . The fry are generally sent after they have been feeding for one month, when they are pretty well able to take care of themselves, and are very suitable for stocking large sheets of water which are accessible by road from railway stations. It is best to turn them out into feeders above the loch, into which they will descend in from ten to fourteen months."

CARRIAGE OF YEARLING TROUT.

"These trout are from ten to fourteen months old. They vary very much in size, according to whether the season is mild or otherwise. They generally run from 2½ to 5 inches. . . . We generally recommend those at a long distance from the fishery to arrange to stock

their water, especially in England, where, the temperature being warmer, the fish will grow quicker in winter than they can here. . . . Wherever there is no change of carriage this size of trout can be forwarded safely without an attendant, and guaranteed to be alive and in good condition at the end of any journey not exceeding forty hours, while they can be sold so cheaply they will prove a very profitable investment, to any one who has suitable ponds, to feed for the market. At this age the death-rate compares most favourably with that of any other animal. In our own experience we have found it occasionally as low as twelve per 1000. Wherever there is safe water, without other fish, accessible to a railway station we recommend this size."

CARRIAGE OF TWO-YEAR-OLD TROUT.

"Two-year-old trout—that is, fish from twenty-two to twenty-six months old—generally run from 5 to 8 inches. They are preferable for deep reservoirs or waters where predacious fish already exist, by which yearlings are liable to be destroyed. They cannot economically be forwarded on journeys exceeding thirty hours' duration, and it is advisable always to send an attendant with them. They have the great advantage, however, of frequently attaining from a half to three-quarters of a pound before the end of the ensuing summer, and having, in the case of the Loch Leven trout, assumed the smolt scale, they readily acclimatise themselves to any water."

CARRIAGE OF LARGE TROUT.

"The transit of large trout is at present too expensive to render them available generally for stocking. For those, however, who wish immediate sport, trout up to 2 lb. weight each can be supplied, provided the journey does not exceed twenty hours, and up to 5 lb., provided the journey does not exceed ten hours. If the aquarium cars used in America were introduced into this country, live salmon could easily be transported from one end of the kingdom to another; as it is merely a question of keeping a certain quantity of water at a sufficiently low temperature, the art of conveying live fish long distances is still in its infancy.* The great secret, however, in travelling fish long distances consists in carefully preparing the fish for at least a week beforehand, and in the regulation of the temperature at starting and during the first part of the journey."

CHARR.

"Charr are distinguished from salmon and trout by a feebleness, having teeth on the head of the vomer only (Günther). The charr best known to pisciculturists at present is undoubtedly the *salmo fontinalis*, or brook trout of America."

Those of our readers who would like further interesting information about the culture of *salmonide* we must refer to the above work, or to the pamphlet on trout-culture issued by our friend Mr. Charles Capel, of Footscray, Kent. Mr. Both, Mr. Guy and Mr. Capel will be happy to give those who think of stocking their waters with trout, salmon, or charr every information, and Mr. Capel adds the valuable grayling to his list.

THE GARDEN ORACLE AND CHRISTMAS NUMBER OF THE GARDENER'S MAGAZINE.

MESSRS. W. H. AND L. COLLINGRIDGE have sent us copies of the above for notice. Mr. Shirley Hibberd's name is well known as an authority on gardens and gardening, and we have much pleasure in recommending his really excellent illustrated Christmas number, and his "Garden Oracle," or floral year-book, now in its twenty-fourth year. It is an invaluable guide to the gardener, whether amateur or professional.

CALVERT'S MECHANICS' ALMANACK. Price 4d. Office, Great Jackson Street, Manchester.

THIS cheap and useful almanack contains, in addition to the usual matter of an almanack, practical, technical and industrial knowledge, especially instructive and entertaining to artisans and handicraftsmen, and those generally engaged in mechanical, engineering, and building and constructive trades; decorative, artistic, manufacturing and kindred operations; with original calendar notes, and copious marginal references, relating to events, inventions, inventors, and biography; chapters, original and selected; extracts, humorous and useful; hints, receipts, and maxims. A year book and manual (with annually changed contents), interesting to all at business and at home. Its contents include special articles by W. Lloyd Wise, Esq. on "A Good Patent Law;" R. M. Bancroft, C.E., and P. N. Hasluck (author of "Lathework," &c.), on "Apprentice Schools in France," and "Japanning on Metal," and generally will be found quite as useful as before. There is a double-page illustration of the various knots, loops, hitches, &c., used in building which may, we think, afford a useful hint or two to the tackle-maker.

* We hope shortly to publish a translation of a most practical and useful pamphlet on the "Transport of Fish," from the German of Herr Emil Weeger, President of the Brünn Piscatorial Society, Bavaria.—Ed.

AN ANGLING DISASTER.

'Twss close on the change o' the season
(I don't mean the change o' the moon),
When Winter gaed aff for this reason,
To mak way for the spring comin' roun'.

I wanted to smell her sweet breath,
And panted to get 'mang the hills,
And noo, let me tell, I've mair faith
In spring's caller breath than in pills.

Should ony ane fishin' abuse,
Here's a hint that I canna conceal;
Ye may trespass, and gang where ye choose,
If ye hae a rod and a creel.

I got my trout rod and a basket,
And hied to a stream near the Clyde,
Fishin' as if I'd been taskit,
The art I so eagerly plied.

The fields were a' bonny and licht,
The bushes and tredds lookin' braw,
For they had been coated by nicht
Wi' a pouth'rinn' o' frost or wi' snaw.

The burnie winds here like an S,
And sae deep frae the tap o' the brae,
I wad think the height couldna be less
Than that o' a big stack o' hay.

Below me a deep rinnin' eddy,
Where froth like a pirie did spin,
I thocht on the cove so unsteady
Micht hae the mishap to fall in.

I got an auld root o' a tree,
And made me a seat like a form,
Thus turnin' my face to the lee,
Till I baited my hook wi' a worm.

But, wae's me, the treacherous burn
Had scooped a' the sand frae below,
And ere from the turf I could turn
I felt the turf turnin' to go.

Ere I could say anything ill,
Or empty my pouches o' cash,
I gaed roun' like the wheel o' a mill,
And fell in the hole wi' a splash.

I felt such an awfu' sensation
When my mouth wi' the water got fou,
I thought on the wife and creation,
And bade them a lasting adieu.

I spluttered awhile like a fish,
And really I thought I was droon'd,
But, tho' donnart, got haud o' a bush,
Got out, then began to come round.

What big things sprang up out o' seed!
Think, reader, for instance, on me;
Here am I, escaped frae the dead,
Jist saved by the branch o' a tree.

And little the waur o' my dookin',
Tho' I was an awfu' like sicht,
And looked like a craw when its pookin',
But may never recover the fricht.

This life has its ups and its downs—
Abs'iom deet on the branch o' a tree—
But this I will never disown,
'Twas a branch was the savin' o' me.

Fishin's a pleasure, nae doot,
And pleasure, if taxed by the year,
The biggest o' fools wad find out
It costs them exceedingly dear.

Thro' life it needs unco great care
Oor pleasures to curb and control,
Or, like me, ye may fa' unaware,
And get hurt or get drooned in a hole.

GEO. DOBIE.

MR. BOOTH'S ROACH ROD

In our notice of this rod last week, we said that Mr. B. sent the rod, carriage free, for 4s. 8d. Mr. B. writes to say this is a mistake; but that after this date he will send it, carriage free, for 4s. rod.

ELSTREE RESERVOIR, HERTS.

BY LEO BONVOISIN.

(Continued from page 588).

THE reservoir contains pike, perch, tench, carp, roach, and a few eels. The roach are, as a rule, barely the size of baits, though a good one is now and again taken upon worm tackle. Of carp, I am told upon the best authority there are some very heavy ones, but these artful fish—freshwater foxes, as Walton calls them—are rarely taken. I wonder if anybody, fishing very fine and far off, with a good bolus of white paste mixed with honey, and groundbaiting with, say, crushed boiled potatoes, would succeed in circumventing one or two of these aquatic Reynards. There are also myriads of perch; but the roach are nowhere, small as they are, compared to these little prickly customers. One day in August, I caught here, before breakfast, over two dozen of these little brutes, the heaviest of which would not weigh $1\frac{1}{2}$ oz. Of course, a decent perch is occasionally taken—about one in, well, I am afraid to say how many, but Elstree's real resources consist of its pike and tench. Now, touching these first, and how they are captured. The first-named—which this season are better both in size and quantity, or, more probably, seem the last because they are easier of capture, owing to the extreme lowness of the water—are, the majority of them (I don't think I should be much over the mark if I said two-thirds of them), taken trailing. An ordinary medium-sized flight and leaded trace being used, the usual baits roach and dace, and, when they are to be obtained, sprats. A few occasionally use artificial baits, spoons, &c., but the bulk prefer the natural. Live baiting and trolling are occasionally resorted to—the former principally when the fisherman is using a second rod requiring his attention, or the condition of the water necessitates it. Spinning, paternostering, or the use of the live bait snap, are a very rare exception, though I think each in the hands of a proficient rodster would do much execution. I need not here do more than mention that, like many anglers, I have the most hearty contempt for trailing, looking upon it and live baiting with the gorge hook as the very lowest possible form of fishing; but, in justice to the majority of Elstree trailers, I must mention that one of the greatest, if not the greatest, objection to this style of fishing in the Thames does not exist here, and that undersized fish are carefully returned to the water—of this I have taken particular note. The Elstree punts—and a punt is almost indispensable, fishing from the bank, particularly with the water as low as it is now being rarely successful—are very primitive grey painted craft, with square ends unnecessarily heavy, with little iron rowlock, small wells, and a pair of short oars, leaky, and requiring baling two or three times during the day, but withal tolerably steady on the water. Now concerning the tench, which are both plentiful and of a good weight. The best tackle to use in fishing for them consists of an ordinary Nottingham rod; running line, very fine unprepared plait or silk twist, with a fine (not drawn) gut bottom stained dark; hook about No. 7 and moderately long in the shank; a fairly large porcupine one, too long to reel up on an ordinary winder, or a light cork float—you will by this means be able to use a sufficient number of shots to take the bait to the bottom quickly and decrease the chances of its being swallowed or disfigured by the small fry while sinking. The bait, a good-sized marsh worm, two if small, should lie at least six inches on the bottom—a good deal more if the day is at all rough, to prevent its being continually shifted by the action of the wind and waves. Indeed, if it is very rough—and sometimes it does blow with a S. or S.W. wind—you will find it best to dispense with floats and shots altogether, and to ledger with a small bullet, kept from running down nearer the hook than 18 or 20 inches by a small shot. Cast your line out so that the float rights itself at least seven or eight yards from the punt. The advantage of this is that it decreases the chances of the fish dashing round the punt poles in the first rush after being hooked; and that they are more likely to lie a little way out than in the immediate shadow of yourself, craft, rod, &c., or just within the circle of the vibration caused (however careful you may be) by your unavoidable movements. Many sorts of groundbaits are used by the frequenters of this water, bread and bran, bread, bran, cray and pollard, bushels of grains (often very sour), carrion gentles, &c., but the very best groundbait in my opinion are lob-worms put in without clay, and at dusk, if possible, the evening before—from 250 to 300 will be amply sufficient.

The punts are fixed by means of poles, not the great strong ironshod poles of the Thames, but primitive pieces of timber, more like big clothes props. If you go down overnight, Tom Hawley, the keeper, will take you out, find your punt for you, if there is not one already fixed in a suitable place; and when you have put in your groundbait, will bring you off in a rowing boat, leaving all things ready for the morning, when he will row you quietly out

and fetch you in again. When you require to come on shore for breakfast, dinner, or any other purpose, this will prevent you losing your swim—as the punt poles are frequently left fixed after a day's fishing, and their presence by no means invariably denotes a baited or engaged swin. In very stormy weather, the punts are further kept in their places by one or more huge pieces of flint fastened to a cord and let down over the side.

About Tom the keeper, such brilliant writers as Messrs. Fennell and Keene, could write quite a nice descriptive paragraph. Unfortunately I do not possess the same ability, and moreover, my article, which I had intended should be of very modest dimensions, is getting very long; so I will merely mention that Tom is a capital keeper, a good fisherman, possessing that great quality, viz:—taking a deep interest in the water under his care. He is, as he proudly informed me, an old "Humane Society's" man, having been presented with their medal. He is civil, obliging, and universally liked by the frequenters; he lives at Mrs. Brown's Cottage, close by the water; and has a stock of rods and tackle, and generally a tub of worms (not marsh or lobs, but something between—garden worms I think they are—larger than the first, and smaller than the second.) Apropos of Mrs. Brown—a pleasant, buxom dame, who represents, I believe, Mr. Hills, the lessee of the water—anglers can here have their inner wants, in the shape of breakfast, dinner, or tea, attended to at very reasonable charges.

Now I don't know that there remains much else for me to say about Elstree, excepting that the charges are: for a season ticket, jack and bottom fishing, £1 1s., for a punt, which can be shared with another, £1 1s. Day tickets—jack, 2s. 6d., bottom fishing, 1s.; punt, 2s. 6d. The present season has, so far, turned out the best for many years past among the tench; and some capital bags have been made, 20lb. and 25lb. being had all over the water; while lots of 30lb and 40lbs. have by no means been uncommon. The fish taken have averaged from 1½lb. to 2lb. My take on the day above referred too, 8 fish, weighed close upon 20lb., heaviest fish 3lb. 6½oz. To prevent disappointment, I should, however, mention that the tench fishing is, of course, over for this year.

CORRESPONDENCE.

We do not hold ourselves responsible for opinions expressed by our Correspondents.

A THAMES FISHERMAN.

SIR,—I was rather disappointed at not seeing one of "A Thames Fisherman's" interesting letters in THE FISHING GAZETTE either of the 3rd or 10th inst. I hope it is his intention to continue them (as he said he should do, with your permission)—as they are evidently written by one, who, if not a professional fisherman, has studied the habits of fish and is well acquainted with the locality he describes, and, consequently, contain a great deal of useful information for persons fond of angling, who have only an opportunity of pursuing their favourite sport a few times in the course of the year.

If I may be allowed to express an opinion, I think if some of our experienced anglers were to follow "A Thames Fisherman's" example, and contribute articles to THE FISHING GAZETTE, occasionally giving a description of rivers with which they are acquainted, accounts of the capture of large fish, &c., they would be read with greater interest by anglers than some which have appeared in your columns lately on the structure of fish, as any one interested in ichthyology can obtain such information from works on the subject.—I am, &c.,

Weybridge, December 13, 1881.

ARTHUR C. HEBBURN.

[We kept "A Thames Fisherman's" letter for our Christmas number, and hope to have another for next week.—ED.]

THE "THAMES FISHERMAN" AND THE OLD RIVER.

[SIR,—Allow me just a few lines in which to reply to "A Thames Fisherman's" remarks concerning myself. A T. F. begins by saying I claim to be a brother "professional." This is a mis-statement. I do not; and every one who knows anything at all about me knows that I ceased being a professional in 1876, when I was appointed editor of the *Country* newspaper, and sub-editor of the *Bazaar*, *Exchange and Mart*, 170, Strand. Previous to that I lived nearly two years at Wraysbury, quite long enough to wear the varnish off my punt; and before that, if I must enlighten "A Thames Fisherman's" ignorance, I was with my father for some years in Windsor Great Park, and prior to that at Chertsey, from the time I was five years old.

As to the "Great Curse (?) of our Calling," A T. F.'s reply is preposterous. How can the intoxication of a man twice a year constitute a Great Curse (Capitals, please, Mr. Printer)? Where, also, is the inconsistency in saying A T. F. writes "charmingly terse prose" about what I term "an imaginary grievance"? There is no grievance of the sort, nor "Great Curse." That is my contention.

Another mis-statement of yours, Mr. T. F. I did not describe the bones in the perch's head. I said I couldn't find them; and Mr. Frank Gosden, of Exeter, kindly sent me specimens, and was allowed a few lines of description by the Editor. If you are describing a swim at all, I hold that for it to be of any practical use to those who don't know the water, it should be most minutely pictured, and actual landmarks given. You are not writing for those who are familiar with that part of the Thames, I apprehend.

As to my present handiness with the pole, I will admit it is possible I am not so deft now as our anonymous "Thames Fisherman;" but I must say that, even at this time, when sedentary pursuits have, to a slight extent, possibly softened my muscles and impaired the steadiness of my nerves, I should be ashamed to shoot old Windsor Weir as A T. F. advises. The most ludicrous

sight I ever saw in connection with the Thames, was when the gentleman A T. F. has so beslavered with heroics, and his friend, have been scrambling up the bank and gently letting their big punt over the side shoot with all imaginable fear and trembling, and awkwardness. Would Haines or his son, or Keene of Datchet, old as he is, dream of shirking the risk in such an undignified way. I throw not. Besides, if the fisherman knows how to use his pole at all, there is absolutely no danger. All he has to do is to steer his boat, and in two seconds the punt is through, without any scrambling up banks and tying on of ropes, etc.

I again candidly admit that I derive "amusement and instruction" from A T. F. Can any writer wish for better praise? But I claim to know as much about the stretch of water referred to as he; and as I described it with the greatest care in the *Field* some years ago, while living at Wraysbury, I think I can pass over the gratuitous sneers of an anonymous correspondent, especially as I neither intentionally misquoted nor sneered.

J. HARRINGTON KEENE.

QUERIES FOR "A THAMES FISHERMAN."

SIR,—I have read with great interest the letters from "A Thames Fisherman," giving such glowing accounts of the fishing from Bell Weir up to Old Windsor Lock and the old river, but, although I have visited Wraysbury a great number of times, I have never seen such a take as he would lead one to expect. But apart from that, I have no doubt the fish are there sometimes, although seldom on the feed, especially in winter. Many a time has friend Haynes said to me on a Sunday morning, when I have gone down "Are you mad? You won't catch a fish to-day!" He has nearly hit the mark, and I have had to wind up the day at the Bells, or at Host Read's, the George, till a train became due. Referring to T. F.'s remarks respecting "Old Mortimer," I hope no one else, in consequence of them, will usurp "The Elms" swim, as it may be considered hereditary to the family; for every Sunday a scion of the old gentleman may be seen alighting at Wraysbury station. He informs me that he has fished the old place for twenty-eight years, so please Mr. "Thames Fisherman," do not say it is "to let." The said gentleman (Mr. George Mortimer) is a perfect type of an angler, and is always willing to assist a brother fisherman by giving him every information in his power. But, I am sorry to say that many persons who call themselves anglers are too apt to sneer at advice given them gratuitously and at their own request. In conclusion, I would ask Mr. "Thames Fisherman" two questions. (1) Can the Fleet be fished from the bank when the grass is growing? (2) Is it correct that Mr. Clifford, of Magna Charta Island, can claim the sole right of fishing thereabout. At the same time, he (the "Thames Fisherman") being near the spot, has his attention ever been drawn to the undersized fish taken by the foreigners (employed at the tapestry works) from the river opposite Mr. Ricardo's? Is there no remedy? VORTEX.

THAMES RIGHTS DEFENCE ASSOCIATION AND COARSE-FISH CULTURE.

SIR,—I enclose a cheque for one guinea. Will you kindly forward it to the Thames Rights Defence Association? I have heard a great many contradictory opinions as to the rights of public on the national river; but it appears to me that, from Moulsoford downwards, such a right must exist, if there is such a thing as acquiring the right from uninterrupted enjoyment for upward of twenty years.

I should be pleased to give my mite to any system of fish-culture, provided I could see that it was likely to benefit the great body of anglers.—I am, &c.,

A. J. MARRIOTT.

[Many thanks for your liberality.—ED.]

READINGS IN ANGLING CLUBS.

SIR,—Kindly allow me to supplement my recent note by stating that many admirable papers have long been read before the Richmond Piscatorial Society, and therefore to them is due the credit of initiating this important work in the neighbourhood of London.

The formation of large societies, the prospect of the Central Associations renting water for their members, and your own grand proposition to cultivate coarse fish to stock them with, seem to indicate the commencement of a new period in angling history; and it is but just that the work of the Richmond piscators should be fully acknowledged.

So far as the Gresham Papers are concerned, I can but repeat that we welcome any secretaries or gentlemen interested who may care to hear them read, and none recognise more than ourselves that bond of good fellowship which should unite all true anglers, of which we have certainly endeavoured to give proof.—I am, &c.,

Dec. 19, 1881.

T. CRUMPLEN.

SIR,—When I wrote under this heading a fortnight ago it was with no desire to disparage the noble movements of the Gresham Angling Society in reference to the occasional reading of papers on angling subjects; but, being under the impression that a similar movement had been made by the Piscatorial Society, I adopted my old policy of giving honour to whom honour is due. It may be—and I have no desire to dispute it—that the revival in the old society has been stimulated in, perhaps, no small measure by the Gresham taking the matter in hand; and, in that case, it is only common justice to that admirable society to acknowledge it. And not being desirous of offering any comment of my own in answer to Mr. Crumplen's enquiries of last week, I have gathered the following information. First of all, under the head of "The Piscatorial Society," in last week's *Land and Water*, there is this paragraph:—"Some few years back the members of this society used to read papers on angling and matters connected with fishing. After a time the musical element had its sway; then most of the young musical singers entered the matrimonial state, which most musical men do, and so they had to discontinue their visits, and these pleasant evenings were postponed for a time. The members have now returned to their original ideas to read and discuss their experiences in angling." Mr. T. R. Sachs, the predecessor of the present honorary secretary of the Piscatorial Society, in reply to my enquiries, says that when the society was in Pall Mall there were occasional readings of papers on angling experiences, and notably one by the late Mr. Marsh on "Fly-fishing." Since the society has been at the present quarters at Ashley's Hotel, the late Mr. Frank Buckland made several visits of that kind, and strongly urged the society to adopt the practice of occasional readings, if they wished to attain success. And not very long ago Mr. Alfred Jardine, who has been so much impressed with the value

of reading papers by the Manchester Angling Association, and with a desire to promote the interests of the Piscatorial Society, and make it more generally useful, on at least one occasion recommended that society to make the reading of practical papers a leading feature in its work. Mr. James Lander also states, in reply to my enquiry, that the last paper was read by Mr. H. Gray, the librarian, on "Angling," about eighteen months ago, and that he has the names and dates of five or six papers, by various members at different times. Mr. Crumplen says that the present revival was "the act of an individual member and not of the society," as I seem to think. I have this week seen the writer of the paper, and he tells me "it was not his own act, but that he had been requested to write it." I have no more to add, except that I am sure Mr. Crumplen will acquit me of any desire to laud up one society at the expense of another. I am a very old honorary member of the Piscatorial Society, and I am amongst the first on the roll of honorary members of the Gresham Angling Society. I feel it an equal honour in both cases, and it will always afford me the greatest pleasure to work for both. If I have erred in any way in this instance no one will regret it more than myself; and in expressing my highest admiration of the energy and activity of the Gresham Angling Society, I can assure Mr. Crumplen, and those associated with him, that nothing shall be wanting on my part to do what I can to add to its welfare and prosperity. Mr. C. S. Bentley has very kindly given me a copy of his valuable paper on "The Sense of Pain in Fishes," which he read before the Gresham Angling Society on November 3. It is published in a cheap form, and contains coloured diagrams, and can be had at 67, Moorgate Street. The subject is an interesting one, very ably treated; and, as several benevolent persons have refused to subscribe to the T.A.P.S., on the ground that the practice of fishing gives great pain to the fish, I would recommend them to peruse this excellent treatise and send me a substantial result.—I am, &c.,

B.

SIR,—Our friend, Mr. Crumplen, must not credit his society with the initiation of essay-reading before the metropolitan clubs. I am pleased to say that the Richmond Piscatorial Society had them read by their members, and published long before the Gresham was thought of. In fact, by referring to your columns, he will find a paper, "Piking in Private Waters," which was ready before my society, and written by your obedient servant,

FRED. C. CLENCH,
Chairman Richmond Piscatorial Society.

CHOPPINGTON FISHING CLUB—ITS NAME, AIM, AND PROGRESS.

SIR,—In July, 1880, a few ardent followers of old Father Izaak met and formed a fishing club at Choppington, limiting the number of members to twelve. After the usual business of all infant societies had been disposed of, such as the election of president, vice, and committee, the meeting unanimously decided that the name of the club should be "The Choppington and Guide Post Conservative Working Men's Fishing Club," and the object of such club should be to solicit boards of conservancy and landed proprietors for leave to fish their waters. And we likewise wish it to be understood that in all our applications to the different riparian owners in the neighbourhood, and to stay any misconception which might arise from this name, we thought it right to modify it by giving to them the subjoined explanation, viz.:—That we as a club attach no political significance to it whatever, but that we simply mean by it the upholding and obeying of all existing laws and bye-laws got up by boards of conservancy and landed proprietors for the better preservation of their waters and their game. Also, at the nomination and election of members there are no questions asked in regard to their political opinions. Providing that they never have been convicted of poaching or illegal fishing, our ranks are open to all. So much for the name. Now for the object or aim of the club—seeking leave from noblemen or gentlemen to fish their waters, in which capacity I have applied to many of the gentlemen resident in the vicinity of Morpeth. And I am well pleased to be able to inform you and the numerous readers who daily peruse your most valuable paper, that in this to me a new line of business, I have not been altogether unsuccessful. Foremost among our most distinguished patrons is Sir M. W. Ridley, Bart., M.P., of Blagdon, who has most generously given the club permission to fish three miles on the south side of the River Blyth, which contains trout, pike, perch, and roach, the trout being celebrated for their size, beauty, and edibilities. And were it not for an impassable barrier in the shape of a large dam at Beddington Ironworks, which entirely stops the further upward progress of all migratory fish in all probability the River Blyth would make a prolific salmon water, as the higher reaches of the Blyth and Pont contain miles of the very best spawning ground for these kind of fish, over which runs water pure as the limestone rock fountain, uncontaminated by the refuse of paper mills, factories, or anything detrimental to the health of the inhabitants of the crystal streams which characterise the lovely vales of Stanington and Pont. Then from B. Wilson, Esq., of Blagdon, we have one mile on the north side of the Blyth. And the club has found a most distinguished patron in T. R. Trevelyan, Esq., of Netherwitton Hall, who has granted to the club leave for one member to fish his water every Saturday during the season—a grant which we highly appreciate, as the trout are numerous and the sport splendid. Besides, what is more exhilarating, when the bud is on the hawthorn and the bloom is on the sloe, than an airing out in early morning over the Pigdon Hills, in company with Mr. S., the most obliging of all postmen? Then again from W. E. Ord, Esq., of Nunykirk, we have leave to fish from Comb Hill Bridge upwards; and from Mr. A. Glass, of the Anglers' Arms, Weldon Bridge, we have a day or two in the season. I may likewise state that the gamekeepers under these gentlemen have behaved in the kindest manner possible to every member of the club. The gentlemen themselves we thoroughly and unitedly esteem; and doing so we lay this letter on the altar of public opinion, which will not be slow to perceive that the actuating spirit of philanthropy which has in towns provided public parks, free libraries, museums, &c., for the education and recreation of the working-classes, is not dead, but liveth in the country also.—I am, &c.,

JOHN TWEDDLE,
Corresponding Secretary to the Club.

T. R. SACHS ON PIKE AND JACK.

SIR,—As a friend of Mr. Alfred Jardine, the gentleman who exhibited the 37 lb. and 36 lb. pike at Norwich, and which your correspondent, T. R. Sachs, in a recent FISHING GAZETTE, insinuates were questionable weights, I wish to point out that T. R. S. has repressed a fact he well knew: that one of these large pike was not weighed in until two days after capture, and the other late on the third day. Greville F., no mean authority, says the waste on coarse

fish by exudation of slime and liquids from vent and gills amounts to about 15 per cent. of gross weight during the first twenty-four hours, which is probably near the mark, but you will perceive that Mr. Jardine only allowed 4½ per cent. for loss, irrespective of the lapse of time. Mr. J. had no very accurate means of weighing at the time of catching them, and there is no doubt they exceeded the weight recorded on their glass case.

As for the "Union Jack," it weighed 23½ lb., with a 2 (two) lb. jack in its inside.

Oh! dear Mr. Sachs,*
Was this one of your larks?

And it is a moot question whether T. R. S. could by himself have ever landed that fish, for, as he admits the late H. L. Rolfe, a skilful angler, hooked the fish first "well in the gullet," and, by the bye, it was on Jardine's "snap-tackle."

Mr. Sachs thinks pike-fishing is all luck. It possibly is so with him, for any miff may have luck; but I believe in the angler finding his fish, and after that is done playing with them properly, and as I have never yet seen recorded any really large pike of T. R. Sachs's catching, I hope, when he does have the "luck" to get hold of a good one, he will manage to land it, and that "single-handed."

THE GHOST OF SIR THOMAS GRESHAM.
* Pronounced, Sarks.

THE GRESHAM v. POT-FISHING.

SIR,—When again in London I hope to spend one evening with the Gresham Angling Society, as their rules are good in every way, especially the one which prohibits weighing the lot, irrespective of size. I know several pieces of water utterly ruined by such a proceeding, and one entirely so. This lovely pool was worth fishing about thirty years since. I caught two pike there in one day, about 1850, which measured 4 feet and 3 feet 6 inches in length respectively, also several others smaller in size. This got known, and trimmers and rods soon cleared it out. I fished it with an old friend. We had four rods out, all were gone at once, and we bagged three fish out of the four. You may go twenty times now and never see one. About twenty years since I laid out there a line of eighty hooks for eels. The next morning there were over seventy on it and one pike, caught by the eel getting out of the pike's gills and winding him up the main line, so that it realized the old saying "*Dum capimus capimus*." Pike very rarely take the eels' dead bait. This is a well-known fact. Our Aquarium has lately been purchased for about one-eighth of its original cost by four Yarmouth gentlemen, and I think it will now be properly managed; at all events the rents will be small. More money is to be laid out and a new roof put on. £5000 is really nothing for such a building as this is, or rather will be, when the alterations are completed; and I think they are soon going to work, so as to get all done before the season of 1882.—I am, &c.,

ESOX LUCIUS.

December 13.

UNITED LONDON ANGLERS.

SIR,—According to promise I herewith forward an authorised list of stations and fares as granted by the Great Eastern Railway, to come into operation on and after January 1, 1882, return tickets at single fares, available for the same period as ordinary return tickets.—I am, &c.,

R. GHURNEY.

Stations.	Fares from Liverpool Street.		
	First class.	Second class.	Third class.
	s. d.	s. d.	s. d.
Roydon	4 1	2 10	2 1
Burnt Mill ..	4 5	3 5	2 7
Harlow	4 10	3 8	2 10
Sawbridgeworth ..	5 2	3 11	3 1
Bishop's Stortford ..	6 0	4 6	3 6
Stanstead	6 6	4 11	3 10
Elsenham	6 10	5 2	4 1
Newport	7 6	5 9	4 6
Audley End	8 0	6 0	4 7
Great Chesterford ..	8 8	6 6	4 7
Whittlesford	9 3	7 0	4 7
Shelford	9 3	7 3	4 7½

ANGLERS' TOURNAMENT.

SIR,—Will you kindly permit me, through your valuable paper, to once more request the following societies to send me either the tickets, or cash for same, sent them for the above tournament. I am anxious to close my accounts, and am prevented doing so on account of the number of tickets that are out, many of them, to my knowledge, having been sold. Number of tickets posted, October 17, 1881—Pictorial, 20; Caxtonians, 20; United Marlborough Bros., 5; Hampstead, 5; Angler's Pride, 10. Posted, October 19, 1881—True Waltonians, 5; St. James and Soho, 5; Social Bros., 5; Sussex, 5; South Hackney, 5; Surrey Piscatorial, 5; Stratford Bros., 5; St. John's, 5; Richmond, 5; Peckham Bros., 5; Havelock Bros., 5; Hammersmith Club, 5; Friendly, 5; Duke of Cornwall, 5; Duke of Norfolk, 5; Cobden, 5; Clapham Junction, 5; Bolingbroke, 5; Battersea, 5; Anchor and Hope, 5; Acorn, 5.

Every one connected with the management of the tournament worked hard, giving their time and money to make the affair a success. Not forgetting that the cash for the tickets sold goes entirely towards the funds of the Anglers' Benevolent Society, the least secretaries can do is to render the committee's work as light as possible by sending in all unsold tickets, and cash for those sold. I shall take it as a favour if immediate attention is paid to this appeal.—I am, &c.,

J. HOOLE.

PATERNOSTERING FOR JACK.

SIR,—I read in your paper some time back that paternostering was very efficient for jack, when the angler knew at what time to strike. Will you kindly inform me, and also whether to use the single lip-hook or lip-hook and triangle?—I am, &c.,

H. T.

December 19.

[You should strike about a quarter of a minute after a run, or during the run if it is a long one. As this fishing amounts really to snap-fishing, it is best to have a small triangle as well as a lip-hook.—ED.]

WATERPROOF FISHING BAG.

SIR,—How can I make a cheap waterproof fishing bag, and where can I get a seat fishing basket at a moderate price? Any information will greatly oblige.—I am, &c.,

THE WANDERING ANGLER.

POACHERS AND PRIVILEGE TICKETS.

SIR,—May I ask my brother anglers, through the medium of your paper, whether, for the credit of the West Central Association of London Anglers, it is policy to allow the club members who were recently fined 20s. or fourteen days for poaching, to still retain their privilege tickets? As the association is to a certain extent interested in the good behaviour of all members using the railway privilege tickets, I think it is a case of which they ought to be advised, as difficulties of this description between anglers and owners of private waters are calculated to bring disgrace to the body of anglers generally.—I am, &c.,
42, Litcham Street, N.W., Dec. 19.
THOS. CLARK.

P.S.—I may add that two members of this society were expelled, and lost prizes already won, for even being supposed to fish in the same water.

GENTLES—COLD FEET—COARSE-FISH CULTURE.

SIR,—Can you or any of your numerous readers tell me, through your GAZETTE, how to keep gentles during the winter, and whether they can be kept alive?

I tried the method which I saw in your GAZETTE some time ago, of putting them in bottles and burying them, carefully sealing up the tops, but found they soon died and gave forth a very unpleasant smell.

Also, can you tell me is there any method for keeping one's feet warm other than woollen socks and good waterproof jack boots, as, when roach-fishing in winter, my feet get very cold indeed?

I shall be happy to subscribe towards your scheme of coarse-fish culture.—I am, &c.,
THAMES ANGLER.

A STARVED PIKE.

SIR,—We have all heard of the tremendous voracity of the pike. I have had a small fellow in a tank of water about three yards long and two yards wide, since last July.

I can safely say that not a single particle of food has been placed therein.

Can you give me any information explaining how this youngster has managed to exist so long on apparently nothing. I may add there is a perfect armful of sunken dead leaves in a corner of this tank, and for the past six weeks he has buried himself in them, and on no account will he show himself, unless made to do so, instantly starting back again. Do you think he obtains, when disturbed, anything in the shape of food from these leaves; and, if so, may not this habit of hiding away in this singular manner account for the difficulty experienced by anglers in catching carp, tench, barbel, and more particularly eels in the winter months.

Requesting your indulgence for the shortcomings of an unpremeditated effusion.—I am, &c.,
MARK ANTONY.

P.S.—Though others may have accomplished it, I have only known one angler succeed in taking barbel every month of the year, and only then after huge perseverance. I may mention that those caught in mid-winter gave very fine sport compared to those taken earlier in the season, and that the barbel of November and the barbel of August differed as much as a maiden of seventeen and the same party at seventy, and, when brought to bank, showed no more sport than a Trent flounder about the size of a crown.

[You should feed the fish, or it will die (worms and minnows will do). Cold weather sends the fish you mention into a semi-torpid state, and they lie close in the mud.—ED.]

TAKING CASTS OF FISH. A QUERY.

SIR,—Would you allow me to enquire (through your paper) if any of your many readers could give me a little information regarding the *modus operandi* of taking a cast in plaster of Paris of a large pike.

I should also very much like to see a description in these columns of the secret spring-bait, mentioned in your last edition by Mr. Sachs in his article on pike and jack.—I am, &c.,
ARTHUR R. KNIGHT.

Tottenham, Dec. 12.

SNAP-TACKLE.

SIR,—If you refer to page 443 of Mr. Keene's "Practical Fisherman," you will find a description of the snap-tackle referred to in Mr. Sach's article in your issue of Saturday last, and a plate.—I am, &c.,
W. B.

15, Warwick Court, Gray's Inn, W.C., 12th Dec., 1881.

HOW TO CLEAR A CANAL OF WEEDS?

SIR,—Will any of your readers kindly give me a little of their practical experience as to the right time of the year to clear weeds from a canal. The canal in question has a most splendid crop of silk and flannel weed every year; although repeated efforts have been made, and large quantities taken from the surface, by various means, it springs up again in greater luxuriance than ever. My own idea as to the cause of failure is that our operations have taken place at the wrong time of year, viz., October and November.

Trusting some of your numerous correspondents will kindly give me some practical information.—I am, &c.,
WM. TRANTER.

Portsea, Dec. 12.

[You will have to use a little more "elbow grease," and repeat the operation as often as you see the necessity for it. You ought to keep a certain proportion of weeds, as they afford food and shelter, and are the best protection against the poacher.—ED.]

EDITIONS OF WALTON'S "COMPLEAT ANGLER."

SIR,—I should feel much obliged if any of your readers would permit me to examine, or, what would be preferred, to purchase, copies of the editions of Walton published by Maunders, by Johnson of Manchester and London, by Milner of Halifax, by Chambers of Edinburgh, and by Routledge between 1859 and 1881.—I am, &c.,
THOS. SATCHELL.

Dowshill Hill House, N.W., Dec. 22.

PIKE—MALE AND FEMALE.

SIR,—In reply to Mr. Hensman's letter in last Saturday's FISHING GAZETTE, about female pike; as a rule, they are much the largest, and often pair with males of not much more than half their weight, their instinct prompting them to select young and vigorous mates at spawning time, after which they have sometimes been known to attack the male so savagely that he has died from the injuries. I have male pike of my own catching, one 22½ lb. and another of 18½ lb., but both are decidedly old Esos, and were, I think, past reproducing, or even pairing.

At the end of February, when pairing had taken place, I have in several instances, caught the female, and, immediately afterwards, the male, which invariably was the smaller fish.

Among other large ones of my catching, the following weights were female pike: 37 lb., 36 lb., 23 lb., 21 lb., 20½ lb., 18½ lb., and 17 lb.—I am, &c.,

ALF JARDINE.

FURTHER RAILWAY CONCESSIONS.

SIR,—I have great pleasure in stating that the Great Eastern Railway Company have generously granted an extension of the privilege tickets from Liverpool Street, Bishopsgate, Bethnel Green, Stratford, Hackney Downs and Angel Road, to all stations between Ponder's End and Shelford included. I will forward names of stations and lists of fares. The tickets will be available for the same period as ordinary return tickets. I trust that anglers will guard and protect their privileges in the same spirit that they are granted, and we may hope for something more in the future.—I am, &c.,

R. GHURNEY.

CLUB REPORTS.

ANGLERS' BENEVOLENT SOCIETY.

Since my last report I beg to acknowledge receipt of the following, with thanks:—P. Geen, £1 is. (annual); C. P. Wheatstone, £1 is. (annual); W. A. Crump, 10s. 6d. (donation).—R. GHURNEY, sec.

Dec. 21.

BRIGHTON ANGLERS' ASSOCIATION.

No fishing at present in the Ouse or Adur, owing to the floods. The members met on Monday evening to award the prizes for largest fish during 1881 and also aggregate weights. Mr. Ash, 92 lb.; Mr. Hassell, 65 lb.; Mr. Ancombe, 44 lb. Largest jack, 20 lb., Mr. Hassell; largest bream, 5½ lb., Mr. Tree; largest roach, 1 lb. 10½ oz., Mr. Ancombe. The competition on the 26th December is expected to take place at Chichester, the water always being clear. Great show for a snow-storm. Wind, north-east.—GROUND BAIT.

CAVENDISH ANGLING SOCIETY.

The third annual supper of the above society was held at the club room, the British Lion, Cavendish Street, New North Road, when upwards of twenty members sat down to the excellent fare provided by the worthy hostess. The chair was occupied by Mr. Warner, faced by Mr. Matthews, secretary, who were ably assisted in the course of the evening by Messrs. Lee and W. Lambourne. Mr. Ghurney toasted prosperity to the Cavendish Angling Society, which was heartily responded to, as were many other toasts. A distribution of prizes took place after supper; the most successful member being Mr. S. Penton, who took gross weight prize and several others, among which was 10s. 6d. for his 8 lb. 2 oz. barbel, taken bank-fishing at Teddington. Mr. Charles came in a good second; Mr. W. Lee being third, which position he obtained from Mr. Granfield on the last Sunday. Several friends gave a call after supper and assisted in making the evening one of the most enjoyable on record of this society.

Dec. 21.

CITY OF LONDON ANGLING SOCIETY.

Four of our members went to Rickmansworth on Sunday to compete for two prizes given by Messrs. Parkins, sen, and Mortimer. Mr. Castell winning the first prize with roach and chub; Mr. Hales second, with roach. The rivers Colne and Gade were rising fast, the water being over the tow-path and the surrounding meadows, which, combined with a high wind, made angling very unpleasant.—CAS.

GREAT NORTHERN BROTHERS.

We had only two shows of fish on Sunday, viz., Messrs. J. Theobald and Kirk, roach from the Thames and Colne. The following gentlemen gave prizes on Monday last, the same to be fished for at King's Langley on Sunday next, and to be handed to the winners on Christmas Eve. The prizes consist of ham, fowl, sausages, cheese, rabbits, leg of pork, whiskey, gin, ale, &c., and were given by Messrs. Broach, Walker, Theobald, J. Parkin, J. K. Fitch, W. Parkin, Young, and J. Fitch.—J. A. FITCH, jun.

GRESHAM ANGLING SOCIETY.

The meeting of this society held, as usual, on Thursday evening, was very largely attended, the spacious meeting room being (contrary to expectation) well filled. Captain Alfred in the chair. The society with its accustomed liberality voted half a guinea to the river keeper's dinner fund of the Thames Angling Preservation Society, and the same sum, as a Christmas present, to the keeper of their own private water at Waltham, who, in common with many others in that locality, has suffered from the floods now prevalent. The society contemplate stocking this water, and it will no doubt form an important nucleus for future operations, in the same direction. It was understood that Mr. Marston's suggestion as to coarse-fish cultivation would be considered at an early date, and also the question of the right of the public to fish in the river Thames. Mr. Jardine brought a fine example of a 28 lb. jack, being the last cast by the late Frank Buckland, as well as the last painted by the late H. L. Rolfe, which had a special interest for the members—the casting being very life-like, scarcely less so than the actual object. Several gentlemen kindly brought their jack tackle, Mr. Jardine delivering a very practical address, which was highly appreciated, and for which very hearty thanks were accorded. The whole subject of jack fishing was ably touched on, and when Mr. Jardine expressed his preference for snap tackle, he was, as at other times, warmly applauded. The list of candidates for election was the largest, and most important probably, yet balloted for at any meeting of the society. They included Messrs. W. B. Adlington, J. Ross Faulkner, H. Blamey, W. A. Crump (Thames Rights Defence), H. Brett, E. Jannings, H. K. Lockwood, J. Pine, W. Holmes, R. H. Peatfield, W. T. Howe, J. McDowell, and A. Attwell, all of whom were admitted to membership. It was also resolved that the committee and members should have supper together on Wednesday, January 4th, at the society's rooms, City of London Tavern, 11, Bishopsgate Street Within, the number to be limited to about sixty, for which the majority of tickets were at once taken. The proceedings, which did not finish until an advanced hour, closed with a very hearty vote of thanks to Captain Alfred for presiding. The arrangements for the prize competition, on January 2nd, will be made next Thursday, for which members should enter names at once.

NOTICE.

—o—

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 177, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Faddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Hulmer, 62, Wandsworth-road.
Mr. F. Oliver, 188, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 21, Lombard-market, Battersea, S.W.
Messrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.
Mr. Alfred Young, "The Golden Perch," 174B, Oxford-street, W.
Mr. T. Barnett, 26, Church Street, Lisson Grove, N.W.
Mr. J. Smith, 7, Tottenham Court Road, London.

SATURDAY, DECEMBER 31, 1881.

SOME NOTES ON COARSE-FISH CULTURE.

No. II.

By J. HARRINGTON KEENE.

IN my No. I. paper I referred briefly to the English history of coarse-fish culture, and instanced the county of Sussex as possessing the most important fishponds in past times; I now

proceed to remark on the practical considerations involved in such culture if pursued in the present day, as has been suggested by Mr. R. B. Marston.

In the first place, it will be necessary to decide whether the proposed association shall include the culture of the *salmonidæ* or not. I at once say that I think it should. The apparatus to be used for the hatching and rearing of coarse fish will not be found widely different from that ordinarily employed for trout or salmon, and the seasons of spawning in the coarse-fish community will not clash with the processes in connection with these fish. The fry of salmon or trout will be safe in the roomy boxes or stews by the time the spawn of—say perch—is taken, and so there need be no interference one with the other. Besides, in the winter-time, there will be comparatively little for the attendants to do; the coarse fish will, if ever so little, require very little attention. Another item to be thought of also is the fact that the culture of the finer fishes, if economically and carefully carried out, will realise a profit, and thus relieve the inevitably heavy expenses to be incurred in the transport of the parent coarse fish, and the subsequent distribution. Moreover, the wide scope of such a society would doubtless enhance its value in the eyes of outsiders, and thus benefit the list of subscribers.

The next consideration is the kind of fish, other than the game fishes before mentioned, with which the fish-culturist of to-day should deal. I think that none swimming should be omitted, except, of course, the stone-loach, stickleback, etc., and eel. This latter fish is absolutely not worth culture for sport, but for the table I am of opinion that it is woefully neglected. Perhaps it should not be excepted after all, though it is certain that its culture would be limited to keeping and feeding it, for no one would be able to artificially spawn it.

The question which next occurs to me is, what are the necessary natural characteristics of the place where buildings shall be erected, and the various stews, streams, etc., prepared. First, there must be an abundant supply of pure spring water, and the streams should be, either naturally, or by means of dams and other contrivances, independent of rains and droughts, and not liable to flooding. A few artificial lakes are also indispensable, and there must be facilities for the running off of the water, and the cleansing of the bottom at periodic intervals. The usual procedure of the Prussian carp growers would here be available. A properly constructed penstock, with a grating in front of it, to prevent the escape of the fish, is drawn, and the water of course departs, leaving the comparatively shallow lake waterless, or nearly so. The fish can thus be handled with the landing net.

Of course, however, these, though of the highest possible importance, are questions rather of detail, and, as such, are necessarily controlled by the circumstances of the spot selected. Supposing, however, that they are satisfactorily arranged, and the association formed, the treatment of the various fishes is the all-important subject. Of course, much will be learned by experiment, especially in the manipulation of such fish as are artificially spawned; but, as I have before said, I do not apprehend an insuperable difficulty, and, certainly, means can be taken to prevent anything like absolute failure. A few notes on the treatment of the various fishes may not be unacceptable at this point.

Pike are, I suppose, looked upon as of first consequence, on account of its size and the play it gives. There are two ways of breeding this fish—natural and artificial. As it does not eat its own spawn after deposition, and most other fishes will do, or devour the spawn of others, it can be placed in company with others, and left to mate and follow its own marital desires, but, needless to say, the water should be a lake of suitable kind. The pike, according to a high German authority, four or five weeks before spawning, commences to seek the neighbourhood of the shore in groups, and, almost invariably, each of these consists of one female accompanied by one or more male fish, and so continues, unless disturbed, until the spawning season is over. As a rule, a female of small size is accompanied by one male only, a medium-sized mother-fish has two or three males, and a large one as many as four or five. The larger the mother-fish the smaller, as a rule, are her attendant squires, the weight of the former being generally equal to the weight of all the males put together. If the male of a group, he says, be caught, the female does not mate again, that is to say, the absent one is not supplied during that season, and under no circumstance was the spawn of a female bereaved of her attendant males impregnated by others.

These observations, it is needless to observe, are valuable as a guide to the number to be placed in company, and as to the selection of sex. In the very large fish, it has been believed, that they are monogamic, and, so far as the greater part of the year is concerned, this may be quite true; but I am persuaded, after careful watching, that such is not the case during that part of the year devoted to the reproductive act. The difference between the female and the male in appearance is not easy to be discerned by one unacquainted with the physiology of fishes. The male, how-

ever, is larger in the lower jaw, and longer, with a more decidedly saturnine cast of countenance—though I admit this is quite sufficiently indefinite—and the ventral and anal fins are larger than in the female. The symmetry, however, of the body, in relation to the head, is in every way inferior in the case of the male, and superior in the female.

The ordinary valesneria and rush-reeds are, I think, the best to plant in a lake intended for the natural growth and reproduction of pike. After, however, the first twelve months, the parents must be removed, or they are prone to be cannibalistic, and to devour their own offspring. Of course, during the early life of the tiny offspring—and not before, be that borne in mind—plenty of minnows, gudgeon and dace should be given for the sustenance of the parents, else they will certainly prey on their fry. Then the young pike may be left alone with the exception that all crustacea and the various other animalculæ—entomostraca—should be carefully and unlimitedly encouraged, so that the young pike may feed and grow. Now the habits of young jack are solitary in the extreme. They will not fraternise like other fish, and they love to hide in the midst of the foliage of the reeds, or on sunny days to lie basking in the sun, like their adult congeners. Obviously, therefore, it is not necessary to cast bait to any individual specimens. Throw it into the water, leaving them to feed as they think fit—that is the only course in the natural culture of them, and similarly, to a certain extent, it is the only method with those artificially reared. Of course, if the young fish can be got into a small stew, and tamed, as it were, by being constantly fed by their keeper, they will feed almost in flocks; but the instinct of the creature is against that, and, in all cases, if we desire to preserve the breed of any artificially-cultured animal, it is necessary to preserve the original character as far as may be possible. For, observe where the comparative taming of this fish would lead us. It would be turned into the river selected for it, and, like the artificially-reared trout, it falls an easy prey to any other marauder, be he fish, flesh, or fowl, or of the rufous *clupea parengo major* genus, and the sport he gives is almost a dead letter—*nil*. In this connection, and, indeed, in all cases, it should be arranged so that only the best and largest stream pike are allowed to fructify. I am perfectly sure that the present deteriorated specimens of the Thames are due to the constant inter-breeding of the pike; certain it is that many inland isolated waters produce only feeble fish from this cause.

So much for the natural culture, as I choose to call it, though there are certain artificial conditions requiring fulfilment during its process. I must now turn to the purely artificial impregnation of pike, and the subject is one of no mean difficulty. The operator who determines to operate on an adult female pike must, of course, first be certain that the fish is ripe, that she is a she, and that his appliances are in perfect order, and not likely to be out of reach when they are wanted. Moreover, he must find his male fish, and have him ready in a vessel, for instant handling after the female is done with. The way to handle the female need not be described to a trout-culturist, though, to such an one, the warning must be given: "avoid the gills, if you wish to save your fingers from laceration," for, as every angler knows, the interior of the mouth and flanges of the gills of a pike are armed with most formidable fangs. The fish really ought to be taken in the right hand (if it is only of a few pounds) just below the gill covers, and the left hand may then steady the tail. When the fish becomes passive, the stomach is gently pressed with a gentle motion, and the ova will exude freely, as in the case of trout. The male is submitted to similar treatment, and after carefully washing the impregnated ova, it is to be placed in suitable troughs. Unlike the ova of the salmonidæ, this requires a comparatively high temperature and sunlight. The precise conditions are, of course, regulated by circumstances, but, generally speaking, a varying temperature, between 50° and 65° may be preserved. In a much less time than is necessary for the salmonidæ—which time is, however, entirely regulated by temperature—the fry appear, and in a very short time commence feeding. They should now be removed to the company of insect-bearing weeds, and, if necessary, search should be made for the various organisms on which they feed. In the course of the year pike, under favourable conditions, will grow to five or six inches in length, and feed ravenously on the fry and smaller minnows. Of course, their further development is a matter for the usual treatment.

Perch are, of course, to be treated in an analogous fashion, except in regard of the artificial spawning. The female, if ripe, may be taken and securely held in both hands by means of a damp cloth, and having provided a receptacle with a little water in the bottom, the riband of spawn may be actually drawn from the fish by resting it backwards and forwards on the side of the vessel. In the case also of natural spawning, faggots might be laid in the water in suitable positions, but these should not be moved but with great care and precaution, as to a plenitude of water and equalization of temperature. Perch culture deserves especial at-

tention, and really prevents less difficulties than that of any other species of coarse-fish.

The cyprinidæ, including its sub-order, the leuciscini, comprise the bulk of the fishes which are the delectation of the coarse-fisher. Barbel, tench, and carp, are readily distinguished as to sex after the eye has become accustomed to note the differing peculiarities. In both barbel and carp the pectoral and ventral fins are larger in the sterner sex than in the females. The male tench has its ventral fins concave, with the concave side uppermost, whilst the female's appendages are of the ordinary size and shape. I am not always quite able to detect a male roach, though, as they assemble in the spawning season in squadrons of immense number, separate from the females, there would be no difficulty in this. Let me here add that, in regard to roach, I have reason to know that the unimpregnated ova will remain so without deterioration for lengths of time, varying according to place and circumstance. This allows of slight delays between the operations of the two bodies of fish.

The collection of fish, for artificial spawning and impregnation, would certainly involve trouble, but no great difficulties of a scientific nature. Barbel are easily observed when "at hill," as it is termed, and, of course, the Thames and Trent would have to be laid under contribution for the parent fish. Carp, also, in such lakes as produce them naturally and with a fair amount of prolificacy, are easily watched, and may be observed in the neighbourhood of weeds during the early part of summer, gambolling with each other. The very large fish are commonly infecund. I have opened, I daresay, hundreds of carp which were destined for the Royal households, many of them over 10 lb. apiece, and it has been rare to find one amongst the larger with ovaries not diseased. In many cases, in fact, I have found them quite encysted with hardened agglomerations of unshed spawn. Carp of three or four pounds are the best for breeding purposes.

By the bye, I quite agree with Mr. Marston that anglers wrongly turn away from the carp on account of its not being easy of capture. I admit that it is a wily brute, but then, so is the Thames trout and the barbel, unless fairly on the feed. The carp, if once it begins to take the bait, will do so through the day where they are in plenty and do not run to a very great size. The larger fish are solitary, like all large fish, though, perhaps, in a more pronounced degree than many other species. Supposing them to be in greater numbers in our rivers and lakes, I am inclined to think that many a glorious carp-fight would enhance the day's chub, barbel, or roach fishing. These remarks apply, in great part, also to tench, the procuring of which fish is quite easily accomplished. At that season, when the wheat blossoms, they abandon themselves to the reproductive instinct, and become so tame as to not even flinch or flee away from the naked hand. In fact, it is only necessary to pick them out of the weeds with the landing net by pairs.

Dace most certainly should be cultured, and the size, if possible, improved by judicious selection of the fittest. Really, I don't see why, if the poultry and pigeon fancier can, by availing himself of this simple procedure, produce improved varieties, the fish fancier should not do something similar. I had a dace sent me the other day from the canal the other side of Watford, which was 17 ounces in weight, and anybody who has taken a large dace can testify to the manner in which such a fish on fine tackle would fight. Besides, I think that this fish is very toothsome, if properly cooked, and as there are many rivers almost entirely without it, its increase is to be desired. The Thames, in its upper portions, might be somewhat improved by additions; anyhow, there is no difficulty of an influential character in dace-culture.

One word at this juncture may be said about the reputed double spawning of dace. It seems clear that dace have been found lately full of spawn, I presume, in an advanced state of development. Supposing that this new-known fact in natural history is admitted, I think it does not prove that dace spawn twice as a rule, or that these particular fish are not very early spawners of last year, and consequently of this, owing to some peculiarity of temperature or habitat. And was the spawn so far advanced in development as to warrant the idea that the exudation would be before early spring? It must be borne in mind that the ova of dace is comparatively large, and that it begins to show in the fish almost immediately after the spawning has taken place, in fact; in some instances, there is a slight development of the ovary, which indicates that at the time when ripe spawn has become disintegrated and loose in the membrane, other spawn is being formed, though, as yet, it is of a minute, almost microscopical size. All the cyprinidæ will occasionally spawn more than once, stimulated by warmth; but I repeat my belief that dace do not, as a rule, head up for spawning twice in any one year, and that the statement that they do is erroneous.

In the scheme of coarse-fish culture, which will be proposed at any meeting called on the subject, I should be sorry to see the little *bonne bouche* of fishes, the gudgeon, omitted. The improvement of its size might seriously be considered, and, indeed, its

general culture, inasmuch as I am of opinion that this fish will be found the most fattening of all food for pike and perch—of course, when the gudgeons are small. I don't, however, expect that the artificial taking of spawn can be made successful in this case, unless at the expense of the parents' lives. Proper spawning ponds, of right soil and depths, might be formed, however; and if the sizes were carefully selected and isolated, each swarm by itself, I cannot but think that improved gudgeons would result. I mention this idea as much in the interests of the gastronomist as the angler, for if a society give place to the latter, I hold that it certainly ought to the former.

If it is decided not to go in for the artificial manipulation of coarse fishes, then the association could do incalculable service in rearing fish, and protecting them from their enemies. Any one who has seen the myriads of tiny fry swarming on the shallows of the Thames and its moderate depths, will acknowledge that did one hundredth part of these reach maturity, no coarse-fish culture or close seasons would be necessary to maintain the stock. On bright sunny June mornings they are most plentiful, and a properly constructed net might enclose thousands, which could be returned to the river in the following year, able to take care of themselves.

The question as to the most desirable fishes for the stocking of a water which, to all intents and purposes, is depopulated, is, of course, largely dependent for answer on a variety of considerations connected with the nature of the water itself. Supposing, however, it is, say half a mile long, forty yards across, and moderately deep, with here and there shallows of gravel and quiet deeps, and beds of rushes, whilst its stream, let us say, is three miles an hour, my advice in such a case would be stock it with perch largely, small jack, largish roach, tench, and carp, with a good quantity of minnows and gudgeon. I would introduce the fish in the following proportions:—Perch as 20, jack as 1, roach as 20, tench as 10, carp as 5, and I am assured such proportions would prove, in the end, capitally balanced and productive of sport.

In concluding this necessarily sketchy article, I again urge on all who read the GAZETTE, to aid in the formation of such a society as that suggested by Mr. Marston. The old "acclimatization society" dropped through, but there is no reason why American fishes should not be acquired, as in the case of the Marquis of Exeter, at Burghley, when the funds permit; but at present, *ne sutor ultra crepidam*—let us stick to the fish we have, rather than encounter the enormous difficulties and expense of acclimatization.

[Dr. Haaek and other continental pisciculturists have proved that although it is quite possible to breed the summer-spawning fish artificially in the same manner as with salmonidæ, yet it is an utterly wrong plan to go upon; indeed, if we had not found out this important fact, we should never have proposed the scheme, as the expenses attending apparatus, buildings, &c., would have been too great. We propose simply to aid Nature by protecting the ova and fry in a special but very simple manner, which we shall describe fully as soon as we have got all details worked out.—ED.]

RETROSPECTIVE OBSERVATIONS.

THE NORWICH EXHIBITION.

THERE can be no doubt that one of the greatest events in the angling world during the closing year, has been the National Fisheries Exhibition at Norwich, which was most successfully carried out under the auspices of their Royal Highnesses the Prince and Princess of Wales, the presidency and influence of Mr. Edward Birkbeck, M.P., and the indefatigable services of Mr. W. Oldham Chambers as its Honorary Secretary. The metropolitan contingent represented in the exhibition earned some of the greatest laurels, and possess lasting trophies of their success, not only in the collections of fish specimens, fish paintings, fishing tackle and materials, but in modern inventions and appliances.

INTERNATIONAL EXHIBITION OF 1883.

Although this is not one of the events of the past year, its institution must ever be regarded as being connected with it, and its origin as having arisen from the very great success of the Norwich Exhibition of 1881. The immense amount of support and patronage its promoters have already obtained from all parts of the world, strikingly indicates what the great result will be when the exhibition takes place. There are those connected with it in our great metropolis who are already working hard in the Committee and Sub-Committee to make it thoroughly practicable in its operation, not merely confining their work to the exhibition of angling implements, but of acquiring practical information connected with our fisheries. The recognition which has been

accorded to the movement by the Fishmongers' Company, is worthy of all praise, and, in the position of Honorary Secretary, we have Mr. H. W. Towse, who has already shown that he is fully equal to the important work to be done.

ANGLING TOURNAMENT.

The inauguration of an angling tournament is altogether due to Mr. R. B. Marston, and forms and important feature in the items of 1881. In spite of an unusually wet day when it took place, it was, in its initiation, an undoubted success, and all were satisfied with the practical value attached to it. A general wish has been expressed to make these tournaments at least of an annual character; and it has been also suggested to have one during the close season, in the place of the fish exhibition, and another, in the angling season, on the water. One thing is certain, the late tournament has received so general an approval, and Mr. Marston's idea has been so universally accepted, these displays of "the science of angling," will not be henceforth limited to London, but will doubtless be extended to Sheffield, Nottingham, and other great angling districts.

PROPAGATION OF COARSE FISH.

This is another idea of Mr. R. B. Marston's in the year of grace one thousand eight hundred and eighty one; and, although no decided action has as yet been taken upon it, opinions have been so favourably expressed, that when the proposed meeting takes place, it will soon come into practical operation, and neither money or personal assistance should be wanting to make it not only a local but a national movement. Every one admits the necessity of coarse-fish propagation, and the results, when fruits begin to show, will evidence the undoubted value of it. When it is done it must be well done, and all must help to do it. There are many places that could be pointed out where a further introduction of coarse fish in them would give increased facilities to fish for the great multitude of London anglers. The idea must not die out with the dying year, neither will it, because there are plenty of willing hearts and working hands to give it life and vigour.

THAMES ANGLING.

It has been a great event in 1881, to find the attachment of the Prince of Wales to the protection and preservation of the Thames Fishery, by His Royal Highness becoming patron of the Thames Angling Preservation Society, and it will without doubt give strength and influence to its operations. Not only in connection with this Society has royal patronage been accorded, but in the one at Windsor, Her Majesty the Queen and His Royal Highness Prince Christian are patrons of it; and His Serene Highness the Duke of Teck is patron of the Richmond Piscatorial Society, the success of which in the last twelve months, under its present Chairman, Mr. F. C. Clench, has been strikingly manifest.

RIPARIAN RIGHTS.

The establishment of a Thames Rights Defence Association, is another important item in the expiring year; and although no great step has as yet been taken, there is every prospect its activity will soon be required in testing the so-called rights of private fishing. What the angling public has to do now is to respond liberally to the appeal for funds which is being made by Mr. W. Crump and Mr. Francis, and to which reference is made in the advertising columns in the FISHING GAZETTE. The anglers must give liberally and give at once. A pressing appeal has been made by Mr. Francis Francis, the pioneer of the movement; and, let those who can afford it give him an early and favourable response. Let the Association which has begun in 1881 be found of great value and success in the coming year.

IN MEMORIAM.

It is impossible to close these retrospective observations, without expressions of deep regret at the deaths of Mr. H. L. Rolfe, "the scaley painter," and Mr. S. H. Leach, the Thames Conservancy Engineer. The former, as all anglers know, was great in piscatorial fame as well as in the painting of fish. He was a liberal supporter of anything connected with angling, and no one's death could be regretted more than his. As regards the latter, few, perhaps, are aware of the valuable assistance he has rendered in Thames Preservation, and his readiness to help the President and Committee of the Thames Angling Preservation Society, on all occasions, in carrying out any desirable suggestions for the protection of the fishery; but there are lasting remembrances in the hearts and memories of those who have experienced and felt the real value of his eminent services.

THE END OF THE YEAR.

This week terminates another year, and the next will open out another year, it is hoped for continued usefulness and

success in all that relates to angling. The work which has already begun in 1881, requires energy and perseverance in 1882. The great principle to be recommended is "unity." These "Retrospective Observations" terminate in heartily and sincerely wishing to all, when it comes, a very happy and prosperous New Year. B.

MR. R. D. BLACKMORE AS A WRITER ON ANGLING.

IN our notice of Mr. Colquhoun's work, "The Moor and the Loch," last week, we said that if any of our subscribers were looking out for something to read these long winter evenings we could strongly recommend Mr. Blackmore's novels, especially as in most of them angling plays a not unimportant part. Mr. Blackmore is undoubtedly the most powerful and fascinating writer of fiction alive, either in this or in any other country, and it is a pleasing thing to find that not a few of his best characters are anglers. We shall never forget the intense interest with which we listened to the reading of "Lorna Doone" from the original manuscript, and before that splendid work had taken the literary world by storm. In these days of trashy novels of mushroom growth and toadstool qualities, to ask anyone if they have read such and such a novel is almost an insult, and in most cases elicits the reply: "I never read novels." But "Lorna Doone," "Alice Lorraine," "Mary Anerley," "Christowell," &c., by R. D. Blackmore, are not novels in the ordinary sense of the word; and we cannot trust ourselves to say in praise of them all we should like to say, for fear that we should, by over-doing it, defeat our object, which is to send our readers to the works themselves, in order that they may enjoy the glorious entertainment. Such a work as "Lorna Doone" is one of the highest achievements of which the human mind is capable; in proof of this it is only necessary to glance at the immense number of human beings—the flower of our modern civilisation—who have striven, and who are striving to make their mark on the age through the avenues of literature. How few make even the slightest impression! and how very few attain such a rank as is held by the author of "Lorna Doone"? As popular in America as here, translated and re-published on the Continent, it is not too much to say that no novel of the last ten years has found so many readers as this charming "Romance of Exmoor."

To describe why Mr. Blackmore's novels are so popular would require the space of a volume. We must content ourselves with giving a few reasons; and that they are so popular is to us a very cheerful omen in these "sensational novel" days.

First, then, our author is a man of sound learning, well acquainted with all those great studies of mankind and nature which make up the sum of literature old or new; his is no mere smattering of knowledge acquired only to be paraded, in season and out of season, like a child's new toy. This is one great reason for the high quality of Mr. Blackmore's writing; another more potent element still is his complete knowledge of and mastery over his own language. He is never at a loss for words, let the occasion be what it may; in this respect, no living novelist approaches him.

Then, as to style, Mr. Blackmore has a style of his own, as uncommon, and yet as pleasing, as his matter. But, above all this, is the deep human interest, the fertile imagination, the knowledge and love of nature, with which he fills his pages, enriched with quaint allusion, genial satire, and fine humour. For "quiet, contemplative men," like anglers, we know no books more likely to be deeply appreciated than Mr. Blackmore's. We will give a few extracts from them, just to show the angling interest, and what wealth of freshness and refreshing air, there is about them. To those who do not know the stories, half the interest of these extracts will be lost for want of knowing what has gone before. We should like to quote the description of John Ridd's immortal battle with Robert Snell, but space forbids, so we will introduce him, and let him tell his own tale of how he went loach-sticking in the wild Doone glen, in North Devon, two hundred years ago.

JOHN RIDD RESOLVES TO CATCH SOME LOACHES.

(From "Lorna Doone," p. 38).

"Almost everybody knows, in our part of the world at least, how pleasant and soft the fall of the land is round about Plover's Barrows farm. All above it is strong dark mountain, spread with heath, and desolate, but near our house the valleys cove, and open warmth and shelter. Here are trees, and bright green grass, and orchards full of contentment, and a man may scarce espy the brook, although he hears it everywhere. And, indeed a stout good piece of it comes through our farm-yard, and swells sometimes to a rush of waves, when the clouds are on the hill-tops. But all below, where the valley

bends, and the Lynn stream goes along with it, pretty meadows slope their breast, and the sun spreads on the water, and nearly all this is ours, till you come to Nicholas Snowe's land.*

But about two miles below our farm, the Bagworthy water runs into the Lynn, and makes a real river of it. . . . Now, although my sister Annie came to keep me company, and was not to be parted from me by the tricks of the Lynn stream, because I put her on my back and carried her across, whenever she could not leap it, or tuck up her things and take the stones; yet, so it happened, that neither of us had been up the Bagworthy water. We knew that it brought a good stream down, as full of fish as of pebbles; and we thought it must be very pretty to make a way where no way was, nor even a bullock came down to drink. But whether we were afraid or not, I am sure I cannot tell, because it is so long ago; but I think that had something to do with it. For Bagworthy water ran out of Doone Valley, a mile or so from the mouth of it.

But when I was turned fourteen years old, and put into good-small clothes, buckled at the knee, and strong blue worsted hosen, knitted by my mother, it happened to me, without choice, I may say, to explore the Bagworthy water. And it came about in this wise.

My mother had long been ailing, and not well able to eat much; and there is nothing that frightens us so much as for people to have no love of their victuals. Now I chanced to remember that once at the time of the holidays I had brought dear mother from Tiverton a jar of pickled loaches, caught by myself in the Lowman river, and baked in the kitchen oven, with vinegar, a few leaves of bay, and about a dozen pepper-corns, and mother had said that in all her life she had never tasted anything fit to be compared with them. Whether she said so good a thing out of compliment to my skill in catching the fish and cooking them, or whether she really meant it, is more than I can tell, though I quite believe the latter, and so would most people who tasted them; at any rate, I am now resolved to get some loaches for her, and do them in the self-same manner, just to make her eat a bit.

There are many people even now, who have not come to the right knowledge what a loach is, and where he lives, and how to catch and pickle him, and I will not tell them all about it, because, if I did, very likely there would be no loaches left ten or twenty years after the appearance of this book. A pickled minnow is very good, if you catch him in a stickle, with the scarlet fingers upon him; but I count him no more than the ropes in beer compared with a loach done properly.

Being resolved to catch some loaches, whatever trouble it cost me, I set forth without a word to any one, in the forenoon of St. Valentine's day, 1675-6, I think it must have been. Annie should not come with me, because the water was too cold; for the winter had been long, and snow lay here and there in patches in the hollow of the banks, like a lady's glove forgotten, and yet the spring was breaking forth as it always does in Devonshire, when the turn of the days is over, and though there was little to see of it the air was full of feeling.

It puzzles me now that I remember all those young impressions so, because I took no heed of them at the time whatever; and yet they come upon me bright, when nothing else is evident in the grey fog of experience. I am like an old man gazing at the outside of his spectacles, and seeing, as he rubs the dust, the image of his grandson playing at bo-peep with him.

But let me be of any age, I never could forget that day, and how bitter cold the water was; for I doffed my shoes and hose, and put them into a bag about my neck, and left my coat at home and tied my shirt-sleeves back to my shoulders. Then I took a three-pronged fork firmly bound to a rod with cord, and a piece of canvas kerchief with a lump of bread inside it, and so went into the pebbly water, trying to think how warm it was.

(To be continued.)

VIRTUE REWARDED.

I SUPPOSE, no one but myself was such an idiot as to go out fishing on Thursday, December 22. The Thames at least was in a furious and thick flood, and its tributaries might be expected to be much in the same condition. Moreover, a sharp frost had just set in, and the first day of severe cold is sure to prove a blank. When the frost has lasted some time it seems to sharpen the appetite of our quarry, and I have carried home a well filled creel after a day partly spent in picking the ice off the rings of the rod as often as the line froze on, so that spinning became quite impossible; but the first six hours I have generally observed to be unproductive. However, I had made my arrangements previously, and written to my friend's keeper to let me know if the water was out of order, and to provide an escort; and, as no letter came, I determined wilfully to carry out my programme. So, in spite of the incredulous questionings of my fellow travellers, undeterred by pitying shrugs, and overheard suggestions of the vicinity of Hanwell, I arrived at my destination, where of course there was no escort, as no one had supposed I could possibly come on such a morning. However, I was not to be beaten so I put my rod together, and began to try for perch in my

* A descendant of this gentleman, Mr. Snow, of Oare, very kindly gives anglers permission, when properly asked, to fish the Lynn stream where it runs through his land. But let no unwary angler ask him if he has ever read "Lorna Doone." Thousands of tourists all ask him this, and expect a glass of beer, or at least of milk, on the strength of it! —ED. F. G.

favourite mill pool. Of course it was no use, five minutes convinced me that my finny friends were "not at home to any one." Well, I said to myself, I will just give you two hours' fair chance; and if in that time you have no desire to ennoble your nature by migrating into human bodies, I will leave you to the sordid and low life you at present enjoy. Well, I tried every corner and eddy I could think of, well known and precious spots which had on days of better omen yielded their half-dozen or dozen golden beauties to my basket—in vain: only two, at the end of the appointed time, lay ridiculously mean-looking at the bottom of a twenty pound creel. "O misery," "deplorable," I fancied I heard echoed by the spirits of former victims. However, man must eat, whatever fishes choose to do; so I thought, I will just give you ten minutes more, while I eat my luncheon, and then I shall be off. So just to make everything fair, I put on a brace of fresh minnows, heaved the plummet into a likely spot, laid down the rod, and opened my sandwich tin. I was just taking my first bite, when I saw the line move, and instantly returning from "stand easy" to "attention" and "make ready," felt that something worth having was at the other end of my tackle. A hundred to one on the fish was my mental exclamation, when I realised that at least a ten-pounder was apparently going to amuse himself at my expense. I thought of my wife, as an elegant writer in the F.G. has advised, and "remembered that I am bound to her by a tender tie which a little overstraining may easily break." What chance of a single strand of fine gut holding my new acquaintance? "Oh that is your little game, is it?" I thought, as he ran straight for the roots of a willow bush. Oh, the delight of feeling that he had returned from thence unentangled. I really began to hope that acquaintance might ripen into friendship, as rush after rush was successfully turned, and his powers became gradually limited to the eight or ten yards square of water in front of me. At last he is fairly brought to the surface. Now, how can I get him out? I have but a small landing net with me, the depth of which is not half his length. I remember once before, on a similar occasion, I was alone in a light boat, and having fairly exhausted my fish by making him describe reversed figures of eight, when quite helpless, managed by working a scull with one hand while I held the rod with the other, to run the boat on shore, and land my twelve-pounder on a piece of grass which sloped into the flooded river; but here was no sloping grass, far from it, the bank was about two feet high, and a tree on each side confined me to a very few yards of bank. Have I got a piece of string in my pocket which I can pass round him? Alas, the only bit there, the sponger of my pipe, is too short. Shall I lie down flat on the bank and try to seize him by the tail? I cannot do it safely with one hand, and if I put down the rod he will be off. Nothing but to try the landing net. I passed it gently under his tail till that splendid fan was quite at the end. Utterly useless; he slipped out again like an eel. Obviously his centre of gravity is nearer the other end. I must try his head, spite of the danger of breaking the line. Four times did his head and shoulders enter the net, four times did his handsome form slither out free. All this time the rod was nearly vertical, and bent wellnigh double, the only possible way of keeping him within reach. At last, a most lucky stroke of the net, utterly inexplicable upon any principles of mechanics, laid him struggling on the grass. In the net was the minnow he had taken, still alive on the hook, the gut of which he had bitten through, but the hook of the second minnow had caught him outside of the tremendous palisade of his teeth, he weighed 15½ pounds. I had now the laugh on my side. C. C. J.

FISH-CULTURE AT HUDDERSFIELD.

MR. BYRAM LITTLEWOOD, of Huddersfield, to whom the Thames Angling Preservation Society were largely and opportunely indebted last year for the gift of 3500 fine healthy fry of trout and acclimatized char, for the rearing ponds of Sunbury, has been turning his attention to oyster-culture, with every prospect of the greatest success. In a letter which I received from him a few days since, he says, "I am perfectly satisfied of its practicability so as to hear no more about the scarcity of this highly valued bivalve." From what I know of Mr. Littlewood, his knowledge, energy, and undaunted perseverance, will bring to unmistakeable success anything he takes in hand; and, in reference to the culture of oysters, nothing will make him more popular than bringing that to a satisfactory result. The opinions which have already been expressed by the local press regard his success as a foregone conclusion, and this is speaking from practical experience and personal visits to his cellars, as they are termed, in Cecil Street, Huddersfield. Mr. Littlewood has for some years given his attention to oyster-culture; and one of the members of the T. A. P. S., who was at Huddersfield last year, told me,

the other day, that from what he had seen there was no doubt as to his being thoroughly successful. I hope shortly to have something more to say on this subject, but I think I have said enough now to make all lovers of oysters rejoice at a glorious prospect in an early future, and I hope Mr. Littlewood's efforts will be warmly appreciated. In reference to fish-culture, Mr. Littlewood says, "I am this season going into fishing matters in a large way; at least I intend to produce two millions of Salmonidæ of all its various kinds, including grayling. I am having some *Trutta Lacustris*, which is a kind of trout that often attains the enormous weight of 36 lb. I have some Windermere and Alpine char ova and also *Salmo Fontinalis* going on most satisfactorily, in addition to a quarter of a million of Loch Leven trout, besides a large quantity of common brook trout." It is the intention of Mr. Littlewood to sell the young fry, but only to recoup him for all outlay. It will be remembered as to his gift to the Thames last year how well the youngsters travelled from Huddersfield to King's Cross, and from King's Cross to Sunbury—there was scarcely any loss—the fry was so perfectly healthy and well developed. In their transit on the Great Northern Railway every attention was paid by the officials, the management of this line being so perfect in every department; and my long experience gives me power to speak on the general courtesy of its servants. Mr. Littlewood has most generously promised to contribute to the Thames, through Mr. Thomas Spreckley, during the year 1882 one thousand more young fry. It was a fortunate visit of Mr. Spreckley to the Norwich Exhibition in making the acquaintance of Mr. Littlewood, whose generosity and kindness will be long remembered by the anglers of the Thames; and I shall not only regard him as one of our great benefactors, but I shall ever value his services and friendship as of one who is entitled to my highest esteem and respect. B.

[Oyster-culture has long been an accomplished fact in France.—ED.]

TEN THOUSAND YOUNG CARP FOR SALE—COARSE-FISH CULTURE.

IF any of our readers wish to get carp for stocking ponds they may be glad to know that Mr. Materne, fish-breeder, of Saarlouis, in Lothringen, Germany, is advertising that he can supply ten thousand carp fry, and large carp also, if required. We can always supply our readers with the addresses of German fish-breeders who sell gold-fish of various kinds, carp, &c., for stocking purposes. Every mail from the United States brings us accounts of the wonderful success which has attended the cultivation of carp in America. The fish are bred from fish carried over from Germany, and reared and distributed by that grand institution the American Fish Commission, supported by the State, and conducted by such talented and practical men as Professor Baird, Livingstone Stone, G. Mather, Seth Green, and others. As our Government has always too much to do to help us in a similar matter, we must help ourselves, and we are happy to say that the support our scheme of coarse-fish culture is receiving on all sides is most encouraging.

The popular idea that anglers are a united body is a perfect delusion. The amount of jealousy and downright enmity which we have met with between associations, and clubs, and individual anglers, and fishing-tackle makers, is astounding; and would be ridiculous if it were not so lamentable and discouraging.

It is discouraging in this way: you go to a well-known angler, or tackle-maker, or club, and ask for support for some deserving scheme; everything goes on swimmingly, and you begin to hope your time and trouble will not be thrown away, when everything is upset suddenly, perhaps because some name has been mentioned. "Oh! if Mr. Snooks is going to have anything to do with it, I shall certainly not support the affair." Argument with such a man is thrown away, and you leave him with your feeling of wonder that so many promising schemes come to nothing considerably blunted. We do hope that all anglers, and all clubs, and all associations, will sink their differences—generally arising out of the veriest trifles—and join in supporting the proposed scheme for breeding fish to re-stock our depopulated waters. It is not a scheme for the benefit of a few individuals, or a few clubs, or a few waters. You are not asked to subscribe to the improvement of the fishing in a river you never fish. The benefit is open to all who care to assist. Again, it is not a scheme for the benefit of future generations of anglers, though they will thank us for it; it is to increase our own sport. We predict that in a few years' time thousands of acres of water which are now utterly useless, from an angler's point of view, will be teeming with fine fish of all kinds. The extent of this greatly to be desired improvement depends entirely on the amount of support accorded by anglers to the movement now starting. Every angler should assist.

RIVER REPORTS.

MID-THAMES.

"I in those flowery meads would be:
Those crystal streams should solace me."

—IZAACK WALTON.

The flowery meads just now on ye banks of Old Father Thames have been turned into mud gardens in consequence of the recent floods, and the crystal stream is certainly not one all clear glass just now—and all the better for roach, perch and chub anglers, for the fish are just beginning to flash their muddy eyes open after the recent heavy push of water. Within the last few days, grand catches of roach have been had; perch and jack have also been on the feed; and, without rain between now (Thursday) and Saturday, the river will be in prime winter all-round fishing trim. For roach, I would advise worm-fishing; for chub, pith and brain work; for jack, live bait or paternoster; and for perch, minnow or red worm. At Hurley, Messrs. Smith, Harrison, Tree, and Lumley have been doing excellent work daily, fishing from the Treats, the Bell, and at Marlow, decent catches have since yesterday been had.

THURSDAY EVENING.—River fining down nicely, and all fish reported as on the move. Shaw, jun., of Marlow, this morning was broken away with a "smeller" of a jack, after a few minutes' fishing—so this will show the fish can see. Roach, I know, are on.—MARLOW BUZZ.

Thames (Goring).

Water in good order for all-round fishing, in good order for jack and perch. Out to-day (Thursday); took some good roach.—JOHN RUSH.

Thames (Richmond).

The river has now got to a nice height and a splendid colour for roach, dace, and bream-fishing, and there should be, in the course of the week, some good baskets had, as I anticipated last week there would. There was some fishing on Monday, when there was some very fair takes of fish, principally dace, which ran a very good size. The roach not feeding much the punts had between them some half-dozen bream which was in fine condition.—J. BUSHNELL.

Thames (Twickenham).

I am pleased to say the water is falling fast, and the river is once again fishable. We have made a commencement this day, Thursday, and have got about six to eight dozen in each punt, and every day I hope it will improve, which we may expect, if the weather holds up fine. I was sorry to have to send several customers away during the Christmas holidays, but it was impossible to have got any fish the state the river was in, but we shall now be pleased to see them at their earliest convenience, and can promise them a good day amongst the roach. To show the dangerous state of the river, as I mentioned last week, there has been a brewer's horse and van, &c., lost at Teddington Weir, through the last heavy fog. The man lost his way, and the whole fell into the river at the celebrated one tree near Kingston. Fortunately the man was leading the horse and was saved from a watery grave. I believe the value of the whole exceeds £150, and attempts are to be made to-morrow to get it out.—A. PERRIN.

Thames (Walton).

Falling rapidly and every prospect of its still doing so. Much clearer than it was, but not at present in good form for any fishing. If the weather continues there will, I think, be better prospects at the end of the week. The weather is fine, with light frost, but milder towards mid-day. Wind very slight, and towards south-west. Nothing of any sort done. Two gentlemen down yesterday trying for jack, but never had a bite. None of the fishermen have been out. No anglers about anywhere. Large quantities of plover in flocks about, and wild duck and snipe shot on Sunday and Monday. Much more show with the gun than the rod just at present.—HENRY E. WOOD.

Ancholme.

Owing to the prevalence of Christmas festivities, but few anglers have visited the water side, and the catches, so far as reported, have been very light. At the end of last week the waters were bound by frost, and juveniles were indulging in the hope that we should have some rare sport on the ice during the holidays, but on Saturday evening a change set in, and by Monday morning most of the ice was gone, and the trouts in my breeding ponds were rising quite freely at the flies which were dancing in the bright sunshine. The weather is now delightful again, and the waters all that can be desired, so I strongly advise those who like winter fishing to turn out and catch fishes whilst the sun shines.—THOMAS FORD.

Dove.

The Dove has been much discoloured this week. A few takes are reported with the worm amongst the barbel below Rochester, one bag scaling 12½ lb. Pike have not been running at all satisfactorily during the recent frosts, but this may be owing to the thick state of the water. A small fish of 5½ lb. was taken above Uttoxeter on Monday with the Gregory bait. We are glad to be able to state that measures are being undertaken with a view to the better preservation of the fish upon several hitherto totally unprotected lengths of this the classic stream of the fly-fisher. A large number of piles are being made for insertion at stipulated points in the river.—THE SPODGER.

Ilfracombe (N. Devon).

Our herring fishing season is almost over, one boat only has their nets in; they have had two short drifts this week and caught about 500 herrings; big fish are more plentiful than they have been for some weeks. Four large skate were brought in on Tuesday, two weighing about 200lb. each, some fine conger also have been caught, averaging from 14lb. to 25lb. each, several cod in prime condition have been taken by the fishermen, average weight 16lb. to 20lb., and a few ling. This morning P. Redmore brought in from his spiller 125lb. of conger, one cod 17lb., one ling 16lb. Fishermen bait and set their spillers just off the harbour, they haul them twice a day and get a quantity of fish, sometimes there have been a few conger and ling caught from the jetty with hand lines. Weather at present very mild, with good prospects for the next few days.—E. COMER.

Medway (Tonbridge).

The fine weather of the past week has fined the water down beautifully, and it is now just the thing for all kinds of angling. Jack will be in the feed, and there will be a chance for those who have sufficient patience to stick to it to get some roach with a tight ledger. Mr. R. A. Dallas, Beeching, caught a good perch near the Barden Railway Bridge during the week. I hope by next week to have some catches to report.—YE MEDWAY WATER RAT.

Ouse (Littleport).

Water running off nicely, and of a good colour. Will be several days though before it is fairly fishable, as we cannot get near the flats by ten or twelve yards at present. I had three anglers down on 27th, but only one did any good. Mr. Henry Lee, Cambridge, an old angler on the water, got a score of roach, bream, and dace by very long casting in Nottingham style.—CHARLES LOUGH.

Trent (Newark).

During the latter part of last week the weather was very frosty, and I supposed the rod would be laid aside in favour of the skates, but on Sunday a change came o'er the spirit of the dream, for it rained for several hours, and since the weather has been all that could be desired by the angler. But the water has only been in middling trim, it has not yet fined down from the last very heavy flood, and in consequence the sport has only been of a very indifferent character during the holidays. I have been at the Witham this last day or two, and the only sport I had was a couple of small chub, four dace, and about two dozen fine roach. I have not seen or heard of a good bag being made this Christmas, the majority of the catches being only very moderate. The event of the week (down here), from a piscatorial point of view, was the capture of five barbel with rod and line, about three pounds apiece, out of the waters of the Newark and Muskham Fishery last Tuesday, R. Chilton being the lucky angler, and worms being the bait. I found the little red worm to be the best bait by far in the Witham this week, and I believe they have been the most successful in the Trent. At the time of writing, Thursday, the Trent is fining down very nicely, and if the present condition of things should continue, the water will be in condition in another day or two.—THE TRENT OTTER.

Wye and Derwent (Derbyshire).

We had a large flood come down the Derwent last Monday morning from the great quantity of rain which fell up in the woodlands. This rise has done a very great deal of good, for it has taken the snow broth water out of the Derwent, and has caused the coarse fish to feed freely at lobs, maggots, and small branding worms. The grayling have fed but very middling at either the top or bottom during the past week, owing to the mildness of the weather. In fact, all the week, the sun has shone beautifully, and the days have been quite warm, not at all like Christmas weather; and while this open weather continues, we shall have very little sport amongst the grayling. What is wanted is some good sharp frosts. Then, no doubt, there would be some first-class grayling fishing on both rivers. Natural flies have been out very abundantly on both rivers, from one to three, viz., long, flat-winged browns, old blue dun, and small iron blue dun. There have been a few small-sized pike killed in the Cromford Canal with small dace for baits, both by using the natural live bait and by trolling.—GEORGE JAMES EATON.

Starkholmes, Matlock Bath.

Yore (Yorkshire).

I have sent no report on this river for the last fortnight, for the simple reason that there has been nothing taking place worthy of notice, and I regret to say that this week has also proved a blank one for grayling fishermen. I went down to Ripon on Monday for a day's fishing, but found the Yore a perfect torrent, overflowing the banks in many places, and rendered angling of any kind wholly impracticable; the weather is singularly mild for the time of year, reminding one more of April than Christmas. So ends the season of 1881, and, so far as my experience goes, it has been a very successful one, especially as regards grayling fishing. It is many a long year since my angling diary has recorded so many red-letter days in this class of fishing as it has done this season. In conclusion, allow me to express a wish that all "honest anglers" have experienced a right merry Christmas, and here's success to the coming season, and a "Happy New Year" to every one.—FRANCIS M. WALBRAN.

GREGORY'S SPINNING BAITS. "The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Alcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout FLIES which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

THE DAY BEFORE CHRISTMAS DAY.

THE day, as it opened, was bright, beautiful and crisp in the suburbs of the metropolis, and highly suggestive of a nice long stroll in the heart of the country, with a good and comfortable hostelry at the end of it, or the house of a friend, whose well experienced hospitality would vision up to one's imagination something truly acceptable to satisfy the cravings of a well-prepared natural appetite, not of a visionary, but of a substantially real character. Christmas-time, and especially Boxing-day, is often regarded as an appropriate period to enjoy a good constitutional walk in the country; and to those who are literally and mentally engaged all the week, and frequently have their brains at work on the other day, the Bank Holiday which follows Christmas Day appears singularly suitable to them for a real day of rest from mental occupation. It was the day before Christmas Day that I left home early in the morning by train, and my thoughts lay more in the direction of piscatorial matters as connected with the Christmas holidays. I was going in the direction of Staines, and I took up a sporting paper to see the Friday's telegrams, and found, under the head of Staines, that "the water is now lower, and should the frost not come too severe there will be plenty of quiet corners for jack and perch fishing by the beginning of the week." This was, to say the least of it, encouraging, as regards the prospects of angling on Bank Holiday; but when I got to Staines, I found the river completely flooded, not only the meadows and towing-path submerged in water, but the roadway in front of those charming villas near to the railway bridge completely under water, extending almost to the comfortable hostelry of the Pack Horse, where the piscatorial host knows how to cater for the anglers. The water was of a fearfully dirty colour, if anything worse in appearance than the oft-repeated description of pea-soup. The back premises of the hotel was held in water, and to me the prospects of jack and perch fishing on Boxing-day had no possibility of realisation. The river looked as though it wanted a week, at least, to put it right, without any drawback whatever. The fishermen possessed no encouraging hopes—ready to obey orders, but with no recommendation of results. "It is very bad for us at these times, sir, when we want to earn a bit of money, and no chance of doing it," was rather depressing to one's feelings to hear, and that without the power of making any alteration in the aspect of affairs. What could I do? To wish them a merry Christmas when they had nothing to make themselves merry with, would have been a heartless mockery. I could only take them to some neighbouring hostelry and give them a drink, and hope for early better days. I generally leave them cheerful, however short that cheerfulness may last, for I find the fisherman as a rule enjoy a good joke, and like to hear some of those racy speeches which are usually credited to the members of the London Stock Exchange. Well, it is no use making life miserable, and if the prospects of river employment somewhat saddened the countenances of some of the professional fishermen, a bright and genial display of humour cheers them up and sends them on their way rejoicing. I left Staines and took train, by way of Virginia Water, to Chertsey, having to wait at the first of these places for half an hour before the Chertsey train would start; but, thanks to the very courteous station agent, Mr. Wilman, at Virginia Water, I am always privileged to remain in his office until the time is up. I then hear of the character of fishing at Virginia Water, which is never of an attractive character. At Chertsey there was the same story as at Staines—the fishermen in a similar mood, and the prospects of fishing not very bright. I had now seen and heard enough to satisfy me it would be a miracle if there was any jack and perch fishing on Boxing-day; but changes come sometimes quicker than expected, and should there be any captures of those fish on that day I shall be truly glad to hear it, and pleased to find my opinion, and the opinion of others, has been wrong. I was gratified to learn at Chertsey that the well-known fisherman, James Haslett, had piloted one of his clients to the capture of a monster pike. I terminated my visit with a call upon Mr. James Forbes, but I had not time to look at the fish-house. I have reserved that for another occasion, when I hope Mr. R. B. Marston will accompany me, as I am assured by Mr. Forbes he would be very glad to see him.

B.

NOTES ON GERMAN FISHING-TACKLE.

IN the *Deutsche Fischerei Zeitung* of December 20, we notice an article by Mr. Christensen on the rods and tackle sold by Mr. Hermann Stork, of Ulm; one or two of the things described will interest our readers. Mr. C. regrets that he has been unable to test the sixteen various artificial pike and perch baits which Mr. S. has sent him, as, on the two days when he was out for the purpose, neither he nor his attendant, who fished with natural baits, had any sport; but he can state that the baits spin very well.

He advises anglers to dry their lines well, and to remember that though a line may to all appearances be dry, it may still be quite damp in the centre, and if put away in this state will rot.

He describes with great praise a "Bell apparatus for jack-fishing." This invention of Mr. Stork consists of a short rod (only about a yard in length) with a spike and winch at one end and a little bell at the other; the spike is stuck in the ground, the line thrown out and hitched to the bell. "Extremely comfortable must it be," says Mr. C., "after setting the line to retire to some shady place, perhaps provided with a hammock, light a cigar, peruse the newest novel and wait for the tinkle of the bell which indicates a run." Who will say after this that our German friends have not reduced angling to a science! But *chacun à son gout*.

A capital bait net is next described, it is such a simple and effective affair that we hope some English fishing-tackle maker will adopt the idea and make it for this market. The net is a small mesh four-sided silk one, each side being about two yards long, it is expanded by means of four hazel rods in their natural bark (the net being green and the wood a dark natural colour, the affair is not likely to frighten fish); the ends of the hazel rods are fixed in a lead weight which has short arms—fixed cross wise—like ferrules, and are held in place by the net being stretched from each corner to the points of the rods. To get the net ready you have only to put the rods in the holes of the lead cross, hitch the loop at one corner of the net on to one end of the projecting rod, and then the rest in the same way; a cord is then fastened to the lead, and after putting in a little bread paste or bait of some kind, the net is sunk in some place frequented by minnows and small fry, and by means of any strong stick attached to the cord can be rapidly drawn up when there are fish over the net. When done with, the whole affair can be taken to pieces in a minute or two, and rolled up together so as to occupy little more space than a closed umbrella. Mr. Christensen says he finds this net so extremely useful that he never thinks of going fishing without it, and by its means he can ensure getting all live-bait he wants in a very short time.

MR. GREGORY'S NOVELTIES IN FISHING
BAITS, &c.

MR. GREGORY, of Vyse Street, Birmingham, is acknowledged to be the best maker of artificial metal baits for pike, perch, &c. He has created quite a revolution in this matter, and few anglers nowadays consider their equipment for a day's pike-fishing is complete without one or two of Gregory's artificials. Mr. G. has just sent us a sample of a metal spinning bait which he has made for us, and which, we think, will be found very killing and vastly superior to the old gutta-percha baits. It is simply a beautifully made metal fish, which revolves on a strong brass wire, the spin is obtained by a curve in the tail. In the sample sent us the tail is not quite right, it is too large and is forked. We have told Mr. G. to omit the fork, which is only a waste of power, and make a broad salmon tail. The hooks are double triangle at the tail and a single triangle at the head, the hooks are fastened to the wire and not to the bait; it is a great mistake to solder hooks on to a bait of this kind. They describe a large circle in the water, prevent the bait spinning properly and frighten the fish. The lower triangle has a red wool tassel on it; this is a most attractive feature in all pike baits, and gives the appearance of a broken or injured fish—the pike likes to take advantage of a crippled fish; in fact, anything red seems to enrage him as it does a bull.

Mr. Gregory has also recently brought out a metal cap for floats, which will have a large sale, and is not more expensive than the ordinary quill cap which is always splitting. He has also brought out an expanding metal ring for holding the winch to the rod; it will be very useful as a makeshift or for cheap rods.

ANGLING.

ABOUT two years since an angling association was formed in connection with the establishment of Messrs. Sutton and Sons, the Queen's seedsmen, Reading; and from the report read by the secretary, Mr. F. Squire, at the second annual meeting, held on Tuesday, December 20th, it appears the association is now in a very flourishing condition. There are about seventy members—all employés of the firm; and during the past season a very interesting competition has taken place, resulting in the capture of some exceedingly fine specimens of pike, perch, roach, barbel and chub. The prizes, amounting in value to nearly £11, were distributed at the annual meeting by Mr. A. W. Sutton. In almost every case they were awarded for single specimens. The total weight of fish entered for competition was 14 cwt.

NOTICES OF BOOKS, &c.

A CAPITAL BOOK ON SKATING.

A HANDBOOK OF FEN SKATING. By Neville Goodman, M.A., and Albert Goodman. With a Map of the Fen District and many Illustrations. London: Sampson Low, Marston, Searle and Rivington, 188, Fleet Street.

THIS is really a first-rate little work; thoroughly practical, complete, and yet chatty and interesting as well. The appendix, B, is a list of the principal Fen rivers and drains, for the use of skaters, but which cannot fail to be very valuable also to anglers; though, in a future edition, we think that the authors should give the names of the various inns on the streams, as both skaters and anglers want refreshment. The kind of skating most in vogue in the Fen district is rapid, straightforward progression; and, in our opinion, this is much the best form of skating. Figure skating is to Fen-skating what waltzing is to a dashing ride across country. The illustrations show clearly all that can be shown by illustrations. We can strongly recommend the book, which is quite new.

"THE K'RECT CARD."

Lines written on seeing a certain Christmas Card published by Messrs. De La Rue and Co.

Lo! where—summer-skies permitting—
That sweet, nudish nymph is sitting
By those waters fair—
Castalie? May be. I know not.
Classic, though. Ah! see her show what
She has caught! I swear,

O ye gods and little fishes!
'Tis a perch! Perhaps she wishes
'Twere a lusty trout,
Or a grayling; yet the merry,
Pretty, saucy minx seems very
Pleased to pull him out.

Or think you it's a red-mullet?
With her sharp hook in his gullet,
And his gasping jaws,
And wild eyes for death out-looking
Ere—*vœ victis*—she, un-hooking,
Baskets him, because

Fish must—after dingling-dangling—
Die when expert nymphs go angling,
Whereso'er that be
On this earth—of old called *tellus*,
Ancient Rome, more ancient Hellas,
Fabled Arcadie.

"Nymph, are you not Oriana,
Of the young guard of Diana?
Don't you love the sport!
Still the doomed one cease from showing
How to Orcus he is going!
Cut the fatal short!

"Fairest Pink of pure Perfection,
Have a little recollection!
Think of all his pangs!
Look! yon waterlily's pleading,
By its blushing, for the bleeding,
Hapless wretch that hangs.

"Mercy, then, Olympian maiden!
So your creel more heavy-laden
Evermore shall grow;
For if cruelty's amusing,
Yet the time you thus are losing
Lessens sport, you know.

"Come! wake-up my dreaming beauty!
Give the *coup de grace*! Your duty
Turn again and do—
With that rod of yours! Stick to it
Till A GOOD ROUND HUNDRED rue it,

EIGHTEEN
EIGHTYTWO!"

A.R.I.E.L.

London, Dec. 30th, 1881.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

CLEARING THE ROAD FOR THE NEW YEAR.

BY A THAMES FISHERMAN.

SIR,—I hereby duly warn you, and all intending readers of this letter, that it contains little or no information which will assist in the following of the sport which, as true anglers, we are all prepared to swear by. Yet I hope you and they will honour me by wading through to the end, when possibly some of you may say, It's not all bosh, not all "queer complaints," and not altogether uncalled for; at any rate, I feel I am clearing the road for the New Year, so far as my humble pen is concerned.

I promise to make amends in the future for this imposition on your kindness. I will write you of many and many a good swim for each species of fish, and how, when, and with what tackle and bait, you should try your luck in each. I ask you in return—you must perforce grant my request, as my scribbings will compel you—to remember that I am a novice amidst pens, ink, and paper.

The first impediment to future progress is, undoubtedly, the letter from Mr. J. Harrington Keene, in which he says, "I think I can afford to pass over the gratuitous sneers of an anonymous correspondent, whom I neither intentionally misquoted or sneered at." I hold strong notions, Mr. Editor, in respect to anonymous writers; and, while admitting that we are indebted to them for much valuable information, for the bringing to light of many cruel abuses, and for enlivening our dull lives with a flow of wit and humour which would never be ours but for them; yet we can better afford to dispense with this class of writer rather than permit them to don a cloak for the purpose of attacking, either by sneer or innuendo, the character of any individual. Indeed, I go so far as to say, that where the anonymous writer is attacked, he must act only on the defensive, and with such circumspection as the great advantage of his position should dictate to him as fair and manly. By these notions I would judge others; therefore, in common fairness, I must stand or fall by them myself. I have re-read my letter, J. H. K.'s remarks thereon, and my reply thereto, and now his disclaimer of any intention to misquote or sneer—this leaves me no other course but to say, I am in the wrong; I have sneered and inferred, and therein exceeded my own ideas of what is legitimate and fair. These offensive remarks I wish to withdraw; and I promise to be less inclined in future to rush bull-like at the first bit of red, totally blind to what, after all, may prove—as in this case—a complimentary notice, which another public writer would not have given me, although he may coolly adopt the subjects brought forward in my letters.

A gentleman who signs himself "Vortex," asks me—(1) Can the Fleet be fished from the bank when the grass is growing? Most certainly not, without committing an unpardonable trespass. Wait a few days after the opening of the season, and the grass will have been made into hay. I feel sure V. is not one of those few who would thus bring discredit on anglers. I cannot help throwing in a hint here to those who have care of the resolutions passed at the Society of Arts. One of your very best arguments to produce to a land-owning Parliament in favour of altering the fence months, so as to include the whole of June, is the fact that by that time the grass will have been cut. (2) "Is it correct that Mr. Clifford, of Magna Charta Island, can claim the sole right of fishing thereabout?" I feel sure he cannot establish any such claim, and am equally sure that he is one of the last men to attempt it. Unfortunately, there are a few anglers so thoughtless as to rush here and there quite unmindful of fences and gates; the result is that Mr. Clifford and numbers of others are not so pleased to see you as they otherwise would be. If you desire to fish from his private grounds, go to the house and ask his permission, and you will never be refused. I have found him a gentleman, and a clever enthusiast with the rod. Approach him as such, and you will have no cause for complaint. V. further asks me, "If there is no remedy for the taking of undersized fish by the foreigners employed at the tapestry works?" I am sorry to say that I have a very poor opinion, as will be seen presently, of the Windsor and Eton Preservation Society, who should protect this water. I should advise V. to make a report to the association to which his society, if he belongs to one, is affiliated, and they, being subscribers to the Windsor and Eton Preservation Society, will be able to put the screw on—it is much needed. I am pleased to learn that Mr. Geo. Mortimer is following in the footsteps of his father, and I hope he may live as long to fish the Elms swim.

I have resided long enough in this hole and corner on the banks of the Thames to discover that a sentimental grievance, or one affecting a small minority, is little likely to be dealt with efficaciously; we must show that the general body is interested, and sure to be injuriously affected by its continuance and growth, then we have only to be persistent, and the doctors will be called in and a remedy prescribed.

We professional fishermen are fortunate in finding the editor of the FISHING GAZETTE so unmistakably a sympathiser with us. Without your space and powerful advocacy, we must remain unrepresented and impotent; with your aid, we hope to make our voice heard in such a manner as shall assist in the remedying of those abuses, the continuance of which not only endangers our prospects as fishermen, but also the sport of all Thames anglers.

Notwithstanding your past kindness, I could not expect that you would permit a mere repetition of even acknowledged grievances to

appear week after week, therefore I have attempted to clothe them with facts and information which have been stored in my memory while fishing with numbers of those who may possibly read my letters and be able to connect themselves with some of the incidents which I have described.

I should like to say, in reference to my first letter, that I have seen and heard much that causes me to hope that the publicity given to my complaint, together with your weighty remarks, has had, and will continue to have, a good effect; and that the relative position of employer and employed, of educated and comparatively uneducated, will not be so frequently forgotten in the future as in the past. I must confess that I feel the regret of an angler, who, while having succeeded in landing a number of fish has unmistakably failed to land the monster which has more than once done him the honour to notice and play with his bait. I must have you, Mr. Harrington Keene; I will put on a fresh bait, composed entirely of facts, and try that. Within a stone's throw of my door resides a well-known fisherman, who has a number good patrons, and is as frequently, or more frequently, engaged than any other herabout. Amongst his patrons is one who fishes with him on an average about twelve times per season. Previous to the appearance of my letter, "The Curse of our Calling," this gentleman invariably took out with him in the punt a bottle of champagne, some spirits, and a stone bottle of beer; about ten in the morning they return to an hotel for lunch, and the exhausted liquors are replaced. At night, my neighbour returns home drunk, with his day's money intact. Whose money, whose drink, has wrought this disgrace? The gentleman's. This will be repeated six times out of the twelve, and on the other six occasions he is so little removed from being drunk that his craving for drink on the following day is almost as great as if he had been, and the day's earnings will be squandered in a vain attempt to quench his thirst. The gentleman of whom I am writing is a clever and successful angler, and one of the kindest and best intentioned, and would scorn a proposal to make one of a party to plot and determine—as others have done—to make their fisherman drunk; but drunk he has made his fisherman none the less, and in doing so he has spoilt the peace of the fisherman's family time after time. This same gentleman has recently been heard to say, "Never more will I take anything into my punt stronger than beer; I will sooner give my fisherman something extra to spend with his family." All honour to him, and may others determine to do likewise. My brother fisherman is no lazy hulk; no hour in the morning is too early for him, no day or journey too long; drink is his curse, and his empty cupboard is one of its fruits. It is a sorry Christmas for him, the river is flooded, and he has no hope of employment.

My second complaint was that our river Thames has, from causes which I set forth, lost the greater portion of its jack and perch, and that the disappearance of the remainder is only a question of a few years. I anticipate, sir, there are many who may not care to accept such a startling statement on such poor authority; if these gentlemen are jack and perch fishers let them put it to the test. I ask them to come down and attempt to equal their takes of former years; they will soon find that it's not to be done.

Many roach fishermen will learn of the rapid diminution in our stock of jack and perch with perfect equanimity, indeed, some will be pleased and go so far as to say, "a good job too." I venture to state that had they seen and studied the ill effects of too few, or no jack, in roach waters, they would know how necessary to the continued health of their favourite fish is the jack, which will clear away the weak and diseased, leaving the strong and healthy to breed and multiply.

There can be no doubt but that we are one and all interested in the reasonable protection of jack and perch, and the sooner and the more practically we can show our interest, the easier will be our task. You have suggested, sir, that the first step to be taken, is to artificially breed innumerable fry; your readers must all agree with you there. Now for the second step: we should protect these two fish during the six weeks ending July 31st, with the strong arm of the law, as it is during this period that butterfly fishermen and trailers take more in number than fall to the rods of legitimate anglers during the proper season.

I have, in a previous letter, spoken of the stupid system of frittering away the resources of preservation societies in the payment of a number of small sums to men whom they are pleased to dub river-keepers. Is there, outside a preservation society, a single individual so blind as not to readily discern how much better it would be that one good man should be secured who could give his whole thoughts to the fulfilment of the onerous duties of protecting the river? Is there no one amongst the many thoughtful anglers who will come forward and add the weight of his influential name to my weak protest against this foolish mismanagement? Can it be that the anglers of London will think that this is only a "queer complaint," therefore unworthy of notice? If so, I am courting further unfavourable opinion by calling attention to yet another grievance. There has recently been appointed a joint-committee of the Upper Thames Preservation Societies for the purpose of considering and maturing a scheme for the propagation of trout. I don't mind admitting, sir, that I am a trifle riled. I'll fill my pipe and steady my old nerves a bit, or I shall smash a pen or two over this trout committee. First, I want to "know, you know," how many of these gents took part in the apprisement of a certain 10,000 bull trout that were once upon a time turned into the river. Thirty pounds was their value—so we fishermen below stairs were told by the waiter who came down for a fresh supply of wine. Some broadish winks went the round of our little circle on this announcement. The pretty, modest barmaid failed to see the joke at first, and told us with a severe frown that she had no patience with a lot of old men winking and laughing her out of countenance. Of course, we explained

that it was not at her that we were so loudly winking and boisterously laughing, but at the profound piscicultural wisdom of the upstairs dinner-repleted nob, who had arrived at the extraordinary conclusion that ten thousand fry of migratory fish were worth exactly thirty pounds sterling. Now the damsel grasps the joke, and joins heartily in a last peal of laughter in honour of the bull trout, never a fish of which has been seen from that day to this. Now it's to be real Thames trout, therefore, we must be serious, and ask ourselves the plain question, Do trout require this special expenditure? I am satisfied that since the abolition of night-lines—for which I feel we are all greatly indebted to the T.A.P.S.—these fish have had a very easy time of it, and are now more than capable of holding their own against all comers, and that any further expenditure of time or money will be an unpardonable waste.

Were I an active member of the Amalgamated Association of Angling Societies I should propose that instead of sending these trout-culture societies—that should be their title—of the Upper Thames a cheque for the coming year, the money be invested in the coarse-fish culture scheme, the value to be returned in so many hundreds of thousands of roach, chub, perch, jack, carp and tench fry, and that these be placed in the river where most needed. This would, in a great measure, check the cruel indifference to all fish other than trout.

I am no prophet, but as sure as eggs are eggs, some thinking reader will adopt this suggestion.

I must not tire your patience, sir, on New Year's Eve with my growling, so I will finish this, my last letter of the old year, with a little tittle-tattle. We have heard of the village barber's boast that he alone enjoys the privilege of hearing everybody's opinion about everything; and much has been written of the confidences reposed in the mail-coach driver by his box-seat passengers; but nothing that I can remember has either been said or written of the unrivalled opportunities which we professional fishermen have of learning both sides of ticklish questions. Who knows, to-day I may have fished with two members of the Piscatorial Society, and they will, during the time they are with me, run through a variety of subjects; tomorrow, or shortly, I shall have a couple from the Gresham Society, and they will be pretty sure to speak of the same topics; yet, strange to say, their opinions will differ from those already expressed by the Piscatorials.

This is how we learn both sides, and the ins and outs of London angling club life. I have been compelled to overhear conversations in respect to these letters. One gentleman was of opinion that "no Thames fisherman could write them, he could distinctly perceive the one-penny-per-line professional writer's style." The other said "that it was clear to him that they must come from a professional fisherman, as no one else could give the facts, and there were far too many plums in the pudding for a paid writer to part with in less space than three volumes." Another opinion which I have heard expressed is that "no Thames fisherman would be such a fool as to give without reward information that would tend to make anglers more independent of him." Believe me, sir, if I could know that one hard-worked, smoke-dried, true-hearted man had been guided by my description to a swim which afforded him pleasure during a brief absence from his dingy everyday haunts, I should be amply rewarded. I fear no loss of custom; if ever I should be hard driven, I will throw aside my *nom de plume*, and boldly ask those of your readers who have not yet done so to give me a trial.

I have for many years pushed my punt amongst the bank anglers, some of whom have stuck to their swims with "Old Mortimer"-like constancy, and been such frequent visitors that I have learnt their names. Now and then I put them across or give them a ride down stream on their and my return journey. I am always glad to do this as I like their Cockney talk, and especially am I pleased to note the pride with which they speak of their clubs. I have not yet made up my mind which I should join were I a Londoner. If a lord, or "something in the City," I should be eligible for the Piscatorials; sometimes a Silver Trout and I have a chat, then there is no doubt that's the club; soon after, I fall in with a Golden Barbel, and he convinces me; the next is a Good Intent, and I decide to be one of them. It must be a right good club that has such a secretary, and where all the members have good intentions. I have seen wrong done by a club man, but it came to light, and the man was expelled. For a little time after this disagreeable affair I wondered if there were not members of angling clubs who merely fancied themselves anglers, or whose love for the sport was a thing of yesterday, forced into a mushroom growth by the hope of winning a copper kettle. The substantial fact remains that never but once have I known reason to suspect—while I have reasons by the score to respect—them, and to feel pleasure at seeing their faces behind the boughs as I travel up and down stream.

There are fish that we expect to meet with in pairs, but there is no fish so certain to have his mate close at hand as the bank angler. I could mention off hand a score or two of men whom I should expect to see in black were his comrade not close at hand. I may be busy attending to the gentlemen in my punt, but I have an admiring eye for the perfect sympathy and brotherly solicitude of the two men immediately alongside. You may implicitly trust almost every soldier of the grand army of bank anglers. With this firm conviction, I wish them and you, sir, a happy New Year.—I am, &c.

A THAMES FISHERMAN.

ANGLERS' TOURNAMENT.

SIR,—Seeing the name of our club (Social Brothers) in the list of those that have not sent the money for their tickets, I beg to say that we paid for ours weeks ago, and for which our secretary, Mr. J. R. Pavey, holds the receipt.—I am, &c.,

J. GOUBOT.

THE "UNION JACK" AND MR. SACHS.

SIR,—In your number for Dec. 24th, there is a letter signed "The Ghost of Sir Thomas Gresham." In it I find the following passage, "And it is a moot question whether T. R. S. could by himself have ever landed that fish." As I was in the punt at the time of the capture and actually assisted my father, with the landing net, in getting the fish on board, permit me to say that there is no question, "moot" or otherwise, about who played the fish—Mr. H. L. Rolfe or "T. R. S.," as your correspondent so refinedly puts it. As Mr. Rolfe wrote, in *Land and Water*, soon after the event, he never struck the fish at all. As a matter of fact, he laid his rod down and lit his pipe, saying he would wait until my father had landed his fish and give his own time to gorge the three baits he had put on, and he was much astonished at finding his float suddenly appear close to the punt.

From this you will see that the statement of "The Ghost" is grossly inaccurate.—I am, &c.,

FRANK SACHS.

SIR,—My father having informed me that he does not answer persons who are ashamed to attach their own names to their low personalities, I take upon myself to reply to the letter of "The Ghost of Sir Thomas Gresham," in the *FISHING GAZETTE* of Saturday last. Mr. Jardine's "friend" says, "I wish to point that T. R. S. has repressed a fact he well knew, that one of these large pike was not weighed in until two days after capture, and the other late on the third day," and goes on to assert that the fish actually weighed more than the weights stated upon the glass cases, viz.—36 lb. and 37 lb. Now let us see what is said about these very fish in the late Frank Buckland's last book, "The Natural History of British Fishes," pp. 155 and 156. Mr. Buckland says, "In November, 1879, Mr. Jardine caught . . . a grand pike, which, after having been out of the water *twelve* hours, scaled 34½ lb., so that it was a good 35 lb. fish." There is nothing here about 36 lb., or a delay of two days in getting the fish weighed, as stated by Mr. Jardine's "friend." Farther on we read, "In February, 1877, Mr. Jardine was fortunate enough to take with rod and line another pike weighing thirty-six pounds . . . Immediately the fish was captured Mr. Jardine brought her up on the top of a four-wheeled cab." The "immediately the fish was captured" contrasts strangely with the two or three days of Mr. Jardine's "friend," as do the two weights given, the one in Buckland's book, the other on Mr. Jardine's glass case.

By his couplet—

"Oh! dear Mr. Sachs,
Was this one of your larks?"

Mr. Jardine's friend evidently insinuates that the two-pound jack was inserted in the "Union Jack's" inside subsequent to its capture, for the purpose of increasing its weight. As the "Union Jack" was weighed-in at the Piscatorial Society in the joint names of the late Mr. H. L. Rolfe and of my father, the reflection attempted to be cast by Mr. Jardine's "friend" would affect both gentlemen, and I deem it but the due of the memory of my dead friend Rolfe to rescue it from so base an insinuation. The two-pound jack was *already partly digested*. It is a very unfortunate incident for Mr. Jardine's "friend" to lay hold of, for we read in the account of the 36 lb. pike (the 37 lb. of the glass case) already quoted from, that, "Previously to taking Mr. Jardine's baits she had swallowed no less than fourteen roach and one perch, which were all, more or less, in a state of semi-digestion." It has truly been said that "one man may steal a horse whilst another may not look over the hedge."

My only desire in writing is to put things in their right light. I have no wish to rob Mr. Jardine of the glory attached to the capture of the pike, the more especially that, as Mr. Jardine's "friend" ingenuously says, "any miff may have luck."—I am, &c.,

EDWIN SACHS.

22, Hyde Park Place, W.,
December 27th, 1881.

THE ATTEMPTED ANNEXATION OF THE THAMES.

SIR,—It will be well if the *FISHING GAZETTE*, as the representative organ of anglers, should bring to the attention of the anglers of London the great danger they stand under of losing the right to fish the Upper Thames, a right which has been vouchsafed to them and to their forefathers from time immemorial. Now, however, those to whom it has been given to protect the Thames for the public benefit are making insidious attempts to wrest it to private ownership. The "riparian" appointed by the Board of Trade to watch the public interest, has actually obtained the assistance of the Clerk to the Board of Magistrates as his own solicitor, and, under the plea of trespass, has summoned the officer of a Thames Preservation Society—of which, too, this magistrate, riparian, and representative of the public was a contributor and vice-president. Now, sir, the anglers of London cannot expect everybody to do everything for them, and, if they would preserve their own rights, they must be prepared themselves to defend them. Let them remember that in the case of the attempted annexation of Epping Forest, the men of East London rose and pulled down the encroachments, thus preserving their rights in the Forest. It remains to be seen whether the 150,000 anglers of London will leave the Thames Rights Defence Association without funds to protect the rights which the people of the country and the nation at large have hitherto enjoyed unquestioned. Mr. Leo Bonvoisin calculated that a halfpenny a week from the anglers of London would amount to a very considerable sum (the exact figures I forget), and if this halfpenny a week, or half-a-crown for the whole year, is forthcoming, it will be such a supplement to the efforts of other patriots as to ensure for ever to anglers the uninterrupted enjoyment (except by bad weather) of Father Thames.—I am, &c.,

J. W.

READINGS IN ANGLING SOCIETIES.

SIR,—In thanking B. for his complimentary and apparently exhaustive reply, permit me to remind him that he has given no definite answer to my queries, consequently I apprehend that my original complaint was well founded. I asked distinctly for names and dates of the papers read before the Piscatorial Society (if any) within the last twenty years, an issue which B. seems still to avoid—as he fails to give them. That society, of course, has a minute-book, and will no doubt supply him with the information.

I can most sincerely assure B. that I wish every possible success to the Piscatorial Society; and, indeed, to every body of honest anglers, who have the welfare of the craft at heart. The question between myself and B. is a simple matter of fact; and, if he will supply the statistics asked for, that will be all that is required. On other portions of his letter I forbear comment.—I am, &c.,

T. CRUMPLEN.

11, Albert Street, N.W., Dec. 27.

BLACK BASS FOR ENGLAND.

SIR,—We sincerely hope the introduction of our American black bass, both the "small mouth" and "big mouth" species, will be considered when the propagation of coarse fish comes up for discussion. I am certain if some of the gentlemen contributors of the *GAZETTE*, whose experience makes the columns so entertaining, could only have the pleasure of fighting one of these prime fellows on a slim eight-ounce split bamboo or greenheart rod, they would cry, "bass for ever." To say they are game does not fitly describe them; they are clear grit to the backbone, cunning enough to cheat you out of your brightest anticipations, because you can never count them as yours until they are safe in your basket and dead at that. Then, imagine fighting a fellow weighing five pounds, with ten times the amount of vigour in him you will find in a sluggish carp.

If my memory is not treacherous, the waters of the Colne, described by L. B. in the issue of November 19th, are just suited for the bass. Once introduce them in these waters and Mr. L. B. would not cast his bait for nothing. I have stopped fishing several times to see my wife and boy playing a three or four pounder, and enjoyed the fun more than catching them myself. By all means introduce the black bass.

P.S.—My experience of black bass fishing will be found in "Forest and Stream" of October 20, 1881, "Black Bass Fishing, Bear Lake, Michigan."—I am, &c.,

W. DAVID TOMLIN.

Chicago, U.S.A., December 14, 1881.

[We must think about that black bass, and shall hope to get some over.—Ed.]

PULBORO' AND AMBERLEY CHEAP FISHING EXCURSIONS.

SIR,—As the promoter of the above excursion, I shall feel obliged if you will inform me on what authority the announcement was made in your paper of the 3rd of December, that angling would be likely to be prohibited at Pulboro'.

As having originally obtained the permission of Sir W. Bartelott, Henry Challins, Esq., and other landowners, for the London anglers to fish in the waters running through their estates, I have had no notice from these gentlemen that the privilege has been withdrawn, or is likely to be so, and can therefore only conclude that the announcement in your paper, as above referred to, has been made under some misapprehension, as I have heard of no complaint, and everything is done that possibly can be by me to keep the excursion select. If you will therefore kindly give me your authority I shall accept it as a great favour, as, unless it is denied, it might do a great injury to the excursions both as regards the anglers and the railway company.—I am, &c.,

J. CLOUT.

Berkeley Castle, Rahere Street, Goswell Road.

December 24, 1881.

[We made the statement on very good authority, and we have since heard it confirmed on equally good authority, and we regret to say if what we heard respecting the doings of these select excursionists is correct, then the sooner they are stopped the better will it be for the credit of anglers.—Ed.]

WATERPROOF FISHING BAG.

SIR,—In reply to your correspondent, "The Wandering Angler," in the *FISHING GAZETTE* of the 24th inst., as to making a cheap waterproof fishing bag, I think he will find sail-canvas to answer the purpose better than any other material. This he can obtain of any sail-maker or marine-store dealer, the shape of the bag being similar to that used by the country postman.

Cut a narrow strip, say six inches wide, of sufficient length to form the sides and bottom, and sew upon it a square piece of the required size to form the front. Let the back piece be double the length of this, so that it may fold completely over the mouth, and cover the front as well; the overlapping portion to be about an inch wider than the other part. This can be secured with buckles at the bottom beneath which the waterproof coat and leggings can be carried when not required to be worn. Bind the exposed edges with pieces of the same material, and attach two buckles at the top corners behind, for the leather shoulder strap (or short one to hang over the ends of the rods when walking), and a most convenient bag for tackle, sandwich tin, and other angling requisites will be obtained, a similar one to which I have used for some years.

As to the waterproofing, if "The Wandering Angler," will forward me his address, I will send him in the course of a fortnight a sample of an india-rubber waterproof varnish with which he can coat the outside.

This, I have in two colours, black and green, and, as I have long used it for like purposes, can with confidence recommend it to the notice of T. W. A.—I am, &c.,

WILLIAM KING.

1, New Road, Commercial Road, London, E.

GENTLES—COLD FEET.

SIR,—In answer to queries, I have kept gentles during the winter in an earthenware pan. The gentles covered with dry sand, the pan kept in a dry cold place where frost cannot penetrate, as that would kill them. Sealing up in bottles would kill any living thing for want of air. When bank-fishing in winter I always wear goloshes as they keep the boots dry and the feet warm, and are not so tiring and cold as long waterproof leather boots are. When fishing from a punt in cold weather, I use thick leather-soled felt shoes, such as are used in the North of Germany when snow is on the ground, these keep the feet nice and warm. A friend of mine got a sack of bran warmed in an oven and put his feet into that.

TAKING CASTS OF FISH—MR. SACHS' SECRET SPRING BAIT.

I have been present when my late esteemed friend, Frank Buckland and his secretary, Mr. Searle were casting fish, &c., and I would recommend Mr. Knight to apply to Mr. Searle, 73, Arlington Street, Mornington Crescent, N.W., who will no doubt, for a moderate consideration, do any castings and paint same for him or any other gentleman. Mr. Searle has cast a Colne trout for me this year, painted it to life and cased it himself, he also recently painted two salmon casts with which I am very much pleased. In the window of "Land and Water," Fleet Street, are several attractive specimens of Mr. Searle's work.

SECRET SPRING BAIT.

The bait is in the shape of a dace, made in two compressible halves with apertures in each side for the hooks to spring out. The machinery inside is so constructed that the hooks when set within, will only fly out when pressed on both sides. This bait was made by a friend of mine, a watchmaker, for the purpose of travelling through weeds or other obstructions in lakes and rivers.

T. R. SACH

CLUB AND OTHER JOTTINGS.

By L. B.

THE monthly meeting of the United London Anglers Central Committee will be held on Monday evening next, January 2, 1882, at the Bald Faced Stag, Worship Square, Finsbury, Mr. S. Morgan presiding. Some most important questions will be brought on for discussion, and it is desirable delegates should attend.

I spent my Christmas holidays with friends at Southsea, and could not forego the pleasure of calling upon Mr. Tranter, the secretary of the Portsmouth Waltonians. The fates, however, were against me, and I found that Brother Tranter was far away on a fortnight's fishing and shooting expedition.

However, I looked in at the Golden Fleece Hotel, where the society holds its meetings, and introduced myself to the worthy host, himself a member of the society, who kindly showed me the club-room—and a very nice club-room, too, with some capitally set-up specimens of perch, jack, bream, roach, carp, &c., several of the fish having been taken and presented to the society by Messrs. Geen and Hoole, who are honorary members. Mine host informs me the Portsmouth Waltonian Angling Society is an increasing one, that the attendance on meeting nights is very good, and that they have been able to obtain from the South-Western Railway Company cheap travelling tickets to several fishing stations, on the principle of those granted to the London clubs.

Sport has lately been very dull, and I have it on the best authority that a number of well-known piscators have been recently seen whiling away the tedium of watching a float that would not bob by doing a bit of casting, just to keep their hands in for the next big tournament, which piscators generally seem quite to have made up their minds will take place early in June, when there's little, if any, fishing, and when the days are long and Nature looks her best.

Chub fishers are in despair, they say. Thick water, rivers bank high, and the mildest of weather, are anything but devoutly to be wished for by those who follow this particular branch of the art.

I cull the following from an old and interesting book lent to me by Mr. Hoole:—

"FRENCH AND ENGLISH ANGLERS.—The French angler is a very different being from the hard-working salmon-fisher or trout-fisher on this side of the Channel. Fishing is to him a kind of repose, which he usually takes on Sunday, along with the pleasures of tobacco and family delights. If he can be likened to any class of English angler, it must be to the stout old gentleman whom we see fast asleep in a punt on the Thames after dining at the Star and Garter; the only difference perhaps being that the stout old gentleman is content with one rod, line, and hook, whereas the French angler is not often content with half a dozen, but sets perhaps a dozen lines, with three or four hooks to each, each line being attached to a short pliant stick with a bell on the top of it. The sticks being stuck fast into the bank, he proceeds to enjoy his leisure waiting in patient indolence for what fortune may please to bring upon his three dozen of baited hooks, the tinkling of a little bell warning him from time to time that he has another fish."—*Pall Mall Gazette*, 1868.

CLUB REPORTS.

ACTON AND EALING ANGLING SOCIETY.

For Christmas week our members that fished weighed-in the following:—E. Eydman, 5 lb. 1½ oz. roach and dace; W. Edyman, 4 lb. 12 oz. roach and dace; Mr. Slater, 5 lb. 1½ oz. roach and dace; Mr. Cook a nice show of dace; W. Howell, roach and dace. One of our members has been expelled for weighing-in fish that he had bought. Two members of the Knights of Knightsbridge kindly came as witnesses and rendered us great assistance. I should like personally to give you the name of expelled member, but hope the steps taken will be warning to him and others.—BLACK BAG.

AMICABLE BROTHERS' ANGLING SOCIETY.

Christmas Day a blank, the second this season. It is to be hoped that a bad beginning will make a good ending. A special meeting will be held on January 4th, 1882, to arrange the prizes to be fished for and where. All members are requested to attend that meeting.—T. WORLEDGE, sec.
Dec. 28.

BRIGHTON ANGLERS' ASSOCIATION.

The competition on December 26 showed but little excitement; only two prizes being taken, viz.: Mr. Hassell and Mr. Artis, first and second. The members returned home from Chichester early, and partook of a good dinner provided at headquarters by Host Omerod. The river Ouse is getting fishable. Mr. Anscombe taking a very good fed jack on Wednesday, and on Tuesday at Berwick some very fair sized bream. The Adur still in bad condition.—GROUND-BAIT.

BURDETT ANGLING SOCIETY.

The first annual distribution of prizes took place at the above club on Dec. 21, when there was a good attendance of members, the prizes won consisted of a handsome silver cup, taken by Mr. John Hadkiss; a silver watch, by Mr. Weeks; a silk handkerchief, by Mr. B. Smith; two electro silver teapots, by Messrs. Cressfield and Ratcliffe; a gold signet ring and a pair of boots, by Mr. J. Hadkiss; tobacco-jar and ½ lb. tobacco, by Mr. Strong; set of hot-water jugs, by Mr. Hayward; jack-rod by Mr. Coughlan; gold watch and meerscham pipe, by Mr. Taylor; and a very nice alarm timepiece, by Mr. Weeks. There were a great many prizes given for the ensuing year by those present. A vote of thanks to the treasurer, chairman and secretary terminated a very pleasant evening.—T. G. WALKER

GOOD INTENT.

There was a good show of fish brought in to club last night. It is quite a treat to see a good show, and last night put in mind of old times. I trust it will continue to be the rule and not the exception. Mr. J. Bell had 20 lb. of good class roach from the Grand Junction Canal. Mr. George Bates had a good tray of dace from Richmond, and many others had smaller quantities, so that we had most of our trays filled. I am glad to say Mr. H. Brookwell has his case of trout home from Cooper's. Five fish, taken from the Lea is in one case, and very handsome they are. They are in the club-room for any angler to see any Sunday or Tuesday evening.—R. MURPHY.

GRESHAM ANGLING SOCIETY.

The meeting of this society on Thursday evening was of unusual interest, although the attendance was comparatively small when their great gatherings are considered. Mr. Parker presided, and addressed a few congratulatory words to the members, after the minutes of the previous meeting had been read and confirmed. Mr. Jardine, who was unable to stay the entire evening, kindly left a cast for inspection, unquestionably the finest of its kind yet produced. It was a faithful reproduction of a perch, most artistically mounted on a leaf and dish, a portion being finished by Mr. Jardine himself, and it needless to say a vote of thanks to that gentleman was carried by acclamation. Captain Alfred, who had already presented the society with a vigorous painting, one of those beautiful miniatures for which he is so famous (copies of which may be had of the secretary), has added to his liberality by giving a presidential hammer, the same being made from the head of a perch, forming also a snuff-box. There was also a general discussion on Coarse Fish Culture, in reference to the plan suggested in the *FISHING GAZETTE*, and on the motion of the Hon. Secretary, it was resolved to invite Mr. Marston to explain his views at length to the society on some convenient occasion, the general feeling being that, if practicable, the society would do its best to aid him in bringing them to a successful issue. The amalgamation of the three central associations, and the formation of a real Thames Angling Preservation Society by union of existing associations was also touched upon; Mr. Crump, of the Thames Angling Rights Association, making some very pungent and important remarks bearing on the special subject he has in hand. Some fine jack and perch were weighed-in by Mr. McDowall, after which the meeting adjourned, a hearty vote of thanks being given to Mr. Parker for presiding. Members are reminded that the first supper of the society takes place on Wednesday next, and as the accommodation is necessarily limited, names should be given in without delay. The prize competition for jack and perch on January 2nd, is open to be fished for in any public water, and a good show is anticipated.

IZAACK WALTON ANGLING SOCIETY.

Mr. G. Wood showed 3 lb. 10 oz. of nice roach from the Lea on Wednesday, the 23rd inst. The two special prizes which were fished for on Sunday, the 11th inst., and not taken, will again be competed for on Sunday, January 8th, 1882; same conditions. Three special prizes will be fished for on Wednesday, January 11th, 1882, members to choose their own fishing water; all fish weigh; nothing under 1 lb. weight to take a prize, and no competitor to leave London before the morning of the competition. Particulars of the last mentioned three prizes:—Mr. J. Hilliar, jun., 10s. 6d.; Mr. T. Dennison, sen., one gallon of Old Tom; Mr. C. Hambridge, a box of cigars.

Dec. 29.

LITTLE INDEPENDENT ANGLING SOCIETY.

A few members went out this Christmas, but their luck was indifferent. Mr. Humphreys had a few splendid roach weighing 9½ lb.; Mr. Petrie had roach; Mr. Grey, roach; and Mr. Hurwood, chub.—W. BROWN, hon. sec.

MACCLESFIELD UNITED ANGLERS.

The annual supper took place on the 15th December, at the Three Crowns Hotel, Sutton, the worthy host catering in first-class style. About sixty members took their seats to do justice to some of the good things of this world. The cloth being removed, Mr. N. Williams our worthy president was voted as chairman, Mr. D. Bullock, vice-chair. The president promptly commenced by calling on the secretary, James Scanlon, to report the doings of the club for the last twelve months ending November 30, 1881. The secretary gave the following list of names of winners of monthly prizes:—December 6, 1880, W. Sefton, pike, 4 lb. 10 oz.; January 3, D. Bullock, pike, 2 lb 4½ oz.; February 17, S. Hobson, pike, 2 lb. 12½ oz.; March 14, H. Beard, pike, 1 lb. 13½ oz.; April 7, J. Ball, trout, 2 lb.; May 24th, W. Sefton, trout 2 lb. 4 oz.; June 6, F. Clayton, trout, 1 lb. 7½ oz.; June 16, J. Robinson, perch, 10½ oz. June 25, W. Sefton, roach, 7½ oz.; June 28, J. Dickens, pike, 1 lb. 15 oz.; July 6, S. Hobson, perch, 1 lb. 10½ oz.; July 23, D. Bullock, roach, 11½ oz.; July 29, W. Sefton, trout, 8 oz.; August 5, Captain Hulme, trout, 1 lb. 8½ oz.; August 6, J. Bray, pike, 2 lb. 6½ oz.; August 17, F. Clarke, roach, 11½ oz.; August 27, W. Smith, perch, 11 oz.; September 5, T. Boulton, roach, 8½ oz.; September 10, J. Bray, pike, 2 lb. 8½ oz.; September 22, J. Pimlot, trout, 4 lb. 8 oz.; September 24, Captain Hulme, trout, 10½ oz.; October 6, J. Ball, trout, 9 oz.; October 6, J. Ball, perch, 6 oz.; November 1, W. Sefton, roach, 6 oz.; November 7, W. Sefton, pike, 3 lb. 5 oz. These fish were all taken from Langley reservoirs or the portion of Rudyard Lake on the estate belonging to Woldale Farm, the property of our late friend Mr. George Bostock. His death is deeply regretted by all. This portion is rented with the game to this society. The first special day's angling took place at Langley on April 15th, for trout only. Twenty-six members competed. 1st prize, handsome timepiece and 5s. won by Mr. W. Sefton; 2nd prize, a handsome counterpane value 10s., won by J. Sumner; 3rd prize, a copper kettle, won by Captain Hulme, value 7s.; 4th prize, fish tackle, won by J. Holloway, value 5s. 5th prize, a pipe and pouch, won by Lees Hibbert, value 3s. The second special days contest took place at Rudyard Lake on June 18th. The 1st prize was won by F. Clayton, a handsome plated tea pot value 12s. 6d. 2nd prize, W. Sefton, fish rod, value 10s.; 3rd prize, J. Robinson, fish tackle, value 7s. 6d.; 2nd competed. The third special contest took place at Rudyard 1st prize, T. Hickson, brass fruit pan, value 10s.; 2nd prize, W. Williams, bait can, value 6s.; 3rd prize, H. Beard, fish tackle, value 4s. Twenty competed. The premier prizes were awarded as follows:—1st prize for trout, J. Pimlot, weight 4 lb. 8 oz., a handsome pair of vases, value 17s. 1st prize for pike, W. Sefton, weight 4 lb. 10 oz., crust stand, value 12s. 6d. 1st prize for gudgeon, W. Williams, 2 oz. 6 grains, satchel value 5s. The prizes being awarded, the president proposed the usual loyal toasts and thanked the honorary members for their kind presence that evening, and the kind presents

of game from honorary members, as venison red deer from Mr. Cundliffe Brooks, M.P.; pheasants from W. B. Brocklehurst, Esq., and A. Brocklehurst, Esq.; N. Goodwin, Esq., for hares. Their healths were drank with musical honours which was responded to by Mr. Philip Cooke. Harmony commenced with Mr. J. McGuinness who was highly encored, followed by J. S. Thomson, Mr. T. Boulton, and others. The evening spent was as jolly anglers do, the worthy mayor giving one hour's grace on the occasion it was heartily enjoyed. Some of the game not arriving in time there was a repetition of the supper on the 22nd when another social evening was spent. The railway managers were thanked for their kind favours in granting all we have desired. Thirty sat down to the second supper. The health of the worthy host and hostess were drank, "God save the Queen," and all was over for the evening.

THE ORIGINAL ALEXANDRA SOCIETY OF ANGLERS.

I have not had anything to send to you since December 11, although our members have been out. Mr. E. Dymond, sen., was out on the 26th, and strange to say caught a barbel 2½ lb., at Digby's water, near Ponder's End, and one small jack. Mr. High has been out the whole of the holidays jack-fishing, but has not meet with a single run.—E. DYMOND, sec., pro. tem.

ORIGINAL CLERKENWELL PISCATORIAL SOCIETY.

Several members of the above society were out on Monday last and met with little success, Messrs. Obbard and J. Drew saving us from a blank, the former with roach the latter with jack, both from the Lea.—THOS. W. LUCY, sec.

PORTSMOUTH WALTONIAN ANGLING SOCIETY.

The above society have again commenced their weekly reading of piscatorial papers, this being the third year of these instructive and interesting productions, and it is very gratifying to the officers and committee to find that among our younger members there is a considerable amount of praiseworthy ability and close observation, as evidenced by the animated discussion that follows each reading; and to promote this, it is desirable that we may be enabled to produce one paper every fortnight, until the end of the fence months in June. At the end of the season the papers will be collected, printed and formed into a nice little volume for our already increasing library. Our esteemed friend and brother angler, Mr. J. S. Dyer, gave the first paper this season, entitled "Anglers and Angling in General," and, as expected, produced hearty and unmistakable marks of approval. Mr. J. H. Bracey, our worthy president, found many new and interesting facts to place before us in that rather well-worn subject "The History of the Pike"; and on Thursday last Mr. Redward's paper on "Sea Fishing," with practical illustrations, was everything the title suggested; the practical illustration consisting of models of anchors and the various modes of working a fishing-boat at sea, releasing the anchor under difficulties, &c.,—a very practical and useful paper, the only drawback to it being the evident signs of haste displayed in what was intended for drawings of the various landmarks and good spots along the coast for fishing. Several papers are promised by the members, the next on the roll being "Carp Fishing," by Mr. J. E. Buck, our worthy vice-president; also "Microscopic Aquaria," by Mr. Mortimer, &c. Some very fine rock-whiting have been weighed-in by Mr. Westaway; Mr. Bracey, one jack, 5 lb. 9 oz.; Mr. Mortimer, roach and rudd from our private water. We expect a great acquisition to our club-room shortly in the shape of an otter, which has been kindly promised us by our esteemed friend and brother sportsman, Mr. J. Taylor, of Fareham, who is well known for his wonderful success with the trout on a small stream near here. I should like to have given his totals for the past two seasons, but, unfortunately, I have lost them.—WM. TRANTER, sec.

ROYAL GEORGE ANGLING SOCIETY.

At the general meeting of this society it was decided that we should remove to more convenient premises, and the meetings will now be held at the Sun Tavern, Newman-street, Oxford-street, W., where all communications should be addressed. Several prizes remain to be angled for, and others are expected in shortly. Members are kindly requested to attend and give us their support, so that we may be as successful, if not more so, in our new premises as we were in our old.—F. MILLARD, sec.

Dec. 28.

SOCIAL BROTHERS.

I have not sent a report lately, as we, I presume, like most of our angling friends, have been doing very bad of late, the state of the water being dead against us. Just to give you an instance, we had to go out three times to fish a peg-down match. The first time not a fish was taken, the second ditto, the third time resulting in the capture of a small chub by the winner, and one dace for the second. Sir, hoping the forthcoming year may prove better than the outgoing one, I beg to wish you and all angling friends a happy and prosperous new year.—J. GOUBOT.

STANLEY ANGLING SOCIETY.

On Boxing Day a prize, presented by Mr. W. Nelson Hunter, was competed for, Mr. Charles Scull proving successful, with a small show of roach and chub. Several other members weighed-in fish, but the takes were very insignificant. Arrangements are at present being made for the seventh annual ball, held under the auspices of this society. It is intended to take place early in February. The next paper will be read by Mr. J. Duncan—subject: "Fishing near Reading"—on Wednesday, January 18, 1882. Members are reminded that our next meeting, on January 4, is the annual Punch Night. A magnificent preserved specimen of a grayling, weighing over 3 lb., was exhibited by a friend at the meeting this evening.

STALYBRIDGE ANGLING ASSOCIATION.

This society has now got fairly afloat with Monday-night readings, which are very attractive and entertaining. The members of the Q Inn Angling Club, Back Grosvenor Street, met on Monday night, December 19th, for a social gathering, and had for the subject, "Pike Fishing," spinning, and live baiting. The worthy host (Mr. David Shaw), who is an ardent pike fisher, read a paper on the subject, and in the course of his remarks explained the ways of putting live and dead baits on the hooks with fish provided by one of the members, which made it more interesting. A number of artificial baits

were placed on the table for the inspection of the members. The following took part in the discussion: Wm. Thorp, Saml. Greenwood, Wm. Wardle, J. B. Udale, Wm. Jackson, John Tasker, Jos. Warhurst, Joseph Leigh, John Leigh, H. Beswick, G. Whitehead, John Thorp.—JAS. B. UDAL.

UNITED BROTHERS.

The district visit of the West Central was held at the above society's spacious club-room on Wednesday the 21st, but there was a very poor attendance. owing, no doubt, to the nearness of the holidays. There was some capital songs rendered by the following gentlemen: Messrs. Stidolph, Duke, Gandle and Page of the Peckham Brothers, and Messrs. Watts, Belton, May, Bros. Tyler and Freman, of the United Brothers; also the following gentlemen who were non-society men: Mr. Slatter, Baldwin, Dear, Avery and Hardy. Mr. B. Gaston very ably presided at the piano. Chairman, W. Belton, Vice-Chairman, F. Watts. P.S.—I should like to call attention to the fact that Mr. Wilson, the district officer was not in attendance to call the roll. Perhaps he can explain. The old members fished their match at Ware on the 27th, with the following results:—First, F. Belton, with roach and dace; Second, W. Belton, roach and dace. River in splendid order for bottom fishing.—WILLIAM BELTON.

Dec. 27, 1881.

UNITED LONDON ANGLERS.

The monthly meeting will take place on Monday evening next, January 2, 1882, at 9 o'clock precisely, Mr. S. Morgan, chairman. Several questions of great importance will be discussed, among them the advisability of the association's renting the right of fishing from private lands and other waters for the benefit of their members. Secretaries will oblige by a settlement of all accounts outstanding for the year 1881. The new concessions generously granted by the Great Eastern Railway will come into operation on and after Sunday next, January 1, 1882.—R. H. GHURNEY, Secretary.

WALWORTH WALTONIANS.

On the 19th Mr. Boalch was out with C. Brown at Richmond, and he managed to get a few roach. On the 18th, all the members that care to compete for the prizes given for that day will visit Windsor and fish from the bridge to Maidenhead if they like; but they must fish from the towing path and bank only—any style except torpedo floats and trimmers.—PRIXE.

Dec. 14.

WESTBOURNE PARK PISCATORIAL SOCIETY.

A match took place on the 11th inst., roach only, taken anywhere. Thirty-two members contested. First prize, 31s. 6d., was taken by Mr. Stevens, with 3 roach, 2 lb. 2½ oz.; second, 20s., Mr. Severn, 4 fish, 1 lb. 13 oz.; third, 15s., Mr. T. Hawkins, 1 roach, from Godfrey's, 1 lb. 5½ oz.; fourth, Mr. Thompson, 10s. 6d., 3 roach, 17 oz. Last evening Mr. W. Hawkins had a very handsome roach, turning the scale at 1 lb. 14 oz. alive, from Godfrey, Thorney Broad, West Drayton. After being weighed, it will to-day (Wednesday) be returned to the same water, by Mr. Hawkins. Now don't you think that is sportsman-like. In this club no roach are weighed less than 8 inches in length.—W. ADEANE.

Dec. 14, 1881.

THE FOOD SUPPLY OF LONDON.

A FISH PRESERVATIVE.

THE *Lancet*, in continuing its report on the food supply of London, urges that there is sufficient reasonable suspicion as to the existence of both a fish and meat ring to warrant the placing of the markets under the coercion of a Government inquiry, with power to compel witnesses to give evidence on oath. The salesmen are too often themselves purchasers and speculators, and naturally sell their own goods first. There are instances given in the report showing that the price paid to the consignors is not always in keeping with that for which the goods were sold. The smaller the market the easier it is to control the trade, and the Billingsgate salesmen purchased the best fish they could find, notably some magnificent salmon, at Columbia Market, and resold it at Billingsgate, so as to leave the public and the trade under the impression that it was at Billingsgate and not at Columbia Market that the good fish was to be obtained.

But (says the *Lancet*) Lady Burdett-Coutts discovered another means by which, in default of better market accommodation, the price of fish might be reduced. A French invention based on a solution of acetate of soda and glycerine was brought to her notice that would preserve fish for an indefinite time. This was submitted to Dr. Sedgwick Saunders, the City medical officer, who not only reported most favourably, but himself ate mullet, smelt, and salmon which had been kept a month in this solution, and found these fish perfectly good. Thereupon Lady Burdett-Coutts sent at considerable expense enormous quantities of this solution along the whole coast, so that fish might be preserved, waste during a glut prevented, and the supply better regulated. This, however, did not at all meet the interests of the trade, and they strenuously opposed whatever would tend to prevent profitable fluctuations, and by avoiding waste reduce the prices. The suppression of this very useful invention is a clear proof that the market is capable of a combined effort to maintain personal interests even at the sacrifice of the public good.

WANTED, by the 'TRENT OTTER,' a situation as Keeper to a private fishery, or as Water Bailiff to a Board of Conservators, or a Fishery District; the former preferred; for further particulars apply to the editor of the FISHING GAZETTE.
